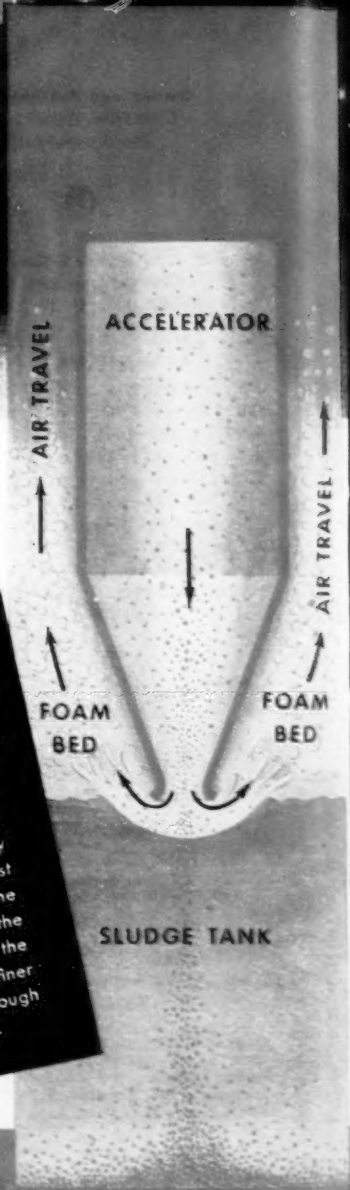
AHON *Hydro-Foam* DUST COLLECTOR

RAPS DUST

Under Water

ndries—in metal working plants—in the glass, chemical and paint industries—*wherever DUST azard to health and production*—this modern d of dust control is serving effectively and with ng economy. A completely pneumatic system AUTOMATICALLY COLLECTS AND DEPOSITS R WATER all forms of harmful dust without the nozzles, jets, pumps or cloth screens. Having ving parts, other than the suction-exhaust fan, s nothing to wear or get out of order. Let Mahon ers show you—by actual facts and figures—*effectively* and *inexpensively* this advanced d of dust control is serving under conditions ilent to your own.

Write for descriptive folder



SAFEST, SUREST PRINCIPLE OF DUST ELIMINATION

¶ Dust-laden air is drawn into Intake Chamber where coarser particles drop by gravity into the treated water in the sludge tank below. ¶ The air then enters a battery of Accelerators, where it is impinged at high velocity against the surface of the water, forcing most of the remaining dust to the bottom of the tank. ¶ This impinging action aerates the solution and creates a bed of foam in the Foam Chamber, which serves to trap the finer dust particles as the air currents pass through and out of the unit, thoroughly cleaned.

Consider the Ant

"GO to the ant, O sluggard and consider her ways and learn wisdom." So said Solomon, the son of David, King of Israel, in his Book of Proverbs, written some 3000 years ago.

That was a thousand years after the ants, masters of organization since nearly the beginning of time, learned the hard way that organization itself cannot produce constructive results without the addition of a plus ingredient. The story goes as follows:

There were ants, of course, in the Garden of Eden, together with all the other species of animals, birds and insects. The ants differed from the others, however, in being naturally fond of work. So while the lions and tigers, elephants and deer, scorpions and black widow spiders spent their days indulging in peaceful contemplation and conversation, the ants hustled about looking for business. They didn't have to, of course, but they were made that way.

Each ant, in those days, went about pretty much on his own. If he felt like building a house he did so. If he felt like harvesting a crop of grass or leaves he did so. If he felt like exploring the surrounding country he did so. There was nothing for him to fear for he had no enemies and all creatures were vegetarians.

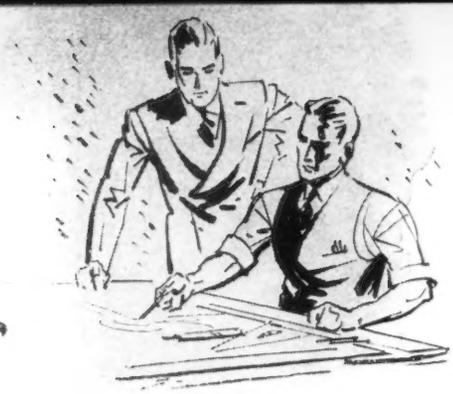
The picture changed, however, when Adam and Eve were evicted from the Garden and the premises were closed to the public. Peace no longer reigned on earth and life for all became a struggle for existence.

The ants met the situation by organization. They divided themselves into groups, builders, foragers, housekeepers, agriculturists, soldiers, etc. They initiated specialization and perfected it and this worked well for them for a time. But eventually it resulted in building a class consciousness between groups. The builders thought they were the most important because they made the houses, the foragers because they furnished the transportation, the agriculturists because they milked the ant cows, etc. So there began a struggle between groups for position that lasted until the coming of the great war with the spiders.

Ant armies were proverbially the best in the world and they did a fine job until the ants behind the lines, who were their suppliers, got to quarreling among themselves, each group seeking more recognition.

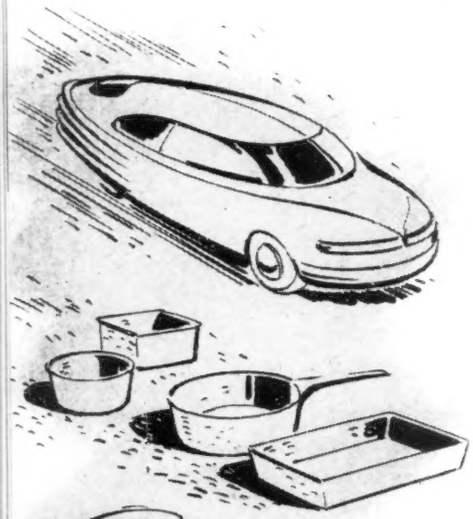
As a result of this pulling and hauling at home for selfish ends, the gallant ant soldiers were deprived of support and nearly exterminated by the spider army. Whereupon the chief of the ant republic borrowed a grasshopper's antennae and made a radio talk to his people. Said he: "My friends, organization has its excellent points but it may well be our undoing unless we add another ingredient — cooperation." And from that time on the ants have cooperated to beat the band and have multiplied and prospered.

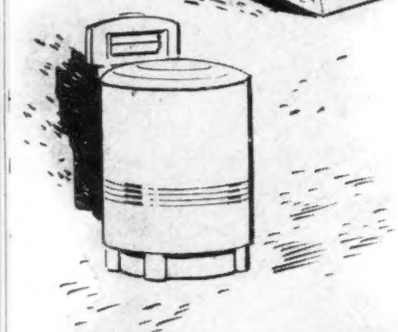
Maybe we today could "consider her ways and learn wisdom!"

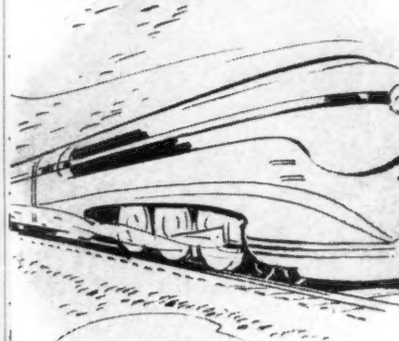


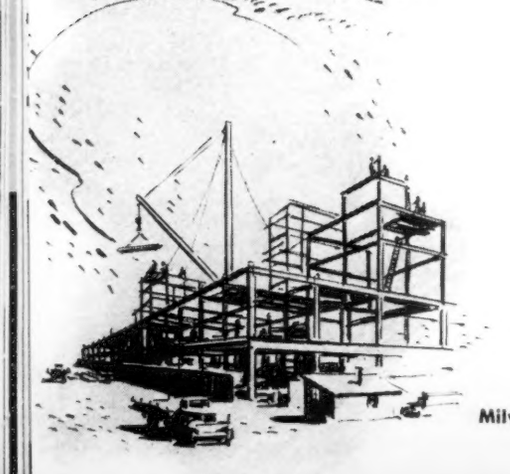
Design —

For Safety and Dependability With Inland Steel









The buying public has learned to associate steel with safety and dependability. People ride in steel trains over steel rails, live and work in structures made strong with steel, travel the highways in steel automobiles, cross streams on bridges of steel, farm and manufacture with steel equipment, use steel furniture and innumerable household appliances—all with the knowledge that these things, made of steel, cost less, are more durable—have greater strength and safety.

Steel affords strength without excessive volume and weight. It is strong in tension as well as in compression. It quickly recovers from strain, and is resilient under shock. Steel reduces fire hazard to the minimum, and is practically unaffected by climatic conditions. Steel normally resists corrosion and can easily be more fully protected against such action. Steel absorbs neither moisture nor odors.

Inland has been a leader in the development of steels to meet changing industrial requirements—has continuously cooperated with industry to make available various physical properties and surface textures that give steel its unsurpassed flexibility in product design and fabrication.

The Inland laboratories and the Inland staff of engineers and metallurgists are at your service to help you meet the design problems of today and of the post-war period. We will be glad to help you on any design, material selection or fabricating problems.

NEWS FRONT

• Walter Reuther, UAW leader and author of the 1940 Reuther Plan, has formulated a new program for reconversion to peacetime production. Reuther proposes a Peace Production Board with full powers over allocation of materials, manpower and tooling.

• Allocations would be granted by a system of "social priorities" under which the most urgent civilian needs would receive top preference.

• Recommending a 30-hr. week, Reuther says that 30 hr. of present production equals 40 hr. of 10 years ago. Pay for the 30 hr., of course, would equal the 40 hr. pay of an earlier day.

• Extension of the wartime patent pooling system is also proposed. Plan recommends setting up of a central research agency of the government to coordinate all research work on patents and technology.

• A sizable nickel property in Brazil (Livramento, Minasgeraes), owned by Cia. Nickel de Brazil, has been acquired by the American Smelting & Refining Co. A commercial plant will be erected on the property in 1944.

• The Allied advance in Italy captured a completely equipped Alfa-Romeo engine factory (including foundry, work shops, offices, etc.) concealed in four huge bomb-proof grottoes in Naples. The plant had turned out large numbers of 12-cylinder Benz motors. Another grotto near Naples contained the main repair shops of the chief technical headquarters of the Italian Air Force.

• Castings and forgings in England are being tested sonically. The equipment consists of a microphone, which picks up the vibrations when the casting or forging is struck with a hammer; an amplifier, which magnifies the sound; and filters, which suppress harmonic frequencies. Base frequency of a defective casting differs from that of a perfect specimen.

• The nation's basic mineral resources are being rapidly depleted while no new deposits of equal grade or magnitude have been discovered to replace dwindling ore reserves. Probably no more than 50 lb. of copper is recovered at best for each ton of ore mined. Average is about 20 lb. per ton.

• Although applications for domestic copper premium payments were no longer accepted after Dec. 31, contracts for zinc, lead and copper from Latin America run for two years after the war.

• Anticipated magnesium capacity of 700,000,000 lb. annually has not been realized. The size of the magnesium stockpile is probably no more than a few weeks' supply.

• During March, Canada's Dominion Magnesium Co., Ltd., produced an average of 8½ tons of magnesium daily at an average cost of 39.7c. a lb.

• Ninety-four per cent of magnesium production facilities are government owned. DPC plans after the war to shut down high cost plants or divert them to other uses.

• In addition to galvanizing and brass for construction, the zinc industry is looking forward to a postwar surge of zinc alloy die castings. In little more than 10 years die castings developed from a minor outlet to a market for 125,000 tons of special high grade zinc.

• Domestic production of copper threatens to decline in 1944 because of labor shortages. The favorable shipping situation, however, will permit greater imports.

• Decline in demand for molybdenum springs is following a reduction in foreign requests. Normally getting 2,000,000 lb. a quarter, the United Kingdom asked for 500,000 lb. for the fourth quarter.

• Overall use of molybdenum for the year, which amounted to 52,400,000 lb., ran 10,000,000 lb. below projected production figures.

• Total renegotiation cases completed during 1943 totaled more than 17,000. War Department estimates that all cases for 1943 will number 25,000. Pace in handling cases increased toward end of the year and remainder will be completed early in 1944.

1943 • 1944

By T. W. LIPPERT
Managing Editor, THE IRON AGE

WHAT is doubtless an apocryphal story has it that as the late George F. Baker and some ten golfing companions prepared to tee off at Tuxedo Park, one onlooker said to another, "Do you realize that those men getting ready to drive represent over $40,000,000?" Then, as Mr. Baker drove off and stepped from the tee, the onlooker observed, "And now, the group represents $18,000."

Apocryphal or not, the story pretty aptly portrays the state of business today. The government is driving off and, with something akin to masochistic fascination, nearly everyone from Jesse Jones to perhaps even Mike, the neighborhood garbage man, is watching that first tentative step from the tee to the hazards of a particularly tough course. In retrospect, even though Government's spastic approach to the tee in 1942 may have had its weird overtones, only those with the most shallow of factual underpinning can deny that the industrial follow-through in 1943 was smooth and powerful.

To be sure, the past year's industrial performance was one of wavering violently between the extremes of malnutrition and satiety. The virtual collapse of an enormous tank program, drastic cut-backs in ammunition requirements, and the killing off of an enervating submarine campaign, each lifted a sizable load from the productive structure. But, even so, the flood of the products of war was such as to warm the heart of the most ardent admirer of American industrial efficiency. All this, and with the civilians engaged in a record buying spree, and never approaching within radar distance of the "foothills of severe privation" that Mr. Nelson and many others so grimly and so frequently promised.

Now, while it is always a little presumptuous to build victory arches before the last battle is won, particularly with a whole inter-related series of labor disputes threatening, all evidence has it that the purely industrial phase of World War II has either hit a plateau or is actually beyond that onto the declivity. Of course, machine tools many months ago passed through their peak, and today all the common metals, with the possible exception of nickel and copper, have passed out of the critical classification. In fact, many producers of certain metals and metal products are not a little concerned with the size of their stocks and the rapidity with which additional accumulations are being made, as well they might be, what with inventories in many instances worth more than the companies involved. And, even in manpower, some of the strain is disappearing and there is a declining tendency to hire a body just so long as it is still warm. It is not too unlikely that in 1944 there actually might be annoying (sic!) labor surpluses unless the whole industrial tempo is supported by a greater return to civilian production than is now anticipated.

The sunshine of industrial fruition has tended to soften considerably the mistakes of tooling up—mistakes not really very deplorable in view of the size, complexity and urgency of the job done. Shortage zealots, in general, have been reduced to mumbling in their beards or searching for more promising fields for exploitation. What is even more frustrating, regional political cliques are receiving more and more evasive answers to their pet ideas for the location of marginal or downright uneconomic productive facilities, and are consequently beginning to turn their attention to rather obviously spurious protective schemes for facilities now in operation that may soon have to search for markets against the first faint stirrings of fierce competition. Probably not even the most cynical fully realize the innumerable distortions woven into the industrial fabric by enormous sums of government money and the gush of hell-with-the-cost war orders, two props either now slowly wilting or destined for sudden collapse as Washington goes through an inevitable but probably short-lived phase of parsimony.

Meanwhile, the past six months or so have been favored with the flowering of a whole new cult of statistical commandos, with certainly as many representatives in industry as in government, who plot a rather precise return to pre-war normalcy with almost the exactitude of differential calculus and with a sublime confidence that is indeed quite warming. Certainly no sane person could possibly quibble with the end result desired, whether it be return to even 1938 or, better yet, 1937 normalcy—but, above all, not to 1932 abnormality. But the very lushness of the parade of plans and the very ostentatiousness of the publicity involved may suggest to some Freudian a subconscious recognition of the imponderables of Government's economic and political policies, the citizen's attitude toward taxation and spending, international trade decisions, all the doubts best reflected by Shakespeare in the lines,

> "Oft expectation fails, and
> most oft there where most
> it promises."

Or, perhaps, all this is unduly pessimistic. In any case, the writer could function somewhat as a devil's advocate to examine unpleasant possibilities, albeit unpopular. Certainly it would seem that three years or more of the most costly war of history has possibilities of really wrenching a social structure. And it is difficult to believe that the return to a healthy industry, a prosperous and happy people, can be achieved solely by a few simple easy-to-take pills, whether they range the extremes of the elaborate complexities of currency shenanigans as exemplified by, say, Stuart Chase's "compensatory" economy, to

With a welter of superficial post-war planning slanted in favor of some industrial or ideological group or area assuming the proportions of national escapism, perhaps a little more attention should be afforded the issues at hand rather than the tooling-up for something cosmic in the future. There are a lot of bleak problems that would better be sweated out before extrapolating war-inflated production to a millennium demand of the good life as pictured in the sleeker magazines.

the sweet faith of prohibitionists in the power of abstinence. To the writer, all the industrial, social, political, economic and psychological factors involved in adjusting industry and individuals back to a peace economy, cross and intermingle to such a degree as to daze the sight, and in some instances cut across so many emotions as to propound very complicated problems for solution. And, if industry, labor, politician, and J. Q. Citizen, vox pop, the average American that cartoonists always picture getting it in the neck, don't thread this maze with some degree of sensitive and intelligent sacrifice, they may well fall prey to the blandishments of collectivists either of the left or right—those elite-ins who have such facile answers to any and all difficulties.

Whether readjustment to and functioning in the post-war economy is covered in the plan of an earnest business man, tinkering with some new or improved product, or painted with broad strokes on a world-wide canvas by a theorist, there is considerable unity in basic pattern, a number of threads of thought common to them all. These are:

(1) That Germany will be defeated this fall and that Japan will fold up perhaps a year or so later.

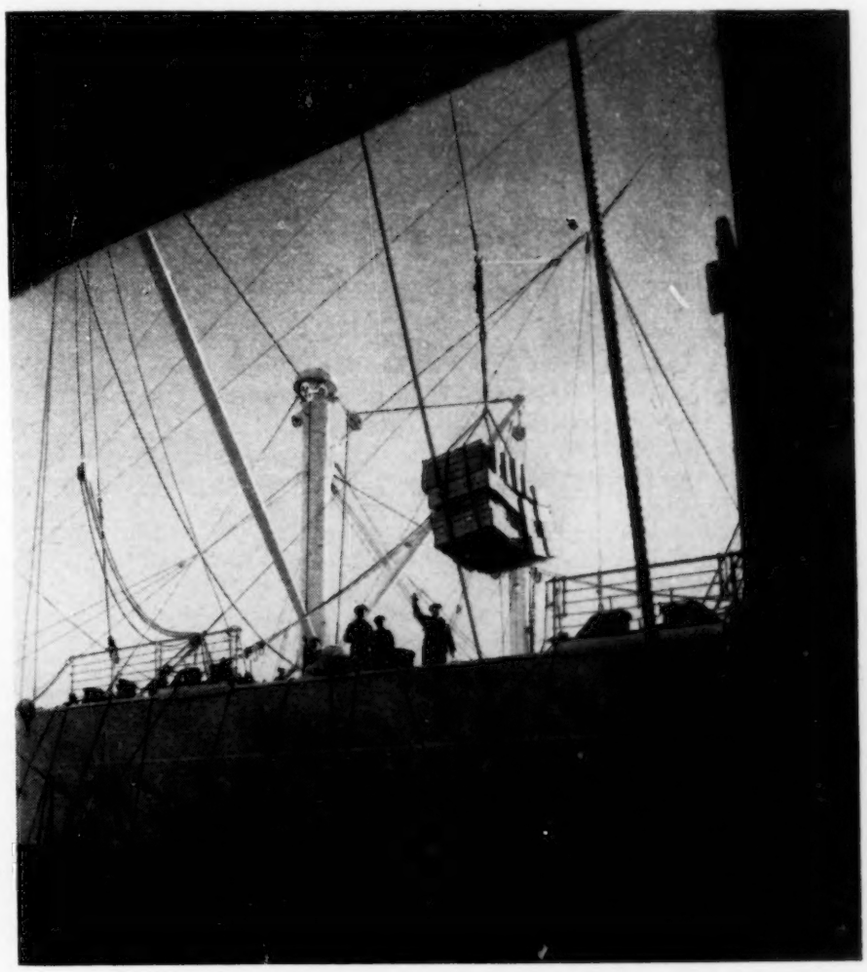
(2) That, following, or even somewhat anticipating, Germany's defeat there will be a rush to return to production of civilian goods, as war output is drastically cut back to a replacement schedule barely balancing the requirements of the Pacific campaign.

(3) That, as soon as large blocks of industry return to civilian production thereby absorbing the millions of orderly demobilized soldiers, there also will be available a frenetic market starved for luxuries and necessities and flush with savings and readily cashable war bonds that can serve as a base for a phenomenal pyramid of installment buying.

(4) That, the war debt can be serviced over a very long period and therefore be more of an annoyance than a burden. And, even perhaps if it is pushed around enough it will, like quicksilver, slither down through the cracks in the economic structure and quietly disappear.

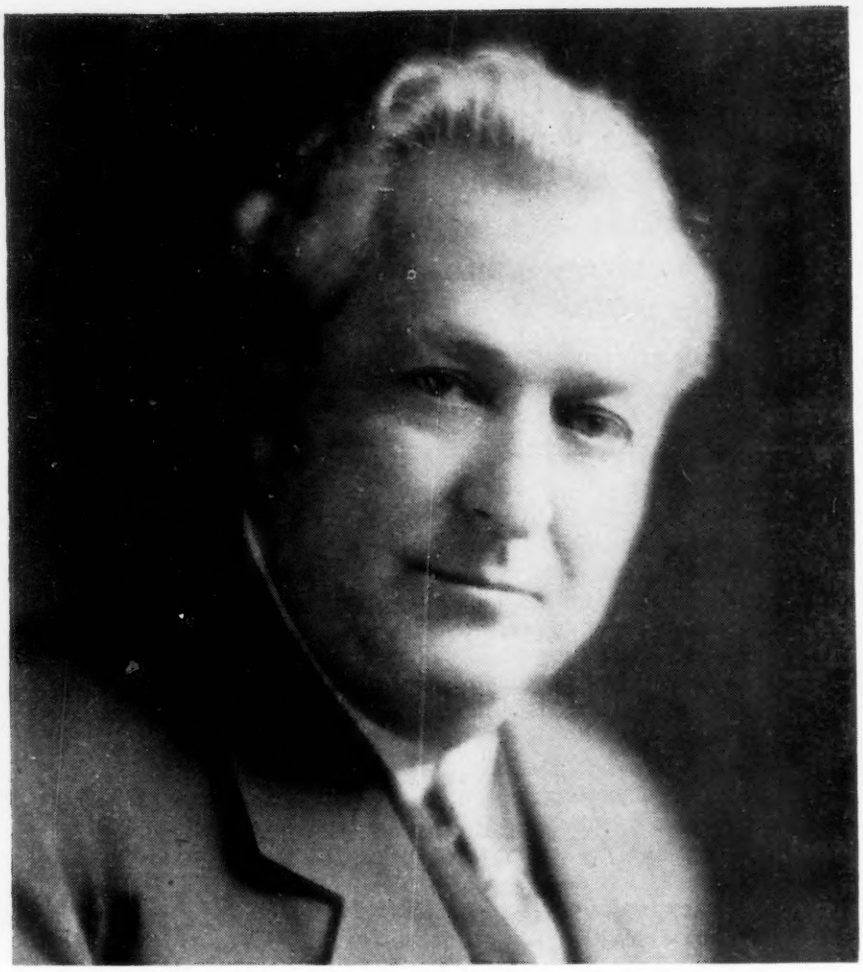
(5) That, the U. S. will become a great exporting nation, dominant in the new air transport routes lacing the world, also the greatest maritime power of all time. All these facilities will afford convenient channels for releasing troublesome capital goods and even consumer goods surpluses to all the war-torn countries of the world.

(6) That, under the impetus of new inventions and a super-vitalized, war-bred technology (technology being the one and only thing ever improved by war!), capital and consumer goods industries will flourish for several years after which there will be a de-



EXPORT

. . . Is conspicuous in many a post-war plan. But, while the experts prattle of currency groups, of "bancors", of "unitas", can ingrained U. S. insularism forsake tariff interferences to team imports with exports?



SENATOR PAT McCARRAN
. . . Like many another, his recipe for the financial and industrial future is the pernicious economics of narrow self interest. Armed with the plenary powers of S. Res. 190, he intends to recentralize industry.

cline and a breathing spell to take up the slack of some deferred readjustments.

(7) That employment must and will be kept at an extremely high level if government ceases interfering with business, and that the full flowering of free enterprise can well meet the demands so imposed.

The seven steps on the return to normalcy are orderly, to say the least. Few pitfalls are recognized and everybody [illegible] is up the next decade prosperous, happy, loved by the whole world, with a standard of living so infinitely superior as to make the present appear a little stuffy, static and unimaginative. Even so, just to be doubly sure, perhaps each of the seven steps could be examined in detail.

(1) That Germany will be defeated this fall, and that a year or so later will see the finish of Japan, all seems rather likely. As the headlines proclaim, even conservative military men are now going on record for both the timing and the end result. But the very severe casualties in the immediate offing may well bring the country up with a jolt and create for the first time a definite real awareness of the sacrifices at the front that deserve better at home than a promise of dismissal pay or bonus.

(2) A severe drop in war production may, however, not follow Germany's defeat, but could easily be well developed long before that time. For some industries, the post-war period may actually be right now, not in the future, and Baruch just recently cautiously intimated as much. (He has also said that a country at war should order its national life as to admit of no other thought.)

The great supplies of metals available for other than war use, the very great possibility that there will be sectional surpluses of manpower very soon, and the spate of activity on the part of the Office of Civilian Requirements are all sign-posts leading to a greater and greater attention to filling up the pipe-lines of civilian consumption. Perhaps all this will spurt along at a pace considerably faster than is anticipated; in fact, it is just barely possible that when the first great waves of demobilization occur there will already have been made in this country large quantities of civilian goods which will have taken the edge off of the civilian market just at a time when from a manpower standpoint it might be desirable to have the biggest possible backlog of orders.

As contract cut-backs occur in various localities every effort will be exerted by labor and by business organizations in these areas to maintain peak production. A rudimentary tendency in this direction already has been evidenced. The natural result of all this will be an increasing effort on the part of the War Production Board through its division of civilian supply to O.K. production of various types and quantities of civilian goods. At first, the excuse will be given that these goods are absolutely essential to the maintenance of bedrock civilian economy, but later on it may become all too obvious that rather than the maintenance of bedrock economy the operation will be one of bowing to pressure groups or maintenance of employment. Many of these goods are liable to be made by groups of war workers, including large blocks of women working at war inflated wages.

Through the country as a whole there may thus develop numerous anomalies. On one hand women will be enticed from hearth and family to work in war plants; men will be removed from war jobs by Army induction, and large blocks of workers will be turning out civilian goods which in no way can be considered essential to the prosecution of the war. Add to this the shearing across of competitive interests, and the obvious unfairnesses and inequalities of sacrifice to individuals and industry groups, and there is liable to be boiled up a brew that could well make what is blandly called the "unwinding process" something that could wreck many a beautiful friendship.

(3) Now, as to that moot third point, the all-important expectation that industry will automatically fall heir to a magnificently conditioned sellers' market, as everyone cashes in savings and war bonds to replace all the worn-out luxuries and necessities demanded by modern living. This writer cannot go quite so all-out on this as practically all his contempo-

1944 .

raries. In fact, so very many refer to this phase of the return to normalcy as the coming post-war boom, a particularly unfortunate choice of word, what with its connotation of bust.

There have been a number of surveys made of the Gallup type which indicate what many millions of people intend to purchase in the way of enormous numbers of automobiles, refrigerators, stoves, houses, television sets, helicopters, air-conditioning, ad infinitum, to satisfy all of the frustrated desires for necessities, transportation and luxury. This type of market survey is ground through the statistical mill and translated into demands for raw materials and labor. There are literally thousands of post-war committees working in various industrial companies which have mapped out elaborate charts showing how all of this is to seep down into the individual companies to support various rather rosy rates of operation. Parenthetically, it might also be mentioned that while many companies talk freely of new post-war products, very few are actually doing much more than give the idea lip service.

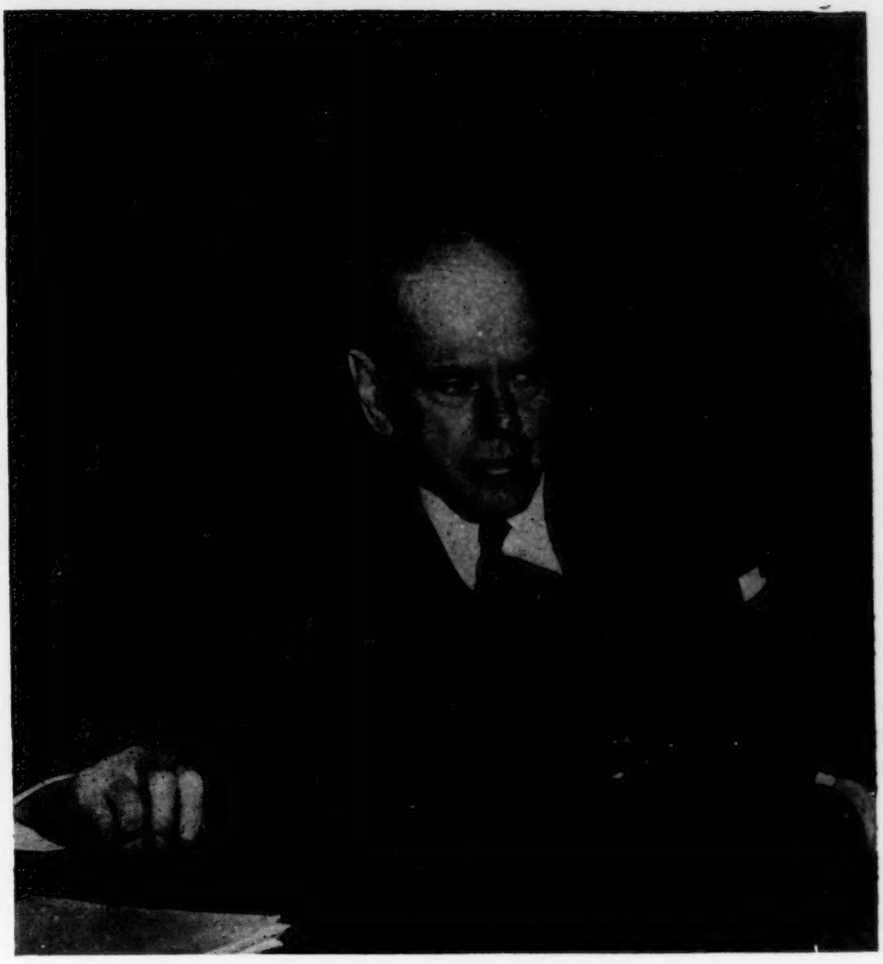
Now, the writer's survey is strictly of the men's washroom type rather than of Gallup precision. But, here again, it is very possible that the buying pattern may not be as explosive or as insistent as many envisage, although undoubtedly there will be a period of release of pent-up demand supported by a flood of easy dollars. In fact, this is a dangerous period of the transition and too widespread a liquidation of wartime savings, temporarily invigorating as it might be to industry, could well jeopardize the entire economy and enmesh business and individuals in a deflationary spiral leading to a whole new futile series of government, social and monetary panaceas.

The average citizen, while unfamiliar with all the economic nuances involved, still carries scars of the psychological devastation of the depression and is more unnerved about post-war conditions and perhaps more prone to welcome corrective safeguards than is generally recognized.

Talk of post-war possibilities is easily on about a 10 to 1 ratio to concern regarding the war. This not only applies to civilians but applies to soldiers, and while relatively few instances do not prove the whole, there are certainly many soldiers who are saving money and in general preparing as best they can for what may be a difficult period before they can re-orient themselves into the civilian framework. And, while these soldiers are returning and trying to readjust themselves into the civilian pattern, and while on every hand many are losing war jobs to be statistically reabsorbed into civilian industries, the psychological conditioning will be such as to discourage too careless or spendthrift an entree into the marketplace. The over-all civilian economy has in no way been driven down into a desperate level. Automobiles can be stretched out to an extremely long life at minimum usage; refrigerators can be tinkered with and kept in operation, and all that multitude of usual consumer goods may not find everyone beating out other's brains trying to get the first ones to pop off the assembly line.

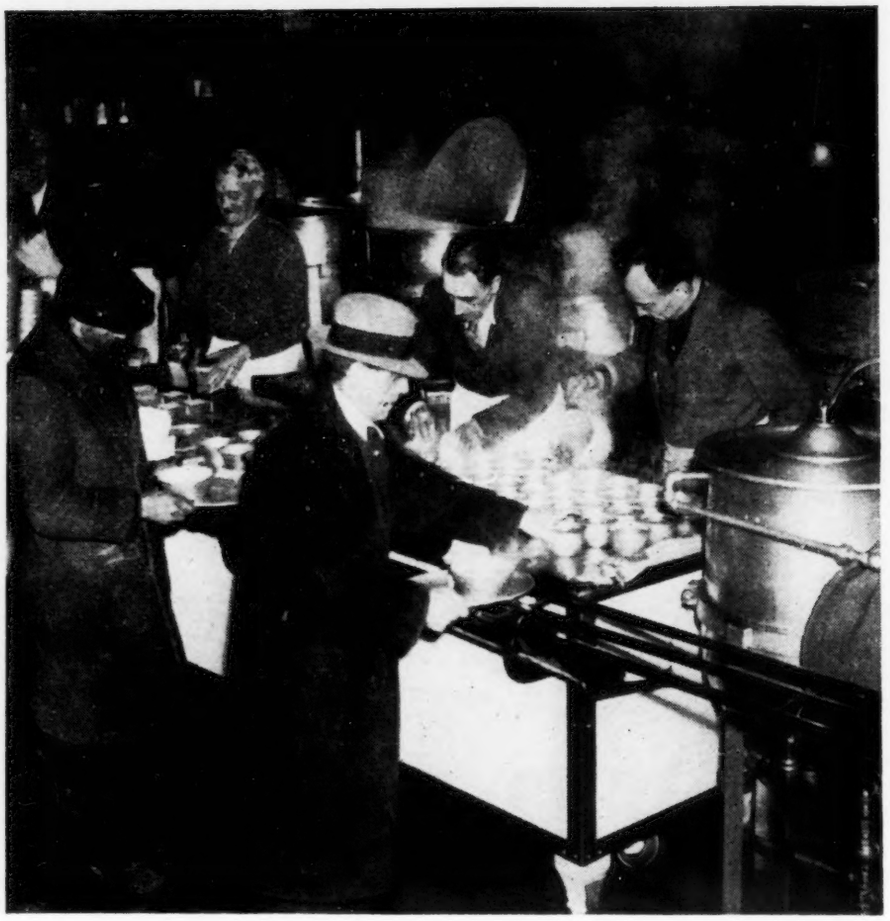
Furthermore, as for (4), it is always pleasant to dream of all those innumerable trick extensions of payment of war debts and all those very flossy economic aberrations such as "the debt is owed to ourselves and therefore is no burden," or perhaps "some little inflation can be permitted and everything sort of wiped out in a rather painless fashion," or "war goods were paid for in manpower when they were produced and even though they were destroyed there is actually no debt involved," or "the war debt can be stretched out over a long period of years and thus become no great burden." But dreams are illusive and fickle figments and beyond all dreams lies reality.

No one has satisfactorily explained how all the war bonds are to be cashed without (a) a simultaneous increase in taxes to cover their payment, or (b) further loading of still more long-term bonds onto already overloaded banks. Add to the $6,000,000,000 or so needed to service a war debt of over $250,000,000,00; continue to add to that debt with some $8 - $9,000,000,000 dismissal pay for the armed forces; and add to that untold



EUGENE G. GRACE

. . . Boss of Bethlehem Steel Co.'s $2,000,000,000 of war goods produced in 1943. Personal remuneration in 1943 after going through the tax mill, $42,546; in 1942, $90,527; in 1941, $163,000.



UNEMPLOYMENT

. . . Is not a luxury a vigorous nation can afford. The psychological shattering of individuals and the nation in 1932 need not recur unless realistic action is reduced to the status of a bit player on the stage of peace readjustment.

billions for inevitable pensions; and add to that a spate of billions to take care of miscellaneous pump priming and subsidies for the various pressure groups even now developing their campaigns of attack.

Pre-war British experience indicated that a national debt of about twice annual national income can be borne without too much difficulty. On this basis a post-war national income of $150,000,000,000 (at 1943 prices, when national income passed $130,000,000,000; pre-war income equalled $65 - $80,000,000,000) can manage a debt of $300,000,000,000 (Federal + State + local). The figures however all rattle around up in that zone wherein lies the final sensitive cracking point from which there remains only a rapid slide to national bankruptcy and debt repudiation. Certainly this outlook cannot be viewed by the author with quite the frigid tranquillity of Wall Street's Edward L. Barnes, who points out that "not before 1949-50 at the earliest is the country expected to be in a sufficiently troublesome economic, fiscal, or business predicament to force deliberate recourse to some form of currency debasement."

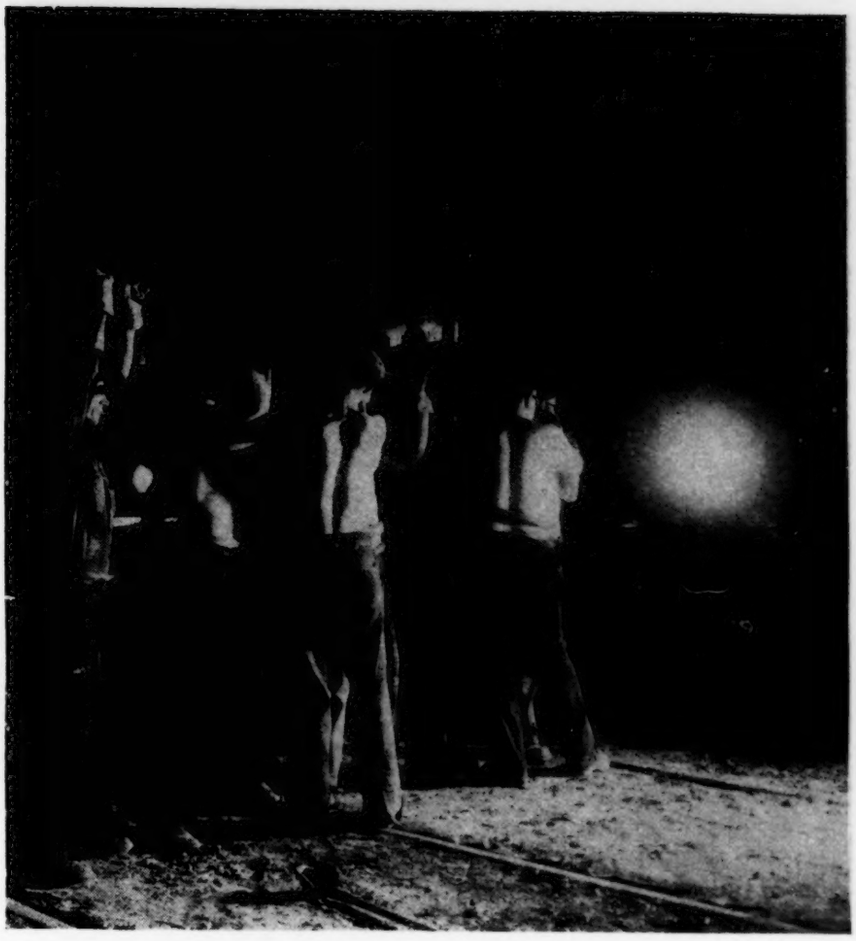
Sometime, somewhere, before the last bucket is thrown into the Treasury only to thump on the bottom, the whole national consciousness must accept the fact that debts must be paid, that debt payment is always unpleasant, and the only way to pay is by severe taxation. And, the sooner the better. Furthermore, business, labor groups and the very least citizen must participate in the repayment.

Meanwhile the errors of omission as regards taxation policy over the past several years have been of such magnitude that if continued much longer they will completely erode the whole core of the country's economy. With the greatest quantity of money in the country's history jingling in pockets, bulking bank accounts and flooding the market places, tax policy has been unbelievably flaccid and tax load relatively moderate. While both Executive and Congress must share the bulk of the condemnation for this rank dereliction in responsibility, even the least citizen is minutely involved, as his day-to-day determination to fight a hard, an all-out war has not been quite so firmly entrenched as all his brave words to that end would indicate.

While the details of taxation technique are such as to baffle even the experts, there does seem to be a great deal of common sense in the contention of industry spokesmen that only through the easing of corporate tax structures can free play be given to the risk capital that has so long been repressed and which will be so very essential in implementing exploitation of all the new technologies available after the war. Unfortunately, every time industry spokesmen plump for such easing, the words are rammed back down their throats by labor and political spokesmen as just one more indication that industry is attempting to squeeze one more good thing out of the war. Now the Treasury is proposing increasing corporate taxes even further, rather than shift some of the tax load from corporate income to individual income, whether the latter be in dividends or in pay. All this despite the fact that the real function of corporate income kept in the business is to finance more goods and more jobs, and after performing its function there it can subsequently go through the tax wringer when it is released to individuals as dividends.

The disinclination of the State to recognize the serious deterrents to industrial activity inherent in certain taxing practices, bodes ill for more widespread and dramatic alterations in taxation policies that could perhaps give a really worth-while fillip to post-war private enterprise. The British, for instance, are giving serious consideration to a number of tax renovations of apparent merit. Sums needed for maintaining intact the existing productive power of a business would be free of all tax; depreciation allowances would be raised and the definition of obsolescence would be widened; profits put into *financial* reserves would be taxed, although the reserves "ploughed back" would be taxed at something below the standard rate, and the rate may vary according to trade cycles; and, businesses might be asked to form special reserves called "extension accounts," such profits being taxed at rates lower than those available for distribution, and when unemployment threatens

1944 .



LABOR

. . . Has its post-war plans also, and they are just as self-centered as any that business might have. Despite irresponsible actions of minorities, labor and management together turned in a 1943 production performance that warrants an accolade for both.

the tax may go even lower and rebates made on all sums brought out of the extension account and spent on approved purposes. Certain phases of these possibilities involve undesirable encroachment of Government in the affairs of business, but in this country Government has already wriggled in pretty far.

Policies and actions bearing on export and foreign trade (5) will have a crucial effect on the industrial health of the country and in turn on the virility of private or free enterprise. It is generally agreed that conditions have altered somewhat since 1776, when the *Pennsylvania Journal* said, "America's situation is remote from all the wrangling world, and she has nothing to do but to trade with them."

The question of foreign trade breaks down into the nearby phase and the long-term phase. The latter is bound up in a maze of top-drawer policy-making now in the formative stage. There is justification, however, in holding out hope that international exchange stabilization, tariff adjustment and quota elimination will be correlated on a sufficiently realistic and unselfish basis as to stimulate the international flow of goods to such an extent as to bolster the economy of all nations. This country's participation in such agreements need in no way be one of top-lofty sentimentality lubricated by a gush of cash, nor can it be one of hogging the works in the belief that this country, not Germany, is the real home of the Herrenvolk. Be all these decisions and plans as they may, in the end the whole question of export of labor and materials in the form of goods and services has to be one of balance by acceptance of goods and services in return. For the U. S., with its great stock of gold and overwhelming credit position, this will involve particularly drastic alterations in policy and psychology.

Several factors involved on the immediate export situation are directly related to the pattern of industrial reconversion to peace in the U. S. Some attention, sans political overtones, is long overdue regarding the innumerable ramifications of Lend-Lease. While there can be no possible justifiable criticism of the bulk of Lend-Lease activities which further or facilitate the war effort, there is a great deal of secondary evidence that very large quantities of products, both of the consumer and capital goods types, are going to Australia, New Zealand, Russia and other countries which are being laid up for use after the war. And, while Lend-Lease considers the quantities of tanks, airplanes and guns shipped to other countries as no longer a military secret, there has been remarkable resistance to flushing out figures on consumer goods and products not of a military nature. And, there are orders for productive facilities even now passing through the hands of Lend-Lease which cannot be shipped and put into operation before the war's end.

Through export channels a means will likely be found to relieve American industry of the tremendous overload of capital goods, automotive equipment and certain types of consumer goods that are of such magnitude as to obviously threaten a healthy return to peace-time production. Industrial equipment producers — furnaces, cranes, rolling mills, fabricating machinery, etc., etc.—and the machine tool industry particularly are faced with the existence of stocks and facilities that could well support the next decade or so of general industrial activity. And, while inventive ingenuity can render existing equipment obsolescent, the inertia of such large quantities promises at best a slow squeezing of the equipment down through various levels of the industrial framework and finally onto either the scrap heap or into secondary export channels. Meanwhile, the creators of the equipment are so deflated as to threaten the pace of the entire industrial effort, integrated and interrelated so intimately as they are with all industries.

The imperativeness of lifting this burden and the certainty of many European nations starved for such equipment after the war so neatly complement each other, that disposal abroad came to be recognized by practically everyone at about the same time. The idea certainly has far more merit than half formulated and ill-

concealed opinions that the stuff should be tossed into the ocean, burned, or for God's sake gotten rid of somehow.

But, to give the equipment away, even if disguised by some impossible form of Government or private credit, would be merely a multiplication of the follies following the last war. There's too much wealth involved, and much of the payment for the equipment is yet to be sucked out of each individual, to expect popular acceptance of the action irrespective of what relief might be afforded business. Rather than the repudiation of international obligations that were so inevitable in the late twenties, product repayment would be preferable even if it had to be in liquor so that everyone could at least have the wry satisfaction of a beautiful hangover.

So what to get in return? It should be something immediate that wouldn't interfere with future export activities. Here, again, the serious inroads into U. S. material reserves and the slicking off of the cream of high-grade metallic resources brought many simultaneously to about the same conclusion—the creation of a strategic reserve of critical and semi-critical minerals, and to a much lesser extent of productive equipment, the shortages of which have so impeded the prosecution of this war. Definite declarations in an Act to this end would have to limit the size of such impounded stocks, would have to confine its liquidation to an obvious *military* emergency as distinguished from some economic disturbance, and would have to propound elaborate safeguards to protect the Act from being hugged to collapse by the innumerable pressure groups which would inevitably endeavor to use it as a catch-all for all types of over-production or marginal output.

It could be argued that such a creation of a military reserve would be a provoking step and could well quench the faith of other nations in America's spirit of high endeavor in leading the world to the peaceful world to come. And, it could also be argued that such action is costly. But, no one is of the opinion that military equipment will be liquidated with the careless abandon following the last war, and the costs involved in the impounding of such stocks would be only a fraction of that represented in military equipment. High endeavor be as it may, and a future emergency be as remote as it now seems, no one involved in the war production effort can take other than a gloomy view of a repetition of the confusions, close squeaks and dangers that threatened this nation's very existence in the six months following Pearl Harbor. An opinion to the contrary would be equivalent to distrust of life insurance as an accelerator of death.

While acceptance of the scheme of stock accumulation may imply recognition of merits in the stock-piling proposal of Nevada's Senator James T. Scrugham, there are very all-important differences from the bill S 1160, on which hearings have already taken place. The honorable Scrugham, being from Nevada, quite naturally expressly excludes iron ore, coal and petroleum from the provisions of his Act, and with typical high-minded statesmanship drags in economic security for small and marginal mines. That is, mines which by the smallness and low tenor of their ores, unfavorable geographical position, or some other controlling characteristic, are unable to profit at established market prices, and require the crutch of financial subsidy as a prerequisite of operation.

Stock accumulation as conceived by others seeks to avoid these types of regional log rolling, and envisages no support of uneconomic operations for periods long after the war. Rather, it is a means of trading what is possessed in excess for something that contributes to the long-term wealth of the nation. At the same time the in-

Steel's Record Performance in Detail

THE tableau of steel in 1943 was one of coming into the year on a wave of improvisation, of shifts and expedients to cram the last wad of steel into each of a multitude of armament pipelines and to accommodate urgent and progressively larger over-all demands. As the pace of war shifted and veered, so was one program compressed as another accelerated. All these tricky patterns of demand would indeed have been an overwhelming frustration to the industry if the labyrinthine ways of priority control had not given way in the second quarter to the flexibility and elastic-exactness characteristic of the Controlled Materials Plan.

At year's end, December found the steel supply picture one of sufficiency. Perhaps not an elegant sufficiency, but still fully enough to meet any and all the varied ordnance requirements, the drain of history's greatest Naval construction program, and even the seemingly insatiable requests of Admirals Vickery and Land over in the Maritime Commission. And there was just enough steel left over to really whet the appetite of manufacturers champing at the bit to initiate limited production of civilian products.

Very early in 1943, about the end of the first quarter, it became obvious that production facilities were completely incapable of fulfilling the

TABLE I

Production of Iron and Steel, by Product (1929, 1935-1943)

(In Net Tons and Per Cent of Total)

NOTE: Data for 1929, 1935-1942 from A.I.S.I.; 1943 figures are estimated by the author.

1944 .

year's distribution pattern laid down by WPB. At the same time it was equally obvious that completion of new capacity was going to require a bucketful of digitalis to snap back to even an approximation of the original construction schedule. And, as counterpoint to this discordant symphony, the Army and Navy and sundry (as, for instance, Texan) politicians were marshalling every conceivable force to mount construction of still another 10,000,000 tons of new capacity.

What to do! For a month or so WPB wallowed around in an abyss of indecision, trying to reconcile irreconcilables; finally to arrive at the opinion that the goal was based on fundamentally perverted analyses—that requirements overlapped, were bloated beyond all reason and included huge gobs of steel for shoehorning into inventory pipelines that were already stuffed. Then, at the insistent prodding of H. Q. Batcheller, the various agencies squeezed the water out of their requests, an action suddenly facilitated by virtual collapse of the $1,000,000,000 tank program, realization of the enormous over-estimates of ammunition requirements, and relief occasioned by licking the submarine menace. The military pulled in their horns, the pork-sniffing politicians were held at bay, and total steel demands were brought within several million tons of expected output.

The next steps were to whip producers into squeezing additional output out of existing capacity and to institute a paring of inventories all along the line—the latter "Share the Steel" program was in part voluntary and in part forced by WPB representatives touring the country probing into plant warehouses. With the several million tons of deficiency between supply and firm demands pretty well taken care of through the output spurt and putting the bite on inventories, the entire armament program was worried over the fourth-quarter hump without recourse to acceleration of construction of new capacity.

Thus was the country spared a futile construction spree and saved untold millions of dollars. Certainly, the re-balancing of the consumption budget rather than forcing in of one block after another of new capacity required considerable courage and foresight, for subsequent events indicated that, if completed, the bulk of the economically marginal productive facilities would have been called upon for little more than token operation. At year's end, at least 10 per cent of electric furnace capacity was idle, several new DPC blast furnaces were not even blown in, at least one eastern ore mine was not operating due to a labor shortage, and large integrated developments in Texas and in Utah were being carried to completion more as a gesture than because of dependence on their output.

That a somewhat weird program had been laid down for the steel industry in 1943, there is no denying. After an all-time record downlake movement of 92,000,000 gross tons of iron ore in 1942 (goal = 91,500,000 tons) a new and larger goal of 104,000,000 tons was set for the 1943 shipping season. Expansion of the ore boat fleet and completion of the deeper General MacArthur locks at Sault Ste. Marie were all directed to moving this phenomenal amount of ore in the 8 months between thaw and freeze-up. An extraordinarily late opening of the ice pack was an initial set-back to the program, but constant pressure resulted in progressive recovery during the season. As the boats "Olcott" and "Gov. Miller" docked at Lorain on Dec. 9, just one jump ahead of the freeze-up, a total of 84,404,852 tons had been brought down during the season and some 48,500,000 tons were stocked on lower lake docks and at the furnaces, fully sufficient to carry the steel industry through the winter months into the 1944 shipping season.

Coke supply was set at 61,768,000 net tons, whereas actual output skimped through to 56,000,000 tons, a goodly portion of the deficiency, the result of scattered slowdowns and formal work stoppages in anthracite and bituminous mines in May, twice in June, and in October, for a total loss of 5,520,000 man-days of output. It was in coke that the steel industry really ranged close to disaster, and, today, the stock situation is so scanty as to constitute an ever-present threat to full operation. On the other hand, scrap, which in 1942 was but a frail support to the whole production structure, was in 1943 no problem at all. In fact large quantities of alloy scrap were actually glutting the market, seeking homes even at no price differential. But melters had had their stomachs full of production delays and defining problems engendered by unsegregated alloy scrap and were loathe to utilize such scrap beyond the amounts forced by WPB or until grim necessity left no option. Scrap spokesmen are urging Metals Reserve to absorb the present alloy scrap surplus, and plans are afoot to permit certain S.A.E. numbers to be used in the blast furnace and the open hearth where the alloy content would do no harm. The steel industry's bogey for purchased scrap in 1943 was 14,386,000 net tons, whereas actual shipments during the year bettered that

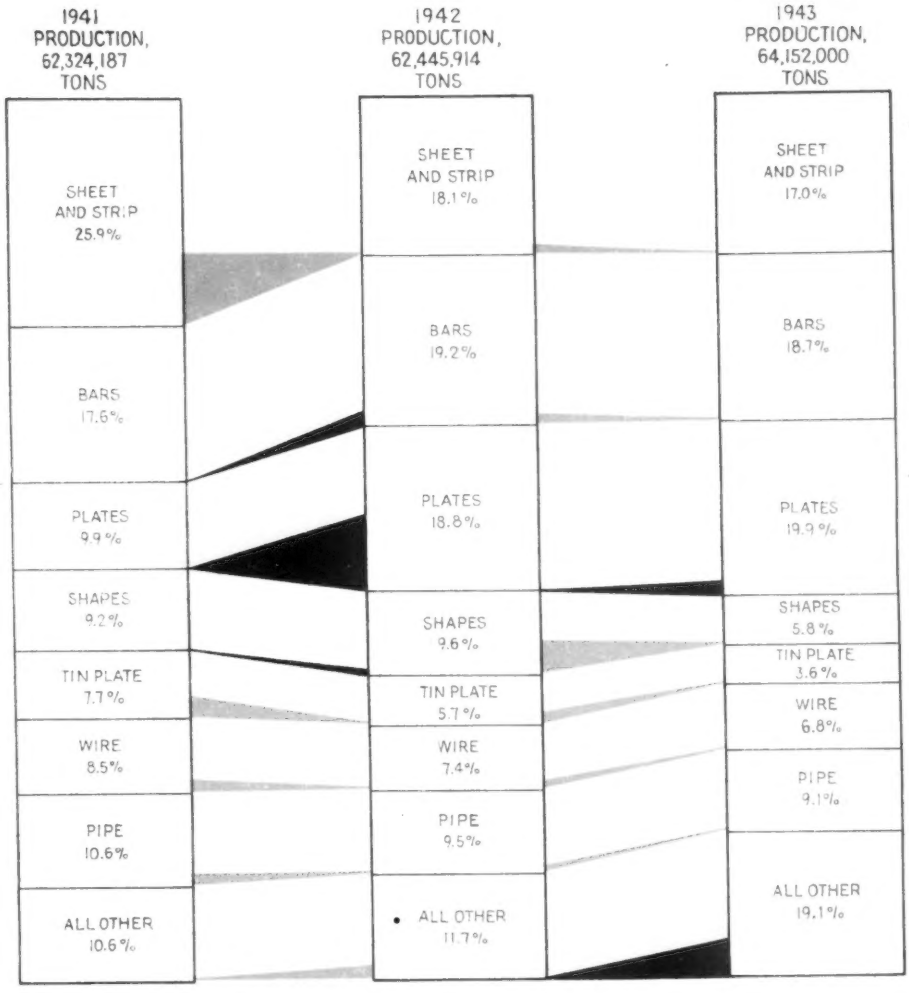
NOTE: Distribution 1937 to 1938 by M. W. Worthing, based on data from The Iron Age; 1939 to 1942 from The Iron Age, various Government reports, and A.I.S.I. estimates, with jobber tonnage distributed and other alterations made by the author according to the technique devised by M. W. Worthing; 1943 data are estimates by the author.

(a) Negligible, or not available and included in All Other.
(b) Included in Pressing, Forming, Stamping.
(c) Included partly under Furniture and Furnishings and partly under All Other.



• Shift of product participation in total steel consumed during 1943, as compared with 1942 and 1941. Note that the past year showed none of the spectacular shifts in product production so typical of 1942, the only sharp change being the decline in shapes as a reflection of constriction in construction. Pressure on plates continued to accommodate the Maritime Program, but all other products lost ground percentage-wise but not necessarily in tonnage. See chart above and Table I for details. Red indicates percentage decrease and black represents increase.

figure (included 900,000 tons obtained by detinning cans, 600,000 tons recovered from slag dumps, and some 5,700,000 tons developed through salvage drives, farm and city collections, etc.)

The plan was to have blast furnaces deliver some 68,579,000 net tons of pig iron during the year, whereas actual 1943 production was about 63,700,000 tons. And, the industry was scheduled to turn out 97,115,000 net tons of steel ingots of all types in 1943, whereas actual output for the twelve-month period was 89,100,000 tons. Thus, 1943 pig iron production of 63,700,000 tons represented an increase of 5.9 per cent over total 1942 output. Ingot production in 1943 of 89,100,000 tons was a 3.6 per cent lift over 1942 activity. Of the 89,100,000 ingot tons turned out in 1943, about 78,686,211 tons came from the open hearth, the average yearly operating rate being 98.3 per cent of capacity; 5,755,629 tons came from bessemers, the yearly operating rate being 91.2 per cent of capacity; and 4,659,169 tons was electric steel, the operating rate being 97.8 per cent of capacity.

According to the original plan, the 97,115,000 tons of ingots were to be converted into about 69,340,000 tons of semi-finished and finished steel products (a 71.3 per cent conversion factor), to be distributed in approximately the following manner (in net tons):

Semi-finished (for shipment)	8,400,000
Structural shapes	4,500,000
Plates	15,600,000
Rails	2,200,000
Bars	12,000,000
Pipe and tubes	5,160,000
Rod and wire	4,440,000
Tin and terne plate	3,000,000
Sheet and strip	10,800,000
All other	3,240,000
Total	69,340,000

• 1943

But against these estimates, the actual 1943 output of 89,100,000 tons of ingots were converted into 64,152,000 tons of semi-finished and finished products distributed in the following manner:

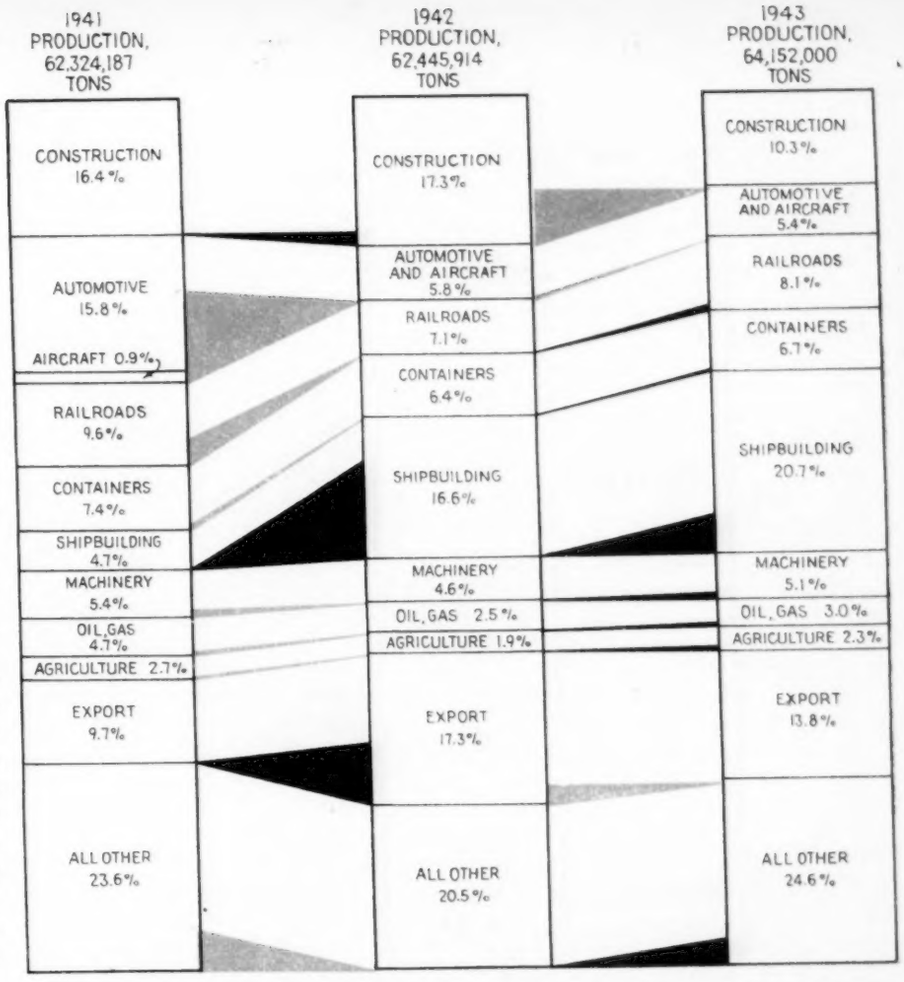
Semi-finished (for shipment)	5,781,000
Structural shapes	3,758,000
Plates	12,750,000
Rails	3,184,000
Bars	12,005,000
Pipe and tubes	5,861,000
Rod and wire	4,385,000
Tin and terne plate	2,324,000
Sheet and strip	10,899,000
All other	3,205,000
Total	64,152,000

The most significant difference between intention and performance was the considerable drop in semi-finished steel shipments, the result of a sizable decline in export demands. Rather than ship so much steel for conversion abroad, primarily England and to a small extent to Russia, finishing facilities in the U. S. were loaded up more than originally projected. Export, which in the previous year of 1942 took 17 per cent of steel output, large quantities being raw steel such as ingots and billets, in 1943 dropped to 14 per cent of output, with finished steel represented in proportionally greater quantities.

Product distribution of total production, both in tonnage and percentage of total, are shown in Table I for the years 1929 and 1935 to 1943 inclusive. Significant changes in percentage distribution of the various products for the past three years are shown pictorially in the graph on this page. Note that drastic changes were made in most products, particularly in sheet and strip, in 1942 to accommodate a great spurt in plate output. In 1943, however, shifts in the distribution pattern were minor and, in general, continued the pattern laid down in the previous year.

Table II shows details of steel distribution by consuming industry groups for the years 1937 to 1943 inclusive. And, the chart on the opposite page indicates visually the changes in percentage distribution of steel output among consuming groups for the past three years. Here again, in 1942, some really terrific bites were taken out of automotive consumption

1944 .



• Following the trend established in 1942, shipbuilding continued to spurt in 1943, on the basis of percentage participation in total tonnage of steel consumed. At the same time there was considerable sweating down of construction participation, and exports fell off markedly. Most other industry groups enjoyed minor recovery, as detailed in the chart above and in Table II. Red indicates percentage decrease and black represents increase.

and to a lesser degree all other groups, to accommodate spectacular increases in shipments to the shipbuilding industry and to export. In 1943, the chart shows considerable whittling down of construction and export outlets, to accommodate continued sizable expansion in shipbuilding and minor recoveries in most other classifications.

Of the 89,100,000 tons of ingots produced in 1943, very close to 13,500,000 tons were alloy grades and the remainder, 75,600,000 tons, were carbon analyses. Only six years ago, in 1938, the 1,654,000 tons of alloy steel produced represented about 5 per cent of the total steel output. By comparison, in 1943 alloy steels were turned out in nearly nine times the 1938 tonnage, accounting for 15.2 per cent of total steel produced. Even so, this striking 1943 alloy performance was not as prominent as had been anticipated early in the year. With a tank program in full swing and shell and bullet core deliveries swinging along on an upward trend, the alloy sights were set very high and only were cut back severely after the middle of the year, when various programs were pared to sensible proportions.

The trend in alloy and carbon steels, vis-a-vis total production, for the past six years, is as follows:

	(Millions of Net Tons)		
	Alloy	Carbon	Total
1938	1.654	30.098	31.752
1939	3.212	49.587	52.799
1940	4.966	62.017	66.983
1941	8.206	74.633	82.839
1942	11.526	74.506	86.032
1943	13.500	75.600	89.100

Of the 13,500,000 tons of alloy steel turned out in 1943, just about 3,880,000 tons came from electric furnaces and 9,620,000 tons from open hearths. Here again, every pressure was being exerted to complete new electric furnace capacity in the first half of 1943 to fulfill programs favoring electric furnace alloy specifications. Toward third quarter, however, program cut-backs wrecked electric furnace backlogs and emphasis shifted for a short time to pressing for carbon steels, the result being a shifting of certain open hearth alloy analyses to idle electric furnaces. However, by November the whole steel supply picture had eased to such a degree as to remove pressure from both types of refining units.

The rise in electric furnace participation in alloy steel output has been steady over recent years. From less than 372,000 tons in 1938, electric furnace alloy steel production has risen without interruption to the nearly 13,400,000 tons in 1943. During that period the percentage of alloy steel output produced in electric furnaces rose from 22 per cent to 29 per cent of the total.

Specific data showing this trend are as follows:

	(Millions of Net Tons)		
	Open Hearth	Electric Furnace	Total
1938	1.281	0.372	1.653
1939	2.462	0.750	3.212
1940	3.679	1.287	4.966
1941	5.744	2.463	8.207
1942	8.060	3.324	11.384
1943	9.620	3.880	13.500

Now, to carry the breakdown of alloy steel just one more step, it is interesting to examine the sharp increase in stainless steel output during 1943. Of the 3,880,000 tons of electric furnace alloy steel produced in 1943, very close to 425,000 tons were made up of various stainless analyses. This establishes by far a new high point in stainless production, being a rise of 24.8 per cent over 1942, and a rise of 14.3 per cent over the previous high total of 371,984 tons in 1941.

Specific data showing the trend in stainless output over the past six years are as follows:

(Thousands of Net Tons)	
1938	95.95
1939	179.62
1940	249.98
1941	371.98
1942	340.78
1943	425.00

Non-Ferrous Metals

UNIVERSITY of California alumni were as elated as though a star prep school quarterback had been persuaded to enroll when in 1942 Donald H. McLaughlin agreed to join the faculty as professor of mining and dean of engineering. No mere pedant, McLaughlin had tidy side assignments as chief geologist for Homestake Mining Co., the country's leading gold producer, and consulting geologist for Cerro de Pasco Copper Corp., which had won him acknowledged reputation as a kingpin mining geologist. But before the westerners stopped preening themselves on snatching this prize professor, he began expounding to classes and learned societies a doctrine regarded locally as almost seditious.

Jaws dropped as McLaughlin said in clear tones that, with America's basic mineral resources being depleted at a rapid rate, new discoveries of comparable magnitude and grade probably would not be made to replace them. From this heresy he went on to deduce that when methods of extraction from low grade domestic ores became more costly than production elsewhere Americans either would have to seek their minerals in other parts of the world or eventually accept a groveling standard of living behind tariff walls.

Some rabid westerners thought that Dr. McLaughlin should be expelled for casting doubts upon the inexhaustability of the country's resources, but he had fact on his side. Bitten by his own ideas, however, McLaughlin soon took leave to become vice president of Cerro de Pasco.

The basic story of this war, insofar as America's mineral resources are concerned, is the rapidity with which we have eaten our way towards exhaustion of basic ore reserves. The story is summarized plainly enough in the grade of ore being mined and treated by the country's major copper producers. Probably only Anaconda recovers as much as fifty pounds of copper for each ton of ore mined. Utah Copper Co., which produces a big share of all the country's copper, likely gets about twenty pounds per ton, and the Phelps-Dodge "rock farm" at Morenci, Ariz., the newest big mine, still less. And copper is no rare metal, but second only to steel in usage!

With a 12c. per lb. base price, and with Metals Reserve Co. willing to dig into the federal till for a bonus when necessary, domestic copper production is a going proposition, but its future is no brighter than that of any high cost war factory.

The future is not etched so sharply in grade of ore for lead or zinc, but the picture is painted in the bold, clear strokes of production costs. The tri-state district (Oklahoma, Kansas, Southwestern Missouri) upon which the country has been dependent for about 30 per cent of its zinc production and 7 per cent of domestic lead production admittedly has been kept alive only by the hypodermic of federal bonuses. The death rattle is loud in one of the principal Idaho panhandle producers and others are in their dotage. As with our people, the overall life expectancy of our mines is slowly shortening, though there may be tons of ore left yet. As to the ferro-alloys, it is sufficient comment upon domestic resources that the bulk of chrome and manganese requirements in the past year were imported by ocean-going vessels despite obvious handicaps.

As though nature has not painted a grim enough prospect, the industry occupies its few spare moments by counting on its fingers the vast tonnages of scrap being generated which will flood the market upon the termination of hostilities.

No matter what tomorrow brings, the tremendous appetite of Mars has been satiated. Just a year ago supplies were insufficient for war and essential civilian needs in aluminum, magnesium, copper, zinc and all the the ferro-alloys except ferro-manganese. Today, of this list only copper remains in the scarcity group. Controls are being relaxed all along the line. The improvement in position during the past year has been due to three factors in the following order:

(1) Translation of war requirements to a more realistic basis, thus eliminating the great disparity between estimated requirements and production.

(2) Continuation of stringent use controls over all industrial metals.

(3) Increased production of many metals. It should be noted, however, that the supply-requirements balance has been achieved in the face of decreased 1943 production of some of the important base metals, emphasizing the importance of the first two factors. Last spring's production figures bear a strong family resemblance to next spring's projected production. Yet, brakes are now being put on,

Smaller, more realistic estimates of requirements, restrictions on use, and emphasis of mine production solve America's war metal problems but leave ore reserves depleted and industry groggy.

while as late as three months ago WPB was wheedling, exhorting and paying for redoubled effort.

Production At a Price

Copper, lead and zinc mines have been operating under the Premium Price Plan since February, 1942, being paid premium prices for all production in excess of assigned quotas. The cost of these premium price payments—over $4 million monthly was being distributed among 1300 companies by July, 1943—is borne by Metals Reserve Co., RFC subsidiary. The production quota for each mine is set by a committee including representatives of WPB and OPA, and at last count, more than 2000 had been assigned.

Originally it was announced that premium prices of 17c. per lb. for copper (5c. over market), 11c. for zinc (2¾c. over market), and 9¼c. for lead (2¾c. over market) would be paid for a period of 2½ years beginning Feb. 1, 1942. Mines which had no production in 1941 were eligible for zero quotas; that is, premium prices could be paid for their entire production provided cost of production made it necessary. On the other end of the scale, large operating mines were assigned 100 per cent quotas—no premium for less than 1941 monthly production. If a property failed to produce its quota in any month, premiums were not to be paid until the deficit was made up. Under this general framework, it was possible to encourage and develop high cost properties without paying more for production from existing mines. Nearly the entire domestic copper production in 1942 was made at market prices without premium payments.

By the beginning of 1943, it became apparent that the lead and zinc premiums were inadequate. Therefore, there was established an additional quota bracket (known as the "B" bracket) beyond which another 2¾c. per lb. would be paid for lead, and two additional quota brackets ("B" and "C") for zinc beyond each of which an additional 2¾c. per lb. would be paid. For instance, a mine might be paid 8.25c. per lb. (the market price) for the first 100 tons of zinc produced monthly; 11c. per lb. for the second 100 tons; 13.75c. per lb. for the third 100 tons; and if its production reached or topped 400 tons, 16.5c. a lb. for that portion. By April, 1943, though nothing was said about it at first, special contracts had been authorized by which as much as 26½c. a lb., more than double the market price, would be paid for over-quota copper production.

The key to successful operation of the Premium Price Plan has been, of course, the ability of the quota committee to set quotas high enough to encourage production, but no higher than necessary to enable a conservative profit. Although the plan itself was extended until July 1, 1945, the settlement provided in case of earlier termination of the emergency is not enticing.

On Oct. 27 WPB slammed the door on "B" premium payments to lead mines not operating prior to that date. "B" and "C" zinc premiums were denied to mines not already operating and to those "having a low labor productivity and located in areas in which there was a serious labor shortage." On the heels of this announcement, it was announced that no application postmarked after Dec. 31, 1943, for special copper premium prices would be accepted because of

o o o

"successful efforts toward balancing the copper supply with requirements of the armed services and the most essential civilian uses." The copper announcement came less than three months from the time the quota committee was feverishly making commitments to pay more than double the market price for copper.

It is noted, however, that contracts for zinc, lead and copper purchases from our good neighbors to the south run for two years after the war. One Mexican project, the Gran Cananea, just south of the border in Sonora, will not come into production until well into 1944. Operated by an Anaconda subsidiary, the $15 million project will exploit a large body of low grade ore, and will count as a major producer. For 1943, Chile was by far the largest Latin American producer, with Peru and Mexico trailing.

The mine labor problem has been the principal limiting factor in copper, lead, and zinc production, reflecting the lack of desire by skilled men to do hard and dangerous work for low pay in remote, unattractive, and uncomfortable mining camps, even though the War Labor Board realistically allowed small wage increases. Concentrated recruiting campaigns by War Manpower Commission, in which mining was given top priority over all other industry in referral of job applicants west of the Mississippi were barren in result, and the same final desperate remedy that was applied in 1942 was repeated in 1943—the release of soldiers with mining experience to work in the mines. Some 4500 soldiers were released in September, mostly to molybdenum, copper, and zinc mines. Whereas the 1942 crop had been sent out by the army less because they were miners than because they were indifferent soldiers, the 1943 contingent was better equipped professionally and has stayed on the job in greater numbers.

In June, the Mineral Resources Coordinating Division of WPB inaugurated a labor priority list giving preference to certain of the most critical minerals and to the most efficient mines producing each mineral. This list was intended to serve as a basis of referral of manpower by the U. S. Employment Service but since the Employment Service had very few people to refer the list actually made very little difference. It did, however, subordinate and channel labor away from less essential mines which theretofore had been posing as heavy contributors to the war effort.

After ten months of grunting and groaning, slightly more than a million tons of refined copper had been produced domestically, according to United States Copper Association, and it appeared that the year's production might top 1,200,000 tons. This compares with 1,135,708 tons in 1942, and 1,065,667 tons in 1941. Net domestic consumption (including deliveries on duty paid foreign copper), according to the Association, stood at 1,437,769 for the ten months period, which would extend on a yearly basis to 1,725,323 tons. In 1942, 1,517,983 tons were consumed; in 1941, 1,517,765 tons. The refined copper stockpile, about half of it government owned, is in the neighborhood of 400,000 tons.

Arizona is conceded to have produced more copper than any other state in 1943 although no single mine even approached the output of Utah Copper Co., whose mammoth Bingham Canyon operations undoubtedly made Utah a strong second. Anaconda pushed Montana to a poor third, and New Mexico, Nevada, and Michigan trailed.

From the standpoint of consumption, it is no secret that ordnance requirements for brass and bronze were dominant by far. More amazing and less talked about are the miraculously small quantities required by the utilities and electrical industries whose needs were supplied largely by reshuffling and patchwork. According to the Office of War Utilities, consumption of wire, cable, and bus bar was reduced from $29 million worth in 1940 to a current annual rate of $8 million, a cut of 72 per cent. Moreover, of the $8 million about $1 million is being obtained from wire mills, the remainder being largely salvaged from plant.

For 1944, the prospect is not one of easy availability of copper for civilian manufacture, although undoubtedly larger quantities will have to be released to the utilities for transmission lines, and wire products will be available to a greater extent for replacement and repair. At the outset of the war, many military products preferably made of copper were forcibly shifted to other materials, and these will be the first to be allowed back in the fold. In other words, only by continuation of the belt tightening policy can the supply-requirements picture be held in equilibrium.

Curtailment of manufacture of small arms ammunition has released huge tonnages, but these will be gobbled up largely by the shift back to brass from steel cartridge cases. Steel cases never had been fully satisfactory, and Dec. 1 marked the reconversion date. The Maritime Commission claims that use of iron and steel for a wide variety of ship fittings has saved more than 15,000 tons of copper and brass in the construction of its Victory Fleet, and the Navy no doubt has eliminated a comparable amount. Such items as these will, of course, take precedence over civilian manufacture if any real excess of copper appears.

Continued close control of civilian manufacture was foreshadowed by WPB's announcement Dec. 1 of a program for redistribution of 1,200,000 new bronze valves having a value of $3,500,000 through normal trade channels. On the other hand, it was announced that directives prohibiting the use of brass in the manufacture of radiator valve bodies would not be renewed following their expiration Dec. 31.

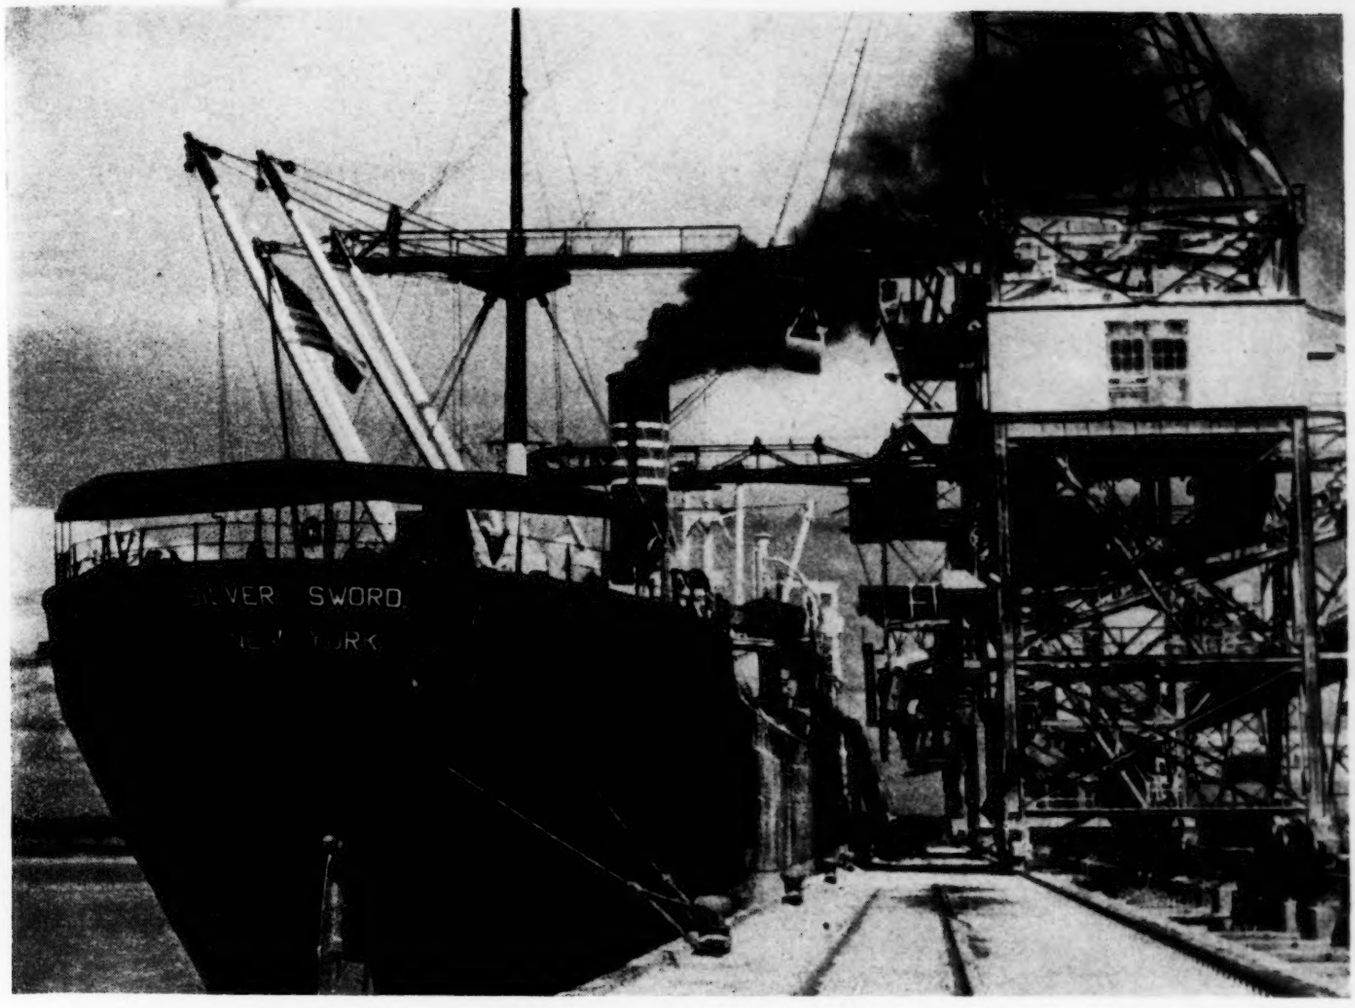
WPB's prologue to lifting the veil of secrecy on mine and metal statistics came early in November when it was announced that brass mills had produced 2,611,890 net tons of primary products during the 12 months ending June, 1943. The monthly production rate during the first six months of 1943 was 235,074 net tons, a 300 per cent increase from 1940 average monthly production of 67,500 net tons. During the 12-month period, the production included 214,787 tons of copper products; 152,463 tons of alloy tube; 478,419 tons of alloy rod; and 1,766,221 tons of alloy strip.

Unique from a metal finishing point of view was the conversion of steel rolling mills owned by Weirton Steel Co. to the rolling of brass strip. At Weirton, the slabs are hot rolled on a structural mill, cold rolled to gage on a 48-in. tandem cold mill. Capacity is about 25,000 tons monthly. Acme Steel Co., Chicago, is performing a similar operation with gilding metal, using a 16-in. mill.

Curiously enough, the war brought to America shortages in metals whose principal ore resources were domestic rather than foreign. In the early part of the year, copper, zinc and molybdenum all were high on the shortage list. For a time, zinc exceeded copper in scarcity by reason of the same basic production causes—lack of labor in the mines and smelters. On the requirements side the picture was also similar, for more than 50 per cent of our zinc requirements have been for brass and bronze.

What An Awful Scare

Domestic zinc mines began to stumble early in the year, and, with the aid of increased premium price payments, every effort was made to re-



● A large fleet of ships ferry bauxite from South American mines to this Gulf Coast plant.

suscitate even small properties which had been inactive for years. Despite its short anticipated future life, the Tri-State region contributed better than a quarter of total production. The Coeur d'Alene district of Idaho, which had been counted on to replace the faltering Tri-State mines, was one of the hardest hit by labor shortage. The slag-fuming plant of Bunker Hill and Sullivan at Kellogg, helped overall production and the fuming plants at Tooele, Utah, and East Helena, Mont., also were saving factors.

As in chrome and manganese, vessels returning from war zones conveniently situated near sources of raw material carried zinc concentrates which otherwise would not have been available. Thus, Australian imports continued steadily at a time when they were sorely needed.

When final figures are announced, it will be surprising if domestic mine production reaches three quarters of a million tons, compared to 1942, and 1941 totals of 760,210 and 749,125 tons respectively. Slab zinc stocks, incidentally, have been guessed to be at least 185,000 tons.

After consumption for brass and bronze, the remaining 50 per cent used was primarily for galvanizing, the peacetime leader, and for die-castings.

For the second successive year, smelters had difficulty in handling concentrates as fast as they were received, and by November stockpiles of two smelters in Texas and one in New Jersey had grown so unwieldy as to make it necessary for Metals Reserve Co. to purchase a half interest in the piles. This was done in order that the smelters might continue to receive shipments. As with copper smelters, comparatively low wage rates made it difficult for zinc smelters to recruit labor, and the undermanning in turn contributed to the production bottleneck.

The easier metal situation culminated in a revision of the WPB zinc conservation order, No. M-11-b on Nov. 11, easing restrictions on the use of zinc in the production of several comparatively minor items. Resumption of galvanized sheet production, which in peacetime constituted the largest single outlet for zinc, on a large scale is dependent as much on availability of steel sheets as of zinc. The current tight situation in the flat rolled market prohibits speculation as to when this field will again sprout. In the post-war period, the industry looks for an immediate strong demand through galvanizing, brass for construction, and especially zinc alloy die-castings which in a little more than ten years developed from a minor outlet to a market for 125,000 tons or more of special high grade zinc. The paint industry, whose civilian market has built up with the war years, is also regarded as a probable big post-war customer.

That Beauty Cocktail

From the early days of the war, while most of the other metals gained a glittering notoriety because of their scarcity, lead has been a bashful wallflower always available for the asking. But, in the latter days of 1943 as other metals became easier, lead became scarcer. Not a few persons were surprised to learn that only about 40 per cent of total consumption was being secured from domestic mine production, the deficit being made up

It did, however, subordinate and channel labor away from less essential mines which theretofore had been posing as heavy contributors to the war effort.

After ten months of grunting and groaning, slightly more than a million tons of refined copper had been produced domestically, according to United States Copper Association, and it appeared that the year's production might top 1,200,000 tons. This compares with 1,135,708 tons in 1942, and 1,065,667 tons in 1941. Net domestic consumption (including deliveries on duty paid foreign copper), according to the Association, stood at 1,437,769 for the ten months period, which would extend on a yearly basis to 1,725,323 tons. In 1942, 1,517,983 tons were consumed; in 1941, 1,517,765 tons. The refined copper stockpile, about half of it government owned, is in the neighborhood of 400,000 tons.

Arizona is conceded to have produced more copper than any other state in 1943 although no single mine even approached the output of Utah Copper Co., whose mammoth Bingham Canyon operations undoubtedly made Utah a strong second. Anaconda pushed Montana to a poor third, and New Mexico, Nevada, and Michigan trailed.

From the standpoint of consumption, it is no secret that ordnance requirements for brass and bronze were dominant by far. More amazing and less talked about are the miraculously small quantities required by the utilities and electrical industries whose needs were supplied largely by reshuffling and patchwork. According to the Office of War Utilities, consumption of wire, cable, and bus bar was reduced from $29 million worth in 1940 to a current annual rate of $8 million, a cut of 72 per cent. Moreover, of the $8 million about $1 million is being obtained from wire mills, the remainder being largely salvaged from plant.

For 1944, the prospect is not one of easy availability of copper for civilian manufacture, although undoubtedly larger quantities will have to be released to the utilities for transmission lines, and wire products will be available to a greater extent for replacement and repair. At the outset of the war, many military products preferably made of copper were forcibly shifted to other materials, and these will be the first to be allowed back in the fold. In other words, only by continuation of the belt tightening policy can the supply-requirements picture be held in equilibrium.

Curtailment of manufacture of small arms ammunition has released huge tonnages, but these will be gobbled up largely by the shift back to brass from steel cartridge cases. Steel cases never had been fully satisfactory, and Dec. 1 marked the reconversion date. The Maritime Commission claims that use of iron and steel for a wide variety of ship fittings has saved more than 15,000 tons of copper and brass in the construction of its Victory Fleet, and the Navy no doubt has eliminated a comparable amount. Such items as these will, of course, take precedence over civilian manufacture if any real excess of copper appears.

Continued close control of civilian manufacture was foreshadowed by WPB's announcement Dec. 1 of a program for redistribution of 1,200,000 new bronze valves having a value of $3,500,000 through normal trade channels. On the other hand, it was announced that directives prohibiting the use of brass in the manufacture of radiator valve bodies would not be renewed following their expiration Dec. 31.

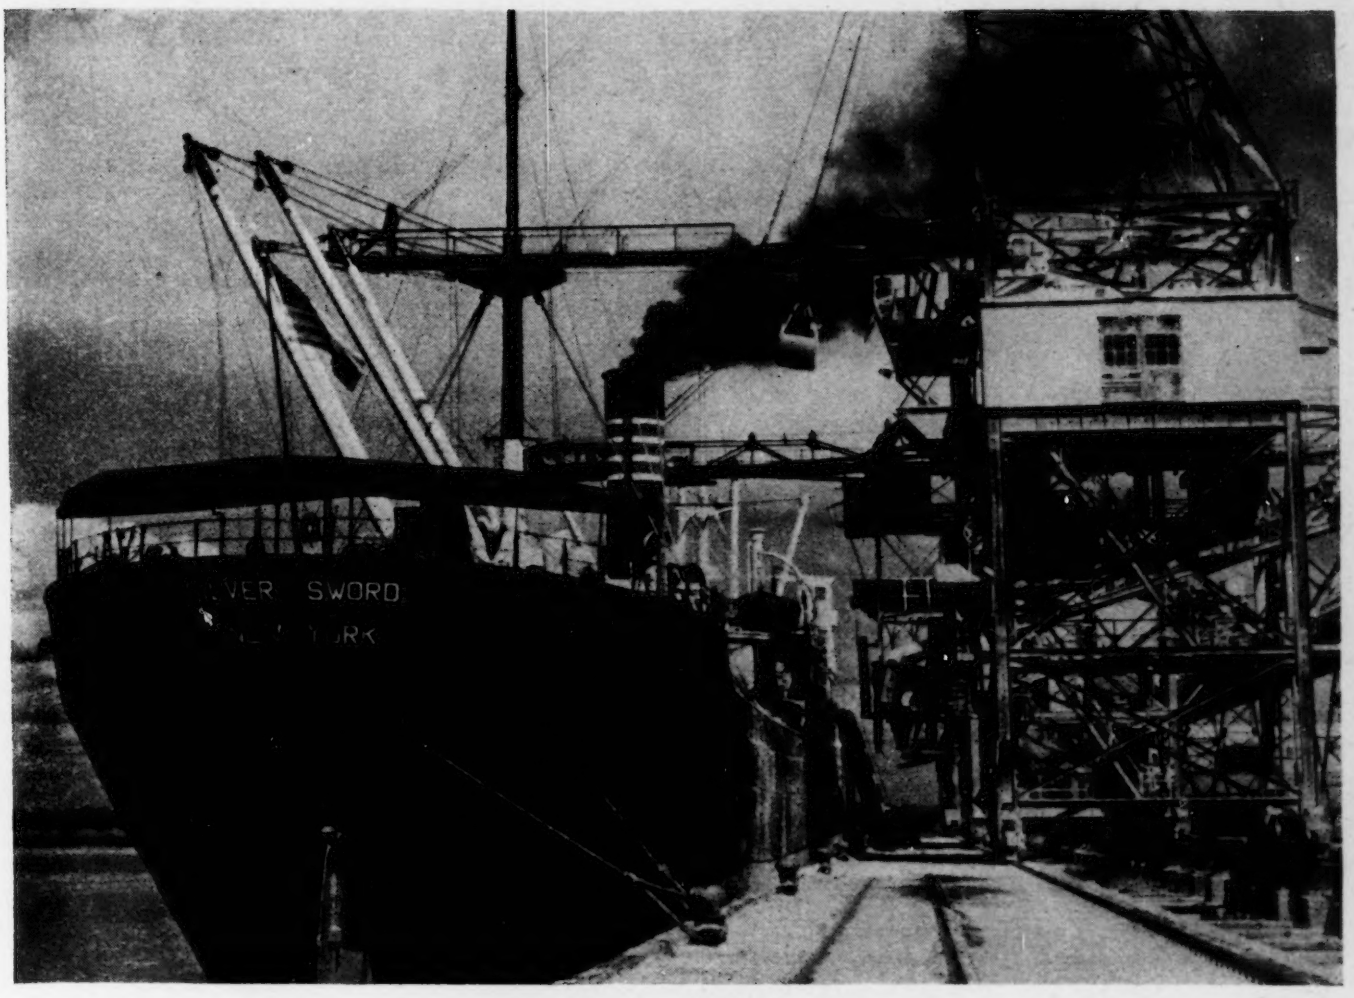
WPB's prologue to lifting the veil of secrecy on mine and metal statistics came early in November when it was announced that brass mills had produced 2,611,890 net tons of primary products during the 12 months ending June, 1943. The monthly production rate during the first six months of 1943 was 235,074 net tons, a 300 per cent increase from 1940 average monthly production of 67,500 net tons. During the 12-month period, the production included 214,787 tons of copper products; 152,463 tons of alloy tube; 478,419 tons of alloy rod; and 1,766,221 tons of alloy strip.

Unique from a metal finishing point of view was the conversion of steel rolling mills owned by Weirton Steel Co. to the rolling of brass strip. At Weirton, the slabs are hot rolled on a structural mill, cold rolled to gage on a 48-in. tandem cold mill. Capacity is about 25,000 tons monthly. Acme Steel Co., Chicago, is performing a similar operation with gilding metal, using a 16-in. mill.

Curiously enough, the war brought to America shortages in metals whose principal ore resources were domestic rather than foreign. In the early part of the year, copper, zinc and molybdenum all were high on the shortage list. For a time, zinc exceeded copper in scarcity by reason of the same basic production causes—lack of labor in the mines and smelters. On the requirements side the picture was also similar, for more than 50 per cent of our zinc requirements have been for brass and bronze.

What An Awful Scare

Domestic zinc mines began to stumble early in the year, and, with the aid of increased premium price payments, every effort was made to re-



● A large fleet of ships ferry bauxite from South American mines to this Gulf Coast plant.

suscitate even small properties which had been inactive for years. Despite its short anticipated future life, the Tri-State region contributed better than a quarter of total production. The Coeur d'Alene district of Idaho, which had been counted on to replace the faltering Tri-State mines, was one of the hardest hit by labor shortage. The slag-fuming plant of Bunker Hill and Sullivan at Kellogg, helped overall production and the fuming plants at Tooele, Utah, and East Helena, Mont., also were saving factors.

As in chrome and manganese, vessels returning from war zones conveniently situated near sources of raw material carried zinc concentrates which otherwise would not have been available. Thus, Australian imports continued steadily at a time when they were sorely needed.

When final figures are announced, it will be surprising if domestic mine production reaches three quarters of a million tons, compared to 1942, and 1941 totals of 760,210 and 749,125 tons respectively. Slab zinc stocks, incidentally, have been guessed to be at least 185,000 tons.

After consumption for brass and bronze, the remaining 50 per cent used was primarily for galvanizing, the peacetime leader, and for die-castings.

For the second successive year, smelters had difficulty in handling concentrates as fast as they were received, and by November stockpiles of two smelters in Texas and one in New Jersey had grown so unwieldy as to make it necessary for Metals Reserve Co. to purchase a half interest in the piles. This was done in order that the smelters might continue to receive shipments. As with copper smelters, comparatively low wage rates made it difficult for zinc smelters to recruit labor, and the undermanning in turn contributed to the production bottleneck.

The easier metal situation culminated in a revision of the WPB zinc conservation order, No. M-11-b on Nov. 11, easing restrictions on the use of zinc in the production of several comparatively minor items. Resumption of galvanized sheet production, which in peacetime constituted the largest single outlet for zinc, on a large scale is dependent as much on availability of steel sheets as of zinc. The current tight situation in the flat rolled market prohibits speculation as to when this field will again sprout. In the post-war period, the industry looks for an immediate strong demand through galvanizing, brass for construction, and especially zinc alloy die-castings which in a little more than ten years developed from a minor outlet to a market for 125,000 tons or more of special high grade zinc. The paint industry, whose civilian market has built up with the war years, is also regarded as a probable big post-war customer.

That Beauty Cocktail

From the early days of the war, while most of the other metals gained a glittering notoriety because of their scarcity, lead has been a bashful wallflower always available for the asking. But, in the latter days of 1943 as other metals became easier, lead became scarcer. Not a few persons were surprised to learn that only about 40 per cent of total consumption was being secured from domestic mine production, the deficit being made up

● Chipping room in American Magnesium Corp.'s Cleveland plant, where castings are made for aircraft use.

from imports, secondary lead, and steadily increasing withdrawals from stockpiles. Production during 1943 was down from 1942 because of the same labor shortage that haunted copper and zinc, but contrary to the scurry to get help for those metals, nobody seemed to care very much about lead. In fact, lead-zinc mines whose values were composed in too large a proportion of the former, were shunted from the top of the labor priority list, bluebook of essential producers. Because Australian rail lines were inadequate to haul both lead and zinc concentrates from mine to tidewater for shipment as ballast to American smelters, lead had to stay behind much of the time, being shipped only spasmodically. Likewise, copper and zinc were given priority on bottoms from South America, where Peru was the principal lead producer. Thus imports followed domestic production on the downward trail during the year, although Canada and Mexico, which also experienced trouble maintaining production, each contributed substantial amounts. The 1944 picture is no brighter. Domestic production threatens to decline further because of labor shortages, but with a favorable shipping situation easing the ocean transportation bottleneck, imports should be larger. Metals Reserve Co. will continue to dig slowly into the stock pile unless there is an unexpected drop in requirements.

Offsetting an expected 1944 decrease in small arms requirements, increases are anticipated in requirements for storage batteries, an essential in the submarine program, for cable, for tetraethyl lead for high octane gasoline and for other war uses. Lead azide, for instance, has to a large degree replaced mercury as a detonator.

Quick, the Cork

Aluminum production, which filled the broad base of the requirements bottle slowly during the early phases of the war, spurted up through the narrow neck in the latter part of 1943. Women who had tossed their saucepans into the community scrap pile soon after Pearl Harbor were astounded to read that aluminum scrap had become so plentiful that dealers were refusing to handle it, for a time, at any price, and finally that the government was relieving this situation by purchase and stockpiling of ingots cast from secondary metal.

WPB told the story of supply progressively forging ahead of allotments during the year in the following table:

1943	Total Supply (Millions of Lbs.)	Allotments
First quarter	582.1	534.8
Second quarter	633.4	585.5
Third quarter	790.4	661.6
Fourth quarter	871.2	774.0
Total	2877.1	2555.9

Reasons given were similar to those explaning the changed situation in other metals: (1) more careful screening of aircraft requirements based on bills of material; (2) more conservative statements of requirements by claimant agencies—ostensibly because of longer experience in compiling estimates; (3) trimming of allocations to processing capacity—in hammer forgings, for instance.

Successive relaxations in permitted uses of aluminum were culminated Dec. 4 in permission to use the metal for the manufacture of intregal passenger buses and collapsible tubes. A few weeks previously the order had been relaxed to permit several uses where copper previously had been employed — electric bus bars, bare

electrical conductor and current carrying accessories, and for various minor civilian uses.

Aluminum capacity today is rated at 2,200,000 lb. annually, but no where in official statements is there confirmation that actual production has reached that rate. At the reduction plants in the Pacific Northwest and in southern California, for instance, nearly a third of the total working force turned over in a month's time and it was reported in Congress that pot lines were dropped from original uncompleted plans because of the manifest impossibility of manning them.

Contributing to the total available supply are scrap now nearing the rate of 700 million lb. a year—twice the total pre-war primary production of aluminum—and imports from the Aluminum Co. of Canada. The Canadian firm had delivered 600 million lb. of a 1,300,000,000 lb. contract by the end of November, and was scheduled to deliver the balance at the rate of 40 million lb. a month to complete the contract early in 1945.

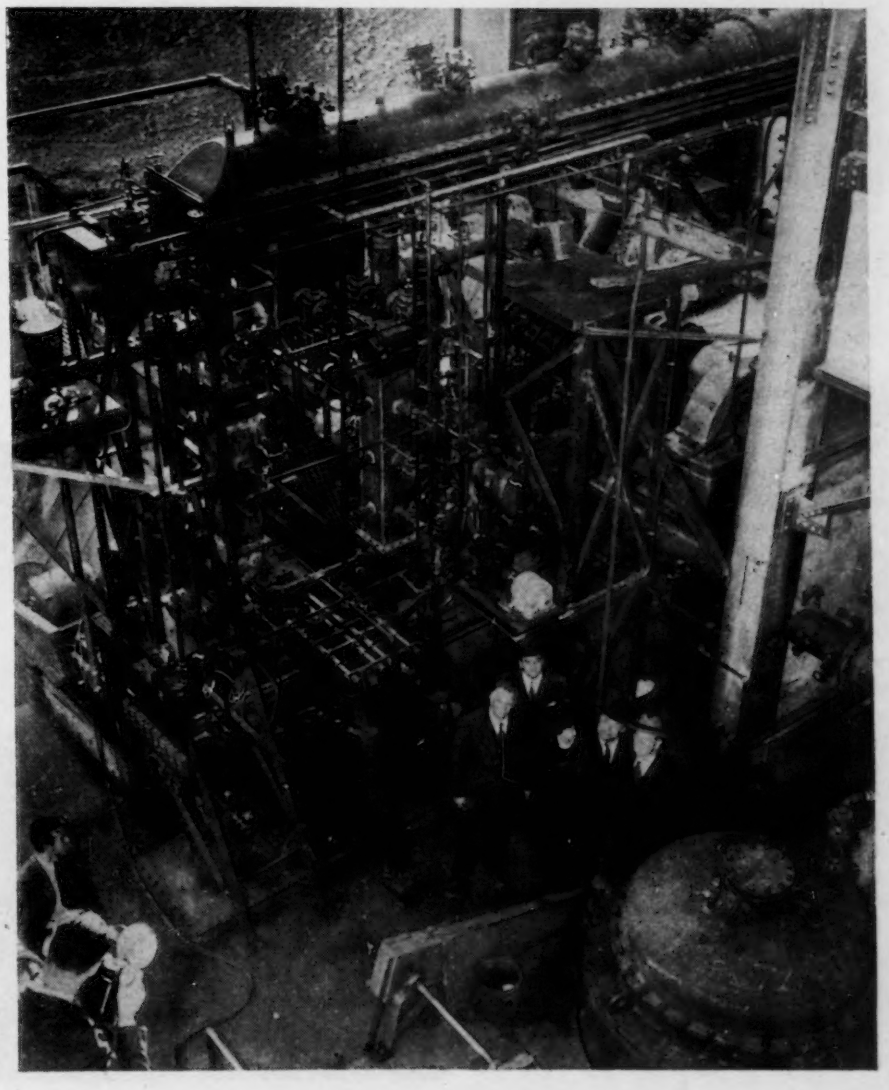
The aluminum fabricating program slurped up through the neck of its bottle with as much of a spurt as did primary reduction. In early November work was halted on a $16 million DPC extrusion plant at Memphis, Tenn., and another at Columbus, Neb. Two weeks later Phelps-Dodge was halted in its plans to revamp at railroad car shop at Hammond, Ind., for the same purpose. Reasons given: revisions of Army's estimated requirements and an unexpectedly high rate of productivity from plants already in operation. But the aluminum fabricating industry already was a giant. Compared to 1939, estimated 1943 output of aluminum forgings was 45 times as great, tubing 13 times, rod and wire 12 times, extruded shapes ten times, and aluminum sheets seven times.

On the raw material side, a scare developed early in the year when bauxite boats from Surinam were popped off by the Nazi-U-boats in the Carribean like shooting gallery ducks. Arkansas bauxite producers were spurred sharply to increase output, and railroads serving the Pacific Northwest reduction plants groaned. The Bureau of Mines took the opportunity to deliver a rabbit punch to WPB.'s Aluminum-Magnesium Division with which it had been battling ever since its proposals were rejected at the outset of the war program. At the annual meeting of the American Institute of Mining and Metallurgical Engineers, Reginald Dean, chief of the Bureau's metallurgical activities and its loudest talker, delivered an innocuous paper in the presence of WPB officials, but in his official press release quoted himself as renewing violent charges against the WPB program. In virtually unprecedented action, the A.I.M.E. magazine called the punch and the Bureau apparently had added to its enemies everyone needed to assure the success of any program it proposed. That was not the end, for in November, with the submarines dispelled, and the bauxite situation well in hand, the Bureau announced its intention to finish a half completed bauxite exploratory program in Alabama on the same day that WPB announced it was curtailing production of three major Arkansas producers.

Halted also by WPB was government financing of a $4 million commercial pilot plant to test the feasibility of using Oregon and Washington clays for the production of alumina. Were this substitution possible, the long raw material haul from Surinam or the deep South to Pacific Northwest reduction plants would be unnecessary. These plants, representing a big segment of the country's capacity, were located in the northwest because of bounteous power available from Grand Coulee and Bonneville dams, but with the slump in aluminum requirements after the war they would be at a competitive disadvantage with the Southern reduction plants nearer to Eastern fabricating plants and ultimate market. When citizens of Oregon and Washington heard of the clay pilot plant's destiny, they chipped in the necessary $4 million to build the plant contingent upon WPB approval. Among the backers was Eric Johnson of Spokane, youthful and dynamic president of the United States Chamber of Commerce.

One of the first OPA ceiling prices to break, and break badly, was that

● Dr. Fritz Hansgirg and Henry Kaiser point out details of the magnesium manufacturing process at the Permanente plant to Sidney Hillman during an inspection tour.



of aluminum scrap. Flow from mills, fabricators, and demolished aircraft from the battlefronts continued to pile in. The oversupply of scrap amounted to 10 million lb. by the end of August, and by late fall there were no buyers at any price. Secondary aluminum smelters secretly had lowered their quotations as much as 2½ to 3 cents per lb. by the end of November when WPB finally tossed a rope to the industry in the form of a Metals Reserve Co. purchase offer. Shaving the OPA ceiling price, so as not to be deluged, the program calls for the stockpiling by Metals Reserve of 16 types of high grade alloy ingots produced from scrap, and two classes of medium grade ingots, one for sand and permanent mold and one for die-casting. Purchase of B grade ingots from any one smelter is limited to 25 per cent of a foundry's total output. The ingots will be stored in Metals Reserve Co. warehouses at New York, Philadelphia, Buffalo, Cleveland, Detroit, Chicago, Kansas City and Los Angeles.

Scrap segregation, amounting to only 30 per cent of that marketed two years ago now amounts to 90 per cent, thus easing labor requirements for segregation by dealers. Along with its ingot purchase program, WPB fired a buckshot barrage for greater secondary aluminum utilization: The Army and Navy were ordered to expand their uses for such items as gun director parts in which substitute materials had formerly been used; the steel industry was permitted to use increased quantities for deoxidizing; Russia was persuaded to accept one-third of its fourth quarter requirements in secondary aluminum, instead of all in primary; a program was pushed to eliminate specifications calling for primary metal when secondary would do; and lastly, relaxations in the use of aluminum were written so that secondary metal would be used. Canada went so far as to remove all restrictions on scrap aluminum and secondary ingots.

The labor problem in aluminum reduction and fabrication plants was double-barreled. Many of the plants were located in labor shortage areas, a factor complicated by the fact that the industry's pay scale has not been in line with that of many other war plants. Foundries were the hardest hit, requiring 73,000 workers out of the 147,490 estimated to be needed by all types of aluminum plants in the last half of 1943. The industry's request for this many new employees, of course, met the same fate as Junior's request for a Flying Fortress for Christmas. Topping of the difficulty, the CIO union representing about 50,000 workers in 26 Aluminum Co. of America plants, announced on Nov. 19 a demand for 15c. an hr. pay increase.

But the questions of ore, capacity, distribution, labor, and scrap were only in the two, four, eight, sixteen and thirty-two dollar categories. The sticker which has been asked from the beginning of the aluminum program was "What will become of aluminum capacity after the war?" The sleeper in this puzzler consists of the fact that Uncle Sam owns a little more than one half the primary aluminum capacity and supplied more than 80 per cent of the cost of new fabricating facilities, which alone are valued at more than a billion dollars. Jesse Jones, who laid out the financial plant, thinks about 900 million lb. of primary aluminum, three times pre-war requirements, can be used in the post-war period—about 40 per cent of capacity. Plants producing this proportion, he feels, can be disposed of means of five-year leases with option to buy, affecting principally those plants located near to power and market. The others he thinks can be converted in part and that the loss to the government need not be total. Canada, with a similar problem, is not so optimistic. George C. Bateman, metals comptroller, told a parliamentary committee that "in about five days at the present rate of production we could fill all the probable annual requirements for post-war airplane production," and says that Canada's expansion of 12 times pre-war capacity is being used almostly entirely to meet the needs of the airplane program.

Uncle Jesse's Prodigy

Those who have tuned up on hosannas to welcome the light metals age because of aluminum's abundancy can take off their robes and go down the mountain for a while, however. Magnesium, the twin saint of the movement, is not shown to be abundant by WPB's cold hard figures, nor is there prospect that would-be makers of magnesium automobiles can get their raw material in 1944.

In the first place, even though primary magnesium capacity has left pre-war production no more than a childhood memory, full output at the originally anticipated figure of 700 million lb. annually has not been realized—and the deficit is substantial. Second, the aircraft program does not completely dominate magnesium requirements as it does aluminum. Third, secondary metal plays a relatively unimportant part.

Though production outstripped requirements by a very modest figure, less than 10 per cent, direct military needs have been filled during 1943. The last unit of the sprawling Basic Magnesium plant at Las Vegas, Nev., whose management was assumed by Anaconda in the fall of 1942, went into production on July 12, 1943. The output of the big $130 million plant alone, with a capacity of 102 million lb., was sufficient to take magnesium out of the critical class.

Then, too, Henry Kaiser's Per-

● One of the smelters at the plant of Alloys & Products Co., which can hold 3000 lb. of aluminum.

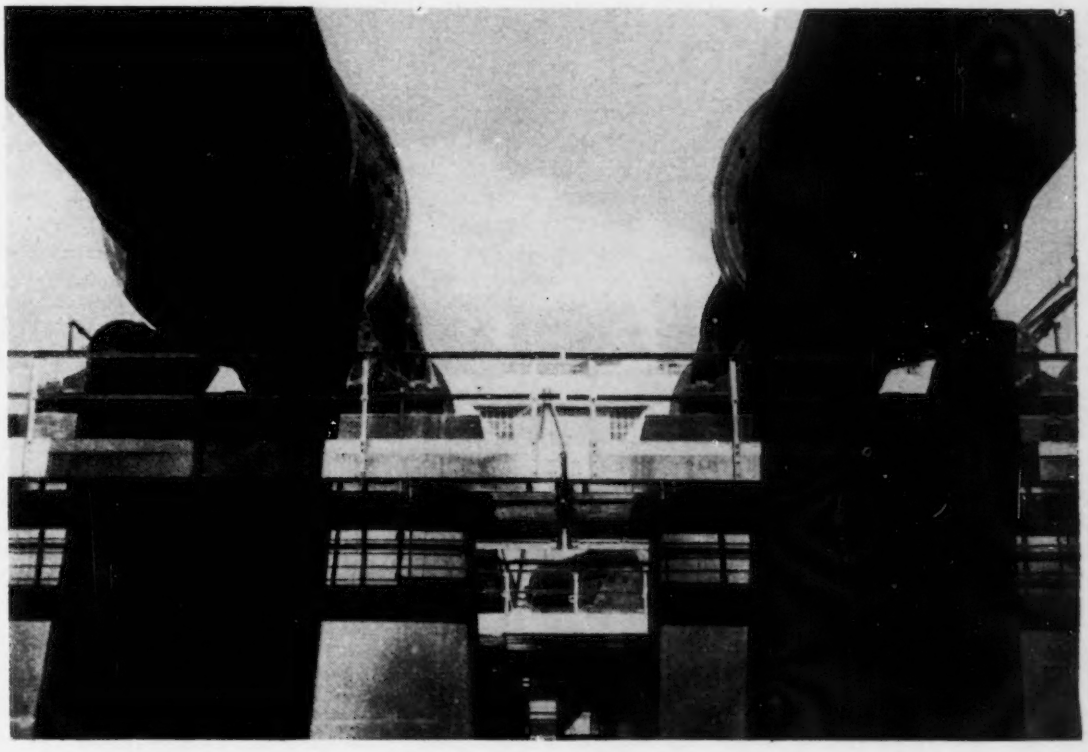
manente plant, down the peninsula from San Francisco, which had been bug-infested technologically from its inception finally accumulated sufficient scientific insecticide to cure its difficulties. Full production was achieved last year, about two years late, but welcome none the less.

On the other hand, the epidemic of labor shortage in the Pacific Northwest has so consistenly plagued the big Defense Plant Corp. ferro-silicon process plant at Spokane, operated by Electro-Metallurgical Co., that there is still serious worry whether capacity production can be achieved in 1944. Another ferro-silicon process producer, Ford Motor Co., at Dearborn, Mich., which commenced production in 1942, never has completely solved mechanical operating difficulties. Still another plant in the electrolytic group, has never fully found its production legs. Unless these producers are able to meet production quotas this year, the gap between supply and requirements can be measured with a micrometer. The size of the magnesium stockpile, though big by prewar standards, is believed to be no more than a few weeks supply.

o o o

● Rotating kilns reduce bauxite to alumina. Liquid solution is dehydrated at 2500 deg. to produce powder alumina.

o o o



Special mention was given in a report by WPB to the Canadian Pidgeon process, which reduces power consumption although large quantities of ferro-silicon are required. It is used at the Spokane plant and several smaller plants. Despite its simplicity, much doubt has been bandied about over the process' postwar feasibility from a cost standpoint. The curtain was raised on cost figures for a short glance by the Canadian government's report on Dominion Magnesium Co., Ltd., Haley's Station, Ontario, which, during March produced an average of 8½ tons of magnesium daily at an average cost of 39.7c. per lb. This compared with a cost of 41c. per lb. during the operating period, October, 1942, to March 31, 1943.

Labor shortages cut a broad swath in magnesium field, but far more spectacular was the battle between AFL and CIO to gain control of the Basic Magnesium plant. Following a long period of disturbance, the CIO finally won an election as bargaining agent by a close margin. Ordinarily such an election is of small importance in the national scene, but the Basic plant by so far the largest concentration of inhabitants in Nevada, that its working force, voting as a block, would be sufficient to swing state elections. The possibility of electing two United States Senators is not one to be overlooked.

The Federal government is still deeper financially with magnesium than with aluminum, owning 94 per cent of production facilities. Defense Plant Corp. contemplates that the high cost plants will be shut down following the war or diverted to other uses.

The post-war future of magnesium appears less well defined than that of aluminum. Beyond the ready acceptance caused by the metal's light weight, the favorable strength-weight relationship of its alloys and its ready workability, more prominence in discussions is being given to such disadvantages as high coefficient of expansion, susceptibility to stress, corrosion and high cost.

Crusoe Can't Eat Steak

Like the shipwrecked sailor rescued after months on a hardtack and water diet who finds his stomach capacity severely shrunken when offered a square meal for the first time, the alloy steel industry by the end of 1943 had pulled in its belt so tightly that the sudden appearance of a nearly normal quantity of alloying elements appeared an unconsumable surplus.

In mid-year, Climax Molybdenum Co., which accounts for about 75 per cent of our molybdenum production, had achieved an altitude on the labor priority list comparable to that of its mine near the Rocky Mountains summit. Molybdenum, which had been drafted early in the war to replace tungsten no longer available from China, was being replaced in melting ratios by tungsten from unexpectedly fecund domestic mines. Unable to stand the altitude, about the only workers to buck an amazing turnover rate were released soldiers assigned to plug a threatening hole in the production dyke.

Then, the heat of demand dropped more sharply than a Chicago thermometer hit by the breeze from Lake Michigan. By November and December, production efforts had ceased entirely, and

development work was the order of the day.

The most significant factor in the drop-off was reduced foreign demand. The United Kingdom, which normally had been getting about 2,000,000 lb. of molybdenum a quarter, reduced its original request for the fourth quarter by 1,500,000 lb. Total fourth quarter requirements, to meet both foreign and domestic demand, are estimated at 11,212,000 lb. of virgin molybdenum, including the Russian protocol but not providing for a special Russian allocation of approximately 1,350,000 lb. of contained molybdenum in "ferro."

Consumption in July and August showed a decrease of about 17 per cent from the first six months average. That put an entirely different complexion on the picture, and by the end of October WPB estimated overall use at 52,400,000 lb. for the full year or about 10,000,000 lb. less than the projected production figure.

Consumers Mollified

While consumption was falling off, the frantic mining efforts began to show results. In the first six months of the year, molybdenum output in usable form totalled 31,200,000 lb., or 5,200,000 lb. monthly, made up approximately 93 per cent of domestic production and seven per cent imports. In July and August, output amounted to 10,700,000 lb., or 5,300,000 lb. a month, representing a gain of about 2.7 per cent. If the production line for the year were allowed to run off the chart on this basis, 1943 production would be about 62,800,000 lb.

But the requirements trend, projected into 1944, appears to be definitely on a lower plateau, with an estimated figure for the year of 44,561,000 lb. of contained molybdenum comprising 11,093,000 lb. for the first quarter; 11,122,000 lb. for the second quarter; 11,123,000 for the third quarter; and 11,223,000 lb. for the fourth quarter.

The story of how the molybdenum stock pile grew is graphically told in allocation and consumption figures for a 12-month period (See Table I).

In the third quarter of 1942, allocations for lend-lease and Canada were 4,386,000 lb., as compared with 3,445,000 lb. in the third quarter of 1943. In the first and second quarters of 1943, 4,147,000 and 3,777,000 lb., respectively were allocated. Russia is getting about 340,000 lb. monthly, and the rest is going to Britain and Canada, with a small proportion to Australia.

By the end of August, stocks had nearly reached what the WPB ferro-alloys branch felt should be a minimum stockpile objective, 24,000,000 lb.—about the equivalent of a six months stockpile of virgin molybdenum at the current consumption rate. Total industry and government-held stocks of concentrates and products, as of Aug. 31, was 23,791,000 lb., made up of 12,315,000 lb. of molybdenum concentrates, and 11,476,000 lb. of products. Because such a large proportion of molybdenum is mined domestically, and water borne concentrates are a minor factor, the necessity of a larger inventory was felt to be questionable. By the end of October, there was no doubt whether molybdenum should be removed from allocation insofar as the WPB ferro-alloys branch was concerned. The only question was what method to use. Removal from allocation, in itself, represents only loosening of the belt a notch or two. Restrictions on allowable uses prevent industry from regaining its normal appetite.

High Speed Slowdown

Vanadium production exceeded consumption all year, the fat going to the stockpile. Again, reduced requirements were the key to the situation. Between November 1942 and Sepember 1943 allocations dropped 40 per cent. This shadows closely high speed tool steel melting, which in November 1942 totaled 11,857 tons, but which had dropped to 5,815 tons in August 1943. During the 12 months through October 1943, vanadium allocations totalled 3,366,000 lb.; consumption, 3,550,000 lb. During the first six months of 1943, consumption was at a monthly rate of 296,000 lb.; during July and August, the monthly rate dropped 12 per cent to 258,500 lb.

With two months yet to go, 1943 production was estimated at 5,700,000 lb. of contained vanadium. September production, the most recent figure available, was 475,000 lb.

The drop in consumption probably surprised no one more than those who figured requirements. Tentative pencil jottings in June anticipated requirements during the first and second quarters of 1944 at 1,154,000 lb. per quarter. By September, the figure was whittled down to 948,000 lb. for the first quarter, 941,000 lb. for the second quarter. No one would publicly estimate a requirement for the second half of the year, probably in light of the fact that the tentative figures for the first half represented a rate of consumption larger than the current one. On Oct. 8, the WPB ferro-alloys branch wrote the armed services that it anticipated an excess of 2,500,000 lb. of vanadium in 1944, requesting the services to indicate what quantities should be reserved for their consumption and pointed out that if current requirements could not absorb production curtailment of production would have to be considered.

By Oct. 15, Metals Reserve Co. had received deliveries of 2,562,776 lb. of ferro-vanadium towards the three million lb. stockpile which WPB had asked it to assemble, and there were indications that the undelivered balance merely represented a matter of transfer from producers' stocks.

The WPB ferro-alloys branch regards 2,000,000 lb. of contained vanadium in products (ferro-vanadium) or vanadium pentoxide) as a minimum stock which should be maintained above ground at all times for the sake of security. On the basis of new consumption figures, this stock approximates a six months' supply, and represents the total of both in-

TABLE I

Domestic Molybdenum Allocation and Consumption

Month	Allocation	Consumption
November, 1942	4,500,000 lb.	4,500,000 lb.
December	5,150,000 lb.	4,450,000 lb.
January, 1943	4,000,000 lb.	4,460,000 lb.
February	3,700,000 lb.	4,200,000 lb.
March	4,000,000 lb.	4,200,000 lb.
April	4,100,000 lb.	3,800,000 lb.
May	3,600,000 lb.	3,600,000 lb.
June	3,100,000 lb.	3,100,000 lb.
July	3,100,000 lb.	2,830,000 lb.
August	2,850,000 lb.	3,000,000 lb.
September	3,070,000 lb.	2,810,000 lb.
October	*	*

*Allocation and consumption in October were expected to remain at the September rate.

dustry's stocks and the government stockpile. This minimum represents a milestone rather than a goal, for total stocks as far back as Aug. 31 were 2,062,000 lb., of which the government held 948,000 lb. and industry (producers and consumers) 1,114,000 lb. During the six months through October, consumers' stocks averaged 415,000 lb.

Rah! Rah! Tungsten

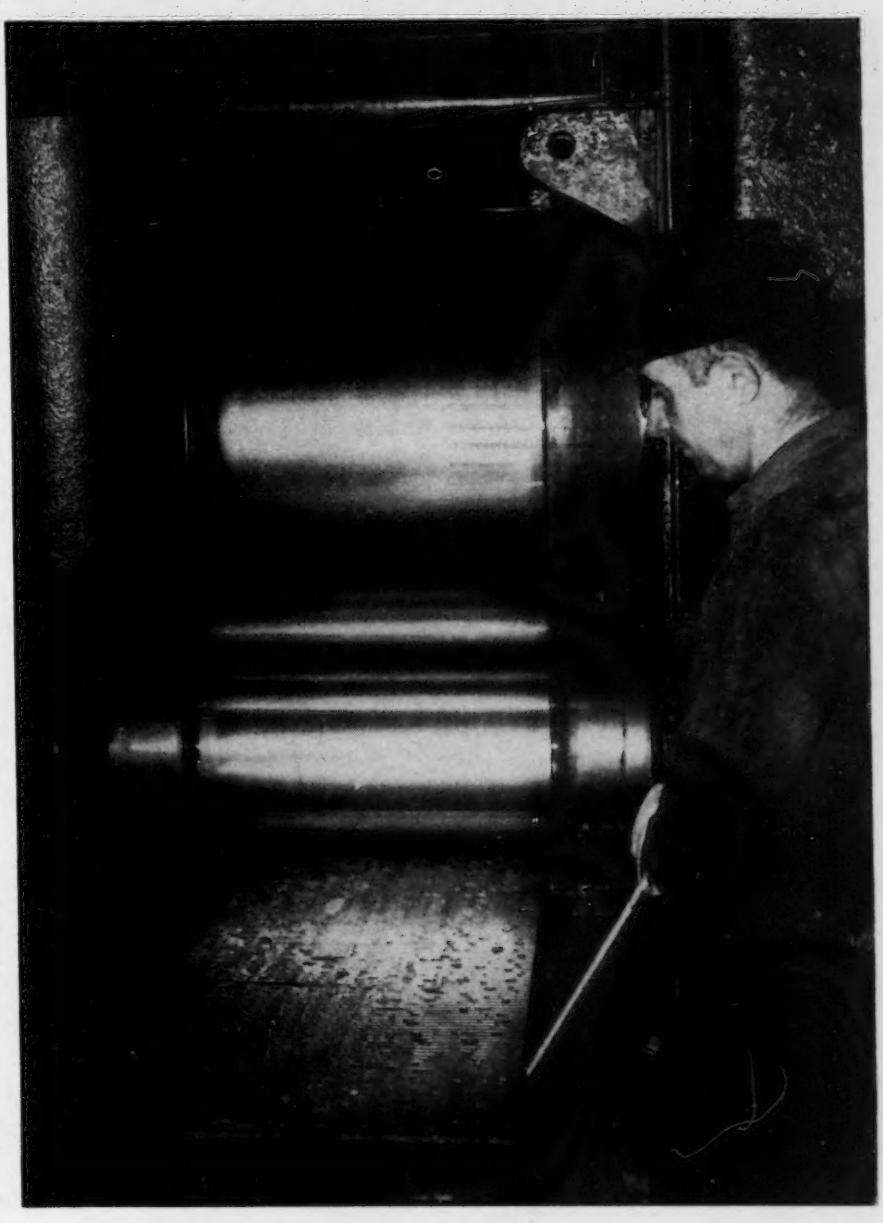
The story of tungsten is as similar to that of vanadium as the plot of one Hollywood movie romance to another. There was the terrific struggle against insurmountable odds when the war cut off all imports of wolframite from China. But all the time our production heroes had been working behind the scenes—without much success—to perfect extraction methods which would make local ores suitable for commercial use in large quantities. Came the crucial test, and bingo! As prettily timed as a last minute touchdown pass, the new processes reached maturity and the extra point was kicked with discovery of the largest deposit of high grade ore ever made in this country.

The production program was well laid out at the beginning of 1943 to balance nicely with requirements, and progress was according to plan. Nevada-Massachusetts Co., although hampered severely by labor shortage, continued to produce substantially from northern Nevada ores, using its concentration process which had reached maturity in 1941 and 1942. United States Vanadium Corp., which in 1941 had solved the problem of extracting tungsten from a large low grade deposit of refractory ore near the summit of the Sierra Nevada mountains in southeastern California, continued large scale production from this deposit. This company also completed and commenced operation, as agents of Metals Reserve Co., of a chemical treatment plant at Salt Lake City to produce high grade concentrates. Low grade scheelite deposits in northern Nevada provided considerable tonnages milled by Getchell Mines, Inc. Many smaller deposits principally in the southern Sierra Nevada mountains of California, in Nevada, and individual mines in Utah, western Arizona, southern Idaho, and Colorado, all chipped in on domestic production. But the role of the glamorpuss, the star halfback who kicked the winning point, was played by the Yellow Pine mine deep in the wilderness of central Idaho, which variously has been estimated to have produced from one quarter to one third of the entire domestic production. During development as a gold mine, samples taken by the Bureau of Mines and Geological Survey, when put under the ultra violet lamp, clearly revealed by their fluorescent glow the presence of rich tungsten ore. In the flurry of exploration following this discovery, a large antimony ore body was found, and the mine this year undoubtedly led in domestic antimony production as well as tungsten.

It may be assumed that domestic tungsten production was approximately matched by imports from Bolivia, Peru, Canada, Argentina and Mexico.

The cut in high speed steel production changed sufficiently to surfeit. By the end of the year, Metals Reserve Co. has cut its Canadian commitments at the ears, and the four leading domestic producers were pulling their punches in order not to knock the pins from under the restricted market. Metals Reserves Co. was stuck with a pledge to buy the output of the smaller producers through 1944, or else refuse further receipts from them and settle in cash at 10 per cent of the contract rate on the basis of their average production rate over the past six months.

Although production is being reined in, WPB's automotive division secured an amendment to order L-158 designed to cut by 20 per cent the amount of tungsten used in ignition contact



● Brass strip is cold rolled to gage on a steel strip mill by Weirton Steel Co. following hot rolling of slabs on a structural mill. Weirton lays claim to being the sixth largest brass roller in the country, but, because of ammunition cut-backs, will likely cease rolling next month.

points. This undoubtedly reflected a shortage of rod, rather than tungsten.

Over the Waves

The story of how we achieved chrome and manganese sufficiently is one from which many interesting chapters will be missing until European phase of the war is concluded. At the outbreak of the war, mineral economists raised their hands in horror when they discovered that nearly our entire consumption by both ores had been imported by water. For chrome, particularly, there was a squeal of terror when the Philippines, which had supplied about 25 per cent of our needs in the immediate prewar years, were lost, and Turkey, which had been a substantial contributor of ferro-grade ore, apparently was bound up in a trade agreement with the Nazis. On manganese, the Bureau of Mines, whose experimental work with low grade domestic ores theretofore had been unappreciated, stepped forward with chemical treatment processes which could tug substantially upward the grade of concentrates from ores with almost undiscernable manganese content. If industry would stretch hard, and lower its grade requirements until blue in the face, it was felt we could encompass our bulging manganese demands in the girdle of self-sufficiency. As for chrome, a comely lady miner flew in from Alaska with a tale of a large undeveloped deposit, California bulldozer operators began gouging out kidneys of a few tons each over a large portion of the state, two rugged Montana projects were tackled with a blood-and-guts enthusiasm and the whole country sighed dolefully as ore boats were sunk in the Caribbean.

While industry was holding its breath sucked in and the Bureau of Mines was bracing itself to tug on the corset string of technological innovation, manganese began to appear, not from the marginal domestic deposits, but, lo and behold, from across the ocean. No one ever said anything officially, but it was recalled that African, Cuban and Brazilian deposits were by no means exhausted before the war, and it was further pointed out that, with the Mediterranean closed, a direct route to Russian lend-lease ports in the Red Sea involved a trip through the South Atlantic. On April 1, 1943, Donald Nelson answered the arguments of domestic miners who were pressing for sky high purchase prices by stating that our stockpile had nearly a two year supply, and that we were able to bring in practically our full needs, thank you, in the form of return cargoes in ships that would otherwise return in ballast. One fair sized, high grade rhodochrosite deposit in Montana which, of course, required a calcining plant, was pushed through to completion, and produced substantial tonnages this year. Likewise, Manganese Ore Co., a M. A. Hanna subsidiary, finally got into operation a beneficiation plant near Las Vegas, Nev., to treat a low grade southern Nevada deposit. Homestake has been probing in Lower California. And, battery grade ore, which is particularly rich, was mined in surprisingly large quantities near Livermore, Calif.

It may be surmised that the solution of the chrome problem also predominantly involved continued imports. South Africa and Rhodesia never were occupied by the Nazis. Whether the Allies bought up a good chunk of Turkish production despite the Nazi trade agreement, and carried it away when the Mediterranean was reopened, is not known. It may be significant that Germany was reported to have complained early this year, when her agreement came up for renewal, that the Turks were far behind on their deliveries. In any event, domestic production consists of regular production by a Rustless Steel Co. subsidiary in Glenn County, Calif., an independent mine near San Luis Obispo, Calif., two new and novel plants on the Oregon Coast, and more or less seasonal and irregular production from several score northern California and Oregon "kidney" deposits. WPB for many months has refused to sponsor any beneficiation projects which would not produce a concentrate of better than 45 per cent Cr_2O_3 and 2.5 to 1 chrome-iron ratio. Early this year the sights were raised allegedly to a 3.0 for 1-chrome-iron ratio, but no one stepped forward with any proposals along this line to really find out. By spring, the Alaskan project was indefinitely suspended, and one of the large Montana projects was deferred, and a little later the second Montana low grade project was ordered put in stand-by condition.

Metals Reserve Co. has committed itself to a purchase of small lots of chrome and manganese ores from all comers through 1944. In fact on May 15, at the recommendation of the WPB ferroalloys branch, Metals Reserve smoothed out its manganese ore purchase price schedule, raising the prices somewhat on lower grades and took the bumps out of its paying price for chrome ore. At last count, purchases were being made at 21 depots in ten western states, but most of the ore purchased never has gotten any nearer to industry, and still stands piled up along the railroad sidings. For some inexplicable reason, Metals Reserve also removed its provision that manganese ore purchased must be the soot-black pyrolusite, and agreed to accept at an equal price carbonate ores which are of no use to anyone in their present condition. So far as can be determined, no provision has been made for converting these carbonate purchases to usable form. In mitigation, it must be acknowledged that the federal government has been badgered more by small chrome and manganese operators, would-be operators, and nebulous promoters with alleged manganese and chrome deposits in the far west than from actual producing mines of all the rest of the minerals put together. If these concessions were the price of an orderly minerals policy, the cost was cheap.

On Dec. 1, WPB upped the permitted use of chromium in the manufacture of stainless steel.

Next Door Neighbor

Nickel is the only major member of the ferroalloy group whose supplies now are listed as "insufficient for war plus essential industrial demands under existing administrative control." (Tantalum and columbium are the other ferroalloys in this category.) It is hard to get anyone in official Washington, except possibly the anti-trust division of the Department of Justice, very steamed up over this alleged paucity. When questioned, officials merely point out that Canada, the principal source of supply, is always close at hand, and that the supply-demand relationship is sort of a shrink-fit proposition rather than an absolute no-go.

So far supplies have from time to time expanded or contracted to almost the exact amount necessary to meet absolute requirements. Imports from New Caledonia and Cuba, it seems reasonable to believe, have been sufficient to pad out the Canadian supply. Moreover, the romance between many former nickel steel users and heat treated carbon steels seems likely to blossom into permanent connubial bliss.

Colbalt supplies are ample, and the zirconium stockpile, much of it imported from Australia, reached ample

proportions when the war was still young.

Baby Wants Candy

In March, 1943, the United States produced somewhat in excess of 1,250,000 ingot tons of alloy steel. By the end of October, production was at the rate of 1,050,000 ingot tons, and going downhill fast. Adding particular momentum to the slide was Class A and B high speed steel production. Contributing to the general indigestion of alloying elements was the production, by October, of 109,000 tons of alloy steel scrap per month more than was being consumed. This trols are removed. About 4,250,000 tons, or about one third of America's 1943 production of alloy steels, will consist of the low alloy NE steels, the American Iron and Steel Institute estimates. Conversion to the NE series is expected to save the nation 24,000 tons of nickel. This saving will be accomplished at the cost of no increase in the use of chromium and with rises of only 3000 tons for molybdenum and 8000 tons for manganese. On typical grades of NE steel made either in the open hearth or electric furnaces as much as 30 per cent of the chromium content, 25 per cent of the molybdenum, and 50 accommodated himself to the change. in metallurgy, the committee member stated, he will be reluctant to make another change. And users who have found a satisfactory alternate for vanadium steels will see little reason to specify the former grade, particularly if its use entails obtaining permission from WPB."

Battle of Washington, S.W.

Although the armed services are reported to consider that, in general, a stockpile of raw materials averaging at least one year's requirements is desirable, WPB ferroalloys branch recommendations so far made public

•Kennecott copper mine, Bingham Canyon, Utah, the largest open-cut copper development in North America. The concentrating mills of the company is at Garfield, 18 miles away.

led the WPB steel division industry advisory committee on conservation and operation to recommend increased use of nickel-chromium-molybdenum alloy steels to the extent of at least 60 per cent of total alloy steel produced for engineering and construction purposes. Particularly mentioned were NE 9400 and NE 8600, RBEC 4700, and the SAE 4300 series. Attempts to force NE 9400 and NE 8600 down the throat of industry were about as successful as getting a candy-minded infant to eat Pablum, particularly when it became known that the basic alloying elements were available in quantity.

Some of the other NE steels apparently tasted sweeter, however, and a currently acceptable question for any open forum involves the exact extent to which the diet of leaner alloys will be abandoned when con- per cent of the nickel requirements are obtained from scrap. Even with this consumption, alloy scrap is going begging and so far represents the only serious price break below OPA ceilings.

Troubled most is the ferroalloy trade itself. An official summary of a recent WPB vanadium industry advisory committee meeting, contains the following paragraphs, concerning remarks by an industry member:

"With government stocks approaching the goal set, producers will have no market for the excess vanadium, it was pointed out, and they cannot afford to accumulate excessive stocks themselves. They are faced with a tremendous selling job to restore vanadium to its former level of use, since war dictated changes in melting practice and end-use will be difficult to alter. Once the steel melter has regard a six months' supply as the necessary minimum. As above outlined, supplies in this amount have been assembled for most ferroalloys. Reports of industry committee meetings show that the ferroalloys branch and industry members have agreed that restrictions on consumption such as allocation control should be lifted wherever possible. Apparently, however, the production executive committee, which represents the white collar or front office class at WPB, feels differently. For, in the offhand manner of a man turning off the hot water faucet, WPB officially announced on Oct. 27, the committee's decision that "after stockpiles of ferroalloys reach recommended levels, domestic production and imports will be kept in balance with the then current consumption. This will insure a

Renegotiation

o o o

By S. H. BARMASEL
Associate Editor, THE IRON AGE

o o o

PERHAPS more words have been spoken and printed and more tempers lost over the issue of renegotiation than any other controversy industry was faced with in 1943.

Renegotiation did not have its beginning on April 28, 1942, government officials concerned with renegotiation invariably emphasize. Some will go as far back as the Revolutionary War when Washington, the man, not the concept of government, damned the war profiteer. Others will go back only as far as the Spanish-American War when the first law limiting war profits on armor plate was passed. All quote the American Legion resolution to "take the profit out of war."

Maurice Karker, then chairman of the War Department Price Adjustment Board, reminded the House Naval Affairs Committee on June 30, 1943, that about 170 bills and resolutions to reduce, limit or eliminate war profits were introduced in Congress between February, 1919, and April 28, 1942. Those that finally became law were the Vinson-Trammell Act of 1934 and the Merchant Marine Act of 1936, setting a ceiling of 10 per cent on the profits from the building of ships for the Navy and Maritime Commission and on Naval aircraft. They were later modified.

From the very nature of their procurement policies at the start of the national defense program, the War and Navy Departments early recognized that huge profits could be made by some contractors. Armed with Executive Order 9217, even before renegotiation became public law, contracts entered into by these two departments were reviewed and prices considered out of line reduced. Several large contractors voluntarily submitted to renegotiation before April 28.

The first Congressional proposal to eliminate inconscionable profits in this war was adopted on March 28, 1942, and has become known as the Case Amendment. It would have set a flat six per cent limit on war contract profits. However the objections of the War and Navy Departments and the War Production Board to a fixed profit limitation as being unfair to some and unduly generous to others, brought out at the March, 1942, hearings of the House Naval Affairs Committee, apparently carried enough weight to overide the six per cent limit and substitute for it the now famous Section 403 of the Sixth Supplemental National Defense Appropriation Act which was approved and became law on April 28 of that year. The proposed method of preventing excessive profits recommended at that time by the War and Navy Departments and Donald M. Nelson was rejected.

Over-All Review

The intent of Section 403 as passed in April was that individual contracts and subcontracts for the War and Navy Departments and the Maritime Commission be subject to renegotiation. The disadvantages of such an arrangement were obvious at once. The blast from Gabriel's horn would probably have signaled the termination of renegotiation. And since renegotiation does not provide for upward readjustments no contractor could offset any losses on some contracts with gains on others. The various price adjustment boards, therefore, decided very quickly to renegotiate on an over-all basis.

Subsequent amendments to the act extended renegotiation to the Treasury Department and later to four corporations under the Reconstruction Finance Corp., namely Metals Reserve Corp., Rubber Reserve Corp., Defense Plant Corp., and Defense Supplies Corp. Under the terms of the directive establishing the War Shipping Administration, renegotiation was extended to this agency as well. In each case, renegotiation was made retroactive to April 28, 1942, the cut-off date.

All contracts which were completed and final payment made before April 28 were excluded from renegotiation. However, if final payment was not made prior to that date, the entire contract became renegotiable. In cases where relatively small sums were outstanding or contracts provided for escalator clauses or performance bonuses the agencies involved have considered payment completed and the contract exempt.

Complexities arose in transactions with any of the eight agencies which provided for continuing contracts with specified delivery dates. If deliveries were not completed by the cut-off date, the entire contract has been considered subject to renegotiation. If, however, the transaction constituted separate contracts, then only those contracts not paid in full were to be reviewed.

Entirely exempted from renegotiation are contractors and subcontractors whose total war contracts for their fiscal year are less than $100,000.

The Joint Statement by the War, Navy and Treasury Departments and the Maritime Commission on Purposes, Principles, Policies and Interpretations issued March 31, 1943, listed additional exemptions. Of primary interest are the raw materials excluded from renegotiation because they have not been "processed, refined or treated beyond the first form or state suitable for industrial use." These exempted products are:

Aggregates consisting of washed or screened sand, gravel or crushed stone.

Aluminum ingots and pigs; alumina; calcined or dried bauxite, and crude bauxite.

Antimony ore, both crude and concentrated; antimony metal, and antimony oxide.

Arsenic powder, and arsenious oxide (white arsenic).

Asbestos fiber.

While wrestling with material controls, production and manpower problems, industry dealt valiantly with two new uncertainties in 1943—renegotiation and contract termination. While industry favors taking much of the profit out of war, still there are some very legitimate objections to existing renegotiation practices.

Bismuth.

Cement.

Chromium ore and ferrochrome not processed beyond the form or state suitable for use as an alloy or refractory in the manufacture of steel; bichromates and chromic acid.

China clay; kaolin clay; fire clay; brick and tile made from clays other than kaolin, china or fire clay.

Copper ore, both crude and concentrated; copper billets, cathodes, cakes, ingots, ingot bars, powder, slabs and wirebars.

Fluorspar ore; fluorspar fluxing gravel; lump ceramic ground fluorspar; acid grades.

Crude iron ore and pig iron.

Natural gas not processed or treated further than that customarily occurring at or near the well.

Gypsum, crude; calcined gypsum.

Lead ore; refined lead bars, ingot and pigs; antimonial lead bars, ingots and pigs.

Lime.

Magnesite; dead burned magnesite.

Metallic magnesium, pigs and ingots.

Crude oil not processed or treated further than that customarily occuring at or near the well.

Phosphate rock; superphosphate.

Ferromolybdenum; calcium molybdate; molybdenum oxide.

Rock salt and common salt of all grades.

Refined silver bars, shot, powder and grains.

Stone, rough dimension.

Sulphur, crude.

Standing timber, logs, logs sawed in lengths, and logs with or without bark.

Refined pig tin.

Tungsten ore and concentrates; ferrotungsten and tungsten powder.

Vanadium ore and concentrates; ferrovanadium; vanadium pentoxide.

Zinc anodes, balls, oxides, powder and slabs.

The heads of the various departments and agencies are endowed by the statute with discretionary power to exempt from renegotiation contracts for personal services, real estate, perishable goods and products for which a minimum price has been established by a public body and where the profit can be determined with reasonable certainty when the contract price is established. Under these powers fresh and frozen foods are exempt while canned goods are renegotiable. Contracts performed outside the territorial limits of the United States and in Alaska can also be excluded under this power as can contracts taking less than 30 days to complete.

Price adjustment boards were first set up three days before renegotiation was approved. Executive Order 9217 issued by the President on April 10, 1942, gave the War, Navy and Treasury Departments, WPB, the Reconstruction Finance Corp. and the Maritime Commission the authority to inspect defense plants and audit their books in order to prevent excessive profits. The boards were to get voluntary downward price revisions or refunds where profits were judged to be excessive.

PAB Personnel

At present there are five main price adjustment boards and a fairly recent joint board comprising the five chairmen and the War Production Board's representative on all boards, Carman G. Blough.

The War Department Price Adjustment Board is mainly a policy-setting body having delegated its power to renegotiate to the services and the Army Air Force. These divisions in turn set up regional sections so that at present there are 48 individual price adjustment boards for the Army Engineers, Air Forces, Quartermaster, Signal Corps, Surgeon General, Chemical Warfare, Transportation and Ordnance. These regional boards have full power to renegotiate contractors whose total sales do not exceed five million dollars. Where total sales are between five and 10 million dollars, tentative agreements reached in the field must be reviewed by the Service chief and in cases over 10 million dollars, approval of the Washington board is necessary before agreements become final. The Washington board also reviews cases where no agreement or definite disagreement was reached in the field offices.

Chairman of the main War Department Price Adjustment Board is Joseph M. Dodge, president of the Detroit Bank since 1933. The other four members of this board are Attorney Maurice Hirsch who is senior partner in the Houston, Tex., firm, Hirsch, Susman & Westheimer, corporate lawyers; Lt. Col. Paul B. Boyd who is on leave as executive vice-president of the Jewel Tea Co., Inc., Barrington, Ill., since 1942 when he became a major in the Quartermaster Corps; Counsel W. James MacIntosh who since 1931 has been a member of the law firm of Morgan, Lewis & Bockrus, Philadelphia, and Carman G. Blough, WPB's representative on all boards, who resigned as partner in the accounting firm of Arthur Anderson & Co.

The Navy's PAB in Washington is headed by Kenneth H. Rockey who resigned in 1939 as president and chairman of the Chilean Nitrate Sales Corp., and had also been president and director of the Rio Blanco Copper Corp. and director of Philip Morris & Co., Ltd., Inc. Its members are Sylvan C. Coleman, member of the investment firm of E. F. Hutton & Co. in charge of corporate activities and director of United Carbide & Carbon Co.; W. John Kenney, vice-president and director of KPH Royalty Co. engaged in the purchasing of oil properties and interests therein; Sidney A. Mitchell, executive vice-chairman of the board, was until 1942, when he joined the Navy Department to organize its finance section, president of Bonbright & Co., New York investment bankers; Auguste Richard, vice-president and director of Pacific Mills; Clarence H. Ross of the law firm of Ross & Watts, and Capt. L. L. Strauss.

In addition to this Washington set-up, the Navy has established a branch of its main board in New York for

• Handling the largest volume of all ordnance districts, the Chicago Ordnance District Price Adjustment Section reviewed approximately 650 renegotiation cases. Shown here in the usual order are James M. Barker, director and former vice-president, Sears, Roebuck & Co.; Herbert P. Zimmermann, vice-president, R. R. Donnelly & Sons Co.; John W. Leslie, president, Signode Steel Strapping Co.; Max H. Hurd, chairman and former vice-president, Link-Belt Co.; Clay Judson, partner Wilson S. McIlvaine, and George W. Rossetter, partner, George Rossetter & Co. Only Mr. Hurd serves the board full time.

the convenience of the North Atlantic suppliers and to relieve the pressure on the Washington board. Headed by Comdr. N. Loyall MacLaren who is also on the Washington board, this body exists as a branch of the main board in that it can make proposals to contractors. Cases handled by the two regional boards in Chicago and San Francisco, however, are reviewed in Washington before settlement is determined.

All members of the Treasury Department PAB have been long time employees of that department. Capt. Harry C. Maull had been assistant director of its procurement division; Raymond Eberly was executive officer of the lend-lease control division; Miss G. A. Parkhurst was formerly assistant chief of the purchasing division, and L. J. MacIsaacs had been special assistant to the assistant to the director of procurement.

Lt. Comdr. Arthur G. Rydstrom, operating chairman of the Price Adjustment Board for the Maritime Commission, gave up his position as vice-president of the Bankers Trust Co., New York. Chairman of the board is Commissioner Thomas N. Woodward of the Maritime Commission. Attorney John R. Paull is its third member.

Officers of the four agencies under the Reconstruction Finance Corp. make up its price adjustment board. Chairman is Charles T. Fisher, director of RFC and on leave as president of the National Bank of Detroit. Charles B. Henderson, chairman of the board of the RFC and president of Metals Reserve, Sam H. Husbands, president of Defense Plant Corp., Howard J. Klossner, president of Rubber Reserve, and Henry A. Mulligan, president of Defense Supplies complete the body.

o o o

Chairman for the War Shipping Administration PAB is Dr. James L. Murphy, who in the last war headed the Buchan-Murphy Mfg. Co., fabricators of silk powder bags and heavy leather goods for the Army. He is currently on leave as professor of corporate law of the Brooklyn Law School, St. Lawrence University. Other board members are Joseph Carr, formerly tax expert for New York's Corporation Counsel; Howell Smith, president of Smith & Johnson, steamship operators, and Paul Sullivan.

Work of this board is departmentalized with Charles Williams of the Bethlehem-Fairfield shipyards head of maintenance and repairs; William Deverall of United Fruit Lines in charge of ship operations; Palmer A. Paddock, chief of the charting division; Capt. W. C. Lush for open market purchases; Major F. X. Conlon for stevedoring and tugboat division, and Robert A. Lamberton, assistant accounting professor, Rutgers University, in charge of terminal facilities.

The majority making up these and the regional boards have been drawn from the field of finance with law second and industry third. Accountants follow with engineers close on their heels. Government careerists and college professors are at the very bottom. The agencies have tried in most cases to enlist men prominent in business to serve on the various boards and their staffs. That so many have had no actual industrial experience that would give them an appreciation of the special problems and complexities confronting contractors has been cause for much criticism.

Renegotiators are insistent in pointing out that their work is not a taxing procedure but one of repricing. Their job is to keep prices down.

The necessity for renegotiation, they say, originated in the 10-year lag in the national defense program. Having to reach and overtake Axis munitions output, contracts were placed at a furious rate. Industry inexperienced in the specialized production for war and confronted with tomes of specifications and inspection proceedings asked for intuitive prices. War spending in the beginning was of no appreciable importance to the equally inexperienced procurement officers. All emphasis was on getting these urgent items into production—and getting them fast. As industry became geared to war, procurement agencies became aware that excessive profits were being accumulated by some.

They were certain that taxation was no cure and they quoted Bernard M. Baruch.

"Excess profits (taxes)," he said, "standing alone have no effect to check inflation. Their only effect is to increase it. Thus 20 per cent of $500,000 is $100,000 and 20 per cent of $1,000,000 is $200,000. One way to increase $500,000 profit to $1,000,000 without increased risk or effort is to

• The House Ways and Means Committee held renegotiation hearings and listened to government and industry speak their minds. Many of the House proposals may be negated by Senate action.

o o o

double the price. . . . The main result of such a system (80 per cent excess profits tax) is to induce rapid price increase to absorb the tax. . . . It aggravates (inflation)."

Renegotiation in its swaddling clothes had not developed coordination. Each board was separate and distinct.

The first step to some semblance of order was the delegation of final agreement to one price adjustment board conducting hearings for all agencies. Thus if a company held contracts with the Signal Corps, Navy and Treasury Department for lend-lease equipment, one board would review the case for the fiscal year and after an agreement was reached the contractor knew that renegotiation was over for that period. Neither the Navy nor the Treasury Department would hound him and renegotiate him all over again.

Other steps toward coordination were the establishment in the fall of 1943 of the policy-making Joint Price Adjustment Board and bi-monthly meetings of delegates of the various regional sections.

Central Assignment Agency

All cases to be renegotiated are assigned to the boards by the War Department Assignments Branch under Major W. Howard Dilks. The agency getting the bulk of the material produced by the war contractor determines the board to handle the case.

No two groups agreed during the year as to the number of 1942 cases to be assigned. The Truman Committee spoke about 85,000; the renegotiators of 20,000 to 25,000. The percentage of assignments to the various boards were not debated. The War Department PAB reviewed approximately 80 per cent while 15 per cent went to the Navy and the remaining 5 per cent was divided among the Treasury, Maritime, War Shipping Administration and RFC boards.

Before a case is assigned, a preliminary letter is sent to the company to determine whether it is subject to renegotiation. From the information returned, the case is assigned.

One contractor answered the preliminary inquiry saying, "We are not considering renegotiation of any contracts at this time, but we are pleased to have had you make the offer." Whether he has considered it or not, he will, if subject, be renegotiated.

When the board gets a case, financial and operating data going back to 1936 where possible, are first obtained from standard financial publications, like Moody's and Standard Statistics, from the files of the Internal Revenue Bureau, the Securities Exchange Commission and the procurement agencies, before the information is sought from the contractor. The manufacturing problems facing the company and its performance are also obtained from the procurement officers.

The contractor must supply regular financial reports including balance sheets and income and surplus statements for 1936 to 1942 as well as the latest interim balance sheet and income statement. Stockholders reports have been said to be adequate, although in actual practice, detailed auditors' reports are generally required.

If from a breakdown of renegotiable and non-renegotiable business, it is evident that no excessive profits have and will be earned, the company is released for that period. If such positive evidence does not exist more detailed information must be supplied.

The most difficult task jn preparing this information is the separation of renegotiable from non-renegotiable business. This is especially true for manufacturers of standard products where the end use of some will be in war materiel and others will go into civilian or exempt production. In such cases a sampling of several months' sales will be accepted by the renegotiators. Cost plus fixed fee contracts must also be separated from fixed price contracts since they are considered independently. Difference in risk is the reason given for this procedure.

Accompanying the financial data is a statement by a company executive relating the history of the company, its contribution to the war effort and any other factors that are pertinent in determining whether excessive profits exist. In preparing this statement modesty is no asset. In fact several companies have turned this task over to public relations firms that have prepared elaborate statements, in some cases running well over 2500 pages, with charts, tables and photographs.

Although the virtue of renegotiation to the renegotiators is its flexibility, certain factors have been set in considering the profit to which a contractor is entitled. These are:

(1) Price reductions and comparative prices.

(2) Efficiency in reducing costs.

(3) Economy in the use of raw materials.

(4) Efficiency in the use of facilities and in the conservation of manpower.

(5) Character and extent of subcontracting.

(6) Quality or production.

(7) Complexity of manufacturing technique.

(8) Rate of delivery and turnover.

(9) Inventive and developmental contribution with respect to important war products.

(10) Cooperation with the government and with other contractors in developing and supplying technical assistance to alternative or competitive sources of supply and the effect of such cooperation on the contractor's future peacetime business.

These are not the only considerations. The extent of conversion to war production, government financing, government supplied equipment and buildings, and accelerated depreciation are some of the other factors weighed by the boards. There are even intangibles to be studied.

A low cost manufacturer of a standard product, for example, had refused the offer of a new plant to be supplied by the government. Instead, he volunteered to teach his competitors how to increase production and reduce prices. Not only did he supply them with his designs but had sent them his experienced men to demonstrate his efficient methods. He was certainly in the most favorable position during renegotiation hearings. However, during the excitement of the review, he inadvertently confessed that he had already acquired new patents that would increase production efficiency and lower prices still further. He certainly did not want the burden of an additional plant when his present techniques would become obsolete as soon as the war was over. Nor did he care whether his competitors learned his current methods. He would still be the low-cost producer. As far as renegotiation was concerned, he would have done better had he "not considered renegotiation at this time."

Losses incurred in 1941 when contractors were still inexperienced or having foreseen that civilian production would be curtailed accepted contracts at a loss cannot be offset by gains in 1942. However, the boards claim to have made it their practice to be more lenient in their allowances in such cases.

No company is considered as a thing in itself. Its position with regard to competitors is part of the total picture contemplated. Reports from other boards handling similar cases can be obtained for comparison. An attempt to have one board handle all companies engaged in one industry has been made for oil refineries and contractors working on a commission basis, which have been assigned to the Navy board.

Percentage of profits allowed before taxes—all profits considered during renegotiation are before taxes—has ranged from about 1.5 to 22 per cent. The greatest bulk falls between 7 and 13 per cent. The highest figures were allowed in cases involving outstanding scientific contributions having a revolutionary effect on the war.

If the amount of refund decided upon by the board is not accepted by the company, the entire case can be sent to the Under Secretaries of the departments or heads of the agencies to be reviewed again. The decisions reached by the Under Secretaries are in all cases unilateral. If the contractor feels that the decision cannot be accepted, the Under Secretaries can stop all payments to him until the amount due has been reached and can order the prime contractor, if the company is a subcontractor, to withhold payment to the set amount.

A machine tool builder who refused to accept the stipulated refund because it was unduly high was threatened to be black-listed from all subcontracts by Under Secretary Patterson unless the company accepted the decision.

Where can the contractor go from here? Is the decision of one board acting as judge, jury and prosecutor or one man handing down a take-it-or-leave-it order to be accepted as final?

Every law passed by the Congress of the United States can theoretically be taken into the courts. When John Marshall decided for the first time to declare an Act of Congress unconstitutional the mechanism for testing laws in the courts was established.

The decision of the Under Secretaries can be appealed. The contractor can sue in the Court of Claims.

However, the freedom to sue if the contractor so desires is but a glittering generality. Only the academician can be pleased with its existence. In practice many companies could not exist while waiting for the protracted court procedures if all payments on war contracts were halted during that period. The question is not can the contractor appeal. It is can he afford to appeal. Also, the wording of the original act was so broad that it negated any legal action. Excessive profits were not defined so that any recaptured amount could be considered equitable.

Settlements Gain Momentum

The end of 1943 saw about 70 per cent of its cases completed by the price adjustment boards. Renegotiation started with the larger companies and is catching up with the smaller ones.

The most recent figures show that price adjustment operations have resulted in saving the government $5,300,000,000 — $2,500,000,000 in cash which procuring agencies have recovered or will recover for delivery to the Treasury Department and $2,800,000,000 in price reductions for future deliveries under existing contracts. Under Secretary Patterson estimated that over one billion of this would not have been returned through the excess profits tax.

Refunds are not the only direct result of renegotiation. Price adjustment boards are careful to point out that because of the information they have obtained procurement officers have been able to reduce the cost of contracts. In fact, both voluntary price reductions on the part of the contractor and more efficient procurement have contributed more than the refunds obtained.

These refunds are returned to the Treasury Department as miscellaneous receipts. Some of it may be credited to the company if it has outstanding contracts with the agency. The board, if it sees fit, may allow installment payment but final payment should be made not later than the fiscal year following the renegotiated period. In special hardship cases a six-month extension will be allowed with further extensions made if the board considers payment to hinder war production.

If the company disposed of what the board considers excessive profits by reinvesting it in equipment, paying salaries or dividends and therefore does not have the amount for refund, an RFC or V-loan can be arranged.

In cases where taxes have already been paid on the profits deemed excessive, the amount paid to the Internal Revenue Bureau is credited and the difference alone is refunded.

At no time do the boards make allowances for post-war reserves. Since the inauguration of the boards they have been attacked for this short-sighted policy. By now they answer the question by rote. The sum necessary for reconversion is conjectural. No one knows how long the war will last. Reconversion for some may be unnecessary. The 10 per cent carry-back and carry-over provision of the excess-profits tax can take care of reconversion costs. The law does not provide for the boards consideration of such reserves.

Because of extensive hearings conducted by the House Ways and Means and Naval Affairs Committee and the Senate Finance Committee as well as the experience gained by a year and

a half of renegotiation certain changes will apparently be made.

To reduce the number of cases to be reviewed the $100,000 limit will probably be raised to $500,000. The right to judicial appeal of a contractor who has had a unilateral agreement *will* be written into the law. The bill as it passed the House specified the Tax Court for this appeal. Indications at the time of writing are that the Senate will change this to the Court of Claims.

Proposed Changes

Another administrative change will be the creation of the War Contracts Price Adjustment Board. Some confusion as to personnel was caused by the omission in the House proposal of a War Production Board member. Membership would be limited, according to the House Bill, to the five price adjustment chairmen. The Senate Finance Committee, however, recommended the appointment of a WPB representative. Full power will rest in this new over-all board. Under the old law full power was given to the Secretaries of the Departments and the heads of the Maritime Commission, the Reconstruction Finance Committee and the War Shipping Administration which delegated power to the Under Secretaries and in turn to the respective price adjustment boards.

This new body will have the right to exempt from renegotiation standard commercial articles if in its opinion normal competitive conditions exist to affect the sale of these products. Were they not excluded, the government would discover great difficulty in getting this material when non-renegotiable business increased. The machine tool industry for fiscal years after June 30, 1943, will probably not be subject to renegotiation. Special consideration has been given here, it is said, because this industry is the first in and the first out of war production.

The definition of subcontracts has been rewritten to include only subcontracts for the article, work, services, building, structure, improvement or facility contracted for under the prime contract or for articles to be incorporated in the item contracted for under the prime contract.

Industry's judgment of renegotiation after 14 months' experience is not unanimous. But all industrialists agree wholeheartedly that legislative measures to prevent soaring war profits are imperative. How to limit these easily earned profits is still a moot question *but the opinion leans heavily toward excess-profits taxation.*

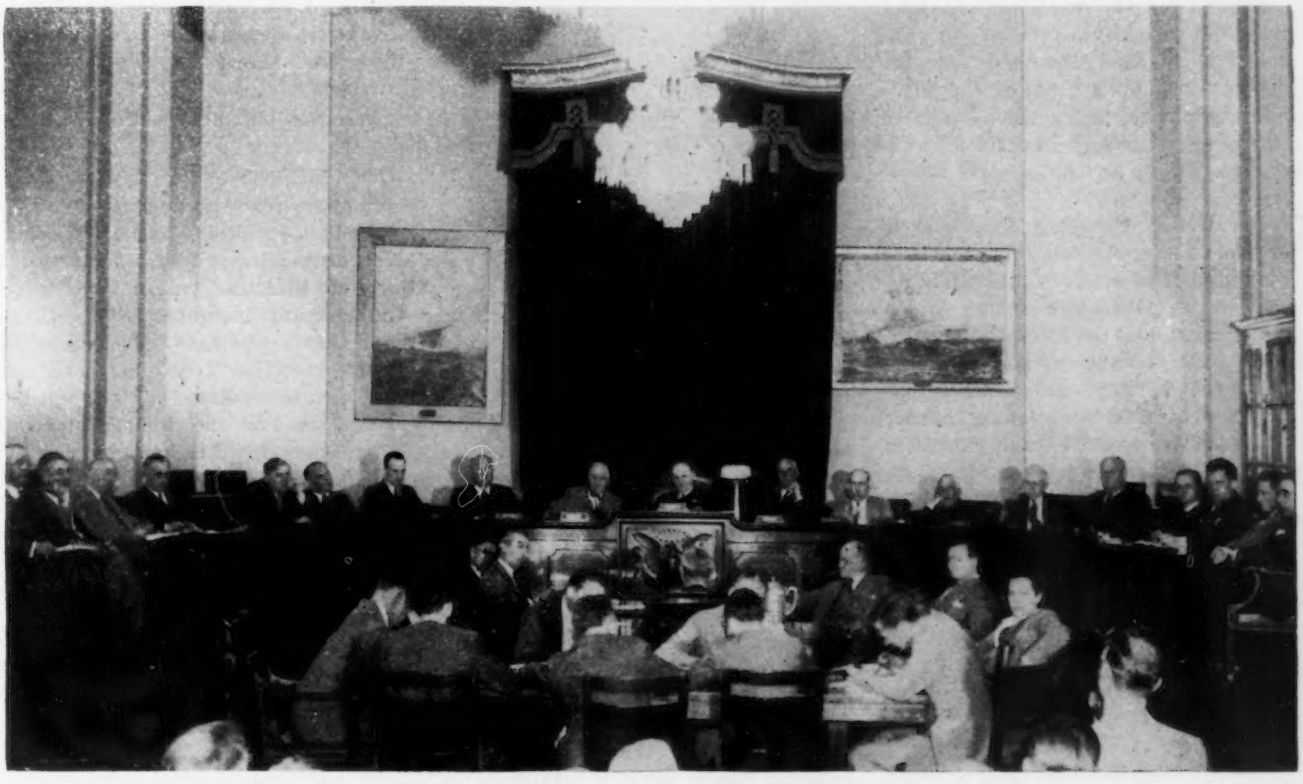
The very large, long established companies have either approved or remained neutral of the renegotiation procedure. Their peacetime profits and capital investment have been sufficiently substantial so that after review they have emerged with either no refund or one that made little inroad into their profits.

Many of these corporations recalling the bogey of the war profiteer directed at them after the last year voluntarily reduced prices to the government before the renegotiation act was passed.

General Motors, for example, returned approximately $295,000,000 on deliveries made up to March 31, 1943, and through price reductions applied $255,000,000 on subsequent deliveries. These figures do not include the sum returned after renegotiation hearings which amounted to about $48,000,000.

The Westinghouse Electric & Mfg. Co. refunded $53,000,000 at the request of the Navy Price Adjustment Board and voluntarily reduced its prices by $6,000,000.

As a result of the policy adopted by its board of directors the International Harvester Co. voluntarily refunded about $20,000,000 on three or four contracts. On some items, the orig-



● As part of the investigation into the progress of defense preparations, the House Naval Affairs Committee looked into renegotiation. In disagreement with the majority opinion were Representatives Mass, Cole, Hess, Wolfenden, Blackney and Grant. They recommended that recapture provisions be repealed on contracts made after Dec. 31, 1943.

o o o

inal price was then cut in about half.

But most companies do not face as bright a post-war world as do these and other large corporations. Because of the proportionately heavier burden, many small companies feel that renegotiation will prevent their existing alongside their larger competitors in the post-war era.

Companies opposing to renegotiation are beset with many problems.

The aircraft industry is bitter in its attitude toward renegotiation since they find themselves in a unique position. They are responsible for the designs and development of America's fighting planes, which when the need for aircraft became insatiable were turned over to the automotive industry.

Because of its high prewar margin of profit and more favorable tax base the automotive industry ultimately receives more government money for its planes than does the aircraft industry. In addition, because of its lean years prior to the war, renegotiation has hit the aircraft companies harder than the automotive manufacturers so that the aircraft industry is penalized twice for its efforts to design, develop and build new planes.

The case of Consolidated-Vultee has been much publicized. Its working capital reduced after the rigors of excess profits taxes and renegotiation to nine million dollars would just about meet the company's payroll for two weeks were all contracts suddenly terminated.

Another industrial group faced with distinctive problems is the machine tool builders. The profits made by that industry have been accumulated at the expense of the 10 to 20-year period following the war. Its domestic market and England and the Soviet Union through lend-lease activities will have sufficient capital equipment to last, according to the industry's estimates, at least 10 years for precision machinery and 20 years for less accurate requirements.

The cyclical nature of the machine tool industry has always made large reserves imperative for a company's survival. These reserves are not now allowed.

The industry has painted its future as a long serious, post-war depression. Estimates show that at the end of the year there were four billion dollars worth of machine tools of which 75 per cent were not over three years old. In contrast, at the end of 1929 there were $550,000,000 worth of machine tools 13 years old or less.

In recognition of its problems the price adjustment boards have supposedly allowed earnings to machine tool builders 25 per cent higher than those permitted to all others, but since the industry has practically sold itself out of business this favored treatment is still insufficient guarantee for its survival in the lean years to come.

Extending renegotiation to Defense Plant contracts compelled most of the industry to be subjected to renegotiation twice during the year. When at first equipment to DPC plants was exempt from renegotiation, the renegotiators pointed out that the profits made on these contracts would supplement the finances of the industry. Now that recapture of excessive profit from these contracts is ensuing the hardship has multiplied.

Small Companies Fear Ruin

The small companies have also raised their voices against renegotiation. The sums recaptured leaves them facing an uncertain future. Many will be unable to return to peacetime production. Here, the nation faces a serious economic problem. As a result of renegotiation, the country may emerge after the war with its production centralized in big business. The recognition of this possibility at the start of the war program led to setting up of the Smaller War Plants Corp. Renegotiation may erase any efforts to save the small company.

Various aspects of renegotiation have been attacked. Many have expressed themselves against the consideration of profits before taxation, pointing out that the only money the company has is what it retains after taxes. The boards have refuted this, saying that it would take years before profits after taxes would be precisely determined and would in many cases subsidize contractors having a high tax base. To allow a contractor the same profit after taxes during the war period that he accrued in prewar years would in fact nullify taxes. The Senate Finance Committee has suggested that excessive profits be determined after income and excess-profits taxes.

One of the chief complaints against renegotiation is that profits cannot be determined until after the refund has been announced. To remedy this, it has been suggested that contracts be renegotiated forwards rather than backwards. New contracts should be placed at prices based on previous cost experience.

Ignoring the need for postwar reserves is a major grievance against renegotiation. The boards have recognized its importance but say that they are powerless to allow its deduction since the tax laws do not provide for such a reserve. Relief exists, they say, in the two year carry-over and carry-back provision, special amortization, accelerated depreciation and the postwar refund of taxes. Without a ready reserve for quick conversion to peacetime production, however, many companies will be forced to inaugurate wholesale layoffs. Coupled with the returning army, the unemployment figures of this extended transition period will without doubt reach staggering proportions. Many foresee the return of the WPA and suggest that reserves at least be held in escrow by the contractor or the Treasury Department.

Postwar planning can be just an illusion if the funds for converting theory to practice do not exist.

Industry has also suggested the exemption from renegotiation of standard commercial products since prices have not increased from prewar levels and in many instances OPA ceilings have been established. The excessive profits resulting from increased volume can be absorbed by the excess-profits tax and the number of cases to be renegotiated thereby reduced.

This reduction in cases to be handled is looked forward to by many executives who have objected not to the recapture of profits but to the caliber of the district price adjustment sections.

Many company executives who were in agreement with the principles of renegotiation have become vociferous opponents after contact with members of the local boards. They have accused some of these district renegotiators and auditors of being ignorant, unintelligent and high-handed. Since they will have to face these men again in 1944, they have reserved these opinions to cloakroom conversations.

In spite of the refunds and price reductions publicized by the price adjustment boards, many feel that the gains cannot be offset by the losses. Much of what has been recaptured was through the excess-profits tax already in the coffers of the Treasury Department. The increased dividends to stockholders, are also subject to tax and the expense of renegotiation to the company will be deducted from taxes and renegotiation in 1944. The cost of administering renegotiation was in the neighborhood of five million dollars.

Some have even wondered whether the warnings of government officials of the slump in war production because of over optimism was not actually a result of renegotiation.

Contract Cancellations

Before any concrete plans for peacetime operation can be crystallized, in-

dustry will also have to be assured of quick and equitable settlements of terminated contracts.

After a year of talk, investigation and projected plans, no uniform policy has yet been formulated. Still the Army has terminated over eight million dollars in contracts while cutbacks on destroyer escort construction by the Navy totaled about one and a half million.

During the year the War Department issued three significant documents: The basic standard termination article; the termination accounting manual, and Procurement Regulation No. 15.

The termination article sets the legal basis for all termination settlements and was intended to encourage uniformity of procedure and prompt settlement. Under this article the government may at any time cancel a contract, either in whole or in part, by a written notice from the contracting officer to the contractor. Upon receipt the contractor must discontinue all work, cancel all existing orders and terminate all subcontracts chargeable to the contract.

The contracting officer may reduce the amount payable to the contractor by ordering the sale at an approved price of any work in progress, supplies, materials, fabricated parts, etc. Most important is the provision authorizing the negotiated settlement of uncompleted portions of the contract. Should negotiation fail an alternative is provided. A fixed formula would reimburse the contractor for all actual expenditures and costs as well as outstanding commitments incurred with respect to the uncompleted portion of the contract. The profit accruing from the uncompleted work is estimated by the contracting officer on the basis of prevailing labor and material costs and the percentage of completion.

Procurements Regulation No. 15 issued by the War Department on Aug. 14 is a guide to all contracting officers on policies, organization, responsibilities and procedures. Under this regulation proposed agreements over $5,000 are examined by settlement advisory sections. Payments either partial or in full over one million dollars must after review by the settlement advisory section be re-examined by the appropriate settlement review committee.

Expenses incurred because of failure to cease work on contract after receipt of termination notice and losses on other contracts are excluded as items of cost. Allowable costs include among other depreciation and obsolescence, development and tooling, research and experiment, engineering and institutional advertising.

• Under Secretary of the Navy James V. Forrestal testified in favor of renegotiation before every Congressional group studying contract review. When the new War Contracts Price Adjustment Board is established, his power to renegotiate will be stripped.

o o o

Procurement officers can exempt profits on terminated contracts from renegotiation.

Prime contractors examine the claims of their subcontractors in a manner similar to that of government auditors. The War Department, however, seems to prefer having their officers settle subcontractors' claims saying that they have effected speedier agreements than have the prime contractors.

Although having no overall policy, the heads of the various procurement agencies have declared themselves unconditionally in favor of speed in settling terminated contracts. They will sacrifice detailed auditing for that objective.

This stand has brought them in sharp conflict with Comptroller General Lindsay C. Warren. He insists that termination be removed from the sphere of the war contracting agencies, accusing them of "extreme generosity, collusion and fraud." Mr. Warren proposed that all claims be reviewed by the General Accounting Office. He would grant loans only in cases of financial need. The procurement agencies state that the purpose of these loans is to finance contractors in the period between contract cancellation and final settlement.

Allied with the War and Navy Department are industry, the WPB and the Maritime Commission. Detailed auditing especially where large investments were made in inventories and machinery would be a long, tedious process. Many companies would be ruined financially, being unable to pay their subcontractors and suppliers while waiting for a settlement. As cancellations became more frequent, this delay would become increasingly extended, making reconversion an impossibility.

The General Accounting Office may be worrying about the taxpayers' money. A more efficient safeguard for the taxpayer would undoubtedly be widespread employment when the war ends.

Industry in addition favors a cash advance prior to settlement. Seventy-five per cent has been the figure recommended. Under Secretary Patterson opposes this as no substitute for prompt final determination of the contractors' claims. But Donald M. Nelson favors such mandatory advance payments up to 75 per cent of the claim.

Industry's Recommendations

The United States Chamber of Commerce would like to see following settlement provisions:

(1) Subject to a 30-day preliminary review, a 75 per cent mandatory advance payment should be made to each war contractor on his certification, including subcontractors and suppliers.

(2) Withholding the advance if review calls for it—contractors would be given notice to post bond for the amount of the advance, submit certificates or other evidence that amount claimed is correct.

(3) Additional amount should be provided above the advance, guaranteed or loaned directly by the government at 4 per cent interest.

(4) Allowable costs and profits should be fixed as settlement guides.

(5) When advances exceed final settlements, advances should be treated as loans, repayable at 6 per cent interest, except that a prime contractor should not be financially responsible for advances made through him to his subcontractors.

(6) The contracting officer should not be personally liable for excessive advance payments.

(7) If Congress permits the General Accounting Office to review pay-

Labor

By DON JAMES
News and Markets Editor
and
DONALD C. MacDONALD
Associate Editor, THE IRON AGE

RECENT weeks have brought valuable and realistic glimpses showing what the United States is going to face in its inevitable readjustment away from high pressure war production.

Attempts to curtail unneeded production facilities have been fought by unionists who at the same time demanded higher wages, shorter hours and lush post-war guarantees. Industrialists have been forced to sit on the sidelines while deals were made between labor and government.

The high school kids, housewives, regular line workers and government bureaucrats intent on resisting downgrading or geographical transfers are only a part of the general problem, obviously. But their attitudes reflect a national mental condition more clearly than the other pieces of the difficult picture. The U. S. has a lot to unlearn before it gets back to a realistic basis. The days when the government pays the whole freight and pays well, out of taxes, are numbered.

Yet in the inevitable readjustment, machines can be junked or stored, materials gradually disposed of, and war plants dismantled, but the men cannot be left to starve. Executives thinking about post-war personnel in terms of the 1930's had best shift into another gear immediately. The coming personnel problem is the biggest hurdle ever faced, one that can make or break industries, companies and individual executives.

Somehow, higher production and sales than ever before must be achieved by management, and in view of industry's impressive war record, the odds favor success by private enterprise, providing it gets a fair break from the Administration. Sure, we are going to have ample men, materials, equipment, purchasing power and new products at the start. But we are going to have plenty of dissension, much of it created by national policies, plus a difficult international situation and scores of controversial domestic issues bearing directly upon the operations of industry.

Recognizing the magnitude of the task, industrial executives have attempted to perfect their plans as far as possible in recent months, and have been so eager for information that often they have incurred the displeasure of officials conducting the war. So obvious is the need for definite plans by every firm and individual that the secrecy and lack of cooperation encountered in high places at Washington cannot be justified. One step alone—the providing of full assistance for the making of tools, dies, jigs and fixtures for the inevitable day when they will be needed—would telescope future problems immensely.

Management is prepared to rebuild departments skeletonized by the war, to assist in the resumption by industries such as construction hard hit by the war, to keep many of the progressive practices which have heightened efficiency and morale, to work out with returning service men the problem of making use of their new knowledge and skills, and to take up the slack equitably wherever possible.

Glib talk and unrealistic thinking about post-war personnel problems must be outlawed. There has been far too much of it in recent months. Some has come from well meaning industrialists who fail to realize that they are putting themselves and the whole system of private enterprise "on the spot."

One example of a problem not completely thought through is that pertaining to the use of persons with physical defects. A large number of these persons are now at work under the high pressure demand for manpower, but the question of their permanent use is as far from solved as it was during the depression, when industry was being condemned for "heartlessly" refusing to hire persons of unsound health or those physically disabled. The fact remains now, as it did then, that employers are required to conform to a multiplicity of local, state and national laws, including workmen's compensation laws which were not written by industry. Drawn up years ago, these laws need a thorough going over today, with the idea of bringing them into line with present needs. Instead of placing the sole risk upon the employer, the interests of the employee and the state might well be broadened, thus helping provide a realistic answer to this one problem.

Management can be depended upon to do more than its share in the transition period. Management is beginning to realize that it faces a supreme test. Human nature being what it is, we can expect that the return to a realistic picture will only be achieved through difficulty in the United States.

Both labor and industry have achieved the commendable goal of weathering a passive revolution, instigated by war conditions, which approximated a social reform within the capitalistic system, without seriously impeding the nation's effort to outproduce the world in materiel.

Among the firsts recorded for labor and manpower during the year, one of the most important was the shrinkage

As the busiest and most prodigiously productive year the nation has ever known, 1943 was also a banner year in the spheres of labor and manpower. More "firsts" in favor of the legions that are labor and realms that are manpower were recorded than at any time during the nation's industrial history.

of unemployment to the lowest level in our industrial history. For the first time, America's labor force was actually short of industrial demand. This fact alone brought about numerous changes, destined to have a lasting effect upon both labor and industry.

Tracing the course of the manpower shortage back somewhat, the year 1939 recorded an available work force of about 54 million with at least 10 million unemployed or engaged by WPA, CCC and other public works projects. By December of 1942, immediately before U. S. entry into the war, the labor force still stood at about 53½ million but in addition nearly 6½ million men were in the armed forces and unemployment had dropped to a scant 1½ million. Employee rolls had jumped from about 44 to 52 million and the WPA and CCC were abandoned. At year end actual employment stood at above 54 million in all industries, a total of nearly 10 million in the armed forces and a pool of unemployed of just less than a million made up entirely of unemployables.

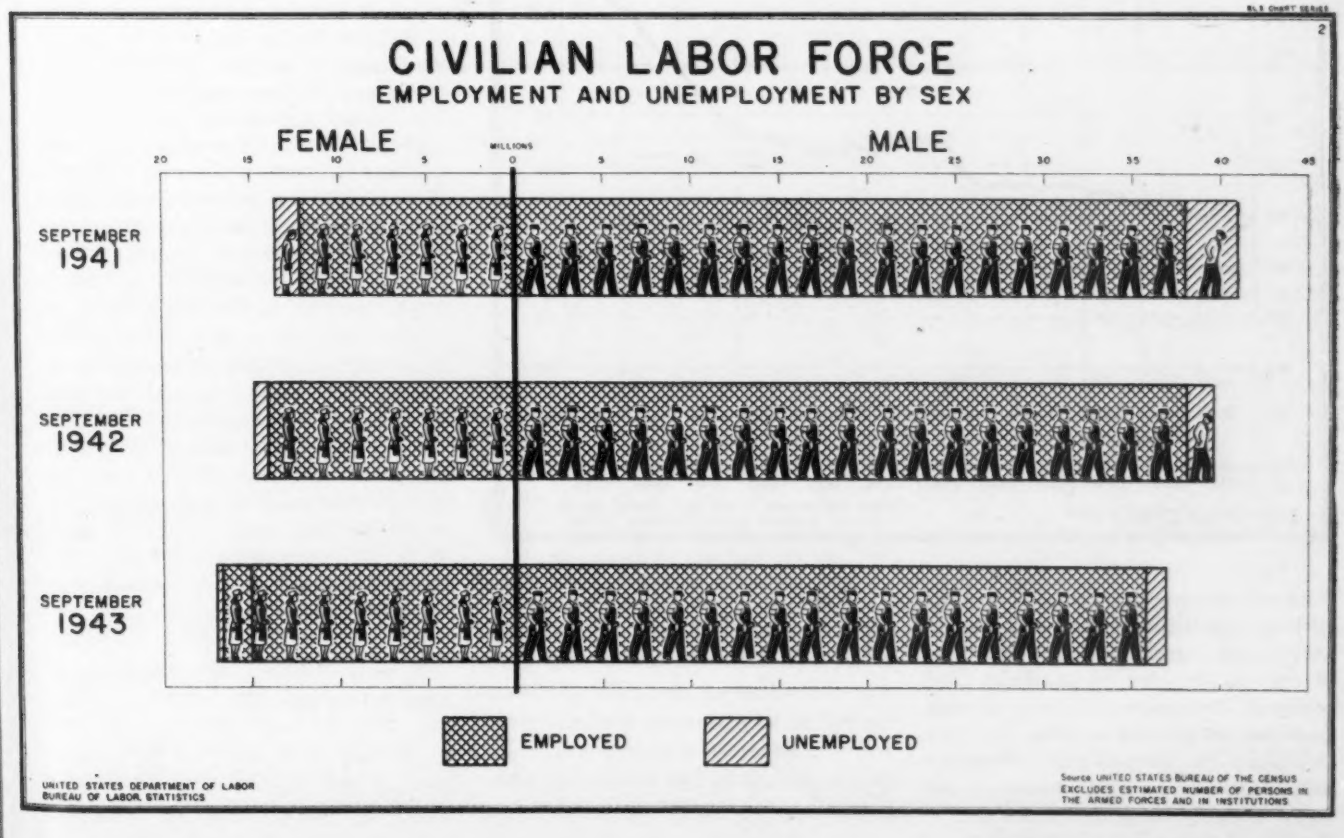
Even a casual summary of these figures reveals that at present 64 million total instead of 54 million people, accustomed to employment, are now involved. The difference between the 1939 employment total and the present one would seem to call for the absorption by industry in peacetime of about 20 million additional workers. This figure included 10 million workers now serving in the armed forces and 10 million growth in the labor force. As such, it is plain that unemployment constitutes one of the major post-war threats to our economy.

However, a number of alleviating factors enter into the depreciation of the 20 million estimate of the labor pool requiring employment. One of the most promising factors involves the return to interests other than work of countless thousands of women, school-age children, over-aged and retired persons, some physically handicapped and the white collar "commandos" who have held office or professional positions and worked a war plant swing shift.

Likewise small retail businesses which have suffered or closed due to war conditions will again utilize thousands now recorded on plant employment rolls and in service. Domestic workers and professional people will return to their previous occupations, thus taking some of the load off of industry.

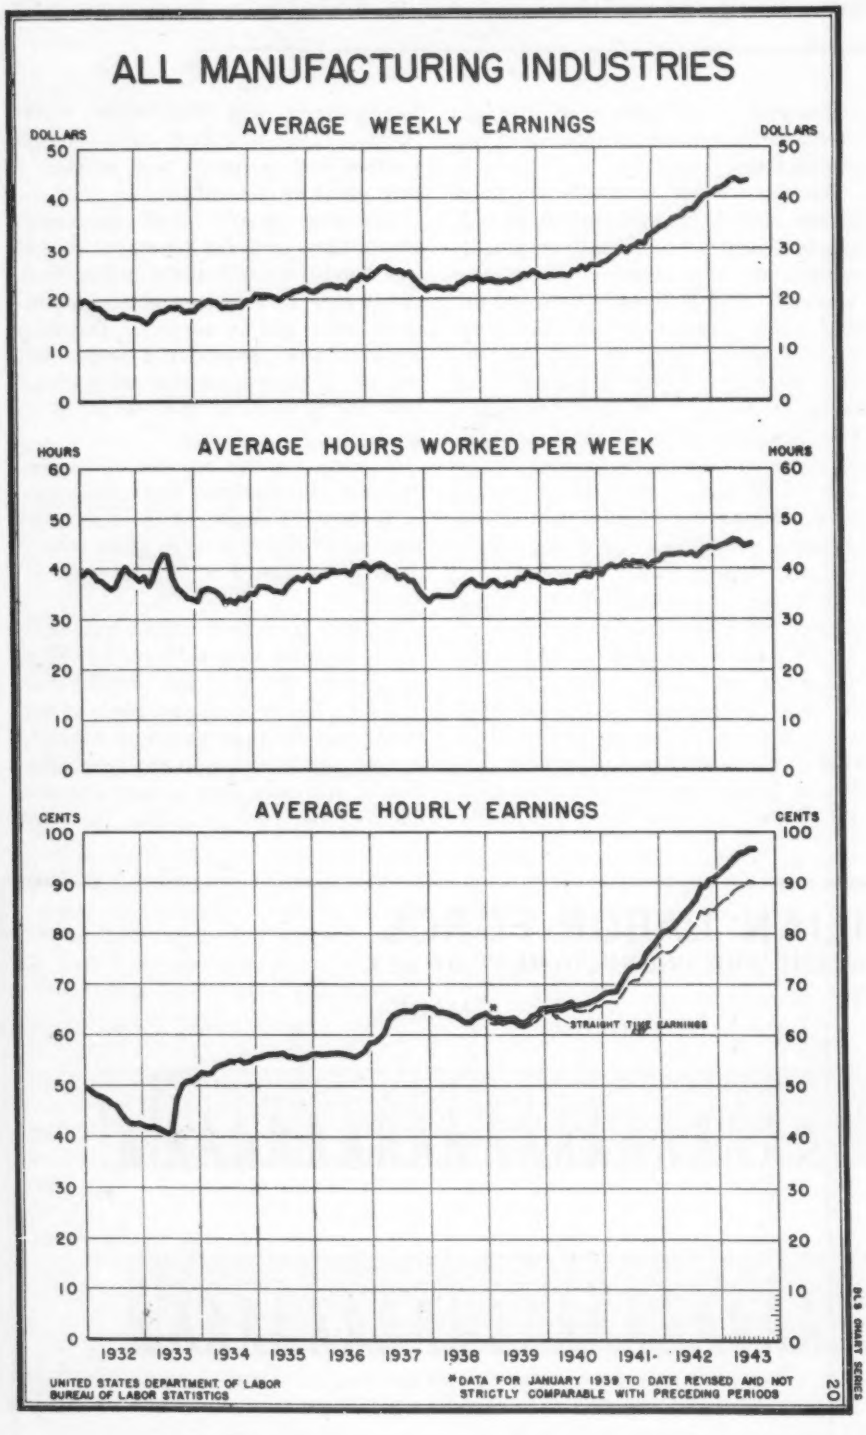
A much smaller number of persons will also be removed from the quota of those to be employed through debilitations of one type or another whether they be result of age or war injuries.

Greatly increased output by industry is another major factor looked to in solving the post-war employment problem. The immense amounts of material and finished products required by our participation in the rehabilitation of war-torn Europe and the production required to slake the vast



drought of civilian articles in this nation are expected to provide a high volume of employment for a considerable period after the war. In addition, the scope of post-war planning by both industry and the communities of America contemplates the utilization of huge quantities of construction materials and large blocks of manpower. Every major city in America and many of the minor ones have already gone on record with specific construction plans for the post-war period and many have earmarked funds to set aside to carry forth this endeavor.

Paul G. Hoffman, president of Studebaker Corp. and chairman of the Committee of Economic Development, estimated in an address given in late November of 1943 that production would be required to be increased approximately 35 per cent over normal peacetime levels in the post-war period. Mr. Hoffman and Philip Murray, president of the CIO, also concurred on an estimated post-war work force of about 55 million and set nine to ten million as the number of additional persons requiring employment as compared with the nation's 1939 levels.



Another movement anticipated in the post-war period will be further activities on the part of labor unions to institute a spread-the-work policy through shortened hours. Drives in this direction several years ago resulted in the Fair Labor Standards Act which established the 40-hr. week in industry. Throughout 1943 the average work week in most industries struck a minimum of 44 hr.; many war industries adopted a 48-hr. week and others worked as long as 60 to 70 hr. per week. The machine tool industry, for instance, averaged 55 hr. per week. Competent observers are predicting a drop to as low as 35 to 38 hr. per week as a measure to spread work in the post-war era.

The employment and wage trends of the steel industry during 1943 parallel the experiences of many industries. Due to manpower shortages and the Selective Service calls, total employment dropped, man-hours increased and total wages climbed steeply under the impetus of overtime payment for long hours and long weeks. In January of 1943, steel employment stood at 553,000 and thereafter registered a steady decline to a low for the year of 529,787 in October, the last month reported, according to American Iron and Steel Institute figures.

While employment declined during this period, production rose to an all-time high in the history of the industry and total man-hours rose from 97,582,686 hr. in January to an all-time high of 104,569,788 hr. in October, many of these representing overtime hours demanding time and one half and double time pay rates. The average work week also rose from 39.8 hr. to 44.6 hr. Reflecting the added costs of overtime resulting from longer hours the average earnings in the industry rose from 110.7c. per hr. to 115.8c. per hr. in October.

The efficiency of the industry and improved manpower utilization is indicated by comparison with the prewar, high employment period. In August of 1941, before America's entry into the war, Lend-Lease production had swollen steel employment to an all-time high of 582,359 men. With this tremendous roll call only 95,899,974 manhours per month were being utilized and the average work week was only 37.2 hr.

A truly revolutionary change occurring during the year, which will have a prolonged social effect, has been the about-face of industry in its attitude toward the employment of women. Their acceptance was, of course, a

forced issue resulting from the manpower shortage. However, women's response to employment has been so satisfactory in many fields that a permanent place for women seems to have been created in many positions not heretofore open to the sex.

The Women's Advisory Committee of the War Manpower Commission recognizes that some women will leave their jobs of their own accord at the close of hostilities but adds that "any easy assumption that a great number of women will return to their homes is to be seriously questioned." The committee states that almost 14,000,000 working women are not newcomers to the labor force and that the number of women who want and need work has increased enormously during the war. The committee estimates that there will be a much higher proportion of unmarried women and that many of them will require employment to maintain their present economic status. Likewise many more women will become breadwinners through loss of husbands in the war.

What is probably one of the most drastic and lasting technical advances of the year, one which may permanently affect the entire policy of industrial engineering, has been the direct result of the employment of women and unskilled workers. This is the new technique of breaking-down involved and difficult manufacturing, fabricating and assembly operations which formerly required a highly skilled person of long experience, into a number of relatively simple component operations that could be taught to a number of untrained workers in a period of a few weeks. In this way thousands of skilled jobs and trades were successfully invaded by women and the places they have made for themselves appear relatively safe unless unionism forces a return to the tradesman's principle.

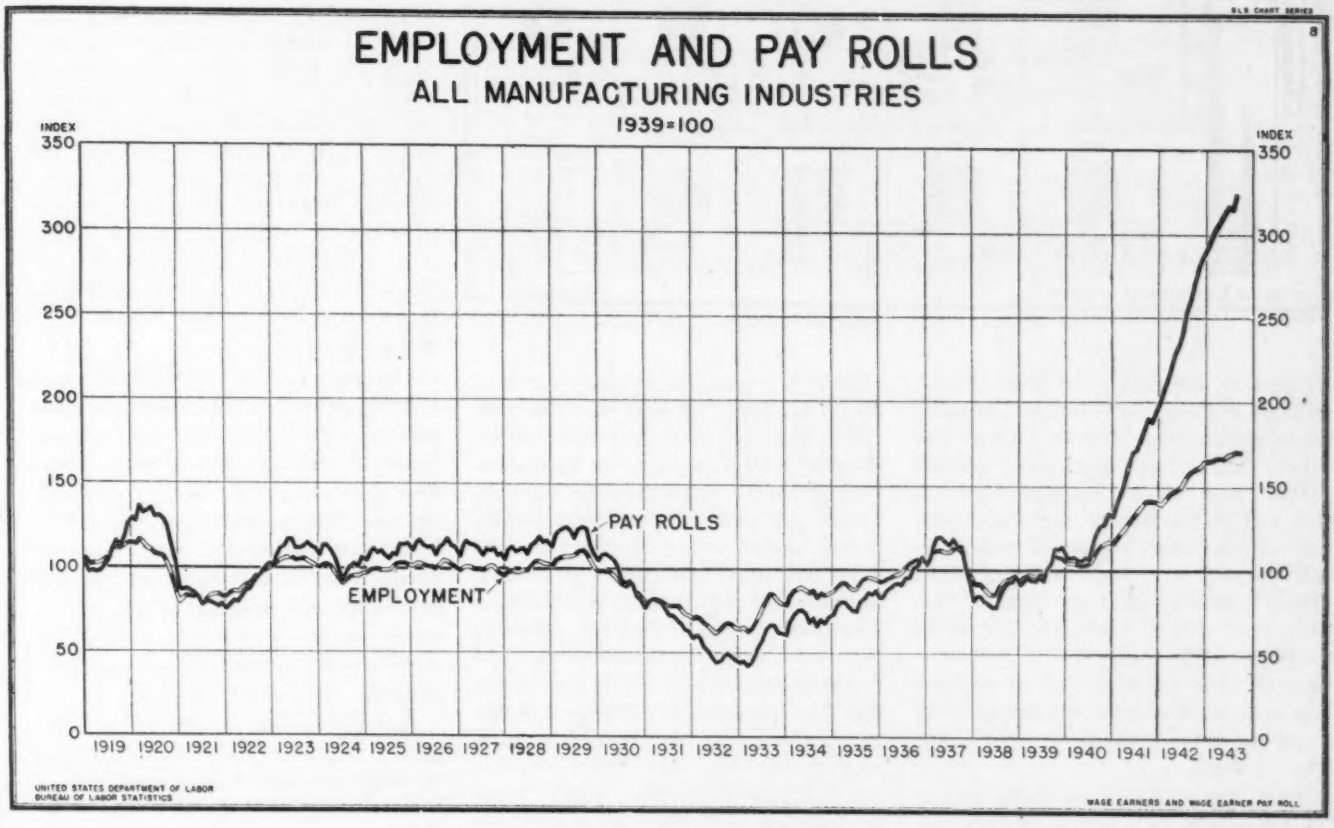
Another first for the year was the national recognition of the importance of labor utilization. With the exception of Henry Ford, followed by the other automotive manufacturers and mass producers, complete utilization of man's time and capabilities was previously given a minimum of thought by most industries. When labor shortages set in, vast programs partly sponsored by experts of the War Manpower Commission set out to teach industry how to achieve best results with fewest men. Many plants analyzed were producing at rates as low as from 10 to 30 per cent of actual capacity. Revised floor layouts, material handling, working hours, job analyses and other means were used to raise productivity per man. While reflecting an improvement, a great many war plants have been reported by observers to be operating at only about 60 per cent efficiency.

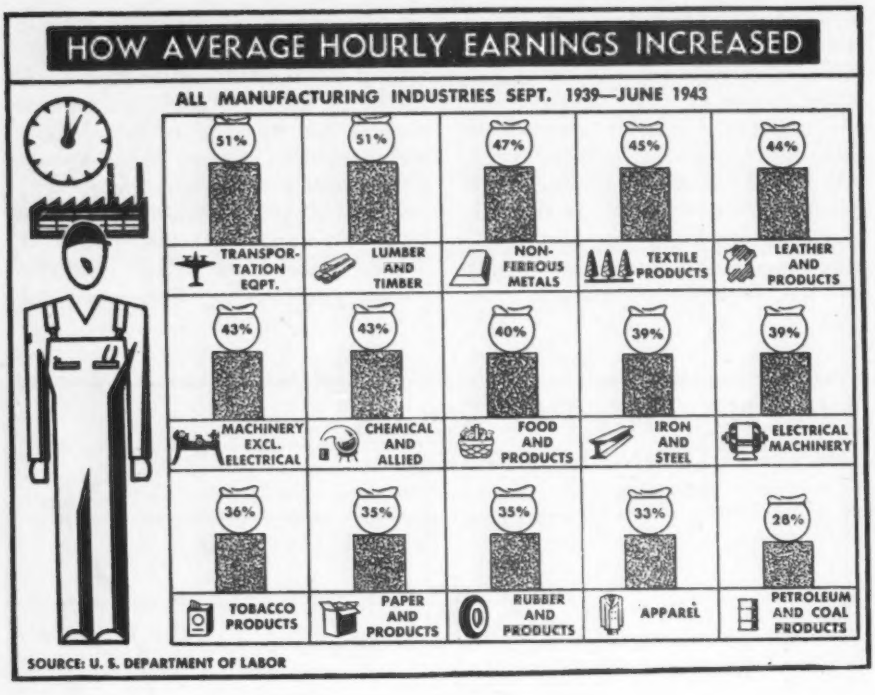
1943 did not witness the first regulation of labor through government control but was the period of most stringent labor control in the history of unionism. Previous years had brought about the passage of many labor laws and the establishment of several labor negotiation agencies within government. These included laws such as the Fair Labor Standards Act and the National Labor Relations Act and agencies such as the President's Fair Employment Practice Committee and the National Labor Relation Board which is now being eclipsed by the National War Labor Board; also the War Manpower Commission itself.

The year was notable for its lack of effective labor control and relative success of its manpower control.

Labor, which in this usage means unionism and collective bargaining power, was decidedly unruly and troublesome. Despite no-strike pledges on the part of William Green for the AFL and Philip Murray for the CIO in addition to minor and perfunctory pledges by other groups, strikes were rampant during the year and as in the case of the four major coal strikes, seriously endangered the war effort.

Most strikes throughout the year, tying up war production in steel mills,





shipyards, aircraft and rubber plants, transit systems, stevedoring and automotive-munitions plants were not union authorized and were termed "flash" and "wildcat" strikes. Irritating and obstructive as they were, little actual production compared with overall output was lost through them. This, however, was not true of the four coal strikes which threatened to paralyze all industry and transportation on each occasion and so reduced the coal stockpiles of the nation that reserves cannot again be rebuilt for the duration.

Steel loss alone during these strikes is estimated by THE IRON AGE to amount to at least 350,000 tons . . . enough to build 10 huge battleships. Again despite the calamitous appearance of the strike record of the nation, statistics show that the lost manhours involved amounted to only a few hundredths of one per cent of total productive hours worked. These figures, however small, overlook the fact that the lost hours concentrated closely within those industries where time and production could least be spared.

The underlying causes of the year's strikes appear to have centered around a demand for higher wages to meet rising living costs and the furtherance of strictly mercenary union aims having to do with increasing membership or gaining individual advantages within certain plants and industries.

At year end, the nation was confronted with a labor picture which places certain power of John L. Lewis, through his 600,000 strategic coal miners, above those of the President, showed the railroad workers mollified by an 8c. raise but with a strike vote ready to use, a concerted drive on by 900,000 CIO members to break the "Little Steel" wage formula and the forces of a number of pressure groups being applied to banish subsidies, the Administration's only hope of thwarting inflation and thereby maintaining a moderate wage level. That the wage and salary dam was breaking was perfectly evidenced late in the year when the WLB granted the miners a wage increase through the subterfuge of a lengthened work day with overtime and a shortened lunch period. Thus an increase amounting to more than permitted by the "Little Steel" formula, so-called yardstick of the WLB, was rammed through to send recalcitrant miners back to the pits and the doors were opened for every other union in the nation to seek like treatment. 1943 ended with inflation a definite possibility.

Incentive Movement Still Alive

An age old dragon of the unions reared its ugly head with renewed vigor last year—incentive pay. Pushed aggressively by the Navy and later reinforced by other procurement agencies and the production experts of the WPB and WMC, incentive pay plans gained some impetus during the year. Individual production increases were reported throughout the country resulting from incentive pay methods but union obstructionism worked to offset general acceptance. The old union plaint of jacked-up production quotas arbitrarily raised to offset wage gains of incentive piece work plans proved too often true. The effects of incentive piece work plans for the year were considered small. Likewise, continuance of the drive after the war is believed unlikely. The movement, however, is still not dead and at year end was the subject of intensive thought on the part of the WPB Management Consultant Division.

Unionism also climaxed in 1943 a series of advances under the kindly Roosevelt Administration which served to place it among the leading powers of the nation. Between 1933 and 1943 union membership rose from about three million to more than 12 million with the CIO and AFL claiming over five million each, the United Mine Workers about 600,000 and the balance represented by independent unions. 1943 saw the conclusive end of so-called "company" unions. Collective bargaining, the checkoff and maintenance of membership became terms that automatically went with being an employer.

The year also saw the beginning of a union drive to corner political power. The CIO openly distributed pamphlets describing in one easy lesson how members could become ward heelers and local political bosses in the hope that eventually some Congressional talent would be developed and thus start the political power of the union in the Legislative Branch of government as well as at the polls through "instructed" voting.

Another lasting institution, started during the war period but climaxing in 1943, was the Labor-Management Shop Committee. These committees, over 3500 of which have been formed in war plants and representing over 6,000,000 workers throughout the nation, now are a decisive factor in how production and personnel management is conducted and due to their success in sharing both the responsibilities and the profits of efficient production methods, are expected to become permanent adjuncts of manufacturing.

Labor, more commonly termed manpower, took a leading place last year as one of the nation's most strategic and scarcest commodities. Like unionism, manpower was troublesome and required more government control than at any time in the history of industry. Taking its place among the year's firsts, 1943 was the first year that manpower was ever recognized as the equivalent of a raw material which must be produced, controlled and distributed. Common labor proved to be one of the scarcest varieties.

An outstanding event of the year

from a manpower standpoint was the emergence of the controlled referral hiring plan, a plan originated by the New York regional office of the War Manpower Commission under the guidance of Ann Rosenberg and first instituted in the Buffalo-Niagara (N. Y.) area. Through the terms of this plan manpower was forced to channel through the United States Employment Office where individuals were referred to essential jobs in companies having labor priority due to the nature and urgency of their war contracts.

Out of this master plan grew localized plans known as area stabilization plans aimed at controlling the flow and utilization of manpower in specific areas according to the local needs. Most prominent example of such control was the plan instituted on the West Coast governing the vast numbers of aircraft and shipyard workers there. The WMC by means of classifying war production centers into areas of critical labor shortage and other less stringent classifications was enabled to apply corrective "area plans" exactly suited to the needs of the area.

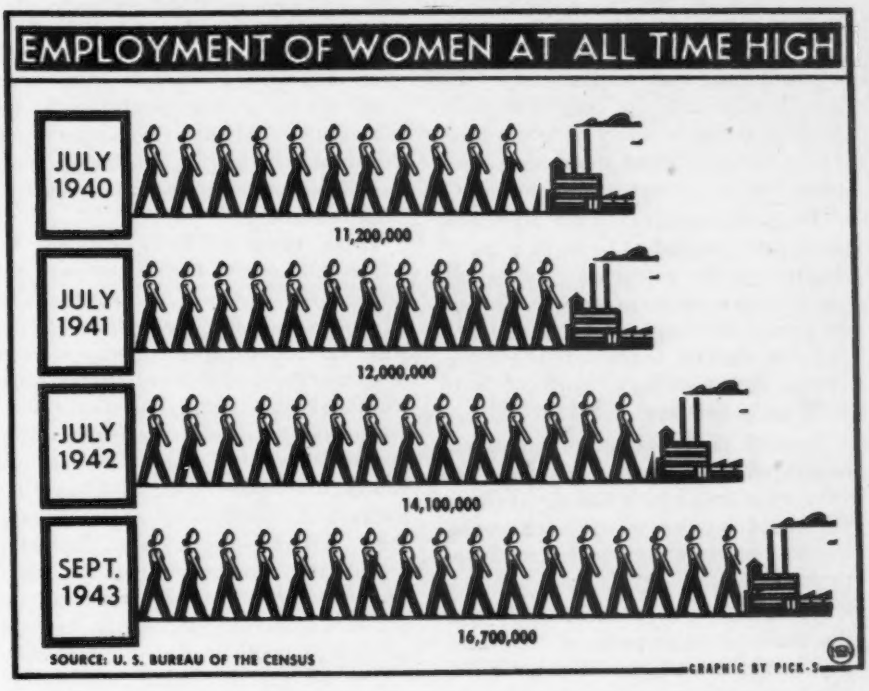
It is notable that while a steady flow of manpower controls and directives were issued as each new manpower crisis appeared, none of the plans or orders was actually carried through to exhaustion and no one or several plans or directives entirely served the overall purpose.

It can be safely said that 1943 was a period of "muddling through" so far as manpower controls were concerned but also that despite these policies of muddling rather than clarity, the necessity for a National Service Act was avoided and sufficient results were attained. At year end, the fears of a National Service Act were completely banished but the problem of manpower had not been solved and threatened to become more serious.

Freezing of Workers

Other "firsts" in the manpower kaleidoscope for the year include the first government controls over the free movement of labor, termed migration by the government. First freezing of essential workers in their jobs came in with the year. First placements of government business according to the manpower potentials of an area occurred within the year. For the first time the use of a non-deferrable list to drive men into essential employment in lieu of the armed services was used.

Also for the first time wages and salaries, presumably in the name of economic stabilization, were frozen. By Presidential order all salaries were limited to $25,000 net after taxes, raises without special consent of the WLB were denied salaried workers making over $5 000 per year and wages with few exceptions were ordered held at a given level except through collective bargaining and WLB approval.



Another first, of lesser importance but promising to grow in importance after the war, was the government sponsorship of worker training programs throughout the nation. Training-Within-Plant programs conducted in plants and through the facilities of the National Youth Administration prepared thousands of otherwise "green" help for useful employment. The aspects of a broadened program of this nature after the war for the rehabilitation of returning soldiers holds great promise in the future.

The activities of the United States Employment Office in the channeling of labor to essential positions recorded an all-time high of 909,000 replacements for the month of September, the last month reported. This high in placements for the year brought the nine months' total placements to 6,980,000, an increase of 39 per cent over the same period in 1942.

Despite this increase the usefulness of the USES appeared to be dwindling toward the year end as new applications for work were falling rapidly. September applications fell to 754,000, a drop of 16 per cent under the previous month and was the record low for the year.

"SHUCKS, SI, IT WAS SIMPLE SOLVING MY MANPOWER SHORTAGE. JUST CROSSED MY CORN WITH MEXICAN JUMPING BEAN AND POPCORN."

With a manpower shortage still definitely evident and acute at the end of the year the trend toward specialized help was emphasized by the drop in placements of colored workers. Women workers, many of whom train easily for specialized work, were being placed at an unprecedented rate.

Long range planning for additional manpower seemed to be waning as recruitments for refresher courses and pre-employment training was in a rapid period of decline. In September, reports showed a low of 13,000 recruits for training compared with 58,000 for January of 1943.

Two of the greatest problems encountered with manpower during the year were ones which had always been presented but never of much consequence before, absenteeism and labor turnover.

Absenteeism on a large scale was the natural outgrowth of displaced population and the use of persons unfamiliar with factory working conditions. Women, it was learned, were the greatest offenders mainly due to the complications of attempting to engage in household operation and at the same time hold a war plant job. The plant job suffered when personal obligations became too pressing. Other contributing factors effecting both men and women workers were overlong hours, exceptionally high incomes, new living environment which required acclimation, sickness, overconfidence in victory and a host of other causes.

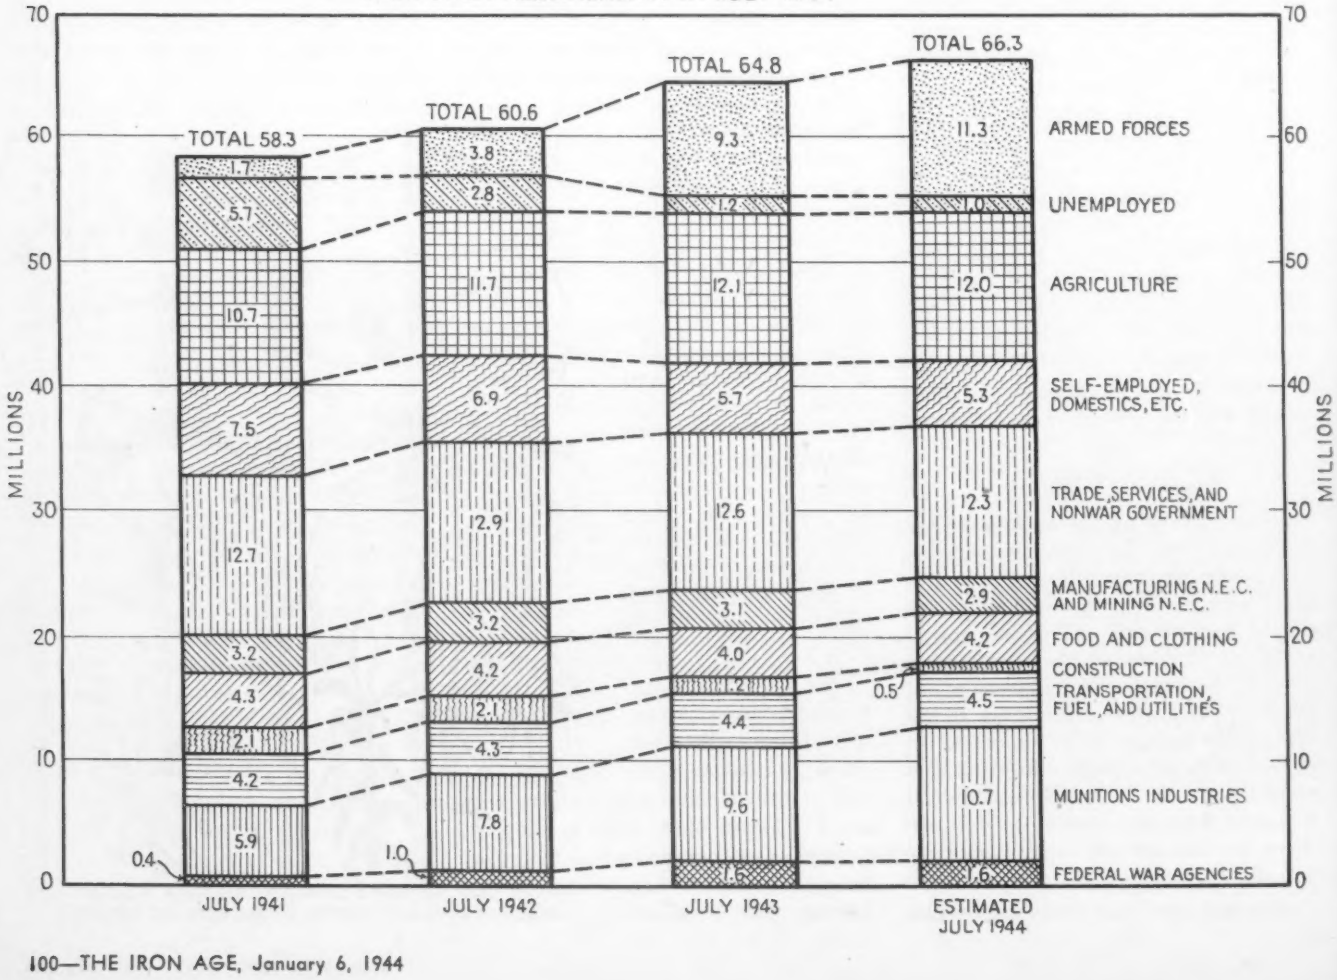
Labor turnover, likewise, grew by leaps and bounds during the year despite WMC efforts to control the flow of manpower and freeze jobs. This also was found highest among women workers. Most prominent causes were the temptations of higher wages elsewhere, lighter or more desirable work, lack of working incentive due to faulty management or contract cutbacks and hundreds of personal reasons. Effects were so great that hiring in many plants required the addition of from 17 to 35 workers per hundred employed, per month, to keep abreast of manpower requirements.

One of the by-product effects of both absenteeism and high turnover rates was the hoarding of labor. A reserve pool of workers kept on the payrolls at unimportant or make-work jobs served to provide a cushion against the inroads of both scourges. Near the year end a WMC practice of setting maximum employment totals for individual companies was beginning to clear excess labor pools and enlarge the labor supply slightly.

A summary of the manpower supply situation at the close of the year reflected little hope that an easing market was in sight. The Selective Service quota for January, 1944, had already been set at 300,000, about double the December quota, with many of these expected to come from industrial deferment cancellations and from among fathers heretofore considered relatively safe by their employers. Despite large cutbacks in numerous armament and munitions contracts the WMC estimated that immediate demand for workers would equal 500,000 while the released workers from closing contracts would approximate 150,000. WMC also listed 69 acute labor shortage areas in the nation in December and 124 others in the labor stringency classification. At this time the armed forces were said to be discharging about 70,000 men per month back into civilian life . . . mostly from hospital beds.

To summarize what may develop in the post-war period as regards labor

CHANGES IN THE SIZE AND DEPLOYMENT OF THE LABOR FORCE FROM JULY 1941 TO JULY 1943 AND ESTIMATED MANPOWER REQUIREMENTS IN JULY 1944



and manpower, consider the following:

• The nation's average work-week will decline to a maximum of 35 to 38 hr. or less.

• Discontent among workers will be prevalent due to deflated take-home pay and union agitation.

• The Smith-Connally Bill and the War Labor Board will likely be eliminated. However, substitute legislation and a new labor dispute board are considered a necessity.

• Inter-union jurisdictional disputes will grow in frequency and intensity when workers are again allowed to migrate from industries and localities thus creating fluxing union memberships.

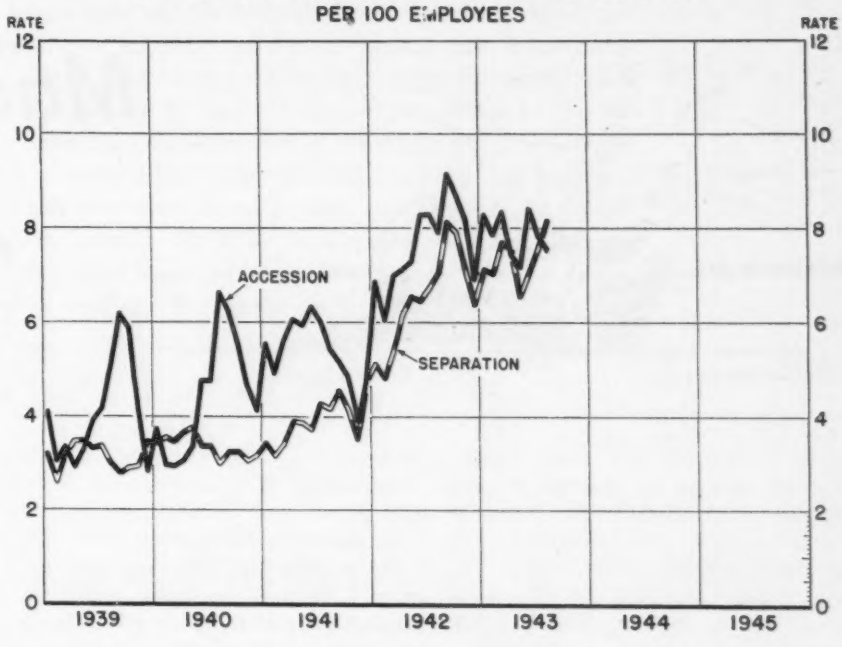
• Labor is expected to demand guaranteed minimum weekly and annual wages based on flexible wage scales sponsored by the cost of living index.

• The greatest union membership drive in the history of industry, palling even the wartime drive, will follow the war. This is expected to be successful as all workers will seek the security of union wage and bargaining advantages in the face of uncertain business conditions.

• Dismissal pay is almost a certain demand of the unions when post-war contract termination layoffs occur.

• Shortened working hours will not aid manufacturing overhead much as a greater take-home pay through increased wages will be sought by the unions.

SEPARATION AND ACCESSION RATES IN MANUFACTURING INDUSTRIES



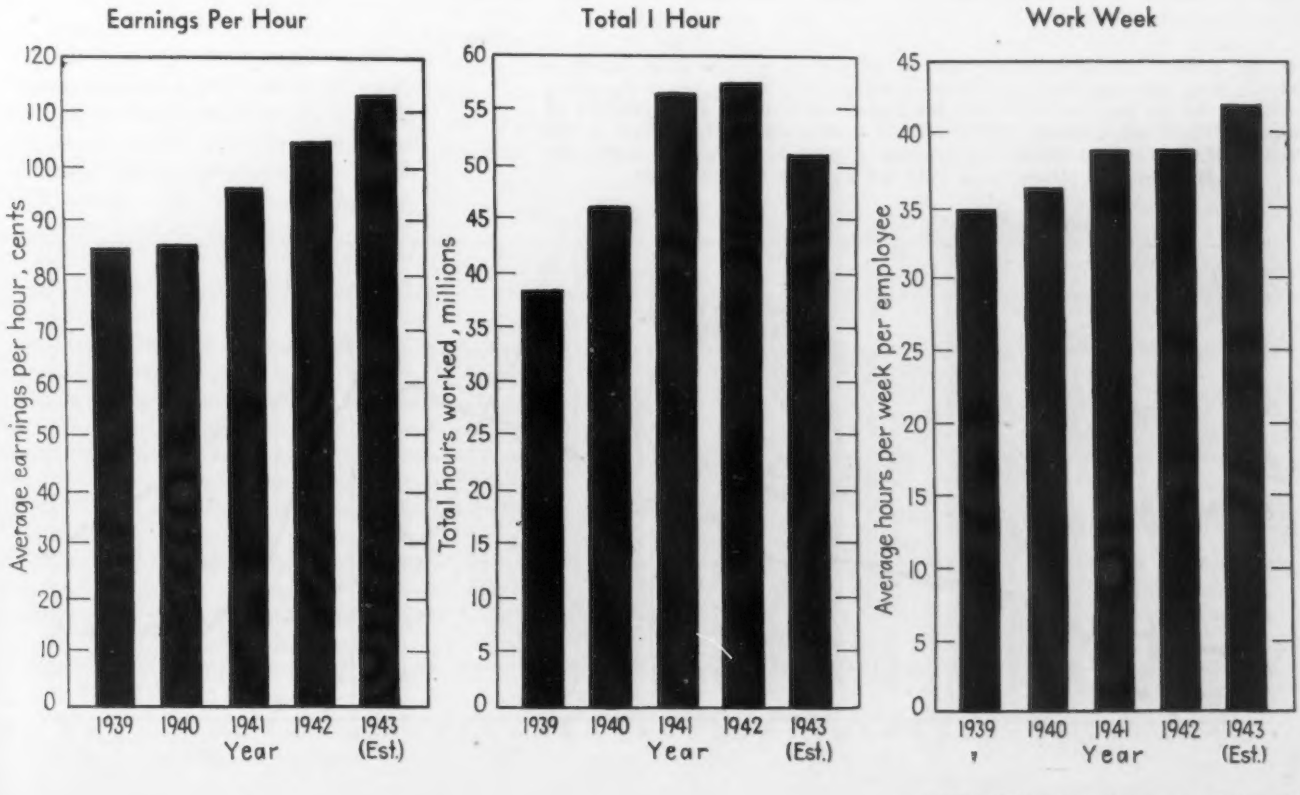
• Incentive pay plans, distrusted by the unions, will fade out as union make-work rules are reinstated to spread the work.

• Labor-Management Committees, labor's first chance at controlling production methods and having a working bond with management, will prosper with union sponsorship after the war.

• Unions, some of which are already teaching politics to ambitious members, can be expected to enter politics much more thoroughly through union controlled offices. Congressional timber is an aim now.

• Government training programs even though faltering at year's end will be strengthened by the demand for rehabilitation of veterans.

The courtesies and assistance of the Twentieth Century Fund, the Research Institute of America, War Manpower Commission, Office of War Information and U. S. Department of Labor, Bureau of Labor Statistics are gratefully acknowledged.



Machine Tools

o o o

By MILTON D. THALBERG

Advertising Manager, Cosa Corp., New York

o o o

ABOUT six months ago I was privileged to enter the machine tool industry in the capacity of advertising manager of a company importing and exporting machinery as well as operating a manufacturing gear shop. All my contacts with this industry prior to my new connection had been indirect since I have always dealt with merchandise or commodities which ultimately find their way into the hands of the consumer.

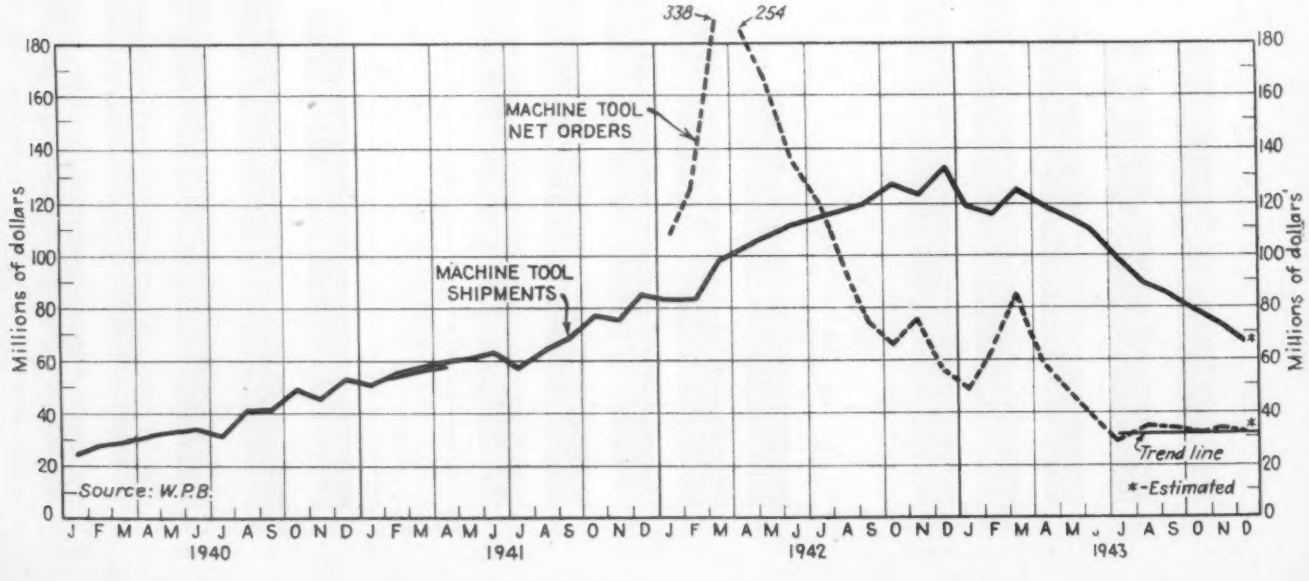
Upon embarking upon my new venture, I resolved to build from the ground up and to store up as much knowledge of the machine tool industry as possible since I was now dealing in a basic industry that can be considered the daddy of them all. In order to gain this education I began reading all types of manufacturers' literature as well as trade papers and text books, and being of a roving disposition, I was not satisfied with "book learning" alone, so I went and talked with people. Soon I found myself deeply concerned with the wave of pessimism that was sweeping the entire machine tool industry.

It has always been my opinion that sales representatives in any industry have their finger on the pulse of all activity and I therefore made it my business to contact and discuss the situation with sales representatives of various organizations in the machine tool field. Much to my distress I found that these men were anything but optimistic about the postwar future of the machine tool industry. In most cases their arguments were sound and one could hardly blame them for their attitude. After devoting more time and thought to the entire subject, I decided to make a complete survey of the situation which would influence our own plans for the immediate future as well as the postwar era.

A Survey Made

Without any reservation, I can say that this survey was a complete revelation. I found that there is a clear line of demarkation between the thinking of the majority of the machine

● Net orders for machine tools reached an alltime high of $338,348,000 in March, 1942, and thereafter have declined, except for a short climb in the spring of 1943. For the past several months the order level seems to have stabilized at around $30,000,000 a month or $360,000,000 a year, about 27 per cent of the $1,325,000,000 worth of machine tools shipped in 1942, but almost double the 1929 volume. Shipments in 1943 will be close to $1.2 billion.



. . . With billions of dollars worth of brand new machine tools installed in war industries in the last three years, the machinery builders as a group face what appears to be a glutted market and a gloomy future. The author of this article—a neophyte in the industry with a merchandising background in a totally unrelated field —takes a much more optimistic view. He belives that the builders of machines that make machines have a vital role to play in reconstructing the postwar world, but that it is going to take a sound merchandising policy and a less discouraged attitude to put a sound sales and service program across.

tool builders and the manufacturers who are making products for the war effort now but who later will produce consumer goods. I believe that in many cases the pessimistic attitude of the machine tool builders is well founded but in many other instances the old saying holds true: "They are sitting so close to the forest that they can't see the trees."

After talking with many of the machine tool builders, their sales representatives and their agents, I found that the majority of them gave me the same arguments:

1—Sure, the machine tool industry is the basic industry but, after all, what changes can be made to improve the standard general purpose machines we now have?

2—What is going to happen to the billions of dollars' worth of equipment that was recently purchased by various plants and is now being used for war work?

3—Is there a real *need* for any improvement, assuming it could be made, in the machines that have just recently been sold?

Of course, these questions are the condensed version of many conversations but all of these conversations practically boil themselves down to these three stock questions.

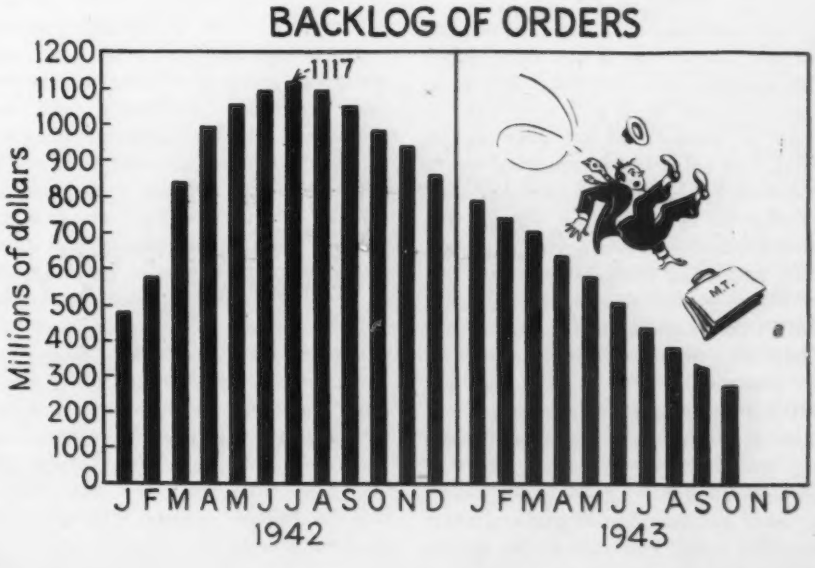
Unfortunately this feeling of pessimism has spread over many organizations and sometimes the sales representatives feel themselves in a state of almost complete helplessness. Some salesmen are in a complete state of funk. One man told me he had sat in his car for 10 min. outside a big eastern plant debating with himself whether he should make the call he had planned or whether he would skip it until the next month. After all, he argued, this company had 50 or more of the latest model radial drills he sold. It would be a farce to talk about buying any additional equipment. Or would it? Another salesman found it difficult to get himself in a frame of mind where he could even leave his office. He was licked before he started.

What Another Industry Does

In comparison with other industries with which I have had direct contact, this state of affairs was really shocking. I could recite several instances where manufacturers have sold their sales organization on one fundamental principle and that is the principle of service. One example will suffice.

A clothing manufacturer of my acquaintance who has made a phenomenal success in the quality field not only does a complete educational job with his sales representatives but will go to almost any extreme regarding service to obtain a retail account that he would like to have on the books. He will equip his salesmen with a complete breakdown and analysis concerning the prospective customer and when the salesman makes the call he will sometimes know as much about the retailer's business as the retailer does himself. The salesman's job is not only to sell the retailer the line of merchandise that he represents but also is to show the retailer how he can obtain better results, render a better service and build more good will by handling his particular line of merchandise. This clothing manufacturer will sometimes spend three months making this analysis and when this presentation is made it is usually very effective since he shows his prospective client how vitally interested he is in his welfare as well as his own.

The above example may seem farfetched as applied to the machine tool industry but it has always been my contention that the fundamentals of good business and selling are practically the same in every field of activity. Why can't machine tools be sold on the basis of service to the customer? You may say they *are* and this is probably true in some instances. On the other hand, recently I have been out with machine tool salesmen making calls on plants about whose product they had only a hazy



o o o

● In the past few boom years, selling largely degenerated into order taking. In the postwar competitive market, some "peddlers" will have to be taught the art of selling all over again.

o o o

notion. How could they be of service unless they knew what the customer's manufacturing problems were? I have even bought machinery from manufacturers who didn't exhibit the slightest interest as to what use I might be putting their product. Perhaps I should have ordered an entirely different model better suited to my purpose.

Upon looking at the charts of the machine tool industry, I find that they went from one extreme to the other over short periods of time. Of course all of these highs and lows can easily be explained but for the past four years the machine tool salesman has found himself in a position that he was never in before. The market was a seller's market and orders were usually far in excess of delivery. Salesmen suddenly found it very easy to sell machines and it was merely a question of "Can you deliver it, and when?"

Future in Doubt

Upon looking into the future one can easily understand why these salesmen should feel anything but optimistic because they will now have to begin to really sell all over again. What the sales representative needs now more than ever before is the feeling that he is getting or will get the wholehearted cooperation of management and that management will develop equipment and machines that will fill the place in our postwar world.

Let us look at the buying end of the picture. When I visited plants that are now manufacturing war material I found a feeling of optimism that was indeed wonderful. Most of these manufacturers are well known for their consumer products and their foresight and enthusiasm is something to be admired and praised. When I asked them about their plans for the postwar period, their eyes would shine and they all told me that their new products would be so far superior to what they had produced before the war that there would hardly be a comparison. When I asked them about the machine tool situation they all admitted that they had bought a great deal of new equipment in the past three years. *However, they expected to buy new equipment after the war for several very important reasons.*

o o o

● Some salesmen hesitate to make calls these days on plants where they have sold large quantities of machine tools for war work. Getting in the right frame of mind to make a solicitation is half the battle.

o o o

These manufacturers all went into the great story of successful business and American ingenuity and explained to me that genuine progress is based on one fact and that is "to produce better products at cheaper prices." These new products that are now on the drawing boards will affect the lives of every one of us and there is no doubt but that new equipment will be needed to produce these new products for which Mr. and Mrs. American Public are anxiously waiting. They told me that there are two things that will enter into these new products and these two things are why they will need new equipment: One is higher speeds; the other is greater precision.

Manufacturers are planning to run their machine tools at higher speeds than ever before. Some of the speeds that they talked about made my head swim. One manufacturer told me that they are experimentally running some milling cutters at close to 20,000 ft. per min. in the machining of aluminum. He told me it was his understanding that peripheral speeds from 10,000 to 15,000 ft. per min. are regularly being used in the aircraft industry today and when these speeds will be applied to consumer products, we will get merchandise that will be better and cheaper than ever before.

The automotive industry has always been famous for its progress. I have been told that in 1936, for instance, Chevrolet Motor Car Co. spent upwards of $25 million for retooling the engine, transmission and rear axle for the 1937 model car. Hardly a bolt or nut was left unchanged from the previous job and brand new equipment was installed to produce the component parts. Of course, after this retooling job was done, mechanical changes made in the next few years were minor ones and the chief innovations were in body styling. On the other hand, considering the circumstances, this type of radical retooling is likely to be done on an industry-wide scale after the war. Already, the automobile manufacturers have begun to place conditional orders with the machine tool builders on an if, as and when basis.

Only a few weeks ago, Alfred P. Sloan, Jr., chairman of General Motors, made some statements regarding that giant's postwar plans. He told

industry that General Motors could be producing cars within three months after the close of the war and they could be in volume production within six months. He also stated that General Motors was prepared to spend $400 to $500 million for retooling and plant conversion to peace time production. This report is only one of several that have recently been presented to American business. If reports of this nature are an indication of what we can expect the moment peace comes, the future of America is certainly a bright one.

Undoubtedly we are facing a new world which will be practically retooled from start to finish and there will be a need for greatly improved machine tools. This is not only my personal opinion but it is the opinion of the great majority of manufacturers with whom I have talked.

More Precision

The second highlight in my conversation with these manufacturers was the great demand for finer precision than ever before. The word "precision" has been creeping into the vocabulary of everyone in the past few years and there is no doubt that almost all types of products will be promoted and sold on the merits that they are "precision-made."

We can soon expect that advertising and copy men will start to sell the consumer on products that are precision-made. A few years ago the sales appeal was "handmade," which was supposed to designate superior products. Anything that was handmade was palmed off as an exclusive or quality product. The same thing will undoubtedly happen to precision-made products and there is no reason why the machine tool builders should not shout from the house tops that precision machine tools are the granddaddy of all good consumer products.

o o o

● Helping the buyer in his production problems and showing him how your latest equipment can reduce his costs and improve quality is the soundest basis on which machine tools can be sold in the postwar market.

o o o

Who Is Mr. Thalberg?

• • • The author of this stimulating and bullish article on the future outlook of the machine tool market is a newcomer to the industry. Through his background of advertising and selling in the apparel field, he brings a fresh viewpoint to a gloomy situation. For six years he handled advertising and marketing activities of the United-Carr Fastener Co. and was at one time a part owner of an advertising agency handling accounts in the apparel field. He first had contact with the metal working industry as vice-president of Lee Metal Products Co., since dissolved. The Cosa Corp., with whom he is now connected, is an importer of some of the finest Swiss machine tools, notably the Société Genevoise (SIP) Swiss jig borers, Maag gear grinders, Mikron bench gear hobbers, Vaumard internal grinders, Bechler Swiss type automatics and several types of precision measuring instruments. Locally the company operates a gear shop where precision gears are manufactured for the aircraft industry. Cosa also represents many well known American machine tool builders on export sales.

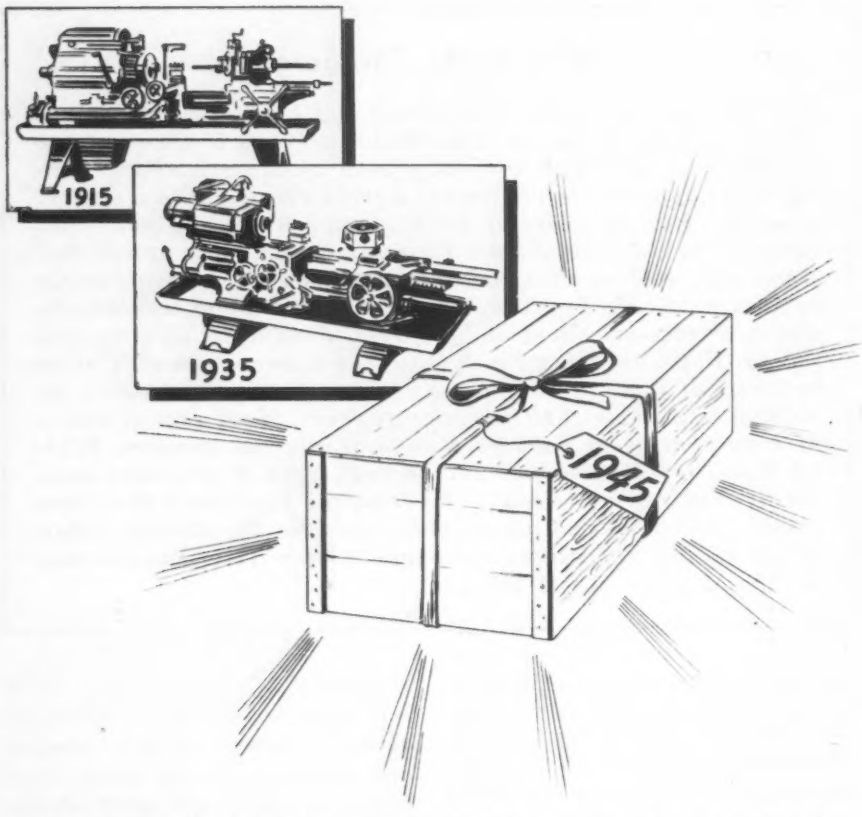
A few years ago a thousandth of an inch was considered the ultimate but today ten-thousandths are considered commonplace. This high precision will not only lead to new speeds and production that was never dreamed of before but it will necessitate skill being built into the machines instead of depending upon the skill of the operators.

American industry has always looked for better equipment and it is up to every sales representative to consider himself a sales engineer in every sense of the word. A bond of the closest type must be established between management and sales and now is the time for the sales representatives to find out what industry intends to do after the war. Some manufacturers of special purpose production equipment are very optimistic and rightly so, but by careful planning and analysis, the entire machine tool industry as well can become just as optimistic.

Of course, if we are all going to sit back and have visions of billions of dollars' worth of idle machine tools, there is nothing left for us to do but to give up and go down for the proverbial third time. On the other hand, we would have a different viewpoint if every machine tool builder were to work up a basic merchandising plan with but one fundamental principle and that is: "How can I make my product fit into this postwar picture?"

The Cosa Corp., whose advertising and promotion I handle, deals only in high precision and high speed equipment. We are spending a tremendous amount of time and effort on our postwar plans. It is our basic belief that the application of our equipment is as important as the equipment itself and we are attempting to set up a service organization and are working more closely with our clients than ever before. We are preparing literature and information that we believe will be of great assistance to industry and our job at the present moment is to determine how our equipment will fit into the postwar planning of our customers as well as our prospective customers. We are fully aware that in many cases it is going to mean a great deal of effort to sell equipment, compared to what it took a few years ago. However, we do believe that equipment can and will be sold if it

o o o



● In 1935, the selling price of a typical turret lathe was more than three times the corresponding 1915 model, but the average productivity was over 4½ times as much. Index of dollar of investment per piece produced dropped 37 per cent. Corresponding gains should be registered in postwar machine tools as a result of the developments in machining techniques made during the war period. In some instances, notably milling, advance in technique has outstripped that of the machines.

will out-perform previous equipment and the results will enable manufacturers to turn out products that are superior to anything they ever offered before.

We believe in a complete reporting job from our sales representatives since the basic duty of the sales representative is for him to understand and help solve the customers' problems. By this system of reporting we hope to constantly improve our equipment and build the good will of our company.

We can all look forward to the postwar era as the golden era of American industry, and improvements will be made in machine tools that were thought impossible a few years ago. This war has brought forth changes that were thought impossible and it is my opinion that in many instances we have merely scratched the surface.

Big Improvements Coming

By improvements in equipment I do not mean the rounding of corners, streamlining or using a new type of paint. What I am thinking of is putting to work some of the revolutionary changes that have been brought about by the war and these changes can and will make better machines that will turn out better products.

Several salesmen in the machine tool industry have adopted a stock method of selling and in many cases this has been successful but they must rid themselves of the mental hazard that they now have regarding the postwar era. Management must rid itself of any thoughts it might entertain that no more changes can be made. Competition is the life blood of any industry and this present war has a far broader scope than many of us realize. Political and economic writers are now talking about radical changes throughout the world. There is no doubt but that people throughout the world will want and need machine tools as well as consumer products. However, I do not pretend to be an economist and I leave that field alone, but I do know that there is hardly a manufacturer who will not listen to a story concerning a new machine tool that will allow him to turn out better products at less money. That appeal is fundamental.

The machine tool industry is a *great* industry. It has always been honest and can always hold up its head with the pride of its accomplishments. However, it must adopt the attitude of a service organization and fit its products to the needs of industry. The representatives of the machine tool industry must be endowed with a spirit of progress and research and every man connected with the machine tool industry must realize how important a part he will play in the postwar world.

Consumers are hungry for new and better goods and it is up to the machine tool industry to make the consumer realize that machine tools are

● Some advertisers of machine tools and machine tool accessories are already beginIndex of dollar of investment per piece produced dropped 37 per cent. Corresponding some answers to this question.

What will users want in POSTWAR Machine Tools?

1. VERSATILITY will be a primary requirement of many machine tools sold in the postwar period . . . but versatility achieved without sacrificing high production rates and low production costs. Following every war, old products become obsolete and new products are developed with startling speed. Manufacturers must have machines which can be quickly and easily adapted to new purposes.

the axis around which modern civilization revolves.

Many machine tool builders will resent my remarks since they believe that they have been very progressive and have formulated sound merchandising, promotional and advertising plans. True enough, many of these machine tool builders have started to advertise the products they are manufacturing but let them really search their souls and find out what they are doing toward planning the improvement of their equipment and toward creating a demand for their product in the postwar world. Right now, of course, we are concerned with first winning the war and second with tomorrow, but with the current trend in machine tool orders and shipments, more time is going to be available to set up certain fundamental selling and merchandising policies applicable to postwar markets.

Every man in business believes he owes an obligation not only to himself but to his fellowman and one thing we are sure of is that the machine tool business has always been basic to our economy in every respect. The obligations of the future are greater than ever and it is up to all of us to determine our place in the postwar era.

Philosophers have said that there is an answer to every problem and the postwar machine tool situation is no exception. The machine tool builders can pull themselves up by their boot straps, and machines will be designed that will out-perform anything we ever dreamed of but it is up to every machine tool manufacturer to find out *now* what is expected of him later on. This is the greatest task we have ever faced but it can and will be worked out for the mutual benefit of all concerned.

Steel Industry Insures for Future

o o o

By ERIC N. SIMONS
Consulting Engineer, Great Britain

o o o

THE war and the increased demand for technological skill and experience has made Britain's steel industry realize the need to provide for the future. The steel trade has survived acute depression and uncertainty, but one result has been a tendency, paralleled on a much vaster scale in less popular industries, for parents to discourage their children from making their careers in it.

This tendency has not been marked enough to be noticeable, but it was definitely there, and those who saw it growing became seriously concerned about it. They saw the banks, and accounting profession, the insurance offices, the teaching and medical professions absorbing more and more of the bright young men who should have been planning for the steel industry of tomorrow.

Not that this has been the fault of the steel industry itself, which has always sought to encourage its young men to train and fit themselves for higher posts. But in the years before World War II there was a disposition everywhere among parents to "play safe," and avoid committing their children to the adventure of a steel works career.

Whether enough was done to attract the young, even by the steel industry, is a controversial point that need not concern us. The point of interest is that the planners have been at work continuously since the outbreak of war, to ensure that Britain's steel will be in the forefront of technical development tomorrow, as it was a hundred years ago and is today.

As an example, the scheme developed by one of Britain's large steel manufacturers to encourage further education may be studied. Where students are taking a recognized study course—of two, three, or more subjects—which, in the opinion of the Works Education Committee is designed to improve their efficiency, this Corporation encourages them to greater efforts by paying flat weekly allowances.

These are arranged:

(a) for students of 14-17 inclusive recording 85 per cent possible attendances and students of 18-20 inclusive who do a course of either two or three evenings study a week, and
(b) extra allowances are given for passing examinations in both age groups, again depending on the hours of study put in.

With regard to the first group of allowances, attendance cards are issued to students, and the extra weekly allowance begins in January each year for students who have registered 85 per cent possible attendances in the fall session, and will continue for four months. The payment continues for a further four months in respect of attendances registered during the New Year session, and if the necessary attendances have been registered throughout the course, payment continues for another four months to complete the year.

In respect of the extra examination allowances, payment begins as soon as the examination results are known, and continues for twelve months. The allowance is paid monthly. All the payments are purely ex gratia, and are discontinued either, where it is shown that the student is not satisfactorily applying himself to his work or his studies; or, where service with the Corporation is terminated or the student is drafted to the Forces; or, when the student reaches the age of twenty-one.

Fees for the study courses are reimbursed by the Corporation in those instances where 85 per cent of attendances are registered. Where employees of any age are attending approved special lecture courses, for example on foremanship, steel manufacture, foundry practice and others, the fee for the course is returned where 75 per cent attendance is registered. Provisions for additional weekly allowances specified earlier do not extend to these lecture courses, however.

In special instances the cost of fees may be, and sometimes is, advanced on loan by the Corporation, and this concession is also extended to cover the provision of instruments where this is necessary.

Shift workers who are unable to transfer to permanent day-shift and are employed on afternoon or long night shifts are paid at time rates for

(CONTINUED ON PAGE 218)

Metallurgy

o o o

By THOMAS E. LLOYD
Cleveland Regional Editor, THE IRON AGE

o o o

o o o

FACED by the war needs for greater production with fewer standard materials, metallurgical developments during the past year were preponderantly along lines of more efficient use of substitute materials. Noteworthy was the advance made as the result of widespread and rather exhaustive investigations as to the proper uses and effects of boron additions to steel. This research with its consequent developments is destined to result in the regular utilization of boron-bearing addition agents in the production of steels of low alloy content with a high factor of hardenability and excellent mechanical properties and is one of the remarkable developments of this past decade.

Boron containing additions yield an increase in hardenability in the treated steel regardless of analysis or brand, provided correct quantities are used and the addition is made properly. The increase in hardenability of the finished steel varies with the type of steel being produced. Briefly summarized, the effect of boron containing additions on various types of steel are as follows:

Carburizing grades, up to about 0.25 per cent carbon:

In plain carbon steels the effects are mild.

In higher manganese and alloy grades, effects are more pronounced.

Medium carbon steels, ranging from 0.30 to 0.60 per cent carbon:

Depending upon the manganese content, the effect on plain carbon steels is marked but varying.

As indicated by the increase in hardenability and improvement in the tensile properties, the proper boron addition through the special commercial alloys is beneficial. The improved hardenability is accompanied by greater strength in critical sections either with an increase in ductility and toughness or at least without normal corresponding loss in these factors, depending upon the magnitude of the strength increase. While the addition of boron coarsens the grain structure slightly, this is usually counteracted by an increase in the added aluminum.

The improvement of the ratio of yield to ultimate strength is greater at higher tempering temperatures, but the improvement in ductility is greater when low tempering temperatures are used to produce high hardness values.

The use of special alloy addition agents with boron will, with varying effect, increase the hardenability of all grades of steel that have been examined thus far. The range of increase in hardenability, however, depends mainly on the base composition. The most beneficial effect on the mechanical properties of a given steel is in steels heat treated to high hardness levels. To get the maximum benefits from any property, the steels thus treated must be quenched and tempered.

The effect of boron, an excellent deoxidizer, when present in a steel in the form in which it can act, presumably in solid solution with the metal, is limited by the amount that the steel can effectively hold. The effect of too much boron is disastrous to hot ductility. About 0.002 per cent seems to be the most effective amount, and more than 0.003 per cent increases the difficulties in hot working until 0.007 per cent is reached and the steel becomes almost unworkable. The boron addition must be in such a manner that it is protected from oxidation or other chemical combinations and must be uniformly distributed through the molten metal. Thus, ladle additions are recommended, while mold additions appear to be quite impractical. Since the addition readily oxidizes, it must be added only to a completely deoxidized bath or be accompanied by enough strong deoxidizers to protect it until it is dissolved and dispersed through the steel.

Boron cannot be considered a cure-all for all difficulties encountered in steel production and may cause some secondary effects not yet observed. This, however, has not so far been noticeable. Boron steels can be forged, rolled and machined at least as readily as conventional alloy steels of the same carbon content and hardenability.

Some specific effect of boron additions are apparent. The addition of 0.007 per cent boron to the common types of steel makes the material hot short, resulting in broken billets and blooms when rolled. Addition of 0.003 per cent gives excellent hardenability, elasticity and strength qualities. As a substitute for nickel, chromium, manganese, molybdenum and vanadium within certain limits, this agent has proved quite satisfactory. In steels over 0.60 per cent carbon, there is sufficient inherent hardenability in smaller sections that boron is not required, but in steels ranging from 0.20 to 0.60 per cent carbon, the addition of boron is most beneficial.

In an examination of two grades of National Emergency steels, NE 9420 and NE 9440, an addition agent containing 0.5 per cent boron, 20 per cent titanium, 13 per cent aluminum, 8 per cent manganese and 4 per cent zirconium was made. The resultant increase in hardenability in both instances was quite noteworthy. The NE 9420 heat had an austenitic grain size of No. 7 after carburizing at 1700 deg. F. for 8 hr., and slow cooling. Test specimens, obtained by forging 3⅞ in. square billets into 1⅛ in. rounds, were annealed at 1650 deg. F.

1944 brought forth important developments that will not only materially advance the science and economics of the metal-working industries for years to come, but have laid the groundwork for more progressive and creative thinking in the future.

Hardenability was determined by end-quench tests on 1-in. round by 3-in. long specimens, normalized from 1650 deg. F. A Rockwell C hardness of 50 was evidenced at the point of quench contact for both treated and untreated bars, but the hardness pattern for the boron treated bar remained higher than for the untreated bar as readings progressed away from the quenched end. At 1 in. from the quench end, the treated bar had a hardness of 19 Rockwell C, while the hardness of the other bar was only 13 Rockwell C.

Similar investigations revealed the effects of temperature, holding time, reheating and other factors on the hardenability of both boron treated and untreated steels. There were indications from the examinations that treated steel has a higher yield point to tensile strength ratio with a higher reduction of area value than untreated steel. Also, within certain reasonable limits, the holding time at 1550 deg. F. does not effect the hardenability of NE 9440. However, the boron addition had a very marked effect in increasing the hardenability of NE 9440, at 0.42 per cent carbon steel, the increase being considerably greater than that obtained by the same addition to NE 9420, a 20 per cent carbon grade.

The major problem confronting the use of boron in steel production is in the analytical phase. No successful routine analysis procedure has been developed as yet and laboratory analytical methods have not been entirely satisfactory. Spectroscopic analysis at present seems to hold the lead, but there are some definite limitations to this. There are only three boron lines available for spectroscopic determination of boron in steel and all are close to iron lines. For low concentrations of boron, the 2497.73 A° line, which is close to the iron line of 2495.7 A°, is used. This boron line is superimposed on this weak iron line, and a boron-free sample is used in conjunction with the boron containing sample and allowances have to be made.

It is the belief of some leading authorities that the problem of analysis is different if the boron is added as part of a complex alloy rather than as a separate alloy. Thus, methods of testing the difference between 0.002 and 0.003 per cent boron may not be useful for percentages a tenth as great.

In such instances as these some authorities believe that tests for more minute amounts can be made only by examination of mechanical properties of the steel under certain methods of thermal treatment.

National Emergency Steels

If there were ever any doubts that the National Emergency grades of steel had come to stay, these inhibitions were completely dissipated during the past year. While NE steel post-war applications probably will

● Centrifugal casting in the foundry of the Ford Motor Co. of Canada.

not remain in the same categories as their present uses, forced by the exigencies of a war-time economy that has been pressed for steel alloying agents, the basic NE grades of steel will find many uses after the war and become standard types or grades.

This prediction is made if for no other reason than the fact that an immeasurable amount of time and energy has been put into the manufacture, treatment and application of these steels. Furthermore, however, many of these grades have proved to be excellent steels for specific purposes when handled right. After the possible initial swing-back to a rather promiscuous use of alloys after the close of hostilities, as witnessed in pre-war years, it is quite likely that the long range picture for the steel industry might be a settling down to a conservative alloy consumption and steel manufacture based on properties required for specific purposes rather than for wide safety margins, appearance or other reasons of the past.

The investigations of NE steels have dipped into every field in which they have been employed, including machining, forging, rolling and stamping, and into their manufacture and preparation for fabrication.

In a study of the heat treating characteristics of NE steels, considerable interesting data have been accumulated. NE grades from 8615 to 8749 have been found to respond readily to normalizing treatments machining in a manner similar to the regular SAE grades, except that for equivalent carbon contents the cycles for the NE grades can be faster. Carburizing grades can be annealed faster, with less tendency to form martensite as a result of too early withdrawal from the furnace at temperatures under 1000 deg. F. NE 8620, 8720 and 8817 carburize very similarly, with these grades being slightly more reactive to gaseous carburizing media rather than coke-charcoal type media. The carburized cases of these grades have some degree of malleability.

From a machinability standpoint, the NE grades seem to compare favorably with A.I.S.I. and SAE standard grades. The following substitutions have been made in various plants with little distinction in machinability between the standard and the NE grades: NE 8024 (manganese-molybdenum) for SAE 3115 (nickel-chromium); NE 8620 for SAE 4620 and SAE 4615; and NE 8720 for SAE 4820. An improvement in machinability was found in the substitution of NE 8720 for SAE 4815 and SAE 4620; and of NE 8724 for SAE 4820, a high nickel molybdenum grade.

High speed steel, cemented carbide and standard drills and milling cutters have all been used satisfactorily in machining NE steels. For high cutting speeds, emulsions of soluble oils are satisfactory for turning, milling and drilling. For low speeds as in broaching, reaming and threading, sulphurized mineral oils and mineral oil plus from 10 to 15 per cent fatty oil have been used. Cutting fluids should be at low temperature, applied in large quantities and at high velocities.

Possibilities and limitations of forging NE steels can be predicted with reasonable accuracy from experience in forging other steels. Because the alloy content of NE steels is lower than that of the steels they replace, forging properties are generally improved, while forging quality does not suffer to any great extent. Easier forgeability and readier flow to desired shapes of NE steels in the plastic state permit an increased variety of shapes in forged parts and because of these properties, modifications in shape without increases in weight and size often enhance structural strength of parts forged from NE steels. On the whole, better die life from NE steels permits closer adherence to tolerances and permits longer production runs.

Manganese-molybdenum structural steels in the NE 8000 series have been found to have forging characteristics similar to those in the T-1300 alloy series. They handle readily for various forging operations, with properties not unlike those of many chromium-nickel structural steels. The chromium-nickel-molybdenum structural steels in the NE 8000 series are the strongest NE steels, suitable where conditions of extreme service are encountered. Proper temperature control and careful handling, coupled with good design and proper fiber direction of these steels permit a favorable comparison in most cases with parts made from the original steels.

Likewise, fabricators and manufacturers delved deeply into applying the NE steels in the manufacture of various commodities. For example, an automobile manufacturer studied the application of these steels for use in the manufacture of truck parts. NE 8744 was used to replace SAE 3140 in the manufacture of spring cross shafts and to replace SAE 3120 and 3125 for spring clips and bolts. NE 8749 replaced SAE 4340 in a trial lot of rear-drive axle shafts, while NE 8620 was substituted for SAE 2512 in the manufacture of ball bolts. This latter product was copper plated to stop carbon penetration at the neck section during carburizing. The details of heat treating, carburizing, and handling of the new substitute steels were worked out completely so that the transition was without undue loss of strength or without a sacrifice of safety in the products.

Centrifugal Casting

The eyes of the foundrymen of the United States scanned again the broad principles of centrifugal casting that were outlined in 1809 in a British patent, as well as the subsequent developments in this field. This field has been a source of remarkable development during the very recent past, with more and more foundries attempting to solve the inherent problems of this metal forming process. The Watertown, Mass., arsenal for several years has been centrifugally casting molybdenum-vanadium steel into gun barrels in horizontal cast iron molds; railway car wheels have been centrifugally cast for many years; and more recently gears have been cast in sand molds.

There are three general types of centrifugally cast products, namely: (1) true centrifugal castings, made by pouring metal into a rotating metal die; (2) semi-centrifugal or profiled castings, made in dies, sand or core assembly molds where the inner surfaces of the castings are formed by cores; and (3) pressure castings, in which centrifugal action is used to force molten metal into the molds. The yields by such methods, due to the elimination of feed heads, risers, etc., are greatly increased, thus making the process attractive.

Centrifugal casting is currently finding widespread application in ordnance and aircraft manufacturing plants and the future promises continued expansion of this technique. Both ferrous and non-ferrous metals are cast in this manner. In addition to the greater yield, manufacturers have found that centrifugal casting gives sounder, denser, cleaner castings, it eliminates the use of cores and greatly simplifies inspection. However, alined to the advantages are several disadvantages to the process. There are limitations as to sizes and shapes adaptable to the process; the installation and maintenance of the machinery is high; and there is difficulty in changing the equipment to make a variety of castings as in jobbing work.

All centrifugal casting is in effect pressure casting, since the molten metal is forced against the mold wall under relatively high pressure by the

spinning mold. This gives better feeding, reduces shrinkage cavities and gas pockets and yields a denser metal. Also, as the centrifugal action tends to throw the denser, heavier components outward with greater force than the lighter particles, light non-metallics are eliminated by flotation inward toward the axis of rotation where they are easily removed.

The use of permanent molds, especially in non-ferrous castings, seems to offer the greatest advantages economically, with graphite, purchased in the form of electrodes for electric furnaces, being the cheapest material for this use. Graphite can be easily machined or bored to any shape, and graphite molds are the only ones that can be used with some non-ferrous metals containing high amounts of phosphorus, since these alloys burn into iron and steel molds.

Graphite does not change shape too much from heat shocks and its low co-efficient of expansion restricts change in size due to change in temperature. Semi-permanent molds, made from patterns, from which a very few castings can be obtained, is desirable when there are short runs. In non-ferrous work, fire clay has been used in place of sand. Baked core sand molds make good castings but increased costs result from the difficulty of removing the casting and sand, more time is required because of slower solidification, and it is necessary to clean the finished casting.

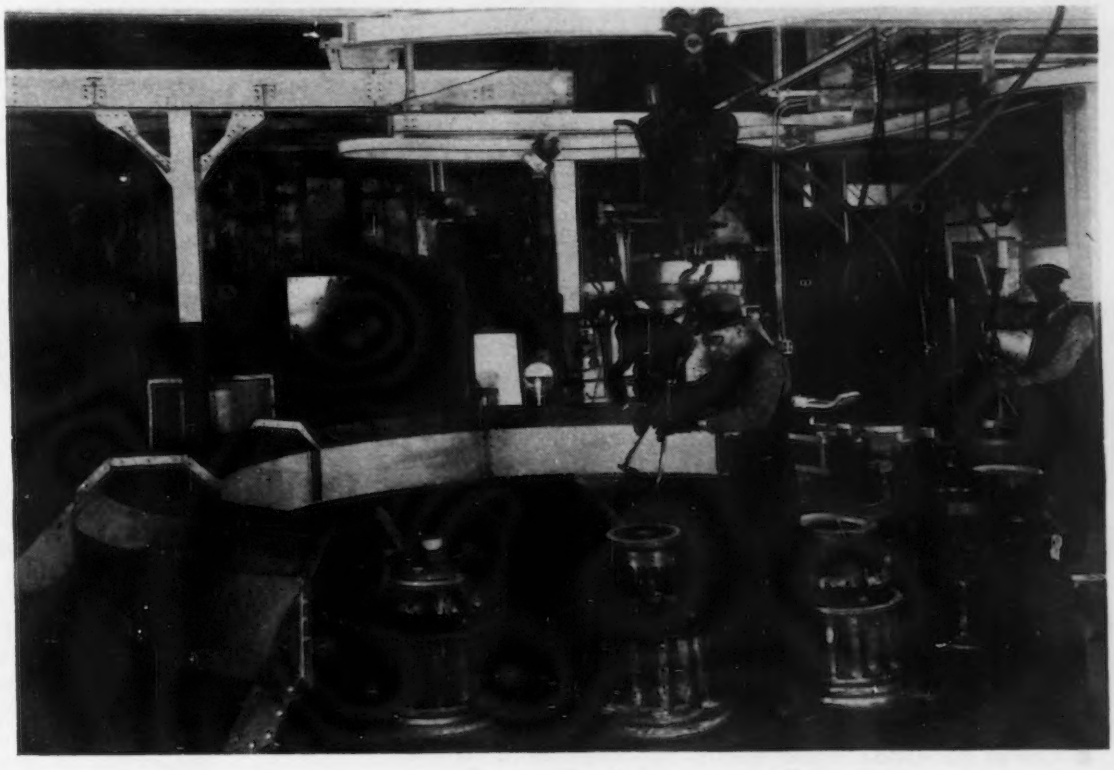
In a Canadian plant of an American motor car manufacturer, there is a centrifugal steel casting foundry that was designed from the floor up with the sole purpose of providing efficient auxiliaries to the spinning line rather than simply adopting spinning operations to equipment and facilities at hand. It is now being expanded, but upon completion will produce some 450 tons of steel castings a day, 175 tons of which will be spun castings. Technical and operating problems have been worked out at this plant quite satisfactorily, and the variety of types of products poured centrifugally is quite extensive. Vertical and horizontal dry sand molds are employed, as well as metal permanent molds. Runs on the permanent molds in several instances have been as high as 5000 casts without mold deterioration. Bren carrier sprockets are cast 13 deep in a vertical mold, aircraft cylinders are spun in horizontal permanent molds, universal carrier track pins spun in a dry sand core, gear clusters have been cast in dry sand cores centrifugally in an unsymetrical arrangement; brake shoes have been similarly cast; and a type of towing clevis bracket has been cast, several to a cast.

All told, the advances in centrifugal casting have been great during the past 12-month period, and the future for this method seems more promising daily. As experience is gained in the industry and techniques developed to the point where some of the smaller foundries can attempt the process with a fair assurance for success, the process will become more widespread and more generally used. Up to the present, only the larger and more economically stable businesses could withstand the expenses of research and development in this field.

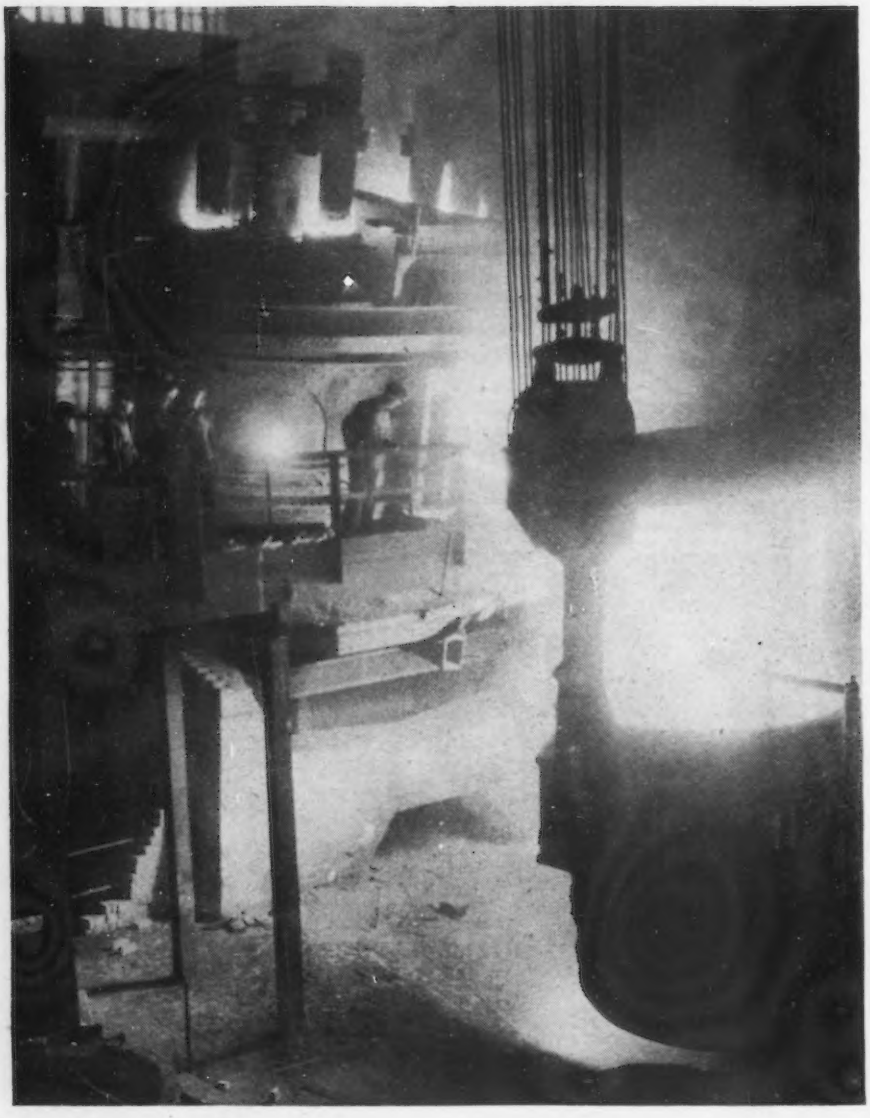
Powder Metallurgy

Powder metallurgy, a rapidly growing and comparatively new metal-working technique, has grown in stature during the past few years as a means for manufacturing finished and semi-finished products. The method of compressing metallic powders in dies and heating the resulting compacts to temperature below their melting point to obtain products of desired shapes offers raw material savings, the elimination of scrap or excess metal, savings of machine tool and labor costs, and certain definite inherent advantages in the composition of the finished physical product.

The types of metallic powders that are pressable are extensive, but the powders used on a large scale are almost invariably the product of the reduction of metal salts by gases, electrolysis, or by atomization. The powders must show definite physical and chemical characteristics in order to be suitable to powder metallurgy, the main characteristic being purity. Impure powders cause problems that cannot be readily solved by the users



● Centrifugal casting of gear blanks.



● One of the world's largest electric furnaces pours a 100-ton heat of steel at the plant of Timken Roller Bearing Co.

of metal powders and some metal powders require an absolute clean surface of the particles in order to get ductility and tensile and sheer strength in the finished part. Generally, metal purity is above 99 per cent in powder metallurgy, with such powders as tungsten running 99.99 per cent pure.

Compressibility of powders is also important, as is the apparent density of the powders. The density is usually the deciding factor in establishing whether or not powder metallurgy can be applied in the manufacture of a given product.

Many types of small parts are now being made by this powder metallurgy technique, and tolerances can be held as close as 0.001 in. Various combinations of metals, non-metals and non-miscible metals are possible. Among the powder metallurgy parts now being made are gears, bearings, screens, filters, contact points, copper-carbon brushes, radio parts and various brass, steel and aluminum parts.

As powder metallurgy is still an art in which science lags behind the practice and application, there are still many problems in manufacturing technique that are unsolved. However, the research that is being carried on by various manufacturers, technical organizations, research institutes and colleges promises some major if not startling developments along these lines.

Different methods of molding powders to solid parts are: Cold pressing and sintering, frequently followed by sizing operations; hot pressing into final shape by pressing and sintering; and metal working old cold pressed and sintered blanks.

In deciding whether or not it is economically feasible to make given parts by powder metallurgical processes, there are certain basic requirements or conditions to be met. The part must be one that is widely used, because dies for molding powder parts are costly and the full die life must be realized in production if low costs are to be obtained. Parts should be simple in design and free of re-enterant angles. Parts must be small so that high unit pressures can be attained without exceeding capacity of available presses. Dimensions in the direction of pressing should be kept thin, held, if possible, to ½ in. in thickness or less. Thicker parts may introduce pressure differentials through the piece with warpage occurring during sintering. Wide variations in section of any one piece may cause warpages in sintering because of the differences in shrinkage. Metals with oxides difficult to reduce should be avoided.

Some of the developments during the past year covered the use of iron and aluminum powder molding techniques, as well as the process of alloying that takes place during sintering and annealing of pressed metal powder. In one group of experiments, sponge iron and iron powders of two grades, a coarse and a fine, were processed in three different ways. Sintered sponge iron showed a density of 75 per cent of normal for low pressed compacts, but this was improved by second pressing. Coarse compacts reached densities of about 98 per cent, being twice pressed at 50 lb. per sq. in. and twice sintered 2192 deg. F. for 1 hr. Hardness values for singly pressed materials were very low, but after twice processed, yielded Brinell figures between 65 and 80. Materials after second pressing showed Brinell hardnesses over 100. Tensile data for single process material was 4000 to 5000 lb. per sq. in. and double processing could better this only a little. Strained re-pressed electrolytic powder showed substantially higher values. Sponge iron twice sintered showed a superiority both in yield and ultimate strength. Tensile data of 38,000 lb. per sq. in. for hydrogen reduced sponge iron approached standard values for fused and annealed electrolytically produced iron. Average tensile values of 56,000 lb. per sq. in. for sponge iron compared with 48,000 and 43,000 lb. per sq. in., for fine and coarse electrolytic powder compacts, respectively.

Aluminum powder has not been employed extensively in pressed powder art because (1) it oxidizes readily, forming a film of highly refractory oxides that is likely to interfere in powder metallurgical work; (2) during compression, aluminum and alu-

minum-alloy powders tend to adhere or cold-weld to die walls; and (3) aluminum-alloy powders are harder than elemental aluminum and have some susceptibility to age-hardening. Atomization is considered the best method of making the powders, permitting wide ranges of particle sizes and is adaptable to safe, large scale, and economical production.

To prevent cold-welding to the die, some success has been achieved in lining the dies with flat-lying, overlapping metal flakes of bronzing powders, suspended in a volatile carrier such as carbon tetrachloride, applied to the walls by spraying. Fatty acids or a soap added to the carrier has been found to reduce the ejection pressure considerably and eliminate lamination.

Aluminum and aluminum-alloy pressed specimens produced were found inferior to analogous wrought or cast material, being low in ductility. However, several grades of atomized elemental aluminum powders pressed at high pressures yielded specimens with properties approaching those of wrought annealed commercial alumimum. By mixing alloying elements in the powder, the desired alloys were formed during the sintering operations.

Specimens examined were sintered for 30 min. at 1150 deg. F. in air. The furnace time required an additional 14 min. heat-up and 15 min. cooling period, permitting the temperature to drop to 950 deg. F. Cold water quenched specimens showed that particle size had slight effect on tensile strength, but fine powders showed poor flow characteristics, abraded the die and tended to be forced between the die wall and the punch forming fins. Commercial results can be attained with pressures between 50 and 60 tons per sq. in.

Various combinations of aluminum with copper, magnesium, manganese and other alloying elements were tried, under various conditions. Sintering in nitrogen and air as well as in hydrogen showed that the applicable sintering atmosphere depended largely on the alloy combination. On the whole, the development of powder metallurgy of aluminum is not yet as far advanced as the powder metallurgy of other metallics but work is progressing in this field.

Electric Furnace Steel

Electric furnace steel production came up for organized discussion by the American Institute of Mining and Metallurgical Engineers for the first time on Oct. 1 and 2, 1943, when the first annual conference of the Electric Furnace Steel Committee of the association met in Pittsburgh. One of the main points of discussion of the meeting was the progressive growth of the size of the electric furnace during the past 25 years, averaging 6 tons per furnace in 1918, while today the standard furnace is of 70 tons capacity. This has been possible by developments in design and construction, improved electrical equipment and better furnace controls. However, such experts in the field as Samuel Arnold, of American Bridge Co., and N. C. Stansel, of General Electric Co., expressed the belief that electric furnace size would continue to increase, with important advances being made in design, improved feeding and charging systems, better circuit breakers and power swings, more satisfactory power surge control and finer regulation equipment. Furthermore, many operations in electric furnace practice will be made standard, and, in some instances, automatic by the development of all around better electrical equipment.

Operating techniques in electric furnace steel production likewise will come under better control and, as a result, become more standardized. Instead of each electric furnace plant handling production in a manner that is believed best suited to circumstances, standard techniques that will vary only minutely to accommodate a given set of circumstances will become possible.

The electric steel industry has had more than its share of headaches resulting from the many problems in its increased dependence upon war industries to properly handle and seggregate scrap. First, for many months it was difficult to keep a sufficient supply of any kind of scrap on hand, but as time went on the available scrap quality continued to deteriorate. Scrap allocations by WPB were not at all unusual during the

Welding

o o o

By FRANK J. OLIVER
Technical Editor, THE IRON AGE

o o o

THE tremendous amount of welding done in shipbuilding during the last year, while it has undoubtedly made the achievement of building 20,000,000 tons of merchant shipping possible, has brought serious problems in its wake under the stress of emergency conditions. On the fateful night of January 16, 1943, the "jacknifing" of the tanker Schenectady as she rested at the outfitting dock at Portland, dramatized the problem of residual stresses in large welded structures, a problem far from solved at year's end. In fact, additional failures since the Schenectady, though less widely publicized, have tended to confuse the causes and practical measures of solution.

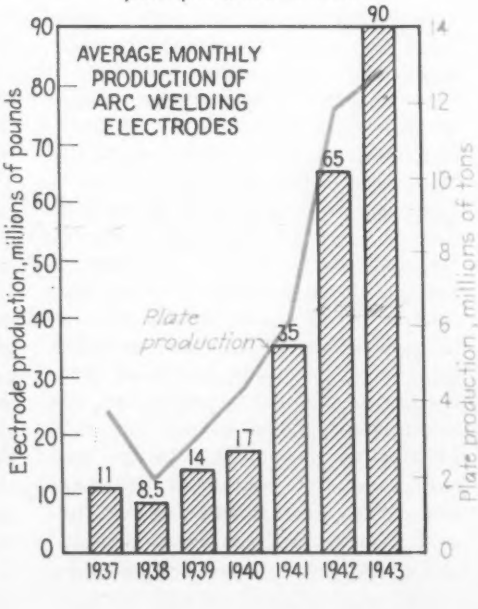
In its report on this failure, the subcommittee of the American Bureau of Shipping laid most emphasis on what it believed to be an accumulation of internal stress locked into the structures by the processes used in construction. It immediately recommended close adherence to proper established procedure, particularly as to welding sequence. Of course, there were many other factors involved. The tear actually started at a badly undercut manual weld at the abrupt (square) end of the curved bridge fashion plate—a perfect stress raiser. This was augmented by the hogging stress due to a poorly ballasted condition which set up a stress of 9000 lb. per sq. in. in plate that was proved to be substandard quality. Add to these adverse conditions a sudden drop in temperature from 38 to 23 deg., aggravated by relatively warm (40 deg.) river water and have that cold wind hit the weak side of the ship and all that was needed was a slight shock to start a tear and propagate it across the deck and down both sides, touching none of the transverse butt welds. An earth tremor supplied that shock at the stroke of 11 p. m. It all happened so fast that not a drop of water was taken in the split open tank since the shell bottom plates knuckled above the river level.

Two Tanker Failures

The Schenectady was the first tanker to be built at Kaiser's new Swan Island shipyard at Portland and it is not surprising that the committee found that "for the laudable purpose of speeding up construction the yard had departed from the fundamentals of good welded construction" and that, like other West Coast yards, there was an insufficient number of trained personnel and of skilled welding supervisors. The design was identical to that of tankers built by a well-established eastern yard which up to that time had built 23 such vessels without a failure. Yet before the year was out, the tanker Esso Manhattan, a product of that yard, broke smack in two in New York harbor, proving, if nothing else, that even in an experienced yard the know-how which undoubtedly exists at the top simply cannot be spread down the line fast enough to newly upgraded supervisors and the newest welder on the ways. Like as not that welder may conceal a shock of curls under her helmet and probably took over, after short training, a job vacated by Joe Gilch, lately inducted into the armed forces.

o o o

ELECTRODE production got in step with plate production in 1943.



Automatic fillet welds were put on the spot too by the Schenectady failure and have since then been ruled out for gunwale connections by the A.B.S., the Maritime Commission and the Navy Bureau of Ships. Meanwhile, the amount of footage of automatic butt welds made in subassemblies and in connecting bottom tank assemblies on the ways has not been curtailed but has increased through the year in the interests of both speed and quality. There was no doubt that the automatic weld joining the deck stringer plate and the sheer strake (upper side plate) of the Schenectady was defective, probably due to an inexperienced operator. Aside from the longitudinal crack it had in its center, there were minute transverse cracks in the weld, a fairly certain sign of the presence of excess sulphur in the plate.

In fact, there was a general complaint in West Coast yards at that time of poor plate, particularly laminated plate, and the criticism has

. . . Although the number of structural failures has been low percentagewise, there have been enough in the past year to cause considerable concern to the entire welding industry. Because the effects of thermal stress in large welded structures are as yet unpredictable, a number of research projects have been started with the idea of exploring basic metallurgical and physical phenomena occurring in arc welding as well as more direct attacks on the problem in the shipyards themselves.. To the controversy between the merits of a.c. versus d.c. arc welding, labor has added its voice. New phases of gas cutting and resistance welding are also noted in this review.

not yet died. Discovery of occasional plates with sulphur and alloy segregations has been reported in many yards. Usually such defects show up at the cutting tables. Heat of the torches has opened up laminated plate like a sandwich and in one case resulted in a fracture transverse to the line of gas cutting, for no apparent reason. Some welding engineers maintain that plate rolled on strip mills does not come up to the quality of material rolled on conventional plate mills. They say that often too great a reduction is made in a pass, not only helping to build up terrific internal strains in the plate but also overstressing the roll stands. A rapid rise in the number of roll stand fractures (repaired by welding) seems to bear out this contention. Shipbuilders in general and the A.B.S. report on the Schenectady in particular stress the low impact values of structural plate, which is accentuated at low temperatures. The breakage of a Liberty ship in Alaskan waters a little over a month ago could well be attributed to decrease in impact values of steel at temperatures below 25 deg. F.

Here again, working against time under emergency conditions has chiefly been to blame for reduction in quality of steel plate. Plate production rose 93 per cent in 1942 over 1941 and registered an additional gain of 7½ per cent in 1943. There was a time when the Maritime Commission was asking for practically the entire plate output of the country. When the extreme pressure on plate deliveries is off, it can be presumed that complaints as to plate quality will subside and welding difficulties may be ironed out also.

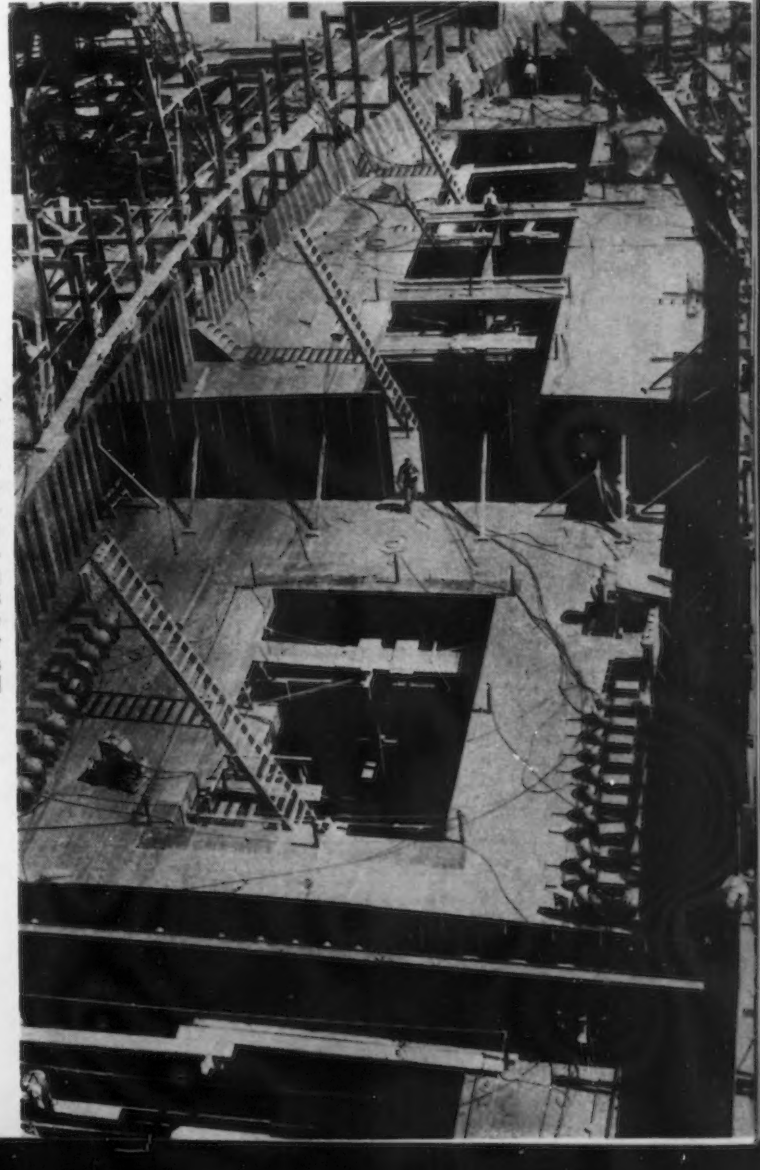
Many troubles result from welding in cold weather. The temperature gradient is higher and the notch sensitivity of the plate itself increases. Charpy impact values are often one-quarter those prevailing at summer temperatures, yet oddly enough, the record of southern yards is no better than northern yards. In fact, the yard with the highest percentage of failures is one on the Gulf Coast. Ships made in southern waters may fail in cold water before the locked-in stresses can be worked out by mechanical weaving of the ship in a seaway. In fact, in the 20 to 30 instances where ships have failed, it was almost invariably in the early days of their careers. After a month or two at sea, a welded ship can take a torpedo or two in the belly and still get home.

Fortunately, all but two of the ships that have had structural failures have been rewelded and put back into service. The J. L. M. Curry, built by the Alabama Drydock & Shipbuilding Co., Mobile, encountered structural difficulties at sea last March and was sunk by gunfire to keep it out of enemy hands. The Thomas Hooker, built by the South Portland (Me.) Shipbuilding Corp., was lost in the same month when she came apart and was abandoned at sea.

Proper Welding Sequences

Meanwhile, every effort is being made to solve the perplexing basic problem of residual stresses in large welded structures. From a practical point of view, the first point of attack is through welding procedures

o o o



LINED up like suckling pigs are two batteries of single operator d.c. welding machines on the deck of a cargo ship under construction at the Seattle-Tacoma Shipbuilding Corp. yards. This company has gone far in working out welding sequences to minimize residual stresses.

ON heavy structures like this marine gear reduction case, a.c. arc welding is favored since it facilitates getting the arc down into deep corners. The jig shown provides for positioned fillet welds.

and sequences planned to minimize shrinkage stresses as much as possible. In the main, the principle involved is to permit freedom of movement of at least one unit of plates or assemblies being butt welded together. If both members are constrained, sufficient stress may be set up to fracture the weld upon cooling. Carrying out this principle 100 per cent is difficult of achievement in a structure as complicated as a ship but M. Q. Cellers, in his article, "Control of Residual Stresses Through Welding Sequence," THE IRON AGE, Sept. 2, 1943, has come as close to meeting the basic conditions of stress-free welding as can be met in practice. The Maritime Commission has also issued a set of instructions on welding procedure.

The most serious cause of locked-up stresses occurs when closing welds are made on big assemblies that are not free to move. In making the final closing butts, the use of small electrodes and low heat in order to keep down the contraction effect has been suggested. Cascade, skip and similar procedures are also used, followed by peening. Another factor is residual stresses left by thermal differences within the plate. Most investigations made in recent years have added up to the fact that major stresses are obtained near the weld, regardless of the procedure. As has been mentioned, heavy rolled shapes and plates have a terrific amount of residual stress in them, right up to the ultimate strength.

Stress Relieving

In welded machine bases, artillery gun mounts and similar units that can be handled by crane, stress relieving in a furnace at 1200 deg., followed by a slow cool, practically removes all internal stresses. Of course, this procedure is not applicable to ship hulls, although it may be used on stern posts. Preheating is another method of reducing the internal stresses, since the heat differentials are minimized. This procedure is widely used in welding hardenable steels in power plant pipe work. Improper preheating, on the other hand, can also generate large stresses on its own account and is hardly to be recommended in shipbuilding. By the same token, improper use of flame straightening techniques, involving local heating and quenching, can also set up shrinkage stresses if overdone. Parenthetically, it should be noted that the consumption of acetylene for this purpose increased in the past year.

Probably the most widely used tool for stress relieving welded vessels is mechanical peening. Although the final stress is indeterminate and the manhours required adds to the cost, it is contended by some that in the long run the overall cost is lower.

Basic Research Planned

Meanwhile, an elaborate research program has been outlined on the general subject of residual stresses. The Welding Stress Committee of the Welding Research Council, composed of 28 top ranking welding engineers and metallurgists, has divided the basic problem into four interrelated stages of investigation, the first dealing with phenomena causing thermal stresses, including the effect of plastic deformation against cold restraints and a study of heating and cooling phenomena, both above and below the the transformation range. The second phase deals with measurement and evaluation of thermal stress patterns. A third investigation will attempt to determine what are the usable physical properties of a structure preloaded by thermal residual stresses, while the fourth phase will cover the behavior of steel and other metals under multiaxial stress fields. Some failures have occurred when nonplastic deformation (brittle fracture) is present, indicating triaxial tension with no opportunity for concurrent compression to take place at right angles to the principal stress.

The committee believes that it is useless simply to weld a piece of steel and measure the stresses because so many variables are involved in each weldment that the knowledge obtained on one piece cannot be extended to general cases. Hence a concerted attack on all the different pieces of the problem is planned, although this approach is so involved and so lengthy that the emergency may be past before a full report of results is available.

In the meantime the War Department has started a big research project at a West Coast university out of which they hope to get some quick answers by a frontal attack on the practical aspects of welding. The Army is more interested in locked-up stresses in armor. Massachusetts Institute of Technology is also making some investigations on its own of a more fundamental nature.

Controlling Weld Ductility

Meanwhile some of the groundwork mentioned above has already been laid, particularly with relation to the problem of heat flow from the arc and the resultant hardness obtained in the heat affected zone of the plate. Two separate approaches have been made on this problem, one by a group

of Lehigh University and the other at Rensselaer Polytechnic Institute, and while each tackled the problem from a different angle, the end data check very closely. The Lehigh group has worked out a tentative system for predicting and thus controlling ductility in weldments by relating the ductility to the Vickers hardness number in the heat affected zone. The hardening response of any given analysis of steel is measured by a modified Jominy test and the ductility is determined by slow notch bend tests made on specimens treated over a wide range of hardness.

With a 3-in. test bar heated to 2100 deg. F. and drastically water quenched at one end and air cooled at the other, there will be a complete range of hardness from maximum to minimum along that bar. If the maximum hardness obtained experimentally with hundreds of welds is matched with the corresponding hardness on the Jominy bar, then for any given hardness the cooling rate in the weld corresponds with the cooling rate in the bar at the same point. Actually, each combination of welding conditions corresponds with a position on the Jominy bar, measured in fractions of an inch from the end.

It follows therefore that any combination of welding conditions (joint thickness and design, initial temperature of metal, current voltage and are travel) corresponds to a single Jominy position. For example, a butt weld between 1-in. plates, welded at 75 deg. F. with 175 amp. at 28 volts at the rate of 6 in. per min. corresponds with a Jominy position 7/32 in. from the quenched end, regardless of the type of steel being welded. Tabular data relating volt-ampere factors, welding speed, plate temperature and "geometry" factor have been published by the American Welding Society so that it is possible for any welding engineer to apply this system, the only laboratory equipment necessary being a simple Jominy end-quench fixture and a hardness tester.

At Rensselaer, arc voltage, current and travel speed are grouped into a single factor, namely energy input in joules per inch of weld, as a factor in determining cooling rates. The other factors involved are plate thickness, plate temperature and joint geometry (butt or fillet weld, etc.). In these tests, the actual cooling rates were measured by thermocouples placed in the heat affected zone of the weld, then mathematical formulas were devised for predicting cooling rates in some new material after tests are made at only two temperatures. In applying the Rensselaer system, it is necessary to have Jominy test bar data on the particular steel available and also an isothermal transformation diagram, commonly known as an S-curve, from which the desired type of microstructure can be selected.

In order to determine the resultant ductility, it is necessary either to test a sample weld, using welding conditions selected to give a particular microstructure or to make use of hardness-ductility relationships involving notch bend tests already established by the Lehigh University program. Of the two systems, the R.P.I. one is the more complicated and is likely to appeal more to the metallurgist who is interested in digging deep into basic phenomena. As has been indicated, however, the professors and the researchers have grabbed the ball on this welding stress problem and the fruits of their work should eventually be translated into practice in terms of welding procedures.

One of the fundamental principles for the avoidance of cracks in welds in hardenable steel is to temper the structure before the heat-affected zone has dropped much below the martensite forming range. It is well known that with a cascade system, the heat of the succeeding pass can temper the preceding pass and help prevent cracking. The Rensselaer group has worked out an equation for calculating the maximum allowable time between passes but in its present form the solution is beyond the mathematical ability of most practical welding men. Some general principles have been deduced from these laboratory tests, such as the fact that larger electrodes produce lower cooling rates, probably due to the difference in the amount of metal deposited. Incidentally, the cooling rate data obtained in the R.P.I. tests have been found to be equally applicable to a.c. and d.c. welding.

Appropos of studies in hardenability of welds, an Ordnance Department official recently revealed that the Army has been experimenting with the use of ferritic electrodes on armor plate welding due to the shortages of molybdenum, nickel and chromium ordinarily used in austenitic rods. It is too early to say what results will be under actual service conditions. However, the problem is being aggressively investigated by research agencies both within and without the Ordnance Department.

A.C. Versus D.C. Welding

This brings us to a consideration of ac. versus d.c. welding, still a controversial subject. With but one notable exception, however, most welding equipment suppliers have been advocating a.c. welding in their advertisements in the past year, emphasizing the absence of magnetic blow on heavy weldments and the ability to get down into deep corners with an a.c. arc; also the lower maintenance costs of a.c. transformers and low idling losses of such equipment, a factor not to be overlooked when considering the usual duty cycle even in production welding. Use of capacitors for power factor correction and the low demand rate has enabled a few shipyards to add a.c. equipment in areas where

o o o

TRACTION bars being welded to the floor plates of tank-carrying invasion barges by a.c. arc welding at the Maywood, Cal., plant of the Consolidated Steel Corp. General Electric a.c. welders are being used on this job, with type W-25 (AWS E-6011) electrodes, an all position a.c. rod that is being extended in use.

o o o

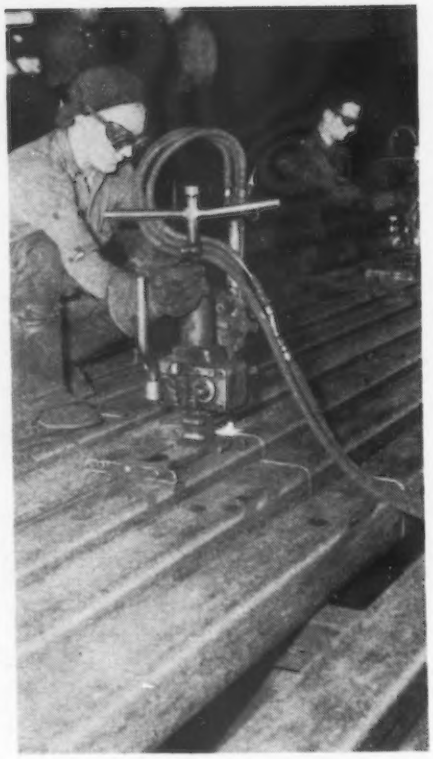
power lines were already at their limit. However, the fact that the yards in general were pretty well equipped, mostly with d.c. equipment, at the beginning of 1943 has limited wider adoption of a.c. machines in that field, except for automatic submerged melt welders. Incidentally, some years ago initial installations of automatic welders were powered from M-G sets and in recent months competitive equipment has appeared using two M-G sets in parallel as the source of power.

The Safety Angle

Open-circuit voltages of a.c. equipment are normally around 80 volts and in extremely hot weather, where perspiration in heavy protective garments is a factor, or in wet weather on shipways, shocks, burns and very occasional fatalities have occurred. Because of a rainy day accident at a Brooklyn yard, "Local 13 News," published there by a unit of the Industrial Union of Marine and Shipbuilding Workers of America (CIO), featured an editorial in its Nov. 16 issue, headlined "The A.C. Welding Machines Must Go." Citing an example of a welder who broke his nose when an overzealous rescuer yanked him from a "hot" line, the paper stressed the weather angle (this man was ankle deep in a puddle) and called attention to the fact that there is many a "4F" classification man employed in the yards these days. The editorial stated that a nationwide campaign was about to be started by the union to get rid of a.c. machines in every yard in the country.

The equipment makers are not unmindful of these hazards. Over a year ago a device was placed on the market for use with a.c. welders so designed that when the operator breaks his arc the primary circuit is instantly broken and a green light flashes on, indicating such a safe condition. Two a.c. welders incorporate a relay that automatically cuts the open-circuit voltage in half when the arc is broken. Yet when the electrode is touched to the work again, full voltage is restored to get the arc established quickly.

In 1943 the first really all-weather a.c. welder was introduced that will function safely in a downpour. Furthermore, when the welder is idling, a control disconnects the welder from the primary line, leaving only a control circuit voltage (35 volts) on the welding lead. This control restores full power to the welder in a few cycles as soon as the electrode is touched to the work. It has the added advantage of reducing the no-load input to less than 1 kva., resulting in a big reduction in the maximum demand where a large group of a.c. welders are operating. This welder has built-in capacitors for power factor correction, as do most big a.c. units. Control equipment intended for the same purpose is also available from an independent controller manufacturer. The only disadvantage of such protective devices is that the voltage drop inherent in long leads renders them inoperative on excessively long lines. While feasible on secondary leads up to 400 ft., which is about the practical limit in merchant shipyards, the system fails on 600-ft. leads, which is a Navy Department requirement.



Linde Air Products photo

PORTABLE, oxy-acetylene bar-cutting machines of this type are being used in various mills to square the ends of rolled bars, to remove etch-test specimens, to cut bars or billets to length for shipment from the mill. The machine is positioned directly on the material to be cut, whether it be round or square bars, and the cutting blowpipe is automatically guided across the bar by means of a swinging mechanism which is actuated by a self-contained hydraulic power unit.

o o o

E-6011 Electrode

On indoor installations, complaints on the safety score are much fewer and there have been some notable a.c. installations made for welding diesel engine bases and heavy duty earth-moving equipment. Extension of a.c. welding in fact has been speeded up by the wide acceptance of the AWS E-6011 all-position a.c. electrode which most suppliers are now offering. This was one of the big developments of 1942. Although the physical property specifications for the deposited metal are the same as for the class E-6010 rod with cellulostic type coating, according to published tests the physicals of the deposited weld metal from the class E-6011 electrode are slightly better than for the corresponding reverse polarity d.c. rod. Its comparitively high yield point and ultimate strength, plus high elongation, make it well suited for joining many types of high tensile, low alloy steels. The fact that the top range of sizes in which the class E-6011 rod is available has been increased from 5/32 to 3/16 in. has promoted its application to heavy work on which a.c. electrodes are particularly advantageous.

At the other end of the scale, in a.c. arc welding of thin gage aircraft tubing where the current must be kept low to avoid burning holes in the metal, the tendency of the arc to be extinguished as the voltage wave passes through zero has been overcome by a new stabilizer recently announced. The device, which is built into an a.c. welding unit, imposes a high voltage, high frequency current on the regular welding circuit. The oscillatory circuit is set up by a spark gap and suitable inductance coils and condensers to give the inductance and capacitance for circuit constants. This high frequency current keeps the air in the arc gap ionized and assures continuous passage of the welding current. This tendency for the arc to be quenched does not occur with d.c. and there is one set on the market that uses vacuum tube rectifiers to convert 3-phase a.c. to d.c. for welding with low voltages and amperages.

Use of "Hot" Rods

Use of the heavy mineral coated "hot" electrodes, class E-6020 and E-6030 has been extended in the past year, particularly in connection with the deep fillet welding technique now advocated by most welding equipment makers. The higher amperage and deeper penetration possible with this type of electrode not only makes for faster deposition of weld metal but less rod consumption per foot, since more of the base metal is melted and equivalent strength of joint is obtained with a smaller fillet. California Shipbuilding Corp. has been able to reduce the manhours expended on fillet welds from 37½ to 45 per cent and to reduce electrode consumption

by 25 per cent ("Deep Fillet Welding in Ship Construction," THE IRON AGE, Sept. 30, 1943, p. 46). This technique has been the subject of continued claims as to who first thought of using a high angle position of the rod with the coating practically dragged along the plates. It has received approval from the Maritime Commission, the American Bureau of Shipping and Lloyd's Register of Shipping, but has not yet been given the nod by the more conservative Navy Department. Incidentally, Calship found that deep fillet welds made with a.c. are superior in strength to welds made with d.c. under the same conditions.

Practically all parties, Navy Department included, favor use of positioned welds and it is not surprising to find wider use of welding positioners. Positioned welds favor the use of larger diameter rods and consequent faster deposition rates. Besides, it has been easier to train down-hand welders which has helped out the problem of green workers, one of the basic causes of structural failures in welded fabrication.

Supply Position Improved

Toward the end of 1943, the supply situation in welding electrodes was definitely over the hump whereas a year ago it was one of the most serious problems of the whole war production program. In the fall of 1942, production of arc welding electrodes was badly out of balance with plate production, to which it is logically tied, but by March, 1943, the WPB was able to announce that parity had been achieved. It was not until last October, however, that stocks began to build up at the electrode plants, although one of the leading suppliers is still quoting deliveries three to four months ahead on popular brands. The largest single factor, as far as WPB is concerned, was policing of inventories and reducing them (by consumption before reordering) to a 60-day supply in line with general CMP regulations. Distribution of welding rods and electrodes had been placed under strict control (WPB Limitation Order L-146) in June, 1942, but shipbuilding, which was taking 65 to 70 per cent of all electrodes, was zooming so rapidly that by the fall of 1942 electrodes were as scarce as Scotch today, except for direct war production. In October, there was a deficit of 25,000,000 lb. per month.

Manufacturers of extrusion presses for coating rod were given AAA priorities and mineral refining equipment was given a green light too. It was estimated by the Navy Department, however, that to make up the monthly capacity deficit by added facilities alone would cost $1,900,000,000 and would require from 8 to 12 months for completion even with emergency priority ratings.

During the fall of 1942, the Bureau of Ships made a survey of all welding electrode producers and evaluated the efficiency of production on the basis of welding rod output per dollar of equipment investment. The ratings assigned each plant visited ranged all the way from 6 points for the most inefficient producer to 37 points for the best (26 points when wire drawing capacity is discounted). The average was around 15 and the Navy concluded that if all companies could produce at any efficiency rate of about 20, a tremendous increase in welding rod output could be obtained.

At this time the Lincoln Electric Co. proposed that since it was able to produce approximately two and one-half times more electrodes per unit of equipment than the average of the industry, some effort should be made to increase production as a whole through more efficient use of existing equipment. The Navy decided that a delay in its contemplated expansion program was justified while Lincoln Electric assisted other members of the industry in improving their output. As a result, according to Navy Department figures furnished the Navy Price Adjustment Board during renegotiation procedure with Lincoln, production of electrodes increased 33 1/3 per cent during the last quarter of 1942, as follows:

	Production, Lb.
October	62,000,000
November	77,000,000
December	84,000,000

By March, 1943, additional capacity previously planned was in operation and output of welding rods passed the 100,000,000 lb. a month mark, at which point rod production got in step

Bethlehem Steel photo

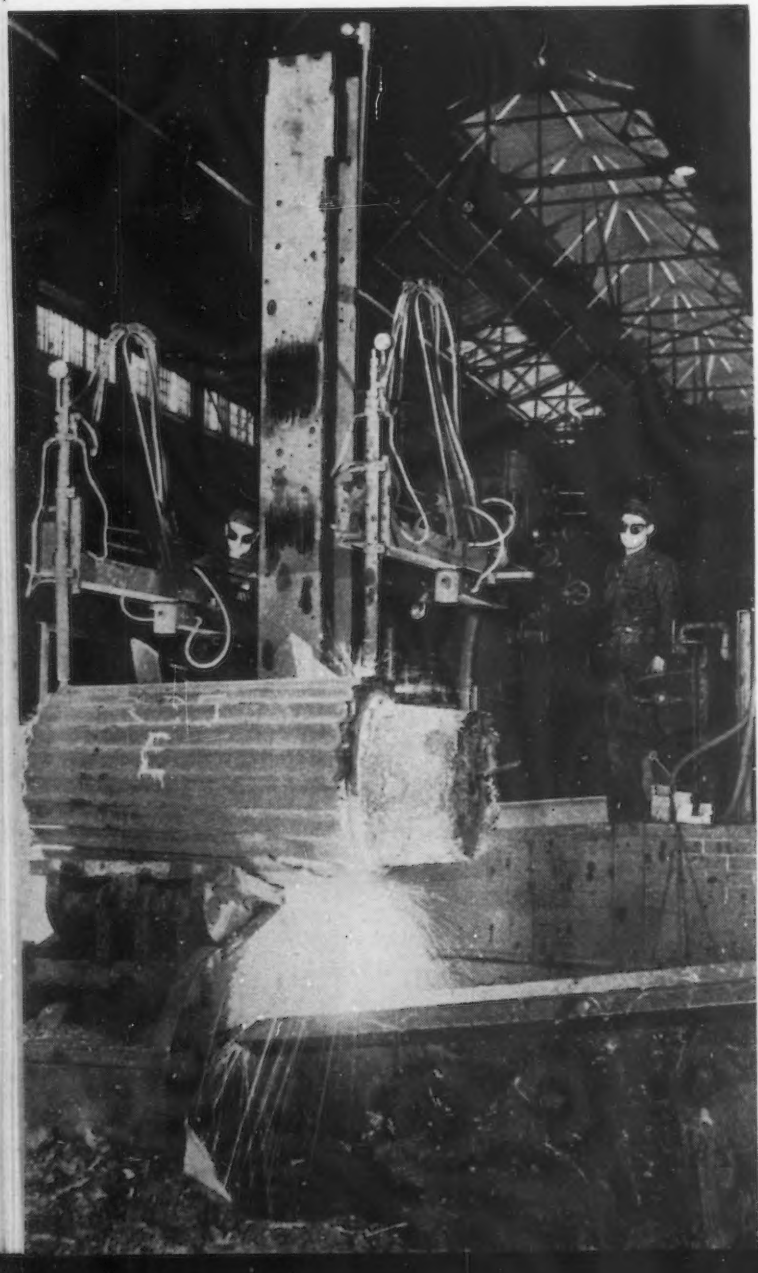
o o o

with plate rollings for the first time. The program is worked out so that if emphasis is shifted, for instance, from cargo vessels to landing barges, the estimated requirements for electrodes can be modified accordingly. In a 10,500-ton Liberty ship, for example, 55 lb. of electrode is used per ton of plate. The ratio is lower for naval vessels.

Oxy-Acetylene Cutting

Gas cutting goes hand in hand with welded plate fabrication and in the average shipyard accounts for 12-15 per cent of the employees in the welding and cutting department. Recent developments in cutting equipment have been refinements intended to increase production and save manhours, principally by multiple cutting methods. As many as 14 torches are being operated from one template, for example, and the stack cutting of 10 to 20 plates has also resulted in reduction in time for setting up, handling and cutting. Nesting has also been employed to obtain the maximum number of pieces cut from a plate. The shipbuilding industry not only employs a tremendous amount of gas cutting equipment but also uses quantities of oxy-acetylene for flame straightening to remove buckles in bulkheads, floors and deck plates which have become warped during welding.

Adoption of mechanical travel to the torches and improvements in nozzle design are extending the field of application of the cutting torch in the steel mill and foundry. The so-called "divergent" nozzle has been one of the noteworthy developments in cutting torches. Despite its name, it maintains a narrow kerf with a straight cut through even the thickest sections. Increased cutting speed, greater precision and the maintenance of higher oxygen concentration to a greater depth are possible with this tip. With equipment of this kind, diesel crankshafts are being torch cut out of 25 to 28 in. thick slabs.



SIMULTANEOUS cropping of 36-in. corrugated flask ingots on each end, employing a specially built ingot cutting machine which follows the contour of the ingot and automatically dumps the ingot after cropping, which takes 18 to 20 min.

Bethlehem Steel photo

o o o

In the steel mill, 32 in. corrugated flask ingots are simultaneously cropped at each end by a specially built ingot cutting machine, which follows the contour of the ingot. Flat ingots up to 40 and 50 in. thick have the hot tops cut off by means of a small portable cutting machine which is simply laid on the work.

Additional attention is being paid to cutting all sizes and shapes of steel to closer tolerances so that machining and grinding can be reduced to a minimum.

Manufacturers of gas cutting equipment predict that flame machining, the process of tangentially removing unwanted metal by oxidization at speeds unapproached by other methods, eventually will take its place alongside the mechanical operations of turning, milling and planing. In the steel mill torch planing of blooms is already a proven operation. Procedures are being developed whereby tolerances of ⅛ in. may be adhered to in rough machining rounds with the oxy-acetylene torch. The immediate future will bring forth more accurate control of alinement and tolerances which should result in widespread acceptance.

In the foundry, gates and risers on steel castings are being flame cut so close to the contour of the casting that no snagging is necessary to smooth the cut surface preparatory to machining. More precise preparation of plates and structural sections used in the fabrication of ships, tanks and vehicles is also being achieved, thus improving fitup and minimizing the use of strongbacks, tie rods and shoring in ship construction, all of which are contributing factors to built-in stresses.

Gas Welding

Oxy-acetylene welding continues to find further use in war production. High speed gas tube welding is producing welded steel tubing for a wide variety of war needs, such as alloy tubing for aircraft use and low carbon tubing for Radar antennae. Hot spinning with oxy-acetylene flames has been extended to the manufacture of aerial bombs, burster tubes, flame throwing units, hand grenades and bomb fuses. Operations include flat and hemispherical closures and by special flame manipulation pressure tight closure of cylinder bottoms can be attained. Oxy-acetylene heat is also being used in the process of forge welding heavy gage tubing to forgings in the manufacture of aircraft landing gear struts. Parenthetically, it should be noted that these parts are

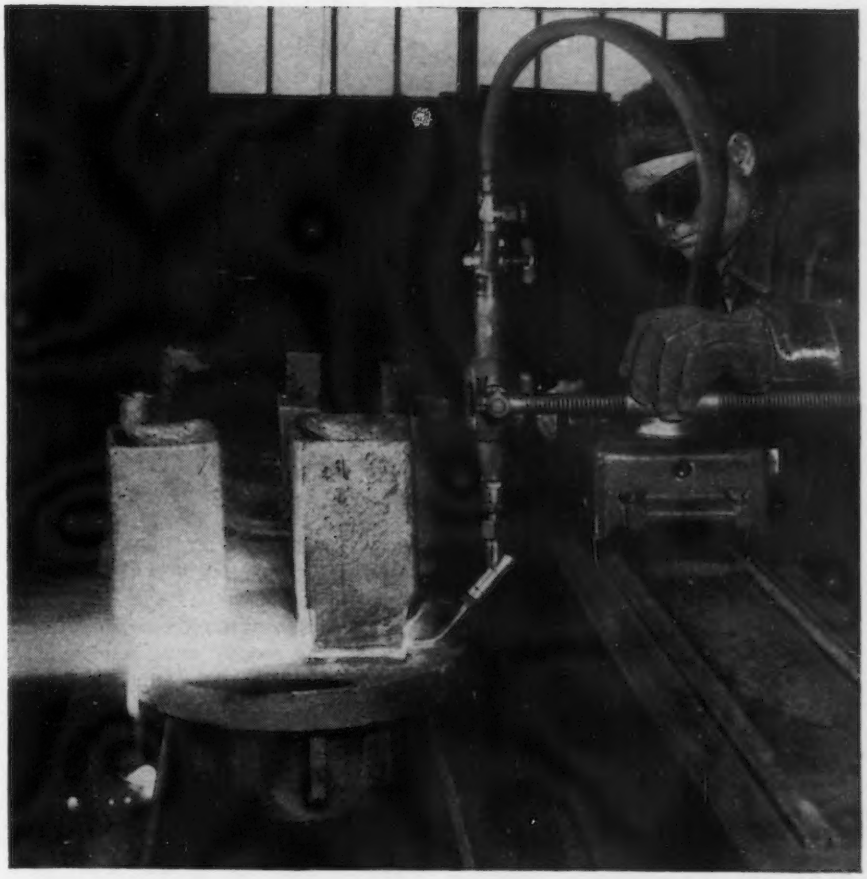
o o o

also being flash butt welded together and experimentally at least the process is being extended up to tubing of 15 and 16 in. diameter, way beyond the present commercial range.

Resistance Welding Trends

In general, the aircraft industry has taken to resistance butt welding with a great deal of energy in the past year. On the West Coast particularly have a lot of new applications been tried, some replacing joints previously formed by gas or arc welding. In fact, more of this type of resistance butt welding equipment is going into aircraft plants than spot or roll welders, with which most of the airplane factories are now well equipped.

Limitation on materials for spot welding electrodes (WPB general conservation order L-318, effective Oct. 7, 1943) by which the use of tungsten or molybdenum in copper alloys is prohibited except in electrode facings or inserts has obviously increased interest in and application of refrigerated tips, which can be made of pure copper. Tests made during the past year indicate that with a special forged cap having internal fins cooled by a refrigerant, as many as 5000 spot welds can be made on aluminum sheet without dressing the electrode faces. With refrigerant there is a notable increase in the number of welds made before pickup becomes evident.



Air Reduction photo

ADAPTATION of a portable cutting unit to machine cutting of risers flush with steel castings. The torch is racked out to cut the second (left) riser and the time of doing this is reduced approximately in half, due to preheat from the torch in the initial operation. With this type of setup a smooth cut is obtained, eliminating the usual snagging operation required after hand cutting with a torch.

On the other hand, more than 15,000 spot welds have been made consecutively without cleaning the electrodes on parts that have been cleaned by a one-step etching process developed at Northrop Aircraft, Inc. The fluid in which detail parts or aluminum alloy assemblies are dipped prior to spot welding consists of phosphoric acid and a petroleum derivative used as a solvent cleaning agent. The tips are not refrigerated. What makes this process particularly advantageous is that the solution has a low enough surface tension to get in between the faying surfaces of assemblies that have been clecoed together in a jig before spot welding. Ordinarily separate cleaning is needed for each detail part.

During the past year techniques have been worked out for spot welding magnesium alloys though they have not been extensively applied as yet. The essential equipment requirements are reasonably high welding current capacity, positive control of pressure and accurate control of welding time. Machine settings are substantially the same as for aluminum and both a.c. and stored energy types of equipment may be used. Electrode cooling is an important factor in pickup although cooling to excessively low temperatures has a harmful effect due to condensation on the points.

Capacitor type stored energy welders, originally designed for aluminum, have been found to be excellent for spot welding thin gages of steel also. The quick shot obtained localizes the heat so that with proper electrode care, strength and uniformity will be obtained in the welds and metal finishing costs reduced since there is no electrode indentation under optimum conditions. Tests made with a stored energy machine on 20-gage hot rolled steel at Yellow Coach & Mfg. Co. indicate that the ideal weld nugget is produced with a voltage setting of 1600 on the capacitor bank with a heat setting of 1140 mf. Shear strength on a single spot is about 950 lb.

Spot Welding Hardenable Steel

During the past year, further research has been carried out on the spot welding of hardenable steels containing up to 0.48 per cent carbon. Successful results have been obtained by a post heat treatment of the welds by a second current flow following the welding impulse. Tests made at Rennselaer indicate that remarkable increases in physical properties are possible for SAE 1020, 1035 and 1045 steel by proper control of the weld cycle time interval between welding and heat treating and the length of the heat treating cycle. For SAE 1035 steel the shear strength is increased 70 per cent and the U-strength nearly tripled by tempering, while in SAE 1045 the shear strength may be tripled and the U-strength increased nearly 10 times. Very great increase in toughness also results in welds that are ordinarily very brittle. Significant improvement in the shear impact strength of spot welds is also possible with the temper treatment. With this technique the heat treating current averages around 90 per cent of the initial weld current inasmuch as the resistance of the weld is considerably reduced after the joint has been formed.

Export

o o o

By FRANKLIN JOHNSTON
American Exporter, New York

o o o

o o o

WHEN I tell you that in a recent three months' trip in South America, I met only 11 other American travelers, not travelling for the government, you might jump to the conclusion that American manufacturers are neglecting their post-war export opportunities.

Anything but! The paucity of travelers is due chiefly to the lack of adequate plane space, steamship travel being out. Indeed, fundamentally, the most important war-time fact about export is the persistent loyalty of exporting manufacturers to their overseas customers.

Loyalty in the face of a situation where, because of the war effort and the demands of the domestic market, they not only do not need export business but export orders are actually often an acute embarrassment. Besides they entail heartbreaking complications and delays in getting export licenses and actually making shipment.

Now this loyalty is to some degree, but certainly not entirely, based on old friendships with valued customers. No, it is also based on a vivid recollection of what export has meant to these manufacturers in times past, particularly after World War I, when exports reached the then highest levels in history at the very time that the United States government disappeared as a customer. Even in the depths of the world depression of 1930-1932 there were some good export markets and export kept more than one factory out of red ink.

In normal years these manufacturers who really cultivate export business will average about 16 per cent export to total sales. That is two months' production per year, and is not to be sneezed at.

In visiting buyers in South America this year, I found that we have learned a great deal since World War I and our post-war prospects are less glittering than we thought they were in 1919 but actually far better.

From 1914 to 1920 export suffered from a "get rich quick" complex. All sorts of speculators, encouraged I am sorry to say, by some big New York banks who should have known better, became export middlemen. They opened up new importing accounts abroad, not wisely but too well, not only shipping huge quantities of merchandise but extending ridiculous terms to Tom, Dick and Harry.

Our export trade was maintained on a huge scale throughout the war and at prices eventually averaging 100 per cent above pre-war. When the armistice came the buyers abroad pyramided their orders, prices kept rising and an inevitable crash occurred.

This time our exports far exceed in quantity and value those of World War I but 82 per cent of it is Lend-Lease. Commercial exports are far below the pre-war period.

However, as regards Latin America there is very little Lend-Lease and while the value of our exports to Latin America today is probably some 40 per cent above pre-war there are no surpluses of merchandise in the market, because European shipments are absent.

Last year our shipments to Latin America were off 20 per cent in value from 1941. My guess would be that this year our shipments will be about the same as last year, possibly larger. But prices are up only 30 per cent as much now as they were at this stage in World War I.

In other words, merchants abroad are not loaded up with merchandise bought at inflated prices. They have very little merchandise. What they have has been bought—if bought direct from American manufacturers or exporters — not at dangerous price levels. For all our criticism of WPB and OPA and the Office of Economic Warfare, we evidently have some concealed assets as a result of their activities.

Criticism of our export methods, because of the amateurs and speculators of World War I, was bitter and antagonized many merchants. I heard nothing of that sort this time.

Of course, there is anything but satisfaction with the war-time controls, but little if any of the criticism I encountered was against American manufacturers or legitimate export merchants.

What I did encounter over and over again was sharp criticism of so-called "fly by night" exporters who seemed to be able often to get merchandise and make shipments to fly by night importers, by-passing the regular channels of trade.

The new decentralization program for handling exports was just being set up when I was down there and was supposed to correct this, and I think it very largely has.

In Chile I ran into some criticism of our packing but never heard a whisper about it in any other market. At the time I was in South America, merchant stocks were sadly depleted yet everybody was making money. What they lost on volume they made up on prices. I did not find even a fair store location for

Post-war prospects are far less glittering than after World War I, but actually are far better. And stories that Americans do not know how to handle Latins, don't understand the psychology of export selling, never learn the language, can't hold their liquor and in general are a bunch of carpet-bag exploiters, just are not so.

rent except in Montevideo, Uruguay, and there they had just had the worst drought in 25 years.

Nor did I hear, with the exception of two rubber companies, of a single manufacturing plant shut down for lack of supplies. Somehow they have managed to get along, but sometimes only by buying materials locally at exhorbitant prices and even in the black market, where there are local price regulations, usually more honored in the breach than the observance.

Let me pay my "respect" to the newspaper writers and authors who only discovered South America in 1939 and forgot that not only did Columbus do so in 1492 but that United States merchants and engineers and manufacturers did so many, many years ago.

So their stories that Americans do not know how to handle the Latins, don't understand the psychology of export selling, never learn the language, can't hold their liquor and in general are a bunch of carpet-bag exploiters who want to make a killing and get back to God's country by the next steamer just are not so.

You will find no better or finer group of businessmen both in ability and in sense of responsibility than the American colonies in Argentina and Brazil. And most of these men will never leave these countries. They have made their careers there and without losing their American loyalty, they are rooted in the lands of their adoption.

When I read some of these newspaper accounts of our Americans down there—and they are largely responsible for our success and our standing there—I think for example of one of these men so freely criticized.

A man with three sons in the American armed forces who has made his fortune in the Argentine. But instead of coming back with his "ill gotten" gains he has bought a big farm 26 miles from Buenos Aires. He had laid this out in orchards but these orchards have wide streets through them, so that his sons or his grandsons can sell the farm for building lots when Buenos Aires, now with a paltry two million population, grows big enough. That's the kind of a "carpet-bagger" he is.

The truth is that American goods are so well liked and our sales efforts so effective that nearly every country in Latin America had been chronically short of dollars since 1930 up to 1942.

That has been our export headache number one down there and it is very encouraging that at long last we are beginning to realize that we cannot sell unless we buy.

This realization has been shown conspicuously by the fact that as against only five Republicans in the House of Representatives who voted in favor of the extension of the Hull Trade Agreement Program, three years ago, this time 144 Republicans voted for the extension. In fact, if these Republicans had not so voted, the extension would have been killed.

Now we owe Latin America a billion dollars and anticipate huge imports also after the war to replenish our stocks. American businessmen no longer talk about "capturing export markets" as they did in 1917 and 1918. We have learned, with some painful lessons, that the ocean is not a one way street.

So you have the spectacle in South America of every grade of political thought from Henry A. Wallace with his plea for the common man, to Eric A. Johnston, who wants to see prosperous industry here through world trade, encouraging and helping South America to increase their output and raise their standard of living.

I found in South America that Americans in general, irrespective of political opinion, believe this is a sound development. They take the broad view that our export future depends on helping other markets to increase their purchasing power.

The narrow view is that, for example, we are foolish to help finance with the funds of the Export-Import Bank the development of the great Volta Redona steel mill in Brazil which, when it gets into production in

● Second only in importance to the industrial revolution in England in the late Eighteenth and early Nineteenth Centuries, there has occurred a second revolution, the rapid industrialization of countries formerly chiefly agricultural, pastoral or mining. The turning point was 1933 when for the first time the curve of world industrial production (excluding the U. S. and U. S. S. R.) drew rapidly away from the curve of international trade, as shown here. Although World War II has greatly stimulated this trend, it is a permanent movement, not a war-born one.

Expenditures

	War Department	Navy Department
1917	$ 459,540,000	$ 257,166,000
1918	5,705,136,000	1,368,643,000
1919	9,265,325,000	2,009,272,000
1920	1,100,866,000	629,893,000
1921	580,795,000	647,871,000
1922	402,058,000	458,795,000
1923	355,723,000	322,533,000
1924	348,606,000	324,130,000
1925	357,957,000	326,365,000

History has a habit of repeating itself. Manufacturers of industrial equipment and supplies will face an abrupt cessation of government buying here, as in 1919. Army and Navy expenditures after 1919 fell off 85 per cent in a single year; 90 per cent in two years. Note how export sales in 1921-25 helped make up for the loss of war orders.

What Happened ABROAD

United States Industrial Exports

	Pre-War Average, 1910-1914	Post-War Average, 1921-1925	Increase, Per Cent
Lubricating oil	$ 5,270,000	$34,439,000	+234
Steel mill products	54,317,000	93,568,000	+ 72
Insulated copper wire and cable	1,992,000	4,498,000	+126
Electrical machinery and apparatus	20,856,000	69,475,000	+234
Industrial machinery	78,553,000	166,526,000	+112
Power generating	12,042,000	30,901,000	+156
Mining, well and pumping	11,467,000	24,783,000	+116
Power driven metal working	11,573,000	13,814,000	+ 20
Textile, sewing and shoe	12,253,000	23,690,000	+ 93
Other industrial	30,610,000	61,681,000	+101
Industrial chemicals	12,748,000	25,165,000	+ 97
Abrasives	1,749,000	4,980,000	+185

1945, is expected to supply Brazil with 60 per cent of its steel requirements.

But I found the representatives of two of the largest American steel companies, both with a large stake in the Brazilian market, not only complacent about this development but perhaps enthusiastic.

They figure that while we may lose some of the low profit tonnage business, we will have a bigger market than ever before for higher grade business.

There may be some doubts as to whether the American taxpayers' money should be used to finance new plants which, while they may benefit our nation as a whole, may destroy the market for some of these taxpayers. It is a delicate political problem.

But there is no question that we cannot stop this new industrial revolution which is taking place in so many parts of the world and nowhere more conspicuously than in Brazil and Argentina, Brazil particularly.

Some Brazilians like to think that Brazil will take the place of Germany after this war. Others seem to think that it was just by chance that we became an industrial nation while they clung to agriculture. Both of these concepts are exaggerated but that's the way some of them think.

In any event, this second industrial revolution is the rapid industrialization of countries formerly chiefly agricultural, pastoral or mining.

The turning point was 1933 when for the first time the curve of world industrial production (excluding the United States and Soviet Russia) drew rapidly away from the curve of international trade. In South America I found some of the British very critical of our encouragement of this trend. They feel we are building up competition for both ourselves and them.

This divergence of opinion between our British cousins and ourselves is one example of how the British are static in their point of view, while we are dynamic. They want to hold on to what they have. We want to expand and are not afraid to experiment. As Eric Johnston told the British recently, they place security first. We place opportunity first.

As in Brazil, all over the world. John L. Keenan in his recent book "An American Steel Man in India" points out that when Tata planned what is now the largest steel mill in the British Empire they got no encouragement in England. But Mark

A. Hanna and George Westinghouse helped them.

In 1907 Brazil's industrial production exceeded the value of her imports by 3.7 per cent. By 1920 Brazilian industrial production exceeded the value of imports by 52 per cent and by 1938 by 300 per cent. This year I dare say the excess is 500 per cent.

According to the U. S. Department of Commerce Commercial Travelers' Guide to Latin America, Brazil in 1937 had 1,671,000 engaged in industry as compared with 8,860,000 engaged in agriculture.

This meant that 14 per cent of Brazil's working population was engaged in industry as compared with 75 per cent in agriculture.

In Argentina on the other hand, 43 per cent of its working population was engaged in industry as early as 1933 as against only 22.6 per cent in agriculture. Almost double in the land of the Pampas.

A Brazilian authority, Jose Jobin's "Brazil in the Making," says that in 1940 the total of industrial workers in Brazil was 1,412,432 engaged in 70,026 plants—an average of some 20 per plant. But they are not all small. General Electric's plant has 1100 people, just 12 of whom are Americans. And a newspaper and pulp mill, using American equipment, has 2000. This operation has 1500 square miles of timber and has, in addition, planted one million eucalyptus trees for fuel.

Some of the industries share in the Brazilian total as follows: Textiles, 22 per cent; foodstuffs, 13 per cent; building construction, 15 per cent; clothing, 8 per cent; chemicals, 7 per cent; and iron and steel, 10 per cent. You will note that metal working industries lag behind the others.

This is true of other markets I visited. Thus in Chile I found that 70 per cent of the merchandise in the Gath & Chaves department store was made in Chile, but in Veiga, Noriega & Cia's hardware store only 10 per cent. But, there are ten plants in Sao Paulo making imitations of a well known South Bend lathe. So you see they don't need much exhortation even from Mr. Wallace to industrialize.

The new industrial revolution is here. It will profoundly alter our export trade, but it can't be stopped. And the American policy is not only more progressive than that of the British but follows the old advice: if you can't lick 'em, join 'em.

So to a large degree, American industry itself has promoted this revolution—the biggest of all South American revolutions by the way. For you find American branch plants on a large scale in both Argentina and Brazil as well as in Australia and even in South Africa.

Contrasting the progressive, if not aggressive, tactics of our people with the static, defensive attitude of the British and the stubborn German emphasis on cheapness, I marvel at the lack of faith in our own export ability which some Americans persistently cling to.

Our exports normally exceeded in value those of any other country in the world. In 1938 our exports exceeded those of either Great Britain or Germany (their exports were about equal) by 23 per cent. Here is how the trade was divided:

1938 Distribution of Exports

	To Europe, Per Cent	To British Empire, Per Cent	To Latin America, Per Cent
Great Britain	28.5	49.8	6.9
Germany	68.4 (1937)	7.2	11.0
U.S.A. (Manufactured goods only, Exclusive of Canada and Newfoundland)	35.4	16.0	27.2

As you see, Germany's best export market was Europe; Great Britain's was her own Empire and it was the United States that really did the world wide business.

In 1938 Great Britain had only 10 per cent of all the exports to Latin America, Germany had 16½ per cent and we had 34 per cent. (Our total share was really far greater since a great many American products are now manufactured in Latin America in American owned branch plants).

When I cited such figures recently a skeptical manufacturer wrote me that if automobiles, radios, movies and refrigerators and airplanes were excluded, we could not show up so well. All right, let's try it. Take Peru, for example. Peru gets out very complete statistics, a 300 page book with 2030 different classifications of imports, showing the amount from each country.

Here is how Peru's imports were divided by countries of origin in 1939 before the full effect of the war was felt:

U. S. A. ..... 41.1 per cent
Germany ..... 14.7 per cent
Great Britain ..... 8.4 per cent
Japan ..... 3.1 per cent

In metals, the principal importations came from the following countries:

United States ..... 16,432,161 pesos
Germany ..... 8,977,629 pesos
Great Britain ..... 1,928,381 pesos
Japan ..... 383,746 pesos

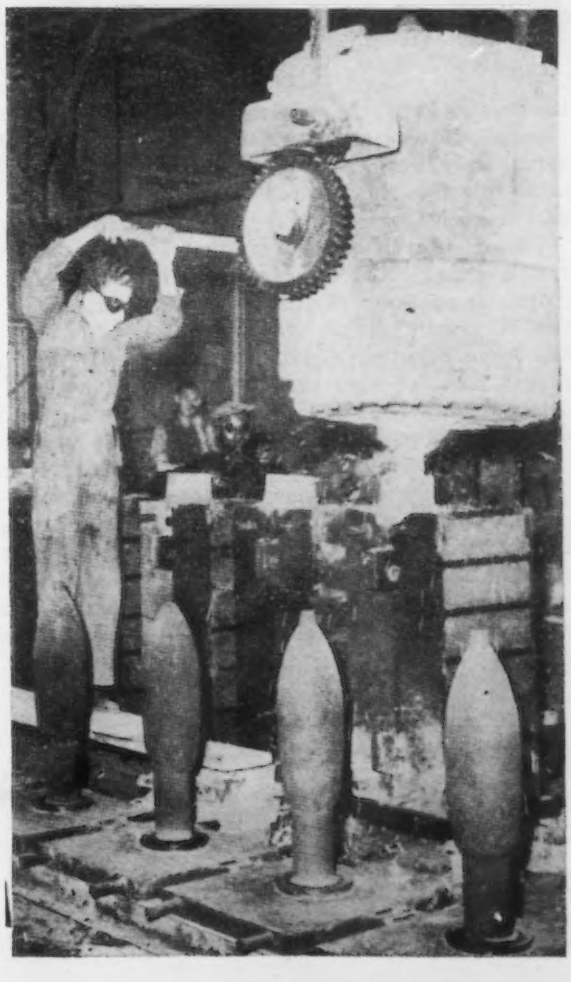
Tools:

United States ..... 40,346,507 pesos
Germany ..... 6,376,883 pesos
United Kingdom ... 5,144,175 pesos
Japan ..... 77,008 pesos

Machinery and vehicles, exclusive of airplanes, parts, automobiles, trucks and parts:

United States ..... 23,890,089 pesos
Germany ..... 5,663,619 pesos
United Kingdom ... 5,025,677 pesos

o o o



● A typical foundry, making bombs for South Africa's war effort.

Japan ..... 13,180 pesos

Incidentally, this manufacturer makes valves and I was interested to note that Peru's imports of valves came principally as follows:

United States	317,529 pesos
Canada	89,806 pesos
Germany	50,059 pesos
Great Britain	30,757 pesos
Japan	379 pesos

I am sure that similar results would be obtained on any survey made of any Latin American country with this qualification—that the nearer the country to the United States the greater the trade we have; the farther the country away, the smaller the percentage—British and German goods being more important in Argentina and Chile than in Mexico, Colombia or Venezuela.

I am constantly puzzled at what I feel is exaggerated consciousness of British competition. British competition is greatly exaggerated and far less formidable than Germany's. The British insist on high profit on their output, however small. They are never afflicted with volumitis. I sometimes think American manufacturers think primarily of volume, but the British think first, last and all the time of the profit. And a steady profit at that. No wild fluctuations.

This near-obsession about British competition sometimes takes the form of suspecting that the British are not above getting materials from us through Lend-Lease and fabricating them to Latin America. This is a libel.

Practically speaking, Great Britain has ceased to ship anything of metal to Latin America, both because of shortages and because of the Lend-Lease agreement. British exports are being maintained at about 60 per cent of par to Argentina but chiefly coal, textiles, earthenware, chemicals, whiskey and other British specialties.

British exports are so bad that no statistics have been published since December, 1940. But Latin American local statistics show that whereas before the war we were outselling Great Britain four and a half to one in Chile and Brazil, now we are outselling them nine to one.

I was told in Chile that only four steamers were alloted by the British to trade with Chile. Two were then in drydock, one had just been sunk off Florida by a U-boat and that left only one operating. I found by personal observation just one British steamer in Argentina's second port, Rosario. In Rio de Janeiro the only British boat I noticed was a former Cunard-White Star liner. Cargo: German prisoners from the Afrika Corps in transit to Texas.

There is one factor about Britain that is hard for us to compete with and that is that where we constantly export more than we import, she does just the opposite. In 1938 for every dollar's worth we exported, we imported only 64c. worth. That's even after the Hull program discounted the Hawley-Smoot tariff. Great Britain, on the other hand, for every dollar's worth she exported, imported $1.75 worth. We now have 80 per cent of the world's gold and everybody is in debt to us. Great Britain, on the other hand, is everybody's customer. And the customer is always right.

Meaning in this case that Great Britain is in a position to bargain bi-laterally with her suppliers, chiefly the Dominions and Argentina—"Buy from those you sell."

Even so, Australia and New Zealand will probably reduce Empire tariff preference after this war, thanks to Lend-Lease and General MacArthur. And it is in the Empire, not in Latin America, that we meet stiff British competition.

And the importance of the British Empire markets are not to be made light of. Despite the limelight on Latin America it is only about one-third of the total export market normally. Europe is one-third and Asia, Africa and Oceania another third.

o o o

● This particular plant, Focos Mexicanos, S. A., Monterrey, Mexico, typifies the new industrial revolution, because its owner was for many years previously an importer of electrical goods from the U. S., and distributer of Frigidaire, Zenith radios, Sylvania radio tubes, etc., but is now a manufacturer only. The plant output is 8,000,000 incandescent lamps yearly, which cares for 95 per cent of the country's needs.

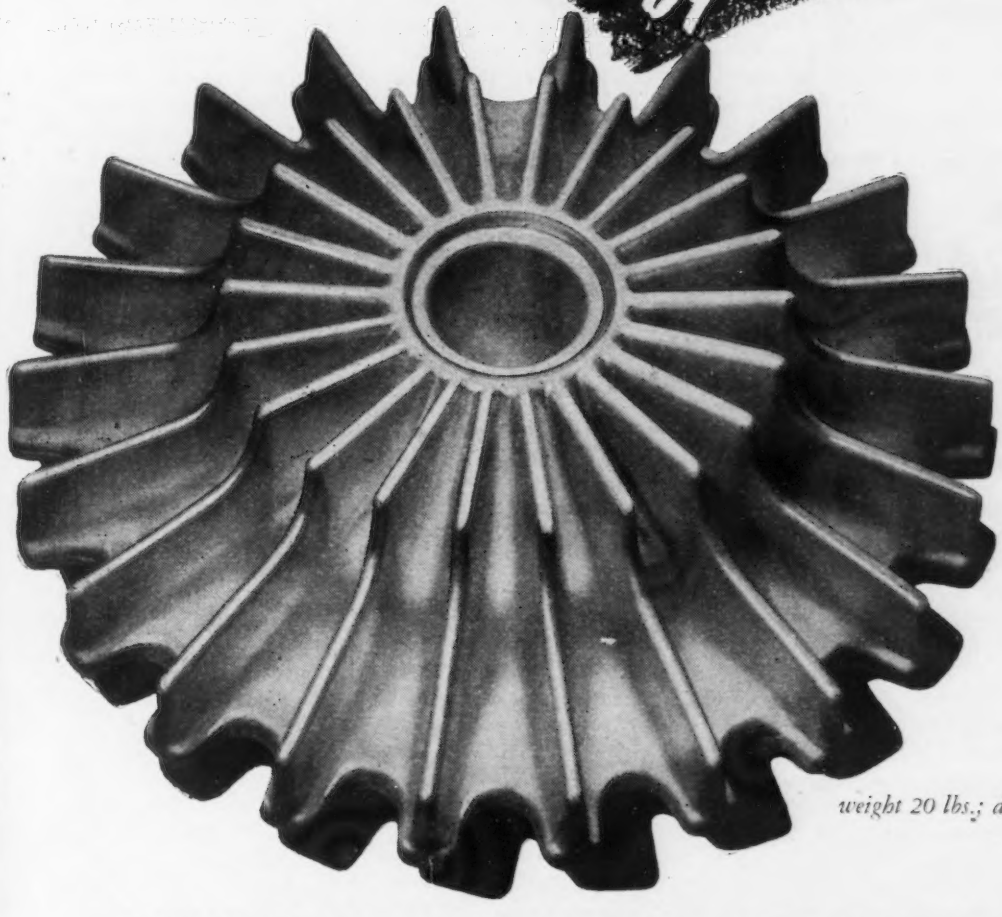
ALUMINUM DIE-PRESSED FORGING by REVERE



weight 20 lbs.; diameter 10¾"

AN INTEGRAL PART OF A TURBO-SUPERCHARGER

The impeller illustrated above—when machined and in assembly—is destined to become an integral part of a Turbo-Supercharger.

It is typical of the strong, close-grained, intricate die-pressed aluminum forgings in which Revere has pioneered so successfully. Revere forgings are also available in copper, various copper-base alloys and magnesium. Almost any shapes and sizes can be had, even those ordinarily pronounced "impractical" or "impossible".

Revere will be glad to offer—*without obligation*—technical advice on any special problems you may have in die-pressed forgings. Write Executive offices.

FREE! A 54 page manual, "Revere Copper and Copper Alloys—Technical Information for Product Designers," with 106 graphs relating to physical and metallographic properties under varying conditions; also, a new, easy-to-read chemical and physical properties chart, with pertinent illustrated information on Revere manufactured forms and welding technique. A complimentary copy sent you upon request. Address: Executive Offices.

STANLEY H. BRAMS

• Unionist Walter Reuther is formulating new plan for reconversion to civilian output, built on central government controls for manufacturing.

DETROIT — Industry may soon be given a New Year present of controversial interest — a second Reuther Plan. The labor leader-author of the original plan which created such a hubbub almost three years ago is hatching a new program, this time for reconversion to peacetime production.

Mr. Reuther's thinking, whether right or not, is brass-tacky enough to start another widespread debate. It is socialistic enough to kindle philosophic argument. And the viewpoints may be those of a large enough segment of labor to make the issue a compelling one.

At any rate, because Mr. Reuther is one of the most articulate of the union leaders, this program might turn out to be controversial as was the original blueprint of 1941, purporting to show how the automobile industry could turn to mass production of bombers, and do it in stride.

The original Reuther Plan was founded on an engineering fallacy. The objective was good, but the methods for doing it had no basis in sound practice. In his new plan, Walter Reuther appears to have profited from his first experience. The conclusions reached thus far, while arguable, represent the end-products of viewpoints rather than provable or rebuttable claims of fact. This makes rejoinder difficult.

The keystone of the new Reuther program is quite obviously a more intense and widespread government control. This obviously infers that Reuther expects labor to continue to be a most powerful factor, if not the most powerful, in Washington after the war. Otherwise, of course, labor would not want to trust its destinies to a federal bureaucracy—an anticipation which, after all, may be the great blind spot in the forward vision of labor or any other organization which offers itself to a government for handcuffing in the fond belief that whenever it chooses it can have back the key to the cuffs.

Mr. Reuther first proposes a "Peace Production Board" which would allocate material, manpower and tooling to all companies in the immediate post-war period. The proposed PPB would be drawn from the ranks of government, labor, industry, agriculture and consumers. Its governing policy on production would be "Social Priority." a system of ranking under which the most urgent civilian needs would receive top preference. Apparently free enterprise would have little place in this program.

MR. REUTHER feels that the automobile industry may be relegated to second place in the consumer market by the housing industry if his beliefs in social priorities prevail after the war. He feels that an enormous housing program is necessary after the war, generated in prefabricated home factories, not only as a means of satisfying the living requirements of hundreds of thousands of families, but also as a means of absorbing temporarily unemployed men in work. The Reuther jigsaw is further fitted with the point that production of housing should be undertaken in surplus aircraft factories after the war.

Implicit in this planning is the inference that if business does not undertake the housing job—or any other job which seems socially necessary—it will be up to the government to do it.

Disposition of government-owned plants is conditioned in the forthcoming second Reuther Plan, by necessary assurances from lessor companies that they will maintain adequate wage standards, guarantee continuous employment and produce socially necessary commodities at fair prices. But government plants in strategic or semi-monopolistic industry should be retained in Washington's hands, Mr. Reuther believes.

Mr. Reuther's forthcoming plan also will propose (and solid backing for this point is evident in further remarks of a recent statement by UAW President R. J. Thomas to a House Committee) that the entire concept of the federal patent system be changed. A central government research agency is proposed to coordinate all research work on patents and advances in technology "and to make certain that technological and scientific knowledge is universally applied in the public interest." Amplifying this, Mr. Thomas urged that "under the guidance of government there shall be a full pooling of technical and scientific resources for the development of new products and methods to provide at lower prices fuller supplies of essential or desirable goods or services for the people." Quite obviously any such program, an extension of the war system of patent pooling, means the death of idea rights as they have always been known in this country.

POST-WAR labor policy should be determined now, Mr. Reuther believes. Primary in any such thinking should be the establishment of a 30-hr. week, the pay envelope to be as fat as it is today under a 40-hr. week. Technological progress, says Mr. Reuther, makes 30-hr. work of today the production equivalant of 40-hr. schedules ten years ago.

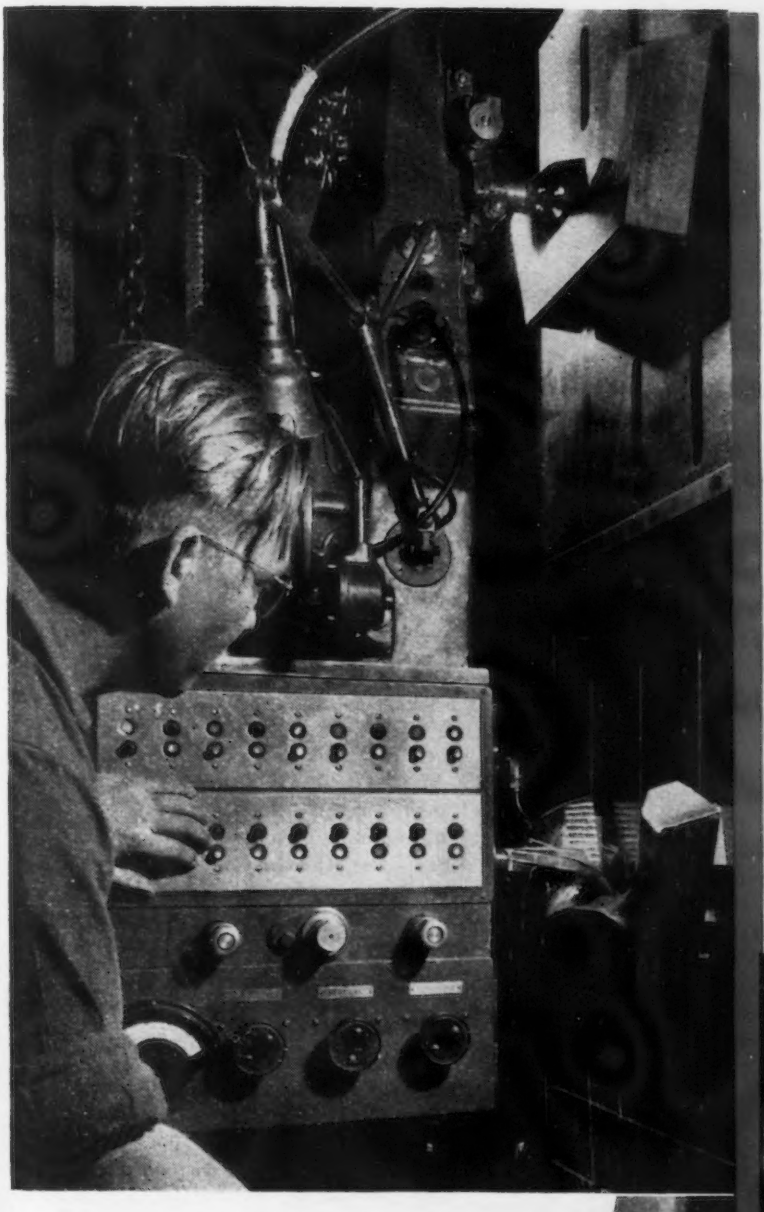
He also proposes a two-month vacation with pay for most of the nation's war workers when the arms program ends, as a means of "restoring health" of overworked men and women and also as a cushioning of plant shutdowns during tooling for peace production.

One other phase of the post-war labor planning would be the establishment, mandatorily, of management-labor councils in every industry, with consumers added to these panels to insure fair play by both sides.

Backing up this program in industrial plants would be a schedule of public work to be undertaken under the Peace Production Board, "not as a glorified WPA," but as a "permanent part of a healthy, expanding national economy." Apparently this new public works program would be an equalizer for slack or fat times in what we now consider private industry.

With reference to automobile manufacture, Mr. Reuther has a proposal first brought up about ten years ago and then dismissed noncommitally in a report by Leon Henderson on the

"Pre-Converted"



BUT STILL AT WAR

HERE you see the versatile Keller — the machine with the mechanical-electrical brain that was "pre-converted" for peace the day it went to war. With in-built ability to stand the gaff twenty-four hours a day, this Keller is still on its wartime job, speeding aircraft production in one of America's big plants.

But when its war work is over there will still be no rest for the Keller — no time out to be rebuilt or adapted for peace. It was pre-converted to start with, and its "brain" will function with the same speed and dexterity in shaping dies or parts for the postwar products of tomorrow. It will continue to serve the designers, engineers and production men who (soon we hope) will be setting their sights higher than ever in the coming fight to win the peace . . . to produce more and better . . . at the lowest possible cost.

Right — Speeding aircraft production, this Keller is automatically shaping a vital part, as its mechanical-electrical brain follows the template shown at the top of the larger picture. Operator sets up the job with push buttons — the Keller does the rest.

PRATT & WHITNEY

Division Niles-Bement-Pond Company

WEST HARTFORD, CONNECTICUT, U. S. A.

stabilization of automotive employment, prepared for NRA.

It is suggested that a sliding price plan be worked out by the auto industry acting in concert, so that during slack winter months delivery price would be, say, ten pct. below list price, while in the boom spring months the price would be advanced ten pct. or so over list. The objective, of course, would be to stabilize employment in the factories.

ANOTHER plank of general interest has not yet been completed by Mr. Reuther, but likely will make its appearance in the forthcoming plan in one shape or another. In brief, this thinking is to expand single product industries, like automobiles, into multi-product facilities. The example he cites is an automobile plant which could be used to manufacture stokers, to take up employment slack during its automotive retooling period.

The engineering fallacy in such latter suggestions is apparent and should be easily provable to the unprejudiced juryman. It is reminiscent of the factual mistakes which were strewn through the original Reuther plan.

However, the actual formulation of the new plan offers a lesson to management. In much of its conversation, indignation and asseveration on reconversion and post-war planning, industry has never publicly outlined the complete machinery of its proposals as clearly as Mr. Reuther has even in the preliminary makeup of his plan. Industry, so far as the public record has gone, has proposed little beyond request for payment of a proportion of its claims to assure capital for operations, and request that its factory floors be cleared to open up space, etc. Mr. Reuther, too, talks in terms of broad objectives, like social priorities. But there a similarity ends. Mr. Reuther goes on to describe how such objectives are to be reached, while the chapter and verse of management proposals are lacking.

G-M Sales Head Retires

Detroit

• • • **Richard H. Grant, vice-president in charge of sales for General Motors Corp., will retire Jan. 15, it was learned, but will continue in an advisory capacity for the corporation. No successor has yet been named.**

U.S. Exports Most Lend-Lease War Planes and Motor Vehicles to Russia

Washington

• • • **Russia**, although she came late into the field of Lend-Lease, has obtained more war planes and motor vehicles from the United States than have been exported to any other country under the Lend-Lease Act, according to a statement by Leo T. Crowley, Foreign Economic Administrator.

Up to Oct. 31 the United States had shipped to the Soviet Union 7000 planes, 3500 tanks, 130,000 submachine guns, 150,000 trucks, 25,000 jeeps, 225,000 field telephones and 750,000 miles of field telephone wire.

Industrial products sent to Russia, which helped her to expand her own production of munitions, included 1,000,000 tons of steel, 350,000 tons of nonferrous metals, 400,000 tons of chemicals and explosives, 600,000 tons of petroleum products and 18,000 metal-cutting machine tools.

The money value of shipments of Lend-Lease goods to Russia up to the end of October was $3,550,443,000, or about 27 per cent of the total amount of Lend-Lease aid granted to the United Nations. Of the Russian total $1,991,102,000 represented military items.

Removal from Lend-Lease lists of some of the capital goods which Great Britain has been obtaining from this country, along with munitions and foodstuffs, may be announced soon in line with a policy to confine the aid to actual war activities. Capital goods purchases would still be subject to export controls.

Ordnance Contractors Being Given "Rebuilding" Contracts for Equipment

Cleveland

• • • **Recently requested** by the War Department to re-manufacture tanks used in replacement training centers, tanks which are badly in need of repair as a result of the intensive training given tank crews, Federal Machine & Welder Co., Warren, Ohio, is now handling this work. The tanks will be as good as new when Federal is through with them, and they will be returned to the Army for future assignments. Federal was picked for this work because of the experience in tank production and its record of high quality production.

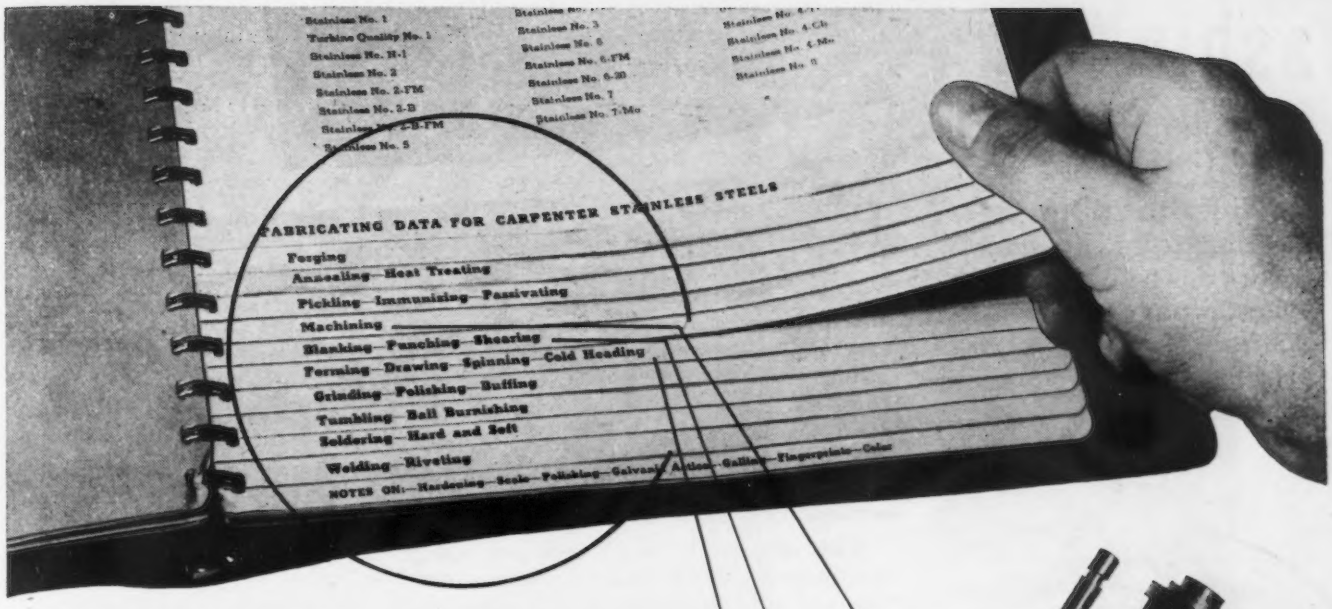
Other ordnance contractors in this district, because of equipment and past experience, are better able to handle the recent repair and salvage program on scout cars once tentatively scheduled for Federal Machine & Welder. Contractors with plants originally designed to produce scout cars will continue on the job of remanufacturing them, and tank contractors with facilities for the production of tanks will continue to remanufacture tanks.

Commenting on Federal Machine & Welder's record, Col. H. M. Reedall, chief, Cleveland ordnance district, said: "Federal Machine & Welder's qualitative production record is excellent, and, in taking over the remanufacture of these tanks, they are performing a dual function . . . filling an important assignment in the war production program and performing a specialized sort of manufacturing at a very considerable saving to the taxpayer. These tanks, coming off the line at Federal, will be the equal of anything turned out new anywhere, and at the cost of 30 per cent of a new tank."

"Fluctuating demands, determined only by the progress and needs of the Army, make it important that ordnance contractors be able to make any production conversion schedules may call for," Col. Reedall added. "New tactics in the field, employing wider use of bombing, and heavy artillery, have been a factor in the tank cutback."

"No one can predict," continued Col. Reedall, "what our demands will be six months from now and we must be prepared to make changes accordingly. We try to anticipate the need, and are ready to re-allocate our contracts, if necessary, in the best interests of war production."

Recently Federal turned back voluntarily to the government over a million dollars saved by reducing the unit cost on the General Sherman tank.



HERE'S A GUIDE

for speeding output of Stainless parts

Hard-pressed production men continue to express appreciation for this book "Working Data for Carpenter Stainless Steels", and the many ways it is helping them speed production of vitally needed Stainless parts. Says one production superintendent—

"...It has opened my eyes to the fabricating possibilities of Stainless Steel." Says another: "By showing what I can expect in working various types of Stainless, this book has certainly been helpful."

And helping Stainless users to solve fabricating problems is no new job to us at Carpenter. Ever since we pioneered the first bright, ductile Stainless Strip... ever since Carpenter's invention of Free-Machining Stainless... our representatives, metallurgists and research men have been in the front line of this business of problem-solving.

It's always been Carpenter's policy to share its "know-how" and experience with Stainless users. So, if you'd like a copy of "Working Data for Carpenter Stainless Steels" drop us a line on your company letterhead. And for personal cooperation on your tough fabricating problems, call in your nearby Carpenter representative.

Easier, Faster Machining, but better valve action, too, because these parts were made from Free-Machining Stainless Steel.

Faster Press Speeds with Stainless that responds easily and uniformly to your press operations. And Carpenter Stainless Strip works the same, coil after coil.

Fewer Rejects on drawn parts, thanks to the uniformity of soft and ductile Carpenter Stainless Strip.

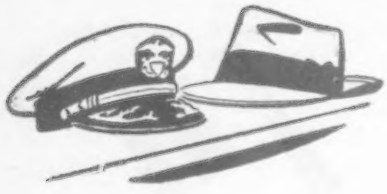
Washington . . . .

L. W. MOFFETT

• The situations Bernard Baruch has been asked to clean up should never have happened . . . Prices of excess steel being sold indicate dumping.



WASHINGTON — Until the Baruch report on contract termination is issued and put into effect chances are good for confusion to continue unchanged in this highly important field.

Supporters of Mr. Baruch say that he and his capable assistants cannot be expected to perform miracles in solving these problems of unparalleled difficulty and magnitude when criticisms are made for the lateness of the report. It is clear that Mr. Baruch has refused to be hurried and feels that the failure of other Government officials to evolve a proper and workable program in more than a year shouldn't be laid at his feet if he does not issue a report in a few weeks.

Nevertheless, the situations Mr. Baruch has been asked to clean up such as rubber and manpower, terminations and surpluses, should never have happened.

In every case, the snarls are directly traceable to the President who has refused to delegate authority to those he has chosen to execute policies and who has also been inattentive to the most pressing of the home front problems until forced to action by the frightful prospect of the railroad and steel strikes. Also, Mr. Roosevelt has had a remarkably unfortunate record in his choice of war and business administrators, both civilian and military.

PRICES which the War Department is approving in the sale of steel inventories amount to dumping. For instance, according to the War Department, the contract of one steel consumer was terminated who had 5000 tons of uncut steel rods and bars. On the average the steel cost $56 a ton. It was sold for $30 a ton. The Government took the loss and the consumer was paid in full, in the settlement of his contract.

WPB officials say that this is general practice rather than the exception and if it is followed after the European war is over, steel prices will collapse in spite of the fact that OPA may soon permit limited price rises to compensate for increased labor costs. Because if the 10,000,000 to 15,000,000 tons of steel which will be above ground and excess as a result of drastic cutbacks in military programs are sold at sacrifice prices under the Army dumping procedure, even the prices to the Government will be inevitably dragged down on new contracts.

The War Department had no adequate method of maintaining inventory on other than major military items. For this failure, the War Department has been needled by the Truman Committee which has pointed out with inescapable logic that the War Department cannot possibly know what it needs in the way of more equipment, nor be able to decide what property if any is excess, without adequate property inventories. The War Department has opposed the creation of a single civilian agency with power to dispose of all surplus commodities because it wishes to retain its authority over property disposal, and because the permitting of another agency to sell the goods and deposit the receipts in the Treasury will interfere with War Department requests for large appropriations, WPB officials say.

High WPB officials say that the War Department does not have personnel who are experienced enough to devise procedures to execute the sale of the millions of items which will have to be disposed of under the War Department regulations. These officials say that the War Department needs more business men.

It is reported by WPB that Mr. Baruch will advocate the creation of a single agency to handle the surpluses and to set definite policies which will prevent dumping.

The creation of a new civilian agency to handle surpluses will also kill the crippling disadvantage that surround nearly all sales of surplus properties today which are governed by the rulings of the various agencies which have control over the property.

AS a result of all the confusion of jurisdictional lines between agencies on property disposal, the WPB Redistribution Division says that the Smaller War Plants Corp. is edging its way into the situation.

WPB officials think that they should be permitted to tell the other war agencies what is surplus and direct the sale of the amount and kind of property which it thinks the Army should get rid of. Of course, the War Department flatly rejects such proposals as an invasion of its authority.

Also, while the War Department claims that it has satisfactory working policies on the priority of contract terminations, the Truman Committee is not convinced of this fact, nor is another very highly placed Administration official.

WPR Redistribution officials complain that they have no adequate authority over the disposition of machine tools of contractors in the process of termination. WPB Facilities Bureau and the Machine Tool Division alone have the authority.

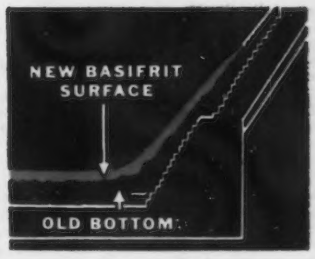
In connection with the disposal of tools, the proposal has been made that the surpluses in this type of equipment is now so overwhelmingly great that dealers should be permitted to buy them for speculative purposes. This would help a great deal, the Redistribution Division says because machine tool dealers have already performed a valuable function in the redistribution of surplus tools to war contractors.

Copper Relaxation

• • • **The use of copper** in farm tractor radiator fins and power take off gears is now permitted. Order L-170-a, as amended, removes the previous restrictions.

To Keep Them Pouring

Resurface Open Hearth Bottoms with BASIFRIT



HERE'S a suggestion to add hundreds of heats to the life of that open hearth furnace whose bottom is old and unreliable: Resurface it with Basifrit.

Briefly, here's how: Before the furnace goes down for repairs, wash it down, using coke breeze on the banks and blowing them down with air about every hour. Run slag out every two hours. Continue until the hearth is washed down about 6 inches. Then start resurfacing. Throw in Basifrit with shovels, *without any admixture of slag* The quick-setting Basifrit burns in almost as fast as it can be shoveled. Apply additional layers, one after another, and finish with a light slag wash. Cool until cracks show, then heat up, coat with raw dolomite, and charge. Take off two or three heats before shutting down the furnace for the repairs. The whole job takes 52 to 54 hours.

Resurfacing is just that simple—with minimum lost production. In fact, resurfacing time is not lost time, because it is soon more than made up by reductions in delay time between heats. And you have a sound bottom to protect the quality of your steel.

Basic Refractories Engineers are always at your service on any problem of hearth construction, repair or maintenance.

BASIC REFRACTORIES, INCORPORATED

CLEVELAND 15, OHIO

Briefly Told—

International Harvester Buys Tract . . . Blood And Guts Copy Urged

● *International Harvester Co. has purchased a 375-acre tract on the east bank of the Mississippi River between Alton and Wood River, Ill., on which it will construct a post-war farm equipment manufacturing plant. Designs call for a single story plant, including foundry, forge shop, machine shop and warehouse with a central heating plant. Approximately 3500 people will be employed.*

●

● **"Blood and guts" copy is needed to combat some types of absenteeism Lukens Steel Co. believes. Accordingly, the firm inserted a series of advertisements in the Coatesville (Pa.) Record, all built around a picture of a guy "taking it easy," with full copy that heaped scorching ridicule on workers who report off because of a hangover, spend the day at the track, or the night over the pasteboards.**

●

● *Bituminous coal miners, working under a contract with the government dug 12,975,000 tons of coal during the week of Dec. 11, largest since the week of March 26, 1927, when the miners dug 13,320,000 tons of coal. Average employment in the bituminous coal mines in 1927 was 593,918 men. It is estimated that there were nearly 200,000 men less than this number employed in the mines during the week of Dec. 11.*

●

● A railroad train reaching 2580 miles—almost across the country—would be required to haul the iron ore, coal and limestone now being used annually by Republic Steel Corp. According to *Republic Reports*, the steel company is now using ore at the rate of approximately 10,200,000 tons per year, coal at the rate of 7,140,000 tons annually, and limestone at the rate of 3,120,000 tons annually.

●

● **Because Parker Appliance Co., Cleveland, did not wait for approval of the WLB before granting wage increases negotiated with five AFL unions, $50,000 in labor costs will be disallowed as a deductible expense for income tax purposes or in determining costs.**

●

● While Canada has sharply reduced her cargo shipbuilding program there has been no slowing down in the building of fighting ships. C. D. Howe, Minister of Munitions and Supply, stated that Canadian shipyards established a new record in November when 11 escort vessels were delivered.

●

● The Gillette tire plant of the United States Rubber Co., Eau Claire, Wis., which has been operating as the Eau Claire Ordnance Plant on .30 cal. machine gun ammunition for the past year, has turned out its last cartridge, and the last of its special machinery has been dismantled. The plant will be reconverted for producing synthetc rubber tires for military needs.

Republic Suffers From Strike of 300

Massillon, Ohio

● ● ● **More than 300 employees of** the Enduro Division of Republic Steel Corp., at Massillon, Ohio, went on strike on New Year's Day in an attempt, according to the company, to dictate a change in work schedules in order to obtain additional overtime. The division has been working 18 turns or six full days, but increased demand for stainless steel for aircraft has made necessary an increase in the work schedule to 20 turns. Normally, such a change would be made by inaugurating a swing shift so that the men work 48 hr. a week, 8-hr. of which are at time and a half pay. The USWA-CIO demands that the work be arranged so that the men work seven days instead of six, thereby requiring the company to pay double time for the seventh day. To meet these demands, the company states that the entire corporation's scheduling procedure, which has been in effect for many years, would have to be changed.

Open Hearth Strike Halts Lukens Steel Co.

Coatesville, Pa.

● ● ● **A surprise walkout** of workers closed the open hearth department of the Lukens Steel Co. here last Friday. Approximately 200 pit crew workers walked out Thursday night during negotiations over a series of demands the men had presented. Ten open hearth furnaces were shut down. The men returned Saturday morning.

Sloss-Sheffield Strike Cripples Whole Area

Birmingham

● ● ● **At least 16 plants** employing about 13,000 persons in this area were shutdown by the middle of last week due to gas and power shortages caused by the Tuesday strike of Sloss-Sheffield Steel & Iron Co. workers.

All operation at Sloss-Sheffield were abandoned on Tuesday when a walkout of 79 commissary and office workers was joined by the company's blast furnace and by-product workers. Shortages of power and gas caused when four blast furnaces were banked forced the closing of the company's coal and ore mines and has generally disrupted the functions of the entire area which depends in part upon Sloss-Sheffield for both gas and power. About 6000 tons of pig iron was lost.

The altercation with the workers resulted from a WLB decision making work rules retroactive to Oct. 20, 1943, instead of back to October of 1942 as requested by these District 50, UMW, members. The strikers returned the night of Dec. 29.

NEW THREAD-GRINDING ECONOMY ON COMMERCIAL PRODUCTION

Greatly increased production of thread grinding which produces a far more accurate and precise thread of superior finish than possible with other methods, may be achieved with Sheffield Precision Thread Grinders. These are the first American designed machines on which either the multi-ribbed or single-ribbed wheel may be used.

The finished thread may be formed in one plunge cut with the multi-ribbed wheel—high production of high quality. Multiple threads are ground in one pass without necessity for precision indexing.

Fine threads can be ground AFTER hardening, especially on thin-walled components, eliminating objectionable stresses and possibility of distortion—also assures thread being held concentric with other ground diameters and threaded sections of work part.

Substantial savings in operating time over conventional machines make it more economical to grind threads with a Sheffield Thread Grinder. Also because of these savings, it is now feasible to grind threads formerly produced by other methods.

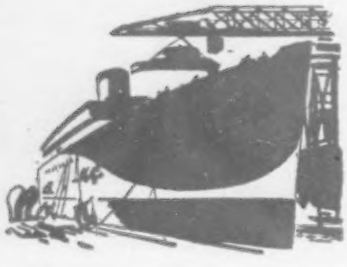
WEST COAST . . .

OSGOOD MURDOCK

• Geneva seems to offer no more conviction nor official assurance for future steel than it did for world peace . . . Gray iron foundries inactive, with unpromising prospects.



SAN FRANCISCO—No less widespread nor irresponsible than speculation on the whether and when of the second European front have been rumors, conjecture, false steers, reports and denials on the whether and when of the $200,000,000 plate mill at Geneva, Utah, now over 90 per cent complete and which will be ready about March 1 to supply a major share of such ship plates as will probably be required for Pacific Coast Maritime construction after that date.

An apparently entirely unauthorized flash press wire over a weekend from Washington last month produced banner headlines in unsuspecting commercial papers on the West Coast, and in the parentally proud Salt Lake papers to the effect that the mill would not be operated, at least in wartime. Traced to their supposed source with WPB in Washington, the dispatches were denied, but there seemed evidence that this particular war program is still under discussion. Maritime Commission wants the plates. Defense Transportation wants to save freight cars by shipping plates from Utah instead of Chicago or Pittsburgh. War Manpower wants workers, of whom it will take 5000 to 8000 to operate the mill. WPB husbands materials and its steel division is conscious of a generally easier national steel situation. Meanwhile Defense Plant Corp. holds a pretty big bag and is proud of the earnest enthusiasm and competence in overcoming obstacles which have been reflected in the administration of E. M. Barber, vice-president of Columbia Steel Co., as construction contractors, and Walter Mathesius, president of Geneva Steel Co., as contracted operating organization. Mr. Mathesius personally is sincerely and enthusiastically impressed with the economic and startegic importance of this plant, not only for the emergency but in the long run, and he has dedicated his energy and his organization to prove its present and future value and the wisdom of its creation.

A few weeks ago WPB announced the halting of further construction on the structural mill. Arrangements have been made for storing scheduled materials as received, so that this unit of the plant could be completed later. It represents less than 10 per cent of the entire Geneva operation and is probably 80 per cent complete already. Its urgency for emergency needs is not as great as plate production. Barring political interference or production slowdowns as the result of sniping by arm chair economists, there is now every probability that approximately one-third of the total rated plate producing capacity of the plant can be in full operation about March 1. Plans are tentative to heat the first of three furnaces the first week in January, to be followed soon by operation of three open hearths, so that pig iron, ingots and slabs can be in readiness for rolling.

REALISTIC steel executives in the Far West, both in production and sales, feel that the Geneva plant will operate economically, that it is strategically situated especially for raw materials, that its capacity is no greater than that of the Pueblo operations of C.F.&I. which has proved practical for the past several decades, and that although it is unbalanced and larger than would have been built under normal circumstances, it seems ill advised to consider halting or limiting the operation at this late date, when so much has been spent, within a few short weeks of operation, and particularly when plates are still urgently needed on the West Coast and rail transportation is desperately short.

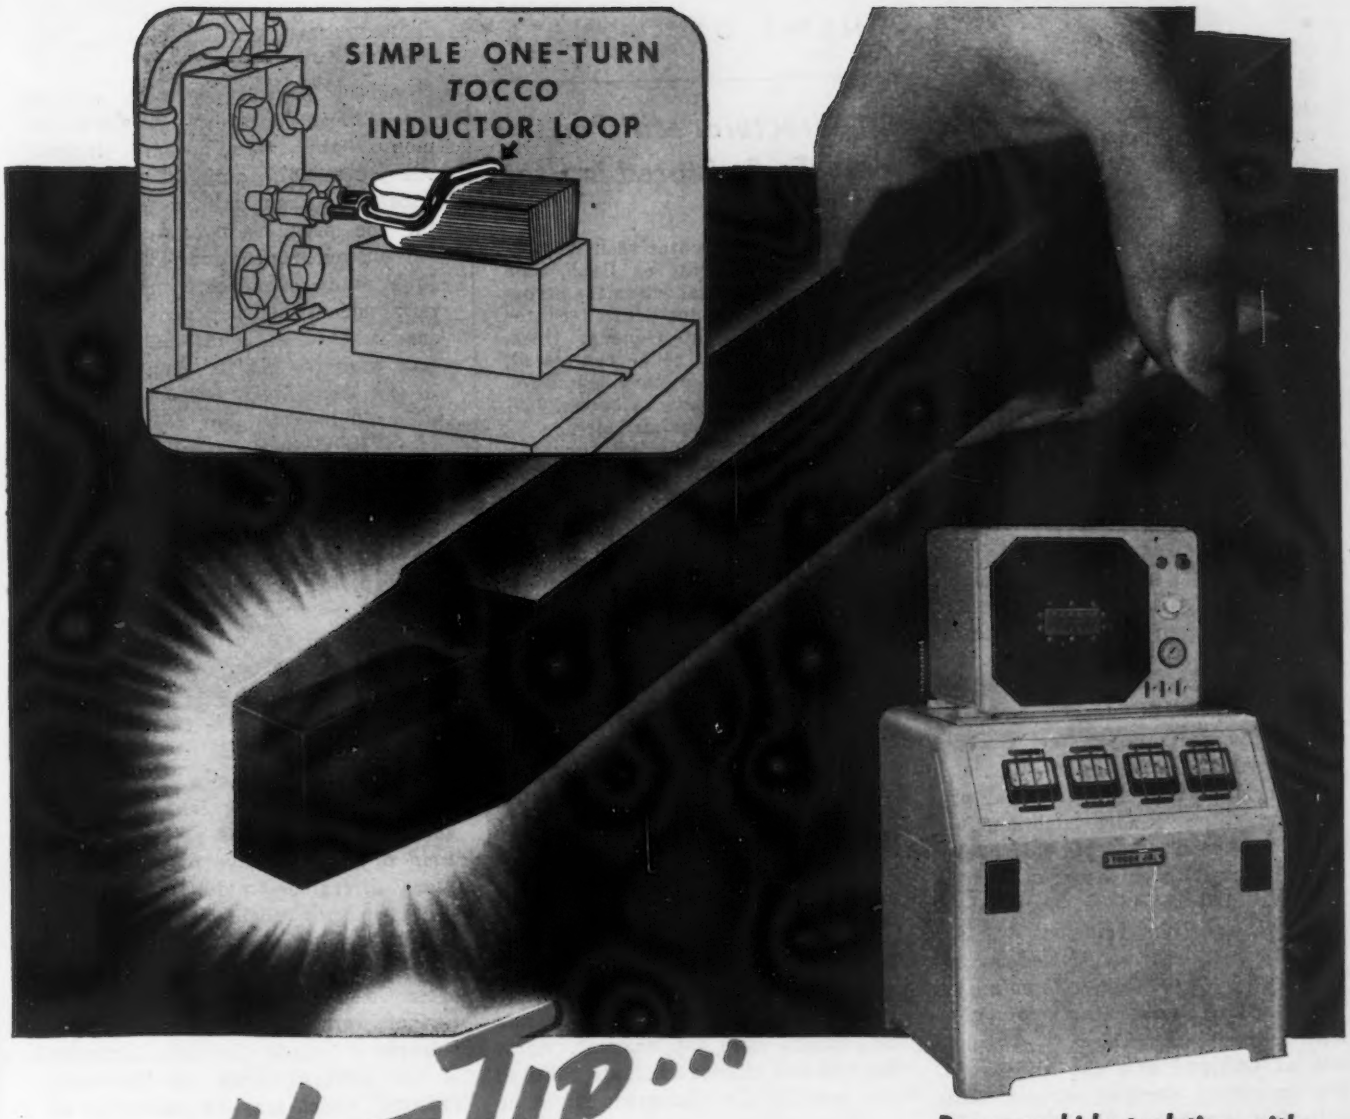
It is reliably reported that Senator Pat McCarran is arranging February hearings, in southern California and later in Salt Lake, to go into steel plant situation on the West Coast, particularly in connection with the California Commission on Interstate Cooperation of which Attorney General Robert W. Kenny is chairman. This record and forum would undoubtedly offer an opportunity for beating the tom-tom for home enterprise and development of natural resources and especially the decentralization of industry and the machinations of monopolies and trusts. If the West Coast steel production of the future is to depend upon the result of Senatorial or Congressional hearings and decisions resulting from pressures and unseen influences at Washington, prospects are dim indeed.

EYEBROWS have arched and tongues are in cheeks since OPA permitted Kaiser Steel to charge the Maritime Commission, retroactively to October, for plates from Fontana at the rate of $64 a ton. This is equivalent to the Chicago mill price plus all rail freight to the West Coast. Mill prices on the West Coast hitherto have been based on water freight from eastern seaboard, and on this basis, carbon steel plates would have been sold, if they had been previously produced, for $53 a ton. Compared with the Sparrows Point, Chicago and Pittsburgh at $42 a ton, even the former $11 water rate differential was criticized as an undue handicap to Pacific Coast industry. When the Kaiser plant was established at Fon-

First Pig Iron Made At Geneva Co. Plant

Salt Lake City, Utah

• • • Pig iron production began Jan. 4 at the Government's new $180,000,000 steel plant near Provo, Utah, with the blowing in of the first blast furnace. This plant is operated for the Government by Geneva Steel Co., U. S. Steel subsidiary. The first iron will be tapped within 24 hr. This furnace is one of three which have been erected at the new plant. Each furnace has daily capacity of 1100 tons of iron. Iron ore was brought to Geneva from Columbia Steel Co.'s open pit iron mine near Cedar City, Utah. Cope production started Dec. 14.



A Hot Tip...

Braze carbide tool tips with this "TOCCO JR. 7½"... the new low-cost "heat-treating department" with a multitude of uses.

● Simply place the prepared shank and tip in the TOCCO inductor, press a button and in 10 to 30 seconds the tool tip becomes red hot . . . so quickly the tool often can be removed with the bare hand before the heat has time to reach the far end!

Timing is automatic, accurate to a split second.

All sides of brazed joint are heated simultaneously, uniformly.

Speedy heating affords high rate of output.

Three sizes of inductor loops (which can be made readily in your shop from standard copper tubing) cover the average range of tool sizes.

Clean, cool and compact, the "TOCCO JR." is ideal for the tool room or production line.

By simple change of work fixture, the TOCCO machine can be adapted to brazing, hardening, annealing or heating for forming of a wide range of parts . . . for war or peacetime production.

Ask for bulletins on the New "TOCCO JR. 7½" and "TOCCO JR. 15" . . . small, low-cost units ideal for brazing of tool tips and scores of other heat-treating applications.

★

tana all southern California hailed the event as presaging a new day, with a Pacific Coast raw steel basing point that would put West Coast fabricators in competition. But if the protective umbrella of $22 a ton rail freight is necessary as a subsidy, from the public treasury now but from private industry later, the advantages of the Fontana operation may be more sentimental than actual so far as West Coast and particularly southern California's industrial ambition for the future are concerned.

GRAY iron foundries pretty generally on the West Coast are shopping for orders and open to propositions. A sizable and steady volume has previously been involved in Liberty Ships and particularly for the simple reciprocating engines for them. With the gradual changeover to Victory ships with turbines and replacement of cast iron by steel castings and forgings on deck and outside of the engine rooms, the principal previous wartime foundry customer will be pretty much out of the market from now on. Since cast iron scrap is and will continue to be short, it appears that the honeymoon is over for West Coast foundries. Malleables are not so short or at such a premium as in the Midwest and the three malleable facilities, one at Los Angeles, one at Oakland and one at Seattle, are supplying demand without difficulty but in comfortable volume.

UNPREDICTABLE, inscrutable but always news conscious, Henry J. Kaiser gave out a widely quoted interview that the peak of war production in almost every item is over and that the time has come to begin the gigantic task of shifting back to peacetime economy and efficiency in production. (There was no discussion of the cost of producing plate at Fontana.) Mr. Kaiser further suggested that the War and Navy departments canvass every man at every fighting front about his specific desires for eventual return to civil life, where he wants to go, and what work he wants to do.

To Army and Navy men primarily concerned with getting as much equipment as possible to win the war as quickly as possible, the statement and suggestions were not welcome. Some skeptics and shrewd analysts believed that possibly the statement might be directed indirectly at nearly 200,000 Kaiser employees on the West Coast in shipyards, steel, magnesium, aggregate and general contracting enterprises, to suggest future labor competition and reduced turnover.

TURNOVER, terminations and turmoil in essential industrial employment have been greatly reduced this past month, since the severe employment ceiling freeze, but a frightful situation has simply been made better although still bad. Among some 90,000 employees at the Richmond shipyards, in the first two weeks in November there were 4313 terminations, 1556 with clearance, 2135 without clearance and 622 dropped from the payroll or "sunk without trace." For the last two weeks in the month the terminations dropped sharply to 2877, only 722 with clearance (less than half of the number for the previous two weeks), 1716 without clearance and 439 dropped. In a study of reported reasons for terminations, 21 per cent were discharged and an additional 17½ per cent were for health. Approximately 10 per cent were military and another 10 per cent for personal business. Belying the shrieks and demands of labor leaders and social reformers for housing, transportation, child care and social services, only 1.6 per cent left for child care, only 1.9 per cent for transportation, and 4.6 per cent because they were dissatisfied. Only 1.1 per cent gave "another job" as their reason.

In southern California the Aircraft War Production Council's figures for war plane workers showed even greater turnover. In a year's time approximately 85 per cent of all persons hired left. Of all new hires, less than 6 per cent have ever had previous airframe building experience, proving pretty conclusively that workers don't leave one plant for another. As of late December, the seven major West Coast companies composing the Council were still losing about 17,000 workers a month through turnover, 55 per cent of them for "personal reasons" which may be translated as low morale, lack of ambition or indifference.

Structural Mill Parts To Be Stored in Utah

Washington

• • • **Representative J. W. Robinson, Democrat of Utah, said last Friday that while the structural mill of the United States Steel Corp. at Geneva, Utah, was not going to be completed, DPC had given permission for the various parts to be finished and stored on the mill site.**

Stories originating on the West Coast to the effect that WPB has decided not to permit the $190,000,000 giant steel installations of the West to operate for the duration were denied by WPB. Steel Division officials said that the Government would hardly spend so much to complete the steelworks, and then turn the key without deriving any benefit from the expenditure. Moreover, it was emphasized that the plate mill was being rushed to completion in the hope that it would be in production late this month or early in February.

Sloan Outlines Post-War Plans for American Enterprise

New York

• • • **Asserting** that "expanding job opportunities are a social, political and economic essential in the post-war era" which can be achieved only by "a virile and expanding system of American enterprise," Alfred P. Sloan, Jr., chairman of the board of General Motors Corp., outlined recently a program to carry that message to the American people.

As chairman of the National Industrial Information Committee, to which 6000 business organizations subscribe and which is sponsored by the National Association of Manufacturers. Mr. Sloan said that every avenue of communication would be utilized fully to bring home to 137 million Americans the post-war ambitions of American enterprise.

. . . *Cited for Awards* . . .

Fatigue Cracks . . .

BY A. H. DIX

We Threw in Reverse Gear

• • • You hold in your hands a triumph of salesmanship in reverse. In last year's 656-page Annual Number our pres. and ed., John H. Van Deventer, announced that because of the paper situation, special issues were out for the duration. This year we deliberately set out to keep advertising in the Annual from attaining jumbo proportions, and, as you see, we succeeded.

No limits, however, were placed on the brains department's acreage. The tillers of this floor's northwest patch have sown a crop that will keep you in calories for weeks to come. The fare is rich and we warn against ingesting all at one sitting. Twenty pages at a time will give your cerebrum that sleek, well-nourished look.

Octogenarian Infant

• • • At the beginning of each new year we have been in the habit of subtracting from it 1855, the year John Williams started your favorite family journal, and blurbing about our years of service as the country's oldest business paper.

But this year our heart is not in it, as Frank Oliver, who occupies the cell next to us, has brought us the deflating news that the going and highly prosperous Stora Kopparbergs Berglags Aktiebolag, Sweden (Great Copper Mountain Co. Ltd.) was started in 1228.

Is that wetness we feel behind the ears?

Suction-Cupped Monickers

• • • *Most names lack mnemonic grip. But a few men are blessed with names it is impossible to forget. Most blessed of those we have run across recently are Posey T. Kime, of the Anti-Trust Division, Department of Justice, Washington, and Oscar Doob, Advertising Director of Loew's Theatre, New York, now on special duty in Washington.*

Counter-Clockwise Twist Drill

Why the left-hand twist drill in "The Bull of the Woods" of Dec. 9?

—*Ole K. Olsen, Inc., New Orleans, La.*

• • • J. R. Williams, "The Bull's" brilliant creator, learned his trade well in an Alliance, Ohio, machine shop, under the critical eye of the original "Bull." Mr. Williams never errs technically. There is doubtless an excellent reason why the drill is unconventional. The lady is probably a southpaw.

Calendar Hoarder

I note with interest that the Clarence Pettays, of Cambridge, Ohio, have written to you for calendars. This amused me no end as we have been receiving two or three postal cards each year regarding our calendar.

—*Daniel Reebel, Advertising Manager, Mesta Machine Co., Pittsburgh*

For the past five or six years Mr. Pettay has been sending me a similar request. It has gotten to be an office duty for all of us to collect our calendars and send them to the old gentleman with our best wishes. To date we have accumulated about six.

—*John G. Mapes, American Iron & Steel Institute, New York*

Calendar collection with the Pettays is apparently no mere whim but passion. Like the man who confessed to the psychiatrist that he was fond of wheatcakes, they must have trunksful.

We have done our part to make 1944 a banner year for the Pettays by sending them the only two calendars we have received, one from the West Virginia Pulp & Paper Co. and another from Waldorf Clothes, Paterson, N. J. Neither is our type, having big pictures and little dates. What we crave is one with little or no picture and big dates, and if Mr. Reebel's fits this specification he will make our life complete by sending us one.

Predestination

• • • As we look back over 1943, the aptronymic discovery that gave us the greatest satisfaction was in finding that Continental Motors' chief draftsman is Joe Sketch.

Scintillating Simile

• • • As the most striking figure of speech published in this journal last year we nominate "as inseparable as a mermaid's knees."

Woolgathering Typesetter

• • • The most embarrassing typographical switch of the year was the *Christian Science Monitor's* front page headline at the time of the Moscow conference, "U. S. SECRETARY OF STATE GIVES FLAT ASSURANCE ALL VITAL TOPICS WERE DISCARDED." The last word, as corrected in a later issue, should have been "discussed."

Winning Editorial

• • • Combining truth and apple polishing, we declare that it is difficult to select the best of our pres. and ed.'s fifty-two 1943 editorials. His Remington is set to produce nothing but gems. But the customers chose "Nameless Children," which appeared first in the June 3 issue and later in a host of other publications.

This is the block buster, aimed at brand eliminators, that ended up with:

> We have a word in this language, and it is not a pretty one, that we apply to nameless children. Do we want this same term applied to the products of America's farms and factories?

No. 1 Feature

• • • Using requests for reprints as an applause meter, No. 1 on the 1943 editorial feature hit parade was the 19 in. by 43 in. NE Steel Chart that appeared as a supplement to the May 6 issue. It has been out eight months; it is out of date, but the demand for it seems never-ending.

Parabird

• • • *The most happy corporate name we encountered last year belongs to a Venice, Calif., parachute fittings manufacturer, the Skylark Mfg. Co.*

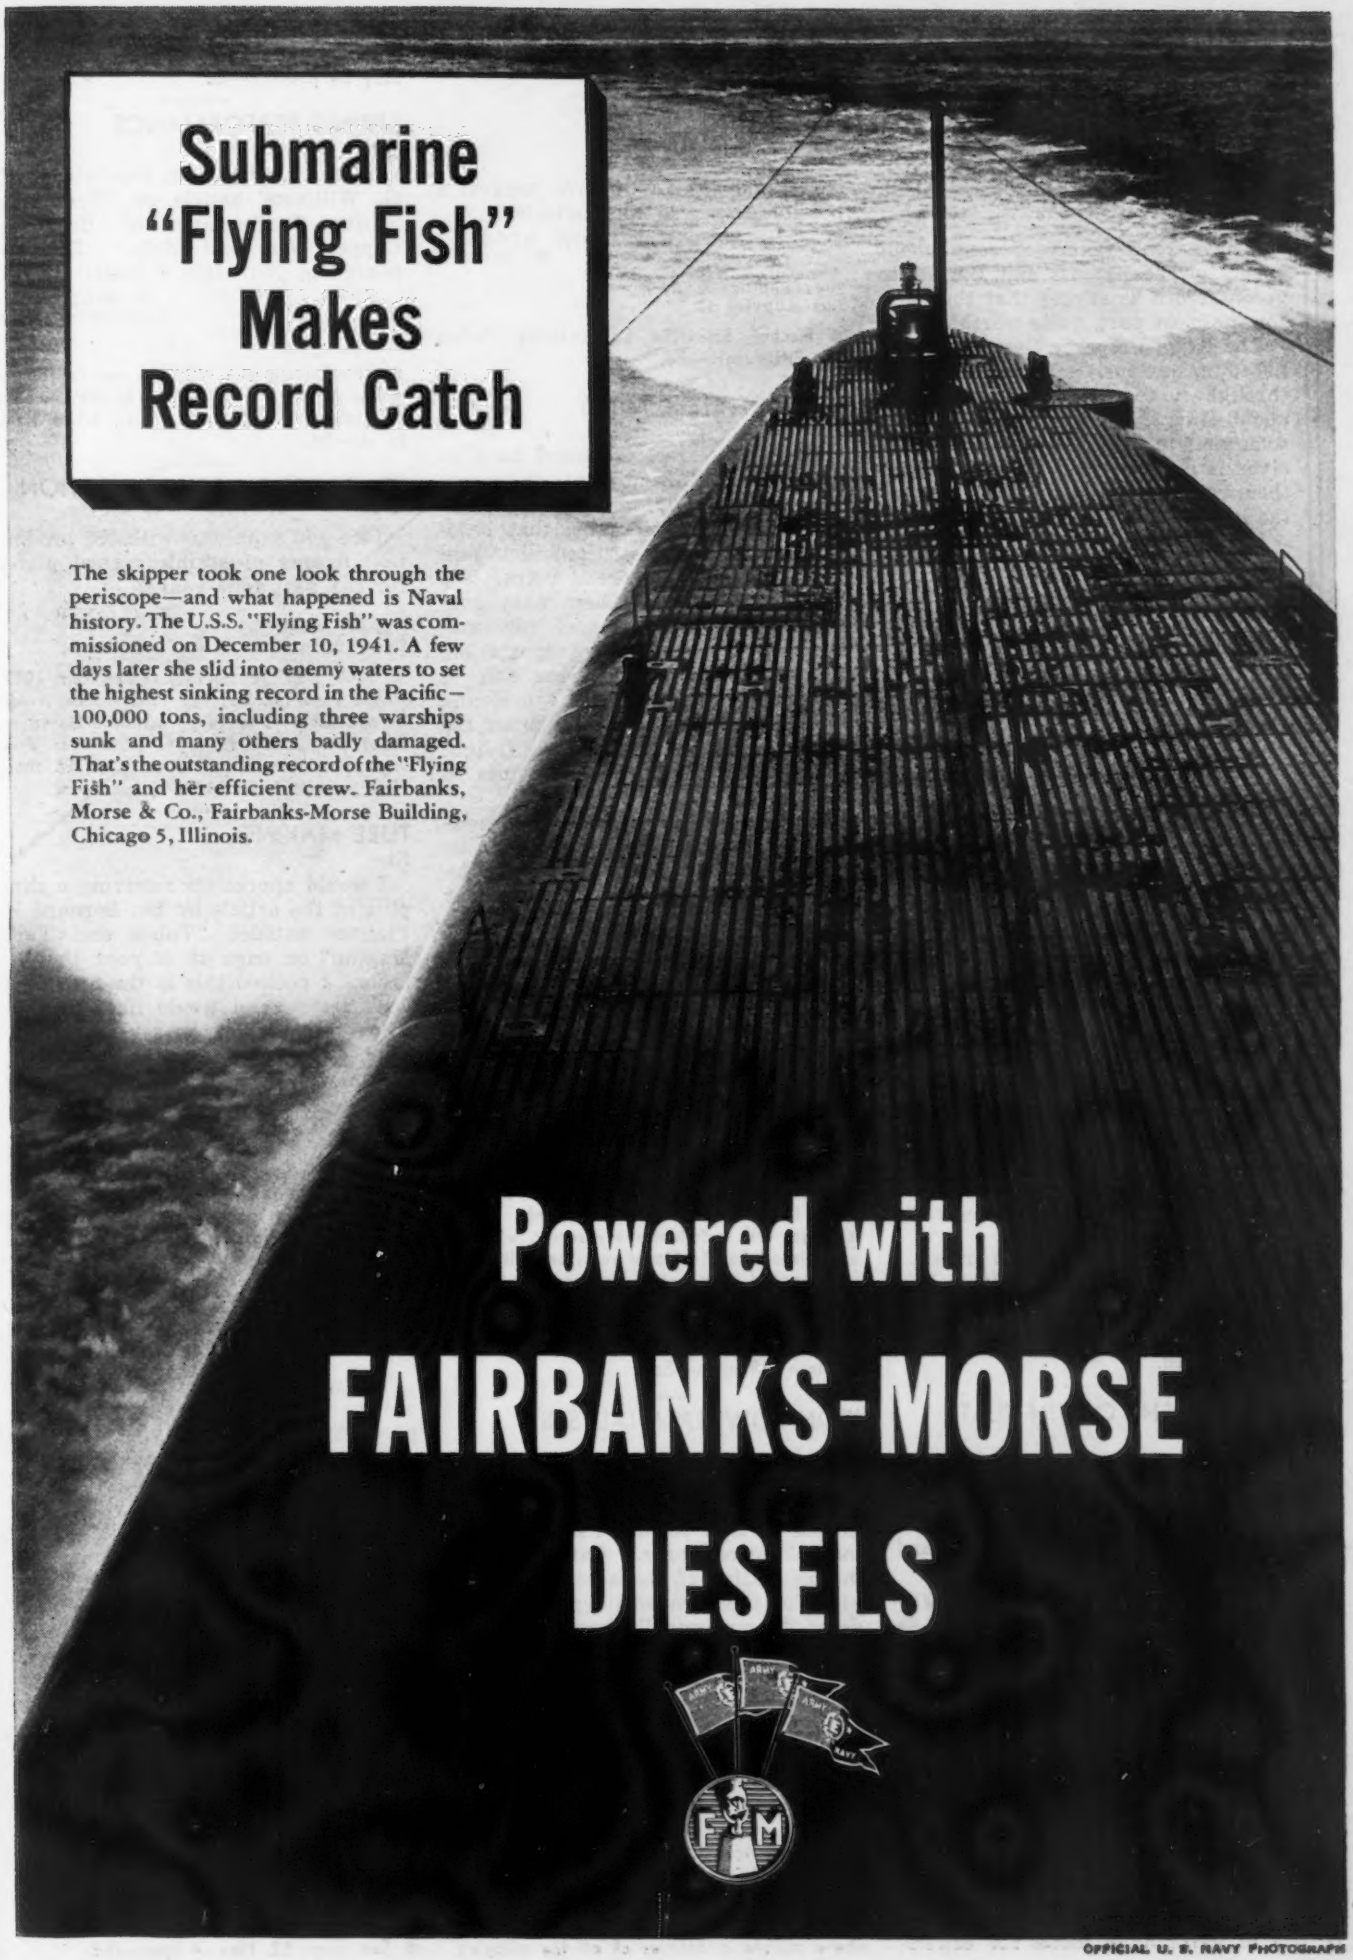
Puzzles

Last week's watch cost $17, and A, B, and C's pocketbooks contained $5, $11, and $13 respectively. That is what our puzzle book says, but as we figure it any answer with the same ratios is correct.

This one, from C. K. (American Cast Iron Pipe Co.) Donoho, will make your 65 deg. living room seem warmer:

A man rows a boat directly upstream. His son sits in the bow flying a kite in the wind which is blowing in the same direction that the river is flowing, but twice as fast. The kite string breaks as the kite is 110 yards behind the boat, allowing the kite to drift freely through the air for one minute and then fall into the river.

In spite of his son's objections, the father continues rowing upstream. But 5 minutes after the kite had hit the water, he turns the boat downstream. After 6 minutes rowing downstream he sees that the kite is still ⅛th mile away and gives up in disgust. What is the wind velocity, assuming that the oarsman's water speed is constant, that the kite travels exactly with the wind when floating in air and with the river when floating in water?



OFFICIAL U. S. NAVY PHOTOGRAPH

Dear Editor:

SEIZED PATENTS OF LITTLE VALUE

Sir:

I have read reams of copy about enemy owned patents and I want to go on record as saying that they are, for the most part, quite worthless.

The Alien Property Custodian published an extensive listing. I went through it carefully and called for about thirty which seemed to apply somewhat to our business. These arrived in due time and I went through them very thoroughly. I finally tossed the lot into the waste basket.

I would make this general statement—that patents of any worth are known and valued and when any circumstances develop which make them available, those familiar with them would take advantage of the situation promptly. Such patents in all likelihood have long since been culled from the lot. What remain, in my opinion, have little or no value.

D. B. TOLLEY,
Vice-Pres.
Globe American Corp.,
Macomb, Ill.

● How do other readers feel about the worth of seized patents?—Ed.

ELASTIC LIMIT OF STEEL

Sir:

We are planning to utilize some scrap steel rolls and it is necessary that we have an accurate knowledge of the elastic limit of this steel, in both tension and compression. We also have some cast iron rolls on which we want to have compression tests made. Can you give us the name of a commercial laboratory in the U. S. that can make these tests for us?

FRANK TROTTER,
Genl. Supt.
Cuban Mining Co.,
Cristo, Cuba

● Write to Sam Tour & Co., 65 Pine St., New York.—Ed.

DEVELOPMENT OF TIN PLATE

Sir:

We read with interest the excellent article by Howard A. Knox on "The Development of the American Tin Plate Industry," in your Nov. 25 and Dec. 2 issues.

We are wondering whether you have any reprints of this article, as they are of much value to anybody in the tin plate business.

F. G. WHITE, Chief,
Dept. Metallurgy and Inspection
Granite City Steel Co.,
Granite City, Ill.

● Reprints may be obtained from the Carnegie-Illinois Steel Corp., Pittsburgh.—Ed.

GERMANIUM METAL

Sir:

I would like to obtain a small quantity of germanium metal for experimental purposes. Can you suggest a possible source of this material?

HAROLD H. BLOCK,
Metallurgist
Airesearch Mfg. Co.,
9851 Sepulveda Blvd.,
Los Angeles 45

● Fischer Scientific Laboratories, Forbes St., Pittsburgh.—Ed.

SEAPORT STEEL MILLS

Sir:

Heretofore steel producers have located their mills and plants at sources close to deposits of ore, lime and coal. Bethlehem departed from that practice when they constructed their mill on tidewater at Sparrows Point. We understand this has been very successful due to imports of raw materials by cheap water transportation, and also due to their being able to load finished products for export and coastwise shipments direct from the mill to vessel, thus eliminating freight and handling from inland points to shipside.

If these are among the main reasons for the Sparrows Point success, would not other steel companies be interested in a similar development at another seaport location?

R. M. NELSON,
Chairman
Savannah & Atlanta Railway Co.,
17 East 42nd Steet,
New York 17

● Bethlehem's Sparrows Point plant is only a part of a much larger integrated steel unit. It uses its own ore boats rather than depending on other carriers. In addition, the Sparrows Point plant supplies a large inland market as well as a coastwise market and the plant furnishes considerable raw material and semi-finished material to Bethlehem's several Pacific Coast plants. As it is large, with excellent ore reserves, with an established Pacific Coast sales organization, and located adjacent to an excellent inland market, it is in a situation to be successful, whereas some other plant with only one or two of the same factors in its favor might run into difficulty.—Ed.

IRON POWDER ANALYSES

Sir:

I am greatly interested in obtaining the tentative analyses of the several grades of iron powder listed in your market price pages. Can you give me an outline of the accepted standards for these various types of powders: "commercial," "crushed," "by hydrogen," and "electrolytic?"

HENRY O. WILLIER
801 Jackson Avenue,
Takoma Park 12 (Md.)
Washington, D. C.

● Commercial—96 per cent plus Fe
Crushed—90 per cent plus Fe
Hydrogen Reduced—98½ per cent plus Fe
Electrolytic—99 per cent plus Fe
Carbonyl—98 to 99.80 per cent plus Fe

The remainder constitutes an oxygen content except in the case of the crushed iron where minute quantities of all the alloying materials usually found in pig or cast iron may be present.—Ed.

SPRING PERFORMANCE

Sir:

Please send us ten reprints of H. G. Williams' article on "Predicting Spring Performance of Beryllium Copper Wire and Strip." This appeared in your July 8 issue.

H. MILLARD,
Engineering Dept.
Micro Switch Corp.,
Freeport, Ill.

● We believe Mr. Williams can furnish reprints of his article. Write to him in care of Instrument Specialties Co., Little Falls, N. J.—Ed.

STAINLESS PLATE PRODUCTION

Sir:

Can you supply us with the production figures of stainless steel plates for the past four years?

M. J. CONWAY
Lukens Steel Co.,
Coatesville, Pa.

● 1940, 3,409 tons; 1941, 14,026 tons; 1942, 15,626 tons. To get the 1943 figure, it will be necessary to make an estimate based on ingot production for 1942. Stainless steel ingot production in 1942 was 340,780 tons; 1943 is estimated at 425,000 tons.—Ed.

TUBE MAKING

Sir:

I would appreciate receiving a clipping of the article by Dr. Bernard P. Planner entitled "Tubes and Tube Making" on page 48 of your Dec. 16 issue. I noticed this is the first part of a series, and would like to know when the rest of the series will appear.

Can you also tell me Dr. Planner's address?

J. P. DODS,
Director of Research in
Charge of Advertising
Summerill Tubing Co.,
Bridgeport, Pa.

● Dr. Planner's three-part article appeared in the Dec. 16, 23 and 30 issues. He is consulting engineer of the National Tube Co., Pittsburgh.—Ed.

UNION CHANGES

Sir:

We would appreciate having four or five reprints of page 103, "Proposed Steel Union Changes vs. Present Contract," in the Dec. 9 issue.

W. D. MOORE,
President
American Cast Iron Pipe Co.,
Birmingham 2, Ala.

HIGH STRENGTH STEEL CASTINGS

Sir:

Your Nov. 4 News Front reads, "High strength steel castings for aircraft parts, hitherto impossible to obtain in the shapes, sizes and quality desired, will soon be available in production quantities." Can you give us more information regarding this statement?

MUEHLHAUSEN SPRINGS PREVENT FROZEN BRAKES

AS applied to motion, electricity has been considered generally as a starting and moving force—but now, with Warner Electric Brakes, it is used for stopping as well.

This brake has another thing in common with many other products—the use of well-engineered springs to control important mechanical actions. Warner relies on Muehlhausen Springs to free the brake bands after the vehicle has slowed or stopped. On one grueling run after another, through heat, rain and crystallizing cold, Muehlhausen Springs perform this job automatically.

A big responsibility for a little spring! But, because of careful design by experienced engineers, it does its job unfailingly.

MUEHLHAUSEN SPRING CORPORATION *(Division of Standard Steel Spring Company)*, 817 Michigan Avenue, Logansport, Indiana

Leading product designers in every industry are consulting Muehlhausen Engineers to secure springs of lasting efficiency.

This Industrial Week . .

- ***New Tests Face Industries at Start of New Year***
- ***Steel Output to Be Lower; Aluminum Cutback Starts***
- ***Machine Tool Volume in 1944 Around $350,000,000***

A PERIOD of new tests of a severe nature faces metals producing and metals using industries at the start of 1944, the year of the European Invasion.

Twelve months ago, tremendous order backlogs, material and manpower shortages and expansion needs were the topics of the day, and few persons were able to visualize fully the unprecedently high production destined to be achieved in 1943. This week backlogs are declining in a number of lines, much of the new capacity has proved unnecessary, and cutbacks, renegotiation and surplus goods disposal are the current subjects of importance.

WPB has under consideration an order which would permit the use of excess steel stocks without regard to the items or to the terms of any material restrictions imposed by limitation orders. This would mean that manufacturers with adequate manpower and facilities could use the supplies for civilian production upon WPB permission.

In six months, the steel production-distribution pattern is expected to be closer to normal than at any time since the war began. Output of ingots will be lower during 1944 than the record 1943 production of around 89,000,000 net tons. Supplies of ingots and semi-finished steel are easy currently. Demand for flat rolled steel is still high and probably will remain there until landing barges, landing mats and other invasion equipment are completed. Substantial increases in rail and pipe production are likely.

THE recently announced closing of four aluminum pot lines owned by the government with a total output of 12,000,000 lb. a month is one development emphasizing the easier situation in metals. Other major cutbacks in aluminum output, which rose to 7½

Month by Month Through 1943 in "This Industrial Week"

January—With much questionable tonnage cleared away, order books are healthier than at any time since war began in Europe. . . . Plate production will move up rapidly in the next six months. . . . Lack of hot topping facilities at steel plants continues to be serious barrier. . . . Scheduling of components can be expected.

February—Making of steel shell cases will be boosted. . . . Excess steel in bessemer, top cut billets and used rail equals 100,000 tons per month. . . . Bottlenecks in alloy steel and aluminum extrusions, delaying aircraft program, are being blasted. . . . Machine tool industry will be looking for work before year is over. . . . Huge quantities of idle steel being uncovered by government.

March—Maritime Commission is designing new type merchant ship. . . . Increased use of open hearth alloy steel being urged. . . . Heated disagreements over certain phases of CMP have arisen. . . . Labor leaders urging 48 hr. week in steel. . . . Steel expansion program lagging behind schedule.

April—Requests for carbon steel by claimant agencies for third quarter are 20 per cent greater than tonnage sought for second quarter. . . . Kaiser will begin making steel in May. . . . Controversy over inspection of steel plates results in pileup of material. . . . Minor strikes are numerous. . . .

May—48 hr. week ordered in steel industry. . . . First coal mine shutdown will be felt for some time. . . . Munitions programs undergoing adjustments. . . . Ingot production for 1943 won't reach goal of 92,000,000 tons. . . . Aircraft firms urge foundries to switch to magnesium. . . . Jobbing foundries beginning to look for work. . . .Around 3,000,000 tons of new steel capacity added since Pearl Harbor.

June—Second coal strike on. . . . Byrnes appointed war mobilizer. . . . Component Scheduling Procedure issued. . . . Tank armor mill at Chicago lays off many. . . . Lake Superior ore shippers doubtful of reaching goal of 91,000,000 tons. . . . Drive for 2,000,000 more tons of steel starts. . . . Work stoppages delay production. . . . Ingots piling up on West Coast may be exported. . . . Third coal mine strike starts. . . .Blooming mills main bottleneck to greater steel output.

July—Recession from high production tempo in war goods manufacture appears. . . . Molybdenum supply and demand in balance. . . . Attempt to decentralize steel industry formulated by Senator McCarren. . . . John Whiting heads WPB Steel Division. . . . Demand for fourth quarter steel by Claimant Agencies 5,000 000 tons above supply. . . . Complaint against WMC for creating "intolerable" situation in steel with its 48-hr. week policies is issued. . . . Switches in war program numerous.

August—Steel mill books rapidly being filled for balance of year. . . . Shortage of manpower outdistancing all other war production problems. . . . Better balance between steel supply and demand becoming evident, but plates and sheets are tighter. . . . Excess ingots beginning to be a problem. . . . Army tank program rapidly diminishing. . . .

September—Plate mills face hectic production situation. . . . A few electric furnaces are idle because of lack of orders. . . . Baruch report on critical manpower situation issued. . . . Steel still suffering from sporadic strikes. . . . Redistribution of huge amounts of idle or used equipment planned. . . .

October—Large steel buyers are seeking to reserve tonnages for use after war ends. . . . Jam on flat rolled steel more intense. . . . Weirton now rolling brass slabs. . . . Armor plate division at Gary will relase more workers. . . . Ingot production setting new peak. . . . Marked easing of ferroalloys noted. . . . Battle starts at Washington over contract cencellation policies. . . . Excess ingots piling up. . . . Production of finished material achieving good gains against order backlogs. . . . New Direction , transferring open hearth alloy steel to electric furnaces, will be withdrawn when shortage of carbon steel ceases. . . .

November—Fourth coal mine strike on. . . . Salaried workers in steel organizing. . . . Wastage of alloy materials in steel studied. . . . CIO will seek to reopen its steel wage contracts. . . .Relaxation of pig iron controls is a possibility. . . . 100,000 tons of unused steel allotments for fourth quarter returned to ASU at Wright Field. . . . Significant post-war trends seen in study of steel operating rates for 300 past months. . . . Labor complains against layoffs but Washington not fully prepared to open civilian goods production on large scale now. . . . Eventually, WPB will ease limitation orders.

December—New cutbacks revealed. . . . Supply of malleable castings inadequate. . .. Layoffs made at some war goods factories. . . . Plan to swap machine tools for Russia's raw materials gain headway. . . . Union demands 17c per hour wage rate boost in steel and numerous post-war guarantees. . . . Attempts to curtail production bring vigorous objections from union. . . . Final total of 84,404.852 gross tons of ore achieved by Great Lakes vessel fleet. . . . Steel industry product mix very unbalanced. . . . Alloy scrap generated at 100,000 tons per month above consumption. . . . Abolishing of pig iron allocations set for February. . . . Lumping of war settlements in one final transaction with contractors being attempted. . . . OPA unfreezes ore prices. . . . Huge steel strike hits industry. . . . Slashing of military contracts to continue in 1944. . . . Direction 2 in alloy steel lifted. . . . Large stocks of ferro-alloy materials shown.

times the pre-war level, are scheduled to come. WPB estimates the 1943 aluminum supply at 2,703,500,000 lb., with allotments made of 2,639,300,000 lb. Consequently, there was a 62,200,000 lb. surplus at the end of the year. Broken down, primary aluminum production was approximately 1,821,200,000 lb.; secondary production and imports amounted to 508,200,000 and 353,700,000 lb., respectively. At the same time, exports amounted to a probably 260,900,000 lb.

Cutbacks in steel and copper expansion programs are sure to follow WPB's announcement on curtailment in the aluminum program. High on the WPB list, it is reported, the Lone Star Steel Co. will not be permitted to go further with its expansion plans at Daingerfield, Tex. The company is completing construction of a blast furnace and had asked for authority to build steelworks and finishing mills. At the DPC steel mill project at Geneva, Utah, reports of first pig iron production and the decision to store finished parts of the abandoned structural mill were almost simultaneous this week.

The improved zinc supply situation has permitted relaxation of some controls recently. Orders have been issued for the production of 2,000,000 electric irons and 50,000 bathtubs during 1944, a modest but significant event. Restrictions on the delivery and sale of tungsten, vanadium, cobalt and molybdenum have been lifted. Ferromanganese and spiegel are reported easier.

THE announcement that pig iron allocations are to cease in February has been greeted joyously by foundries which are now relieved of the burden of reporting and in some instances of the necessity of paying over-ceiling prices. Some foundries were allocated more iron in December and January than they requested. The announcement was unsettling for operators of high cost furnaces, some of which may be forced out of business.

Appraising 1944 business prospects for the machine tool industry, expectations are that total dollar volume will be $350,000,000 to $375,000,000 including some $50,000,000 worth of Lend-Lease contracts. This is a very sharp decline from the $1,200,000,000 figure of 1943. By mid-1944 shipments and new orders may be equal.

Meanwhile, the attention of the machine tool industry is centered upon the 1944 tax bill at Washington, which contains a renegotiation amendment that is reported to be in disfavor with the Administration. Under the Senate version of the bill, exemption of machine tools and other industrial equipment from renegotiation seems to depend upon the facts in each individual case.

BEFORE long, the Baruch report on contract termination and surplus goods disposal is expected to be an important mile-post indicating an orderly route for the government to follow in 1944 and later. The situation Mr. Baruch has been asked to clean up such as rubber, manpower, terminations and surpluses, should never have happened. Prices which the War Department is said to be approving in the sale of steel inventories amount to dumping. For instance, according to the War Department, the contract of one steel consumer was terminated who had 5000 tons of uncut steel rods and bars. On the average the steel costs $56 per ton. It was sold for $30 per ton. The government took the loss. If this general practice if followed very long, mill prices on new steel may be undermined.

The national steel ingot rate this week snapped back to 97.5 per cent of capacity from last week's revised rate of 84 per cent. Pittsburgh operations increased five and a half points to 96.5 per cent and Chicago output rose six points to 103.5 per cent. Youngstown gained 54.5 points to 95.5 per cent while Cleveland jumped 21 points to 92 per cent. Wheeling snapped back to 96 per cent, a gain of 39 points. With Pencoyd out, Philadelphia's operating rate dropped two points to 91 per cent.

KEEP 'EM CUTTING . . AND SAVE THE PIECES

IN this war, machine tools on the average are cutting away steel at a rate more than 12 times faster than in 1918. That's production—keep them cutting!

Keep them cutting *faster* by selecting tool steels more closely suited to the job. Case after case in our files show increases in feeds, speeds, or pieces per grind—increases, often, of 50% and more—when the *right* tool steel went to work.

Keep them cutting *constantly* by knowing the best alternate tool steel for each job. Know it, and know its performance, as insurance against a time when your first-choice steel may be short in supply.

And save the pieces! Every particle of steel, especially High Speed Steel, is important, and much critical alloy material can be saved for re-use if proper methods of reclamation and classification are employed.

Let us help with your problems of selection, treatment, use and salvage.

Exemption of Machine Tools Varies Under Senate Version of 1944 Tax Bill

Washington

• • • **The answer to** the question of whether machine tools and other industrial equipment are exempt from renegotiation under the Senate version of the 1944 tax bill, according to legislative experts of the Joint Tax Committee, depends upon the facts of each individual case.

It appears that special purpose tools manufactured after Jan. 1, 1940, and/or sold at prices higher than those in effect on Jan. 1, 1941, by not more than one manufacturer may be subject to renegotiation when the tools are purchased direct by the Government from a prime contractor.

General purpose tools sold direct to the Government and all machine tools sold to suppliers for use in manufacturing end products or components, going into articles of military procurement, are exempt apparently from renegotiation, under the Senate bill.

Since the tax bill does not specifically exempt from renegotiation machine tools bought directly by the Government, Joint Tax Committee attorneys say that reference must be made to the bill's definition of standard commercial articles which are all exempt from the renegotiation law.

Machine tools sold to manufacturers performing war contracts are exempted under the definition of "Subcontracts" says the Joint Tax Committee. The tax bill says:

"The term subcontract means—A component article means any article which is to be incorporated in or as a part of a contract item."

Obviously the tools used in making a war product are not a part of the end item. Consequently, machine tools in the hands of suppliers and bought by them in performance of their contracts, are exempt from renegotiation under the bill.

The House Ways and Means Committee bill had substantially the same definition for standard commercial articles, but exemption of the articles from renegotiation was discretionary with the procurement agencies. The Senate bill makes exemption mandatory.

There is vigorous opposition to the renegotiation amendment in the Senate tax bill and it may be greatly modified or entirely rewritten. This opposition is said to include President Roosevelt himself and it is reported that he may come out against the amendment in his forthcoming message to Congress. There is also a powerful group in the Senate who want to either kill or widely change the Finance Committee's amendment. Prominent among this group are Senator Walsh, Democrat of Massachusetts, chairman of the Naval Affairs Committee. Joining are such Senators as Hatch, Democrat of New Mexico, and La Follette, Progressive of Wisconsin. Objection made by the Administration and other forces to the amendment is based on the allegation it would leave too much profits for war contractors.

Proposals for a change include higher or even 100 per cent excess profits tax. Also suggestions for a flat limit on war profits but this has been attacked because of difficulty of administration.

Debate Slows Wage Negotiations

Pittsburgh

• • • **Steel companies** and Phil Murray's steel union, last week, were stalemated—not on the question of wages, which is to go to the WLB. but on the make-up of a supplemental contract. Despite the War Labor Board ruling calling for continuation of production under contract terms and a retroactive wage date, in accordance with the Roosevelt telegram of two weeks ago, the union is insisting that the steel companies sign a supplemental contract, embodying WLB decision.

After more than 180,000 steel and steel fabricating workers returned to their jobs last Tuesday and Wednesday, union representatives immediately began a series of meetings to obtain a signed supplemental contract. The major meeting—U. S. Steel Corp. subsidiaries and the USWA—adjourned beginning last week until Thursday of this week, after a fruitless attempt to arrive at a supplemental agreement satisfactory to both sides. The union insisted on suing the WLB decision, which officially refers to the President's telegram but does not quote in detail that part of his message which indicates that any wage adjustments eventually arrived at shall be within the framework of the anti-inflation setup and the "Little Steel" formula.

Steel companies, on the other hand, it is believed, are insisting that the President's telegram, or at least those paragraphs covering the "hold-the-line" reference be part of the supplemental contract. The union has referred to this attempt of the steel companies as adding "extraneous material" to their suggested contract.

The union position in asking for a signed supplemental contract, including the complete text of the War Labor Board directive, is based, according to it, on "traditional practices followed by labor organizations and employers. The steel companies, while not making an official statement, apparently hold to the view that the WLB decree is in itself an order, binding on both sides, without the necessity for a supplemental agreement. It is believed, however, that practically all steel companies will, or would, sign a supplemental agreement, which specifically embodies that part of the President's telegram restricting wage adjustments to the "hold-the-line" program. It may possibly be that this one paragraph, over which there is so much disagreement, and which was not included officially in the WLB decision, will be a bone of contention for some time.

The steel loss encountered because of the steel strike last week, which affected five integrated steel mills and numerous steel fabricating plants, amounted to approximately 170,000 tons—the bulk of the loss being in Ohio and Chicago plants.

Canada's War Production Up 37%

Ottawa

• • • **Canadian war** production for 1943 increased 37 per cent over the preceding year to a record total of $2,776,000,000, according to estimate by C. D. Howe, Minister of Munitions and Supply. For 1942 production totaled $2,023,000,000; for 1941, $805,000,000 and for 1940, it was $307,000,000. Production figures for the year under review are further increased by the expenditure of $217,000,000 on defense construction and capital assistance, a part from the wartime housing program of $186,000,000, which brought outlay to the grand total of $3,179,000,000 compared with $2,452,000,000 in 1942. Since Aug. 1, 1939, Canada's total expenditure on war account, directly and indirectly, totaled approximately $7,500,000,000.

Mr. Howe stated that indications that wartime industrial expansion tapered off in 1943 is found in a slight reduction—$2,000,000—in defense construction and to a greater extent in expenditures on capital assistance account, which fell $24,000,000 below the 1942 total. Largest increases in production during the year were in shipbuilding, instruments and communication equipment and small arms ammunition, all of which were almost doubled. In only one item listed in the breakdown was there a reduction—gun ammunition, including bombs.

Although war production in Canada was at an all time record last year, there were indications of reduced operations in the closing months of the year, when many contracts were cancelled or output greatly reduced. The curtailment was chiefly in production of cargo ships, ammunition, shells, guns, war tanks, aircraft and explosives. According to announcements from Government and other sources further contract cancellations and slowing down in war production in this country are pending for the early part of 1944. How extensive the curtailment will be has not been announced, but it is stated that many thousands of workers will be released from present war jobs during the first quarter.

With the slow down in war production there are definite indications of increased activities in civilian manufacturing activities, and already plans in this respect have been reported on a rather broad scale. During the past couple of months a number of controls have been abandoned on steel and other materials and permission has been granted for several firms to return to their original peacetime production. Among the first of the consumers' goods to be produced will be washing machines, electric refrigerators, farm implements and several other similar products. Announcement was made at the year-end that production of electric motors up to two horsepower may be resumed and that steel will be available for various types of household furniture. Barbed wire and bobby pins and hair pins also are scheduled for immediate production in this country.

Curtailment in the war production program has been reflected in reduced demand and slowing down in production of iron and steel in Canada. For the month of November pig iron production dropped to 142,249 net tons from 146,794 tons in October and 170,578 tons in November, 1942. Production of ferro-alloys at 16,169 net tons in November compares with 16,843 tons in October and 16,733 tons in November last year. Output of steel ingots and castings during November amounted to 259,444 net tons compared with 271,976 tons in the preceding month and 270,812 tons in November last year.

For the 11 months ending Nov. 30, production of pig iron in Canada totaled 1,621,009 net tons compared with 1,810,633 tons in the corresponding period of 1942; output of ferroalloys totaled 201,649 tons against 194,069 tons in 1942, while steel ingots and castings amounted to $2,769,156 net tons down from 2,851,527 tons in the 1942 period.

The following table gives a graphic picture of Canada's iron and steel production covering the years 1923 to 1943 inclusive, in net tons:

YEAR	Pig Iron	Steel Ingots	Steel Castings	Ferro-Alloys
1923	985,620	940,475	50,467	33,545
1924	664,186	700,196	28,576	29,624
1925	638,844	835,016	21,100	28,794
1926	826,003	877,917	37,338	64,305
1927	792,624	972,079	44,475	62,977
1928	1,162,254	1,332,801	50,084	50,267
1929	1,220,961	1,466,688	78,562	89,611
1930	838,839	1,072,321	60,830	73,049
1931	470,442	744,605	41,501	52,375
1932	161,425	349,843	25,664	18,100
1933	254,592	441,346	17,830	33,737
1934	455,789	827,041	23,116	37,055
1935	678,302	1,016,814	35,123	62,182
1936	759,618	1,211,334	38,337	87,678
1937	1,006,717	1,496,575	74,652	91,931
1938	789,710	1,238,078	56,636	59,720
1939	846,418	1,266,056	60,997	85,531
1940	1,309,161	2,177,973	77,899	151,661
1941	1,528,054	2,578,063	123,250	213,218
1942	1,975,015	2,942,921	178,440	213,636
1943 (x)	1,771,000	2,876,780	155,860	217,650

(x) Production figures for December 1943 estimated.

Union Discovers Idle Capacity

Pittsburgh

• • • **The Steel Workers of America early this week called upon WPB chairman, Donald Nelson, to either use the nation's steel capacity for war, or turn back that part not needed for war to essential civilian requirements. According to the union's calculation, 64 open hearths and electric furnaces have been idle in the past few weeks, representing, according to them, a weekly capacity of about 87,000 tons.**

"The nation either needs the complete steel capacity for war or it doesn't," Philip Murray told Nelson. "The steel industry's record of close to 90 million tons of steel shot at the enemy in 1943 gives little psychological comfort to the enemy," Murray said.

The steel union sent a copy of this telegram to General Marshall who, the steel union said, ought to know the true facts in the steel industry "instead of vicious conjecture."

Grey Iron Founders Exempted from Reports

• • • **According to** the steel division of WPB it has been decided to exempt producers of grey iron castings, from reporting shipments for August, September and October, 1943, which averaged less than 100 tons per month of grey iron castings. Producers have hitherto been required to make a monthly report of shipments, unfilled orders, production, and monthly capacities on Form WPB-971.

Bethlehem '44 Shipbuilding Program To Top '43 Record, E. G. Grace Asserts

• • • **The Bethlehem Shipbuilding** program for 1944, as now scheduled, is even larger than in 1943, according to E. G. Grace, president of Bethlehem, who at a celebration in New York Dec. 31, reported that the company produced a world's record total of fighting and cargo ships in 1943—a fleet characterized by Secretary of the Navy Frank Knox as "bigger than most nations could boast before the war."

Mr. Grace spoke from aboard a new U. S. destroyer at the Bethlehem Staten Island, N. Y., shipyard. His speech was broadcast to the company's 300,000 employees.

Mr. Grace disclosed in his speech and at a press conference preceding it that:

1. Production of Bethlehem's shipbuilding division was equivalent in value to more than 1000 Liberty ships—which would represent more than 10,000,000 deadweight tons, or a total in excess of 50 per cent of the nation's entire merchant shipping output for 1943. He explained that for reasons of military security Bethlehem's naval tonnage could not be disclosed.
2. The division's yards serviced, repaired or converted more than 7000 ships—a total representing almost 25 per cent of all the ocean-going ships in the world prior to the war. Since outbreak of the conflict Bethlehem yards have handled more than 21,000 ships, or two-thirds of the pre-war world merchant fleet.
3. Bethlehem's Navy and Maritime Commission program of combat and cargo ships embraces 38 different types, from super-battleships and aircraft carriers to trawlers.
4. The company's production of 13,000,000 tons of steel established a new peak and was sufficient to build 3500 Liberty ships. Output in 1942 totaled 12,500,000 tons and in 1939 less than 8,000,000 tons.

Secretary Knox, in a message to Mr. Grace, extended the "congratulations of the Navy Department to the employees and management of Bethlehem for their magnificent 1943 shipbuilding achievement. Rear Admiral Emory S. Land, chairman of the Maritime Commission, lauded the "remarkable record" of Bethlehem.

Mr. Grace said "a battleship is equal to 40 Liberty ships. That is, the hours it takes to build a battleship, using the same number of men, are 40 times the hours needed to build a Liberty ship. A big combat aircraft carrier (like the *Wasp*) equals 29 Liberty ships, a heavy cruiser about 18 Liberty ships, and—as a good overall picture—the value of the production of the shipbuilding division of our company in the year just closing is equivalent to more than 1000 Liberty ships."

". . . I believe," he said, "that Bethlehem was able to handle this enormous shipbuilding job because of the way we are set up—as an integrated company. By 'integrated' I mean we are a company which produces materials all the way up from the ore in the ground to the completed ship."

He asked employees to remember that "we are all working for Uncle Sam," praised the Navy and Maritime Commission for their foresight and judgment, which, he declared, have been prime factors "in averting disaster and turning the tide to victory," and promised Bethlehem's 67,000 men and women in the armed forces that the company would "everlastingly" exert its utmost efforts to provide them with the "supplies you need, when you need them."

He concluded his broadcast by asking Bethlehem's employees "to join me in dedicating our efforts in 1944 to our country and its glorious flag."

Four Aluminum Pot Lines Closing; Alcoa Cites High Production Attainments

Washington

• • • **The WPB on Friday** ordered the immediate closing of four aluminum pot lines, two in New York City (Queens County), and two in the Burlington, N. J. area.

This action was taken, WPB officials explained, to relieve the stringent coal shortage and also to lighten the transportation load entailed in hauling alumina to these plants from the Mississippi Valley. The saving in coal will be 70,800 tons a month, WPB officials said. In view of the ample production of aluminum ingots at this time, the output of these four plants can be dispensed with, officials explained.

The four pot lines which are closing had a total output of 12,000,000 lb. of aluminum per month. They are owned by Defense Plant Corp. and operated by the Aluminum Corp. of America. Employees of the plants are being given a week's notice, but the plants will shut down immediately in order to save a full month's charge for electric current. Power contracts provide that when a plant shuts down after the first day of any month it must pay for a full month's supply.

• • • **The aluminum industry** last year attained an annual production rate of 2,100,000,000 lb. of metal, seven times the nation's peacetime production, according to Roy A. Hunt, president of the Aluminum Co. of America. He said that it is one and one-half times the production of the entire world before this war and that it is far in excess of what the combined Axis countries can produce.

"What this vast aluminum expansion will mean in terms of jobs will become clearer as the metal is released for civilian consumption," Mr. Hunt declared.

Alco's price for alminum ingot at the time priorities were imposed was 20c a pound; several price reductions since that time have brought it to a record low of 15c at a time when the prices of many competing materials were rising.

"How well employment levels in the aluminum industry may be maintained depends upon a number of things, among them: Whether or not restrictions are more completely removed on aluminum for civilian uses; whether there is to be an accumulation of large metal surpluses, which could conceivably come back to demoralize the industry at a later date; and the degree of success aluminum achieves in finding post-war uses."

About Those Charts

• • • "Carbon steel shipments by products" is the correct title for the two uppermost charts on page 86 of the Dec. 30 issue. "Alloy steel shipments by products" is the title of the two lower charts on the same page. All controlled steel products were included, in thousands of net tons. Further conversion and producers' interchange were excluded. The titles were omitted through error by the chart maker, who redrew for this magazine charts of the WPB Steel Division.

Inventory Limits on Aluminum Products Extended

• • • **Inventory limitations** on aluminum forgings, pressings, upsettings and impact extrusions were extended from 60 days' to 120 days' supply when WPB issued Inventory Direction 14 under CMP Regulation 2.

Restrictions Removed on Sales, Deliveries of Four Critical Metals

Washington

• • • **Reflecting** an easier supply situation in several of the products which have been critically short in the past, the WPB on Thursday removed delivery and sale restrictions on vanadium, cobalt, tungsten and molybdenum.

In modifying general preference M-23-A, applying to vanadium, WPB specified that vendors of more than 500 lb. of the material in any month will still be required to make a report of all sales during that month on form WPB-3454.

General preference order M-39 applying to cobalt was amended in a similar manner except that the requirements for a monthly report applies to vendors selling in excess of 1,000 lb. in any one month.

A steadily increasing stockpile of tungsten plus an excess supply of the material over current use enabled the war agency to revoke its general preference order M-29. No provision for monthly reports was contained in the revocation order.

Much the same supply and demand situation exists with reference to molybdenum with imports and production exceeding the amount used, WPB announced. The agency has amended its general preference order M-110, but inserted a provision that all sellers of more than 2,000 lb. a month are to make a report on sales.

o o o

Minerals Go Under Single WPB Head

Washington

• • • **All metals and** minerals were placed under a single WPB vice chairman last week when the new Office for Metals and Minerals was created. This completed the reorganization of the former Office of Operations Vice Chairman. Arthur H. Bunker was appointed as vice chairman for Metals and Minerals. In this office Mr. Bunker will assume the direction of the Steel, Copper, Aluminum and Magnesium Divisions, the Minerals Bureau and the Minerals Resources Coordinating Division and its related committees.

It was pointed out that the new Office of Vice Chairman for Metals and Minerals will have new and important problems to deal with, arising from the fact that there are developing in many metals surpluses beyond direct and indirect military needs.

Mr. Bunker has been associated with war production since Dec. 16, 1941, when he was appointed Chief of the Aluminum and Magnesium Branch of the Office of Production Management. Since June, 1943, he has been Director of the WPB Aluminum and Magnesium Division.

o o o

New Copper Inventory Group Named

Washington

• • • **The WPB Copper** Division has organized the Copper Recovery Inventory Branch, located on the forty-third floor of the Empire State building, New York, which replaces the Copper Recovery Branch, formerly located at the offices of the Copper Recovery Corp., 200 Madison Avenue, New York, whose affairs have been concluded. The corporation purchased idle copper inventories for remelt purposes and directed a redistribution.

In addition to the program it plans, the Copper Recovery Inventory Branch will perform the functions that were carried on in the past by the Copper Recovery Branch. The Copper Recovery Branch, since its inception, arranged for use "as is" of approximately 112,000,000 lb. of copper and copper-base alloy material.

The Copper Recovery Inventory Branch is staffed with men who were connected with the Copper Recovery Branch. A V. Nappy, former chief of the Copper Recovery Branch, is chief of the new branch.

Any manufacturer or other person using copper and copper-base alloy material in primary forms may have in surplus inventory items urgently needed by others and should make these surpluses known at once, the Copper Division said.

CMP Developments

• Dir. 14 under Reg. 2 extends inventory limitations on aluminum forgings, pressings, upsettings and impact extrusions from 60 days' to 120 days' supply. (Release No. WPB-4749)

•

• Dir. 40 to Reg. 1 rules that beginning with January frogs and switches, which have been classed as controlled materials, will hereafter be classed as "B" products.

Restrictions on Use Of Steel Drums Tightened

• • • **Restrictions on** steel drums were tightened with WPB issuance of Order L-197, as amended. Under the amended order, products are classified in three categories. Those in the first category cannot be shipped in steel drums, those in the second category cannot be shipped in new steel drums, and those in the third category can be shipped in new drums only when authorized by WPB, but may be shipped in used drums.

Priority Changes

L-170-a—Amended order permits use of copper in farm tractor radiators and power take-off gears which heretofore have been prohibited. (12-28-43)

•

L-287—Amended order removes weight restrictions on the amount of metal which may be used in the manufacture of portable conveyors. (12-23-43)

•

M-1-d—Amended order removes from the definition of aluminum scrap, residues containing less than 50 per cent recoverable aluminum. (12-23-43)

•

M-1-g—Amended order relaxes restrictions on the use of aluminum paint. (12-24-43)

•

M-21-a—Dir. 2 has been revoked. (12-23-43)

•

M-38—Amended order permits lead consumers to make quarterly rather than monthly reports hereafter. (12-23-43)

•

M-61—Amended order removes graphite from allocation and places it upon a restricted use basis. (12-28-43)

•

M-297—Revised order relieves a number of types of users of coal tar of the necessity for filing monthly applications for allocations. (12-23-43)

•

P-56—Amended order makes many changes in the original order relating to mines and smelters. (12-23-43)

•

P-58—Revoked. (12-23-43)

•

P-73—Revoked. (12-23-43)

•

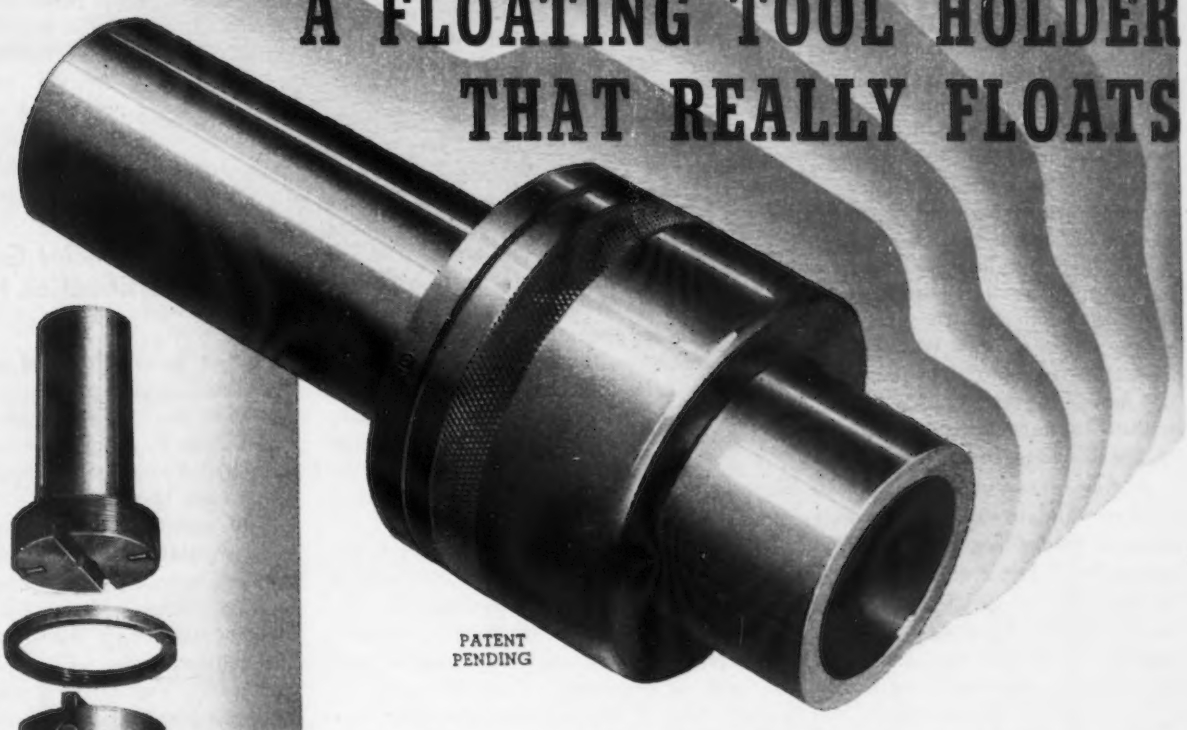
Reg. 13 has been revised in order that all regulations issued prior to Dec. 22, 1943, shall have no effect on redistribution of such materials. (12-27-43)

•

Dir. 1 to Reg. 18 has been revoked. (12-27-43)

At Last!

A FLOATING TOOL HOLDER THAT REALLY FLOATS



PATENT PENDING

ONLY 5 PARTS

1—SHANK
2—ADJUSTABLE NUT
3—UNIVERSAL FLOAT
4—BODY (CAP)
5—SLEEVE

EVERY HOLE—STARTING WITH THE VERY FIRST ONE YOU REAM—WILL BE ACCURATE TO SIZE—PERFECTLY ROUND

Here is indeed an outstanding floating tool holder! Its simplicity of design—a coordination of only five parts—bespeaks its high efficiency.

It will compensate for both off-center and out-of-parallel misalignment—permits the float to be adjusted in all directions.

The moving parts ride on rollers and thus contribute immeasurably to making the members antifriction—producing smoother running with more perfect alignment.

Composed of only five parts, the Empire Floating Tool Holder requires a minimum of maintenance—nothing to get out of order. Nor is there anything to fall out or get lost when holder is taken apart.

It will enable you to ream holes with close tolerances with the very first hole reamed to size.

You will definitely have no more bell-mouthed holes if you use the Empire Floating Tool Holder.

Floating Tool Holders are available with holes in the following sizes: ½", ¾", 1", 1¼", 1½", in choice of shank diameters: 1", 1¼", 1½", 1¾", 2", 2¼".

Send for catalog and price quotations on your specific requirements.

WPB Reports 1½ Million Tons Excess Steel

Cleveland

• • • **According to** T. S. Fitch, special assistant of the War Production Board Steel Division, there are no less than 1,500,000 tons of steel now available for redistribution. Through information obtained by the WPB regional offices, the Surplus Inventory Branch of the Steel Division will correlate inter-regional activities to aid in the redistribution of this material. No catalogs will be issued, but significant items and quantities will be publicized through the regional offices in the War Production Bulletins. Items of five tons or more not moved by the regional WPB office within 30 days will be turned over to the Surplus Inventory Branch.

A new form, WPB-3320, will be used to validate ex-allotment sales of distress stocks reported to WPB. A recent WPB letter clarified procedure to be followed in the purchase of these stocks. It outlines two alternatives: First, the manufacturer may be willing to buy the steel within his allotment, in which case his allotment number and appropriate certification must be furnished to the holder of the steel and the sale does not require further WPB permission. On the other hand, if the manufacturer wishes to buy the steel ex-allotment, he or the holder must apply to the WPB on form WPB 3320 for permission to make the transaction. The name of the manufacturer's claimant agency and the program number must be furnished, but this is for identification only. The steel need not be charged against his allotment.

Priorities Regulation 13 which governs sales of surplus steel is being revised. The amended order will make explicit the rules applying to the transactions in which allotments are not used. Free movement of small items is also in prospect.

At the end of the war, there is expected to be about 10,835,000 tons of surplus material according to Mr. Fitch. Much can be used in regular civilian production while another part can be exported.

o o o

New Rules on Sales of Excess Set

Washington

• • • **WPB has revised** Priorities Regulation 13, governing special sales of idle and excess materials, in order that all regulations issued prior to Dec. 22 shall have no effect on redistribution of such materials. The only exceptions to this general rule are Directive No. 16, governing aircraft inventory transfers, and Order P-98-c, governing special sales in the petroleum industry.

To find the rules governing a special sale of idle or excess materials, there is no need to refer to any order or regulation other than Priorities Regulation 13, outside of the two stated exceptions. However, in this regard, it is pointed out that orders issued after Dec. 22, which may specifically indicate that Priorities Regulation 13 has no effect, shall govern special sales of items that they may cover.

The regulation points out that special permission to sell idle and excess controlled materials for any permissible use under WPB orders and regulations may be granted by the WPB regional offices. Permission may be granted for sales of such controlled materials either to persons who have no allotments or to persons who have allotments but desire to acquire controlled materials in excess of the amounts included in the allotments they hold.

•

WPB May Still Allocate Under Amended Order M-17

• • • **Under Order M-17**, as amended, which removes pig iron from allocation on Feb. 1, WPB specifically retains the power to issue specific directions with respect to production and delivery, in order to take care of individual critical cases.

The order, issued Dec. 21, 1943, also states that while producers will be required starting Jan. 1 to file simplified monthly reports on production, shipments, and inventory enabling WPB to keep a check on whether requirements are being met, consumers are no longer required to file reports. Each producer, however, must continue to file monthly reports with WPB on Form WPB-3174.

Transactions in pig iron remain subject to the provisions of all other orders and regulations of WPB, except whenever the provisions conflict with the newly amended order.

COMING EVENTS

Jan. 10 to 14—Society of Automotive Engineers, Detroit.
March 14, 15—National Association of Waste Materials, Inc., New York.
April 2 to 5—The American Ceramic Society, Inc., Pittsburgh.
April 12 to 15—The Electrochemical Society, Inc., Milwaukee.

•

Claimant Agencies Granted Special Certification Means

Washington

• • • **A special form** of certification for the use of procuring Claimant agencies has been included in CMP Regulation 7, which provides optional standard forms of certification, WPB announced last week.

The regulation points out that if CMP regulations require an allotment number, symbol, or preference rating to be included in a certification, such identification may appear either on the delivery order or on the certification itself. Formerly, it was required that the identification be endorsed on the delivery order.

•

Railroad Frogs and Switches Become Class B

Washington

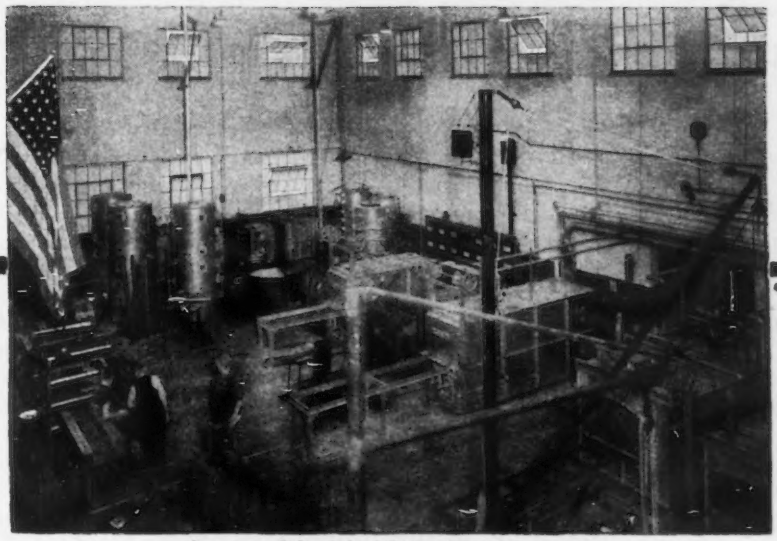
• • • **Railroad frogs** and switches became Class B products, rather than controlled materials, under CMP beginning Jan. 1. WPB announced this change last Thursday through the issuance of Direction 40 to CMP Regulation 1.

This means that frogs and switches are now available to users on preference rated orders rather than on authorized controlled materials orders. Persons who have ordered frogs and switches on the basis of authorized controlled materials orders for delivery after Dec. 31 must furnish their suppliers with preference ratings before their orders may be filled.

•

Pure Tungsten and Molybdenum Still Controlled

• • • **The action of** the WPB announced Dec. 31, removing restrictions on purchases of certain steel alloying elements in "small orders," is specifically not extended to pure tungsten and molybdenum ingot, wire and sheet, since these are still critical. The action was a continuation of M-369.



A corner of the Colonial Heat Treat Department.

How to get more out of your Broaches.....

BY PROPER HEAT-TREAT

The difference between an ordinary broach and a really good one is frequently traceable to the heat-treatment before grinding. Of course, you can't take all your broaches and heat-treat them yourself for longer life. But you can make sure that they are properly heat-treated.

One of the best ways to do this is to check into your broach supplier's heat treating equipment.

As a starter, we will be glad to tell you about our new, modern and complete Heat Treat Department. It will give you an idea why Colonial Broaches do such an outstanding job.

Ask for a copy of Broaching News—Vol. V, No. 2.

How Large and How Small Can Manganese Steel Castings Be Made?

The answer, in terms of what has been done, is "From many tons down to less than a pound." We show a few examples.

Picture 467 shows a 25,000 lb. one-piece manganese steel crusher mantle made for a gyratory crusher manufacturer. No. 330 shows a section of a barking drum used in paper mills. The manganese steel girth gear is over 15′ outside diameter and weighs 16,000 lbs. The two manganese steel tires are 13′ outside diameter and weigh 9,500 lbs. each.

R-409 shows part of an order of bolster hanger key gib bearings for subway cars. Each casting weighs 7/10ths of a pound.

In all three of these applications, manganese steel was selected for its toughness to resist fracture and its ability to work-harden under impacts, friction and pressure.

Manganese steel castings, ranging from a chain link weighing a few ounces to a dredge pump shell 12 feet high, exhibit uniformly the high tensile strength, ductility and work-hardening property of "the toughest steel known."

By no means is manganese steel adaptable to every industrial use where a casting is required. But the range of sizes and successful applications suggests its consideration for your problem of breakage and wear.

Send for Catalog 59, describing all the uses for manganese steel.

Assisting Planning; Enemy Seized Patents

• • • **Each week,** starting with the issue of Nov. 4, this magazine in its news section has been publishing lists of patents seized by the U. S. Government from enemy and enemy-occupied nations, available to firms which obtain a license from the Alien Property Custodian.

Full information covering the rules and procedures accompanied the Nov. 4 presentation, and additional helpful data appeared in several succeeding issues. Seized patent applications were listed July 8.

In the items below, the sub-class number appears first, followed by the patent number, description, inventor's name and nation, and the date the patent was issued. The patent description in full may be obtained from the government as outlined in the Nov. 4 issue.

Class 24—Clasps, buckles, etc.

(115) 2,007,913. End connections for wires, cables, and the like such as used in airships where such cables are fastened to girders by means of gusset plates or similar elements. Ludwig Durr and Wilhelm Stegmaier, Germany. 7-9-35.

(126) 1,867,043. Clamping means to be employed for the securing in position of electric conduits or cords. Eduard Wirschitz, Germany. 7-12-32.

(123) 1,642,314. Joint for wires and wire ropes in which the ends to be joined are clamped in a double muff. Albert Stecke, Germany. 9-13-27.

(136) 1,642,243. Cable-supporting clamp to be used as a permanent fixture in electric power plants by means of which the live wire or cable can be readily mounted or dismounted. Heinrich Hinzer, Germany. 9-13-27.

(3) 1,992,623. Fastener for wrist watches to be carried in button hole of coat lapel. Geyza Karlovszky, Hungary. 2-26-35.

(3) 2,074,643. Device for holding ornaments, etc., by means of simplified clamping arrangement. Mauriz Domenego, Austria. 3-23-37.

(7) 1,732,684. Napkin holder for the purpose of attaching napkin more securely to the clothes of the wearer without injury. Johann Kessel, Germany. 10-22-29.

(11) 1,812,536. Clip for securing articles to cloth. Theodor Kovacs, Germany. 6-30-31.

(11) 1,823,673. Cap with a clip for fountain pens. Asahi Watanabe, Japan. 9-15-31.

(15) 1,692,527. Sleeve holder for shirt-sleeves. Albert Wiegel, Germany. 11-20-28.

(18) 1,722,908. Twine seal or lock. A punched-out piece of sheet-metal provided with suitably shaped and located recesses and slots. Heinz Geiseler, Germany. 7-30-29.

(18) 1,959,720. Device for knotless tying of packages wherein the tape-hole is arranged between the thumb-aperture and the clamping disk. Ludwig Koezi, Austria. 5-22-34.

(19) 1,849,948. Hose clip insuring a better fitting on the cross-section to be embraced. Fritz Muchler, Germany. 3-15-32.

(23) 1,787,949. Box-closing device making use of band iron and a sleeve surrounding the ends of the iron. Werner Loblich and Helmuth Loblich, Germany. 1-6-31.

(27) 2,019,570. Wire strapping for packages with twisted tie. Oscar Kind, Germany. 11-5-35.

(30.50) 1,625,772. Sack closure consisting of two wire bows of practically n-shaped form. Gustav Moller, Germany. 4-19-27.

(30.50) 1,720,152. Wire-tier for sacks consisting of a wire doubled upon itself midway and bent so that at the bend a round eye is formed. Friedrich Sigmund, Germany. 7-9-29.

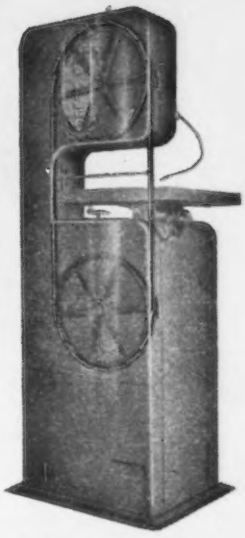
(31) 1,615,176. Belt fastener wherein the pins or cotters are located in edgewise disposed connecting links of a pliant material. Karl Kovarik, Austria. 1-18-27.

(31) 1,852,732. Joint for endless bands such as felts used in the manufacture of paper. Adolf Bong, Austria. 4-5-32.

(33) 2,202,094. Fastener for joining belts and conveyer bands which consists of a wire which is bent into the form of an open tri-

DoALL BAND FILER

DoALL work table adjustment—from 10° back to 30° forward—simple, quick and POSITIVE.



DoALL Band Filer—provides substantial economies in production, tooling and maintenance work on all types of metals, wood, fibre and plastics.

Production Filing TO "DIE-FIT" TOLERANCES

Flat or shaped surfaces—acute or right angles or bevels—internal or external—all are precision filed at amazing speed because of DoALL positive work controls.

Widest selectivity in file size, shape, cut and speed for every type of work; rigid file back and work table adjustment; all these assure precise *file-broaching* output in important volume!

No. 302 Campbell Abrasive Cutting Machine cutting 18/8 Stainless Steel forging blanks from slab 2⅝" x 10" x 14'

Campbell DOES ANOTHER PRODUCTION CUTTING JOB THAT "COULDN'T BE DONE"

● The job placed in the lap of a nationally known manufacturer of drop forgings made it necessary to cut 18/8 Stainless forging blanks from flat stock 2⅝" x 10" x 14'—cut-off lengths 9¾".

Without a CAMPBELL, cuts took so long that it was impossible to maintain production.

Now a CAMPBELL No. 302 ABRASIVE CUTTING MACHINE makes those cuts in 10 minutes—finished, burr-free cuts to dimension, without waste.

If you write the Campbell Engineering Department, they will develop production procedure and costs for you, too, without any obligation.

State materials, shapes and sizes you are cutting. Give lengths of stock, lengths of cut-off pieces and production rate required.

The data worked up for you will be based on actual experience. Remember CAMPBELL manufactures the only complete range of Abrasive Cutting Machines—including 8 types and 19 models. These machines are currently cutting all grades of steel, annealed and unannealed, non-ferrous alloys, plastics, glass and ceramics. Solid bars, tubular and flat stock.

EUCLID CRANES are

STANDBY Troubleshooters IN MANY POWERHOUSES!

Interruption of power cannot always be avoided but must not be tolerated a minute longer than necessary when an emergency does occur. Utmost dependability in the standby cranes is therefore requisite.

EUCLID CRANES are popular in this service and are to be found in many leading industrial and public utility power houses. They embody *speed* necessary to expedite emergency repairs and *ease of control* essential to the proper handling of intricate turbine and generator parts.

WE CAN DELIVER
a limited number of
5 to 10 TON Cranes
in
60 to 90 Days

This Euclid standby crane in the power plant of the Ford Willow Run Bomber Plant is a typical example of recent installations.

Satisfactory performance is evidenced by the roll call of both Euclid Crane and Euclid Hoist users, all discriminating buyers. Many have placed repeat orders and an impressive number have standardized on Euclid equipment.

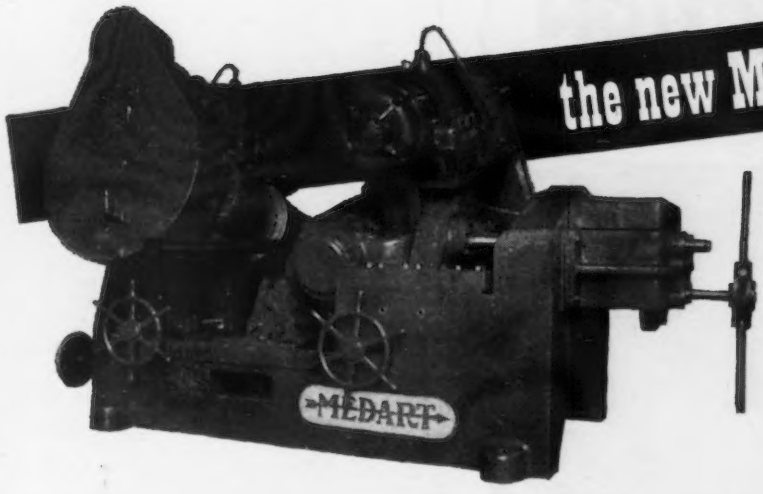
the new MEDART 2 & 2 UNIVERSAL



BAR AND TUBE STRAIGHTENING . . . SIZING . . . POLISHING MACHINES

2+2=5

2 rolls + 2 motors = 5 points of superiority

For high speed, precision production . . . Medart's new 2 & 2 Universal gets the call among bar and tube machines. Similar in operating principle to the Standard Medart 2 Roll Machine, has same patented concave and straight roll arrangement. Difference is, each roll *with its individual driving motor and reduction gearing* is an integral unit. Work piece ranges 1/16 to 6 inch diameter capacities.

Adaptability to more types of work. Exceptional range of conditioning due to variation of roll angle (10° to 35°) which varies the work cycle per unit of length of the work piece.

Greater range of output speeds. Throughput speeds of 50 to 1000 F. P. M. simply by varying roll angularity and by varying the gear arrangement which is *built into the machine.*

Takes up less floor space. No space taking projections or extensions. Medart's Universal 2 & 2 is more compact and takes less floor space.

Minimum of working parts. Simplified operation requires no special operating or maintenance skill. There are no universal joints, no bevel gears, no separate gear reduction unit.

Mechanism is above the rolls. Machine can be used on scaled, rusty or dirty work pieces. This also permits free use of circulating or polishing fluid if needed.

ONLY MEDART PRESENTS A COMPLETE, PROVEN LINE OF ALL-PURPOSE BAR AND TUBE MACHINES

V-DAY PRODUCTION
must flow too!

Logan double-deck Roller Conveyor in an electric motor manufacturing plant.

MANUFACTURERS thruout the nation will attest the value of Logan Conveyor equipment in stepping up the flow of war production. And the lessons learned will carry over into peace-time production as well—enabling companies to meet the changing post-war competitive situation by saving time, manpower and money at receiving points—processing—assembly—shipping. The time is NOW to plan your V-day re-conversion and to consider the practical application of Logan equipment to your problems. Write for complete information. Logan Co., Inc., 545 Cabel, Louisville, Kentucky.

(33) **1,948,411.** Endless belt and seam construction therefor. E. V. Asten, Belgium. 2-20-34.

(33) **2,068,826.** Belt fastener of the kind comprising U-shaped belt lacing hooks. A. Timmerbeil, Netherlands. 1-26-37.

(33) **2,097,108.** Device for connecting the ends of belts, straps, and the like. A. Timmerbeil, Netherlands. 10-26-37.

(37) **1,737,167.** Belt fastener for joining the ends of driving belts of the type in which the ends of the belt, bent at right angles, are pressed between two rows of plates joined in pairs. L. Montigny, Belgium. 11-26-29.

(57) **1,667,679.** Device for supporting ties made of any kind of wire but capable of acting as a spring. J. Roura, France. 4-24-28.

(68) **1,869,462.** Stretching and fastening device for ropes. O. Burheim, Norway. 8-2-32.

(71.3) **1,643,199.** Stretching device for wires and the like. L. Clemencet, France. 9-20-27.

(81) **2,304,348.** Bow-tie clasp of the type that may be attached to the front flaps of a fold-over shirt collar. E. Firon and A. Firon, France. 12-8-42.

(90.5) **1,802,885.** Safety button adapted for the closing of the inside pockets of garments. A. Eguren, France. 4-28-31.

(102) **2,049,082.** Cuff link. J. Sanger, Austria. 7-28-36.

(104) **1,899,313.** Button fastening of the type not requiring sewing. A. Coquette, France. 2-28-33.

(104) **2,130,263.** Collar button with detachable head. H. Christophersen, Denmark. 9-13-38.

(106) **1,965,514.** Collar stud of the type consisting of a tubular socket and a stud each being fixed on a small plate. C. Tolk, Netherlands. 7-3-34.

(106) **2,136,161.** Button in two parts which can be fixed to its support without sewing. Karel Vesely, Czechoslovakia. 11-8-38.

(110) **1,911,935.** Fastening device for jewels and other ornaments. Andre Vidal, France. 5-30-33.

(117) **1,806,005.** Fastening device for the bands or straps of shoes or other articles. A. Thomas, France. 5-19-31.

(120) **1,844,223.** Inserting and protecting device for shoe laces. O. Kircher, France. 2-9-32.

(123) **1,656,578.** Clip for transmission cables with crossties. V. Dutkiewicz, France. 1-17-28.

(124) **1,883,530.** Tightening device consisting of two cooperating complementary parts each being formed with a screw thread proceeding respectively in a right and left handed direction. A. Buisset, France. 10-18-32.

(126) **1,729,945.** Wire clamp to be used in clamping the end portion of a cable in the form of a loop. C. Holm, Norway. 10-1-29.

(126) **1,923,812.** Tensioning device for wires, cords, or metal rods. J. Chobert, France. 8-22-33.

(136) **1,781,080.** Device for gripping cables, wires and the like. J. Ring, Czechoslovakia. 11-11-30.

(143) **1,856,374.** Method of tagging laces, strings, and the like. R. Chasselon, France. 5-3-32.

(157) **1,814,290.** Self closing clasp for brooch pins. L. Cartier, Hungary. 7-14-31.

(160) **1,702,107.** Fastening device for watches and other articles of jewelry. L. Cartier, France. 2-12-29.

(191) **2,001,618.** Buckle designed for use on

By the Army, the Marines and the Navy too

This 11-inch ball-bearing SHELDON Precision Lathe has been selected by the Army for its Mobile Machine-Shop Units, by the Marine Corp. for its trailerized shops and as the ideal maintenance lathe for several types of shops by the Navy.

This lathe and bench unit comes with a SHELDON E-type, 4-speed Underneath Motor Drive, a Draw-in Collet Attachment (1" collet capacity), a Telescopic Taper Attachment, Full Quick Change Gears and a Double-wall Apron with Power Cross Feed. The steel bench completely houses the underneath motor drive in its left pedestal and provides 5 fitted drawers for tool attachments, etc.

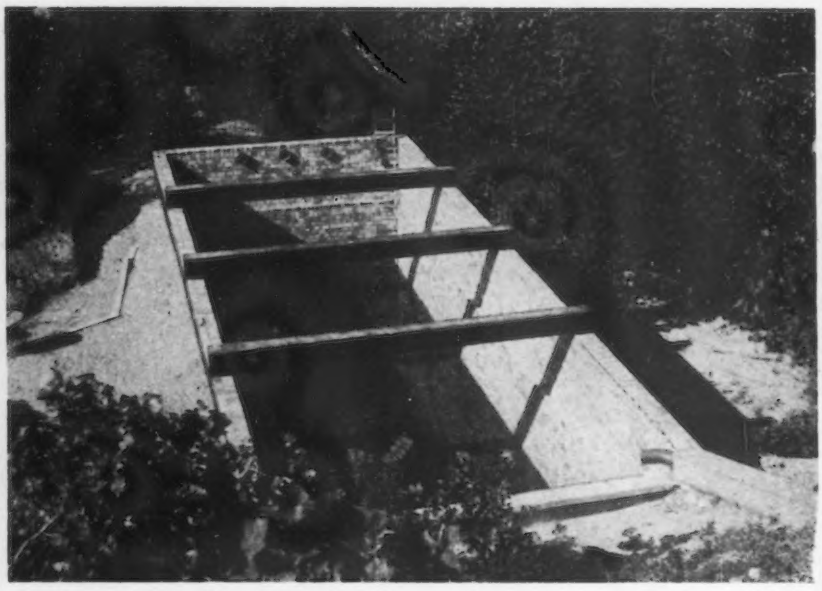
BASOLIT

ACID *Neutralizing* TANK



2500 gallons of waste pickling acid are dumped every 24 hours into this 90,000 gallon acid disposal tank installed 3 years ago for a large wire mill in the Mid-west.

Tank is 60' long x 20' wide x 12' deep, constructed of reinforced concrete shell, lined with TORONTO Acid Brick and acidproof jointing Cement, BASOLIT.

There are many hundreds of rubber lined steel and reinforced concrete pickling tanks, acid storage and neutralizing tanks and acid floors, sewers and pits, where our BASOLIT construction has contributed to long life and efficient operation of modern pickling equipment.

Our Engineering Department will be pleased to furnish detailed drawings and estimates without cost to you.

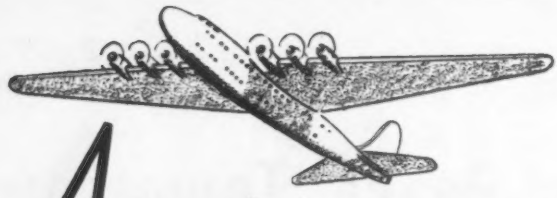
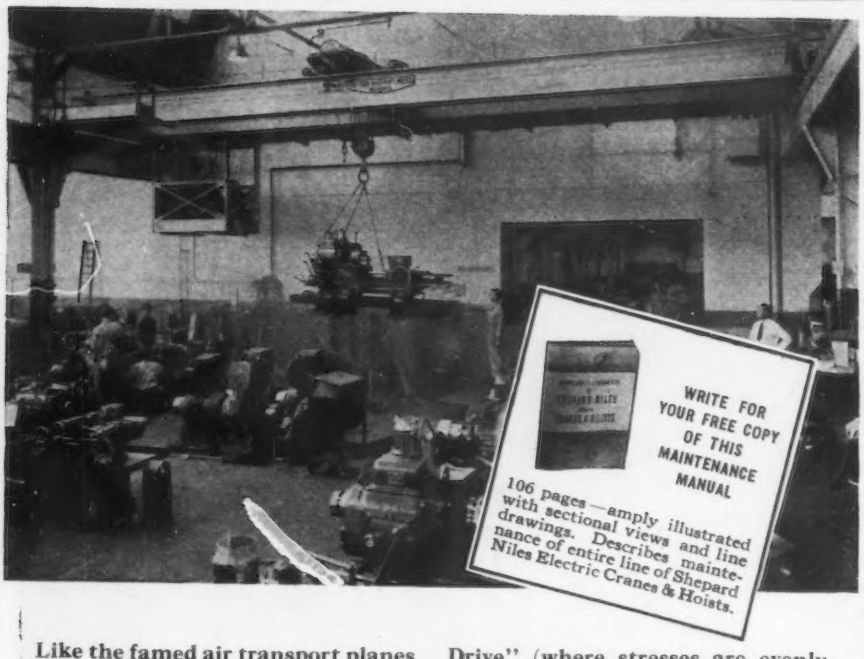
THE FURNACE OF TODAY AND TOMORROW



Air transport

minus the wings



Like the famed air transport planes of the armed services, Shepard Niles Overhead Electric Traveling Cranes depend upon faultless engineering and rugged construction for their ability to "pick-up-and-go" with heavy loads.

While tremendous stresses are put upon the crane girders, the heart of the entire installation is the crane trolley, or hoisting unit. Here is where the going is *really* tough. And *here* is where the time-proven, Shepard Niles - developed features, such as the "Balanced Drive" (where stresses are evenly distributed through the hoisting unit by means of the planetary gearing principle) and the "bath of oil" system (in which the entire gear train operates in a bath of oil) remove the danger of excessive wear.

Ask one of the Shepard Niles representatives in your locality to show you how these and other equally sound principles can be applied profitably to your problem.

* * *

Overhead Electric Traveling Cranes are made in either welded or riveted box girder construction. Capacities: Welded box girder, up to 15 tons; riveted box girder, up to 450 tons.

Shepard Niles

rotary furnace or hearth furnace and then incinerated, scorified and melted. L. Hermanns, Germany. 2-23-37.

(22) 1,605,844. Furnace employing adjustable furnace arches for increasing the size of the furnace chamber and for uncovering the supplementary fuel supplying means when raised and covering it again when lowered. E. Jurges, Germany. 11-2-26.

(22) 1,702,298. Burner for furnace which permits the supply of fuel gases or liquid or pulverized fuel to the furnace either alternately or simultaneously. F. Hetsch, Germany. 2-19-29.

(22) 1,760,050. Gas burner of the type in which the gas and the air to be admixed with the gas are ejected from rotary impellers. R. Eickworth, Germany. 5-27-30.

(23) 1,886,064. Furnace having in combination a main inclined grate and a secondary inclined grate arranged above the main grate for delivering incandescent fuel thereto, and means for supplying fuel to both grates so as to form a burning layer on the main grate on which fresh fuel is supplied. L. Steinmuller, Germany. 11-1-32.

(24) 1,756,096. Method of and apparatus for burning solid fuel consisting of a furnace comprising a combustion chamber having in its top a plurality of charging holes having removable covers, and vertical, tubular retorts disposed beneath and in correspondence with certain of said charging holes. F. Novelli, Italy. 4-29-30.

(28) 1,618,808. Apparatus for the burning of powdered fuel comprising a cylindrical retort having tangential slots through its cylindrical wall and forming an annular air space therewith, and annular partitions for dividing said air space into adjoining compartments. E. Burg, Germany. 2-22-27.

(28) 1,680,183. Furnace for utilizing powdered fuel and the like, in a rising current of gaseous fluid, comprising, an upright shaft having an open lower end and of upwardly increasing cross sectional area, a chamber positioned below the lower end of the shaft and having a cross sectional area greater than that of the open lower end. G. Szikla and A. Rozinek, Hungary. 8-7-28.

(28) 1,701,900. Coal-dust furnace consisting essentially in providing means for blowing coal dust into a furnace having an inclined stepped grate which is supplied with fuel, the blowing of said coal dust being accomplished at such a height that said coal dust will come in contact with the tips of the flames which are produced by the fuel burning on said grate. R. Uhlig, Germany. 2-12-29.

(28) 1,729,217. Powdered fuel furnace comprising a furnace chamber having secondary air inlets near the bottom thereof, inclined slagging walls above said inlets, inclined burners above said walls directed to discharge respectively along the upper surfaces thereof. C. Hufschmidt, Germany. 9-24-29.

(28) 1,800,281. Coal dust firing installation having a common coal dust and air supply conduit, a burner in which said conduit terminates, said burner having a face place provided with a large number of nozzles through which the mixture of coal dust and air is adapted to be blown. P. Buscler, Germany. 4-14-31.

(28) 1,808,120. Burner arrangement for pulverized fuel furnace for the satisfactory intermixing of the pulverized fuel and the air of combustion. A. Runkwitz, Germany. 6-2-31.

(28) 1,887,891. Method of and means for operating pulverized fuel furnaces, with secondary air of combustion, more particularly with locomotives. R. Roosen, Germany. 11-15-32.

(28) 1,896,139. Coal dust furnace intended for locomotives and having a burner that has the shape of a spray nozzle. G. Hayn, Germany. 2-7-33.

(28) 1,910,735. Burner for coal dust firing and process for operating the same. H. Zikesch, Germany. 5-23-33.

(28) 1,943,286. Burner for powdered fuel in which the fuel is delivered from the burners with whirling motion. E. Burg, Germany. 1-16-34.

(28) 1,944,086. Pulverized fuel furnace, more particularly on locomotives, having an improved arrangement of the ignition space of such furnaces. W. Kempf, Germany. 1-16-34.

(28) 1,946,011. Coal dust furnace for flue boilers, marine boilers and the like and consisting essentially therein that the combustion space is positioned within a refractory lining provided at the front part of the flue and that said refractory lining is constructed to form an air admission space which is in connection with said combustion space by means of slots or the like. E. Burg, Germany. 2-6-34.

(31) 1,627,425. Open-hearth furnace comprising a gas producer, a melting chamber, a gas port connecting the chamber and producer at the white heat zone of the latter and means

The Strong Way

Pays in many ways

YOU CAN PUT IT ALL UP TO STRONG, *if you have a steel casting from 30 pounds to 30,000 pounds—or a size range of almost any conceivable shape or proportion. The sweep method shown above—typical of Strong's versatility—saves the customer the costly pattern making otherwise needed for this unusually shaped, 33,000 pound casting. Strong molding facilities range from small snap flasks to steel flasks 16 feet square. This size range is governed only by the size of Strong's largest annealing oven (15 x 19 feet). Be sure you know the modern art of steel casting, as Strong has developed it!*

to produce a cooling and obturating current of air across the ports. E. Bosshardt, Germany. 5-3-27.

(31) 1,671,549. Furnace for domestic heating plants for solid fuel. W. Schmidt, Germany. 5-29-28.

(32) 1,982,564. Apparatus for regulating or governing the speed of conveyors, and more particularly the feed speed of traveling grates, screw conveyers for coal dust furnaces, and the like. G. Brunsen, Germany. 11-27-34.

(33) 1,760,448. Case for books or the like in which an endless row of superposed shelves is supported by a pair of endless chains and can be raised or lowered by moving the chains so that each shelf can be moved in range of the eyes or hands of a person standing in front of the case. A. Steinschneider, Germany. 5-27-30.

(33) 2,043,719. Mechanically moved grate having a set of grate bars, supports for the grate bars, plate springs supporting the said supports in an approximately horizontal position, one end of each of said plate-springs being rigidly secured to one of said supports while the other end is loosely connected to the same. B. Telgmann, Germany. 6-9-36.

(33) 2,108,394. Horizontal grate, which can be constructed in any desired size and wherein the charging and stirring and removal of ash can be effected entirely automatically. L. Steinmuller, Germany. 2-15-38.

(36) 2,091,587. Revolving grate, particularly for the furnaces of steam generators or the like, comprising at least two superposed rotatable discs, one of said discs being rotatable about an axis which is out of alignment with the axis of rotation of the other disc, and means to rotate said discs. O. Engler and H. Peperkorn, Germany. 8-31-37.

(38) 1,644,953. Stepped furnace grate having in combination with a number of fixed grate bars, a number of movable grate bars arranged in a series of groups, movable carriage to support and reciprocate said groups of movable grate bars and means adapted to move the carriages of each group independently of the carriage of the adjacent groups. F. Seyboth, Germany. 10-11-27.

(38) 1,818,661. Furnace for heating boilers and the like and for similar purposes and in particular furnaces provided with stepped grates with movable steps. A. Weigel, Germany. 8-11-31.

(38) 1,908,992. Progressive feed grate consisting of a plurality of inclined grate units extending transversely of the grate, each unit resting at its upper margin upon an adjacent unit and pushing means hingedly engaging the opposite margin of each of said units. J. Martin, Germany. 5-16-33.

(38) 2,250,067. Driving device for mechanically reciprocated grates of furnaces, more especially to grates which are provided with a partitioned draft chamber below the grate bars. J. Martin, Germany. 7-22-41.

(40) 2,147,976. Traveling grate for flue-tube boilers. R. Giesau, Germany. 2-21-39.

(40) 2,257,416. Traveling grate especially for induced draught roasting and sintering or similar plants, comprising an endless circulating grate band including a plurality of cross bars arranged transversely to the direction of travel of the band and provided with grooves. K. Grethe, Germany. 9-30-41.

(43.50) 2,160,449. Apparatus for the starting and landing of aircraft adapted to be towed on the water or carried by a ship, comprising a platform having a central core of tenacious material. R. Weichardt, W. Freistadt and J. Hicke, Germany. 5-30-39.

(44) 1,829,275. Automatic stoker device for furnaces or the like comprising a circular

Copyright 1943

grate divided radially into a plurality of retorts, and means for feeding fuels to said retorts. H. Gleichmann, and W. Gumz, Germany. 10-27-31.

(52) 1,754,586. Method for combustion on the grate, according to which method a portion of the flue gases is automatically deflected by the action of the kinetic energy inhering in the flue gases and to conduct this deflected portion of the flue gases backward to one or several points of the front portion of the grate surface. E. Volcker, Germany. 4-15-30.

(54) 1,813,921. Vapor power plant and more particularly means for regulating the furnace of such plants by controlling the supply of oxygen to the combustion air in dependence of the load in such a manner, that the supply of oxygen is increased when the load rises and decreased when the load drops. W. Gumz, Germany. 7-14-31.

(71) 2,164,262. Air distributor for furnaces or the like having a forced air feed beneath the grate thereof. J. Wagner, Germany. 6-27-39.

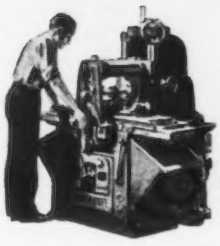
(72) 1,625,082. Method of producing high

What will your future I.P. *be?*

This is the First of a series of advertisements presenting "Industrial Par" and its importance to your company in all future planning. Save this and succeeding I.P. advertisements as the basis for discussion and as a guide to your planning program.

50% increased output per man-hour every 10 years.*

Will your production make this National †† Industrial Par?



RESEARCH reveals that in the 12 years, 1929-1941, the nation's output per man-hour increased 34%. The rate is 2½% per year compounded. And there is ample evidence accumulating that the rate will advance to at least 4%. War — the supreme national productive effort it calls for — accelerates man-hour output. Improved production techniques — developed in war — carry over into peacetime; the pent-up buying power released after Victory will tremendously stimulate production.

Thus manufacturers who intend to keep step with a high level of national prosperity — the volume production which means more goods for more people at lowest cost, and security of jobs and wages for the greatest number of workers — must strive to increase their output per man-hour 50% every 10 years.

To put it another way, American industry sets a definite national industrial PAR for man-hour output or production — 4% compounded per year rate of increase. The management of your company can determine its own competitive standing in terms of its ability to make or break this PAR.

Every industrial executive knows the key importance of machine tools in reaching production goals. Machine tools were basic to the phenomenal achievement of the American aircraft industry in attaining and surpassing the 60,000 plane quota set at the beginning of the war. The majority of the war industries — all machine tool users — were able to produce at a rate far in advance of the timetables set for them.

Manufacturing for peacetime markets is as much of a challenge as manufacturing for war. To make better products — faster — at lower cost — will call for the newest and finest machine tools — essential implements of production efficiency and the increased output that means security of jobs and wages.

Back the attack **BUY MORE BONDS**

Spotlight facts for your future I.P. *planning*

* Production methods — developed in wartime —increase man-hour output; pent-up buying power — released in peacetime — demands increased production.
* The rate of 2½% increase per year output per man-hour, established by a 12 year record of industrial production, can be expected to reach at least 4% per year — compounded.
* Manufacturers must set a goal of 50% increased output per man-hour every 10 years — to maintain a high level of national prosperity and achieve its benefits in terms of security of jobs and wages for the greatest number of workers and the volume production of more goods for more people at lowest cost.
* Machine tools — the most modern, most efficient — are recognized as the most effective implements of mass production and increased output at lowest cost — but only continual replacements with the newest and finest machine tools assures full productive capacity. *Such replacements yearly should be equal to 10% of the total machine tool investment — in keeping with increased output.*
* The cost of machine tools is insignificant in terms of their productive power . . . from 1927 to 1937, according to census reports, American manufacturers had only a total of about 2% invested yearly in machine tools in ratio to a total volume of 9 billion dollars' worth of production annually.

†† **Industrial Par** — *the constantly increasing output per man-hour equal to approximately 50% every 10 years.*

temperatures in a furnace which consists in spraying the fuel into the combustion chamber of the furnace and jetting air through multitudinous passages distributed throughout the walls of the chamber. F. Helbig, Germany. 4-19-27.

(72) 1,757,051. Apparatus for the regulation of combustion in furnaces comprising at least two burners and a fuel feed device in each burner for supplying fuel to the furnace. C. Klopfer, Germany. 5-6-30.

(73) 1,861,388. Fire bridge for furnaces comprising a support having an aperture therethrough, a casting mounted upon said support having passages through oblong in cross-section and communicating with said aperture at their lower ends and opening out of their upper ends approximately at right angles to the direction of the gases of combustion. C. Greve and W. Schwarz, Germany. 5-31-32.

(75) 1,762,505. Fireplace comprising a combustion chamber having its walls composed of blocks in longitudinal rows spaced from one another for providing passages for the admission of secondary air and means for supplying secondary air through said passages. E. Burg, Germany. 6-10-30.

(80) 1,747,738. Plane grate furnace comprising a plane grate, a fire door at one end of the grate and a fire bridge at the opposite end of the grate, and a set of steam nozzles in the proximity of the fire door and above the plane of the grate adapted to produce steam jets. H. Serog, Austria. 2-18-30.

(98) 1,684,691. Means for protecting the drums, and more particularly, the upper drums of water tube boilers from the strong or direction action of the hot gases or flames. L. Steinmuller, Germany. 9-18-28.

(99) 1,806,022. Ignition roof for traveling grate boiler plants. R. Poth, Germany. 5-19-31.

(99) 1,904,596. Arch for metallurgical furnace of the class wherein the arch or upper portion thereof is built up of fire bricks which present a relatively uniform and smooth face toward the interior of the furnace and exteriorly have projections which provide the furnace exteriorly with a profile which presents a series of peaks and depressions arranged either alternately or in varied order and size. W. Alberts, Germany. 4-18-33.

(99) 2,146,751. Furnace roof for high temperature industrial furnaces comprising an arched roof formed of individual refractory bricks arranged in an arc and suspended to span the furnace side walls freely thereof, and abutments at the margins of the roof for supporting the bricks in contiguous relationship with each other. W. Linder, Germany. 2-14-39.

(103) 1,709,801. Art of making metallic foils, films or leaves of extreme thinness. C. Muller, Germany. 4-16-29.

(104) 1,748,173. Production of high temperatures by means of finely subdivided and more especially pulverulent fuel. A. Helbig, Germany. 2-25-30.

(104) 1,762,982. Apparatus for burning coal dust or other finely sub-divided solid fuel and is particularly applicable for use with rotary kilns or the like which are employed for burning, roasting or clinkering cement or similar material. A. Hasselbach and F. Luther, Germany. 6-10-30.

(104) 1,890,542. Device intended to control coal-dust furnaces more particularly those of locomotives. G. Hayn, Germany. 12-13-32.

(104) 1,938,137. Adjustable burner arrangement for pulverized fuel furnaces, more particularly intended for locomotives. E. Dietzel, Germany. 12-5-33.

(104) 2,197,647. Burner for a mixture of air and fuel comprising a combustion chamber and a burner nozzle having an outlet mouth which flares towards the said combustion chamber and serves to conduct primary and secondary air to said chamber. C. Lorenzen, Germany. 4-16-20.

(106) 1,608,996. Means for cooling the masonry for coal-dust furnaces. H. Reiser, Germany. 11-30-26.

(110) 1,746,350. Control device for fuel feeding machanism, especially for coal dust furnaces and similar devices. G. Hayn, Germany. 2-11-30.

(113) 1,760,572. Mechanically-operated grate-feeding means provided with coal throwing shovels disposed in the stoking neck or stoking aperture of the furnace. A. Weck, Germany. 5-27-30.

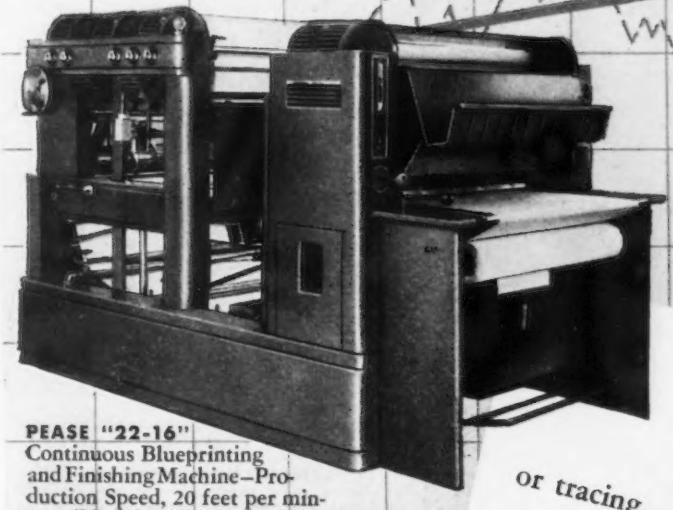
(118) 1,667,703. Apparatus for charging fireplaces with highly-inflammable loose fuel. E. Simon, Germany. 4-24-28.

(147) 2,047,071. Draft regulator for locomotives for controlling the introduction of steam and of overgrate air for smoke-consuming devices, more particularly for use on locomotives. O. Huwyler, Austria. 7-7-36.

(162) 1,681,677. Ship's smoke stack comprising a substantially cylindrical funnel, a double conical insert in and connected with

Blueprints

SMOOTH OUT PRODUCTION KINKS



PEASE "22-16"
Continuous Blueprinting and Finishing Machine—Production Speed, 20 feet per minute. (Model "22," not shown, has a Production Speed of 30 feet per minute.)

EXCLUSIVE PEASE FEATURES

- **Sliding "Vacuum-like" Contact** smooths out tracings, prevents errors in printing.
- **Three Speed Lamp Control** provides operation at 10, 15, or 20 amperes, minimizes running speed and dryer heat changes.
- **Actinic "No-Break" Arc Lamps** burn for 45 minutes without breaking arc, resume instantaneously.
- **Horizontal "Floating" Water Wash** floats prints free from tension and prevents wrinkles, stains, bleeding.
- **Quick Change Chemical Applicator System** very economically allows change from Blueprints to Negatives in 20 seconds.
- **Eight-inch Diameter Drying Drums,** thermostatically controlled, heated by gas or electricity, dry the prints "flat as hung wallpaper."

Blueprints are accurate, easy to read and faithfully reproduce every detail of the original engineering drawing or tracing... Blueprints remain legible and withstand the rough handling, dirt and greasy fingerprints of shop use... Blueprints produce good prints from poor, worn, or soiled tracings... That is why Blueprint reproductions of drawings and tracings are now used more than ever before.

Pease Continuous Blueprinting Machines are simple in operation and combine printing and finishing in one complete continuous operation. They smooth out "production kinks" with their own actual production speed of 30 feet per minute in the case of Pease "22" (not shown) and 20 feet per minute with Pease "22-16."

IN CANADA: THE PHILIP CAREY COMPANY, LTD. Office and Factory: LENNOXVILLE, P. Q.

on the front side and having a discharge opening and also having a downwardly sloping guiding surface for the coal. L. Rainchon, Netherlands. 4-7-31.

(29) 2,175,832. Heating apparatus, particularly suitable for domestic use but also applicable for the heating of large premises, and especially adapted for burning fuels, the combustion of which is ordinarily difficult or necessitates special arrangement, for instance fine fuel of any nature, coke and anthracite breeze, etc., as well as wood in all its forms. P. Demarcay, France. 10-10-39.

(32) 1,625,954. Furnace having a mechanical stoke and comprising as essential elements a grate portion having a large draft capacity, another grate portion having a much lower draft capacity, an underfeed device adapted to advance the fire bed on the grate portion with a large draft capacity and means for supplying supplementary air to the combustion chamber above the fire bed. A. de Bije, Netherlands. 4-26-27.

(32) 1,835,088. Apparatus for controlling the feeding of fuel to furnaces and more particularly to the regulation of the grate speed or the rate of supply of fuel in traveling or chain grate furnaces. E. Roucka, Czechoslovakia. 12-8-31.

(32) 1,835,089. Apparatus for controlling the feeding of fuel to furnaces and more particularly for the control of mechanical fuel feeding rate mechanism or the rate of supply of fuel in, for example traveling or chain grate furnaces. E. Roucka, Czechoslovakia. 12-8-31.

(32) 1,835,090. Apparatus for automatically feeding fuel to furnaces which burn solid fuel upon mechanical grates, such as chain grates or traveling grates which by their movements feel the fuel. E. Roucka, Czechoslovakia. 12-8-31.

(32) 2,113,831. Combustion device for solid fuel furnaces which is characterized by the utilization of the effects of gravity for automatically feeding a furnace by means of a thin layer o fuel and also by the relative displacement of the ignition zone with respect to the mass of burnt products. H. Dupuy, France. 4-12-38.

(32) 2,214,404. Furnace for solid fuels with forced draft wherein the fuel rests upon at least one inclined or slanting support, such as a slanting grate or dead-plate or sole, at the upper part of which an air inlet opening is provided. E. Coenen, Belgium. 9-10-40.

(38) 1,811,339. Automatic furnace comprising a mechanical stoking appliance of the type in which the coal is supplied over a grate and at the same time spread laterally over the grate, and movable grate bars mounted adjacent to the main grate and movable in such manner that they feed the coal and ash and slag in the same direction as that in which the coal is supplied by the said appliance. A. de Bije, Netherlands. 6-23-31.

(40) 1,670,866. Traveling chain grate for mechanical stoking comprising a mechanical chain grate partitioned off into separate air compartments with a view to suppressing the accumulation of coal dust in the compartments so formed while however keeping the compartments practically air-tight as is necessary for the satisfactory operation of the draft. E. Nicolini, France. 5-22-28.

(40) 1,689,675. Combination with a boiler furnace chamber of a traveling grate stoker therein and a pulverizer adapted to pulverize fuel and to inject it into the furnace so as to create a cloud of the fuel over the rear part of the stoker. W. Lulofs, Netherlands. 10-30-28.

(40) 2,092,080. Mechanically moved chain grate for small furnaces and more particularly a chain grate for house boilers having a small grate surface. E. Lemaire, France. 9-7-37.

(44) 2,105,988. Fuel agitator designed for use with furnaces in which the fuel is fed from underneath the firebed. H. Ridet, France. 1-18-38.

(45) 2,034,448. Mechanical underfeed stoker wherein the fuel is fed to the furnace from below in such a manner as to ensure the complete burning of any solid or pasty fuel therein. E. Sevellec, France. 3-17-36.

(55) 2,030,017. Automatic smoke preventer for insuring complete combustion of smoke in fireboxes, and wherein, for that purpose, a jet of live steam is brought to blow the heated air over the burning fuel with the effect that the carbon contained in the gases is completely oxidized. R. Mille, France. 2-4-36.

(56) 1,698,516. The combination with a smoke-tube boiler having uptake tubes and downtake tubes, of a removable member forming a return chamber disposed outside of the boiler, and in communication with all of said tubes for receiving combustion gases from the

DELTA MILWAUKEE Machine Tools

DRILL PRESSES — GRINDERS — CUT-OFF MACHINES — BAND SAWS — ABRASIVE FINISHING MACHINES.

Delta *now offers you...*

3 accurate, dependable grinders...

Any one of these combinations — by itself — is "a heck of a lot of machine for the money." But take all three together, and you have a saving that no shop, large or small, can afford to overlook.

As a surface grinder, it's a husky, big-capacity machine—over 6 ft. high, weighs close to 700 lbs., grinds surfaces up to 13½" long, 6" wide. Designed for ease and speed of operation—with convenient controls, wide graduations on micrometer for close settings, many other latest features for accuracy and dependability.

As a Chip-Breaker Grinder, it gives exceptionally accurate results in grinding the chip-breaker groove on carbide-tipped tools. Equipped with the Univise, which holds the tool at any conceivable angle, may be reset at *precisely* the same angles as original setting without bothersome and often inaccurate measurements.

As a Tool & Cutter Grinder, it makes tool sharpening simpler, easier, cheaper, and extremely accurate. With the Unihead attachment, almost any conceivable angle can be ground.

For a real find that gives creditable results for years, investigate this modern, safe, good-looking machine. Consult your Delta industrial distributor (Delta sells only through distributors) or write for bulletins.

M-8B

Specifications

Wheels must have 1¼" hole.
Table surface 5¾ x 13".
Traverse feed, one graduation is .001".
Micrometer adjustment ⅜" range, each graduation is .0005".
Spindle speeds (with 60 cy. 1750 R.P.M. motor) 3200 and 4200 R.P.M.

No. 24-105
Surface Grinder.....$295.00
No. 24-205
Chip-Breaker Grinder 343.50
No. 24-305
Tool & Cutter Grinder 370.00

Priority required, A-1-A or better, under restrictions of Limitation Order L-237.

uptake tubes and delivering said gases to the downtake tubes. M. Treschow, Denmark. 1-8-29.

(60) 1,728,571. Apparatus for insuring complete combustion in industrial furnaces comprising essentially an injector with pressure steam jets whereby there is injected into the furnace a quantity of air calculated to effect complete combustion of the gases. J. Mille, France. 9-17-29.

(60) 1,758,304. Smokeless heat-economizing apparatus for furnaces of all kinds essentially constituted by one or several rows of injector nozzles designed to be housed in recesses made in one or several walls of the combustion chamber above the grate, at the back of same in the apparatus (boilers, etc.) and even in the flues. A. Winkler, France. 5-13-30.

(61) 2,310,903. Apparatus for effecting smokeless combustion in locomotive furnaces and the like wherein are provided a steam chest, a steam operated boiler blower and steam operated preheated air blowers. S. Wikarski, Poland. 2-9-43.

(74) 1,849,975. Grate for gas producers which is chiefly characterized by the fact that it comprises hollow bars which are placed side by side and are adapted to utilize the gas producing process in which air is insufflated through submerged channels into the water of the ash pit. P. Cousin, France. 3-15-32.

(75) 2,045,194. Apparatus for supplying heated air to a boiler furnace or the like in which a conduit is arranged above the bridge and, if desired, at the sides of the furnace, said conduit having lateral orifices of equal area, the arrangement being such that approximately equal quantities of air are discharged from the orifices. R. Luks, France. 6-23-36.

(97) 2,034,452. Boiler having a furnace flue, a nest of smoke tubes arranged beside said furnace flue, a combustion box or chamber into which open said furnace flue and said smoke tubes are disposed at one end of the boiler, and a substantially vertical baffle within said box or chamber. A. de Bije, Netherlands. 3-17-36.

(99) 1,683,963. Roof for furnace having a metal framework, a plurality of supports carried thereby and arranged in longitudinal alignment inclined from front to rear of the furnace. C. Duquenne, France. 9-11-28.

(104) 2,039,890. Fuel burner in which the fuel is conveyed to the burner by air under pressure. H. de Coster, France. 5-5-36.

(104) 2,055,331. Coal dust furnace comprising in combination a plurality of coal-dust burners, adjustable vanes associated with each burner and controlling the shape of the flame, a mechanically driven rotary coal-dust charging mechanism associated with each burner and a main air supply channel for all burners in common. W. Bredtschneider, Czechoslovakia. 9-22-36.

(104) 2,144,966. Regulator of combustion for thermic furnaces. P. Frion, France. 1-24-39.

(104) 2,146,618. Rotary means for mixing pulverized coal with air in connection with burners fed with pulverized coal. R. Boudrant, France. 2-7-39.

(104) 2,154,320. Pulverized fuel burner comprising a pipe supplying a current of primary air containing pulverized fuel, two rotary mixing devices in said pipe, each of said mixing devices comprising a helically bladed rotor adapted for revolving by said current. R. Boudrant, France. 4-11-39.

(111) 1,679,874. Feeding device for furnaces consisting in that the fuel, instead of being discharged adjacent the front wall of the furnace or boiler, is discharged into the proximity of the fire bridge, and pushed and spread towards the front wall of the boiler by means of spreaders. A. Pastrnak, Czechoslovakia. 8-7-28.

(99) 1,750,355. Ceramic or tile furnace in combination with lateral walls, a flat slab resting on said walls and serving as a continuous stay for the arch, refractory bricks arranged in rows forming a substantially flat roof for the oven and provided with transverse openings. A. Ragoucy, France. 3-11-30.

Class 253—Motors—Fluid

(16.50) 1,730,746. Steam or gas turbine composed of an integral outer element and an inner element, carrying a plurality of axially spaced circumferential rows of blades on its outer periphery. K. Roder, Germany. 10-8-29.

(16.50) 1,759,817. Steam turbine having rotors running in opposite directions and with preponderating axial admission, which is suitable for industrial application. K. Roder, Germany. 5-20-30.

(16.50) 1,845,955. Steam turbine having

The Kellogg Division

of

American Brake Shoe Company

announces the purchase of

Crown Spray Gun Manufacturing Company

Kellogg Division of American Brake Shoe Company has acquired the Crown Spray Gun Manufacturing Company of Los Angeles, California.

This adds to the Kellogg-American line of air compressors a complete range of spray equipment including guns, booths, exhaust fans and paint containers.

Kellogg also makes car lifts and high-speed car washers. With the purchase of Crown's production and research facilities, service in the fields where Kellogg-American is widely known and used will be expanded.

Products of the Crown plant, which will continue to be made at Los Angeles, will be distributed in the future under the name Kellogg-Crown. Each plant will benefit from the research and engineering divisions of both organizations, and from that of the American Brake Shoe group of technologists at Mahwah, New Jersey.

Kellogg Crown products and parts are available at

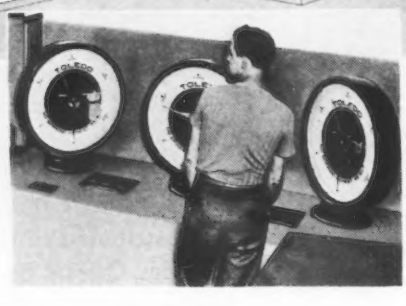
HERE WEIGHT AND BALANCE MUST BE RIGHT!

The LIBERATORS are rolling fast out of Willow Run. And Ford weighs each of them this way—on Toledos.



● Weight and Balance are vital factors in the battle-power of these air-giants. They must be weighed and balanced ACCURATELY. Yet Time is vital too; they're needed at the Fronts.

So the platforms under each wheel are electrically raised or lowered to level the plane; or to check load-and-balance characteristics. These platforms ride on sensitive levers, which transmit the load-force to primary dials, below ground.

To speed the work, each wheel's load also is shown on an electrically connected secondary dial in the floor level control room, where the operator has dials and plane in one line of vision. Thus both Accuracy AND Speed are achieved in this final checking operation—where production ends and performance begins.

TOLEDO RESEARCH backed this war-development. The pre-war know-how of the scale industry's greatest research organization was ready for this special weighing-for-war problem, as it has been for hundreds of others.

And Toledo Research will be ready also, when weighing-for-peace brings its new assignments.

Toledo Scale Company, Toledo, Ohio.

TOLEDO SCALES

TIP FOR TOMORROW *PRINTED Weight Records will be the universal weight-control practice after the War. Hundreds of war plants are using them now. We are at liberty to send you complete information at once, if you wish it.*

Release of Steel For Construction In 1944 Predicted

• • • **Construction** of the nation's war manufacturing plant was virtually completed early in 1943, according to Robert T. Brooks, executive vice-president, American Institute of Steel Construction.

"All-time highs have been reached by the steel construction industry in speed and efficiency of building," he said. "Such obstacles as shortages of steel and other building materials and of manpower had been covercome. The war factories are up, they are in operation and this industry has performed the greatest task in its history.

"There still was important work to be done. The steel construction industry promptly turned its facilities, skill and know-how into new channels. It adapted itself to manufacture of a long list of heavy war materials. They included ship sub-assemblies, invasion barges, pontoons, tank assemblies and portable bridges and airplane landing fields. This work, an important achievement of 1943, continues.

"Looking to 1944 and the postwar period, it appears likely that construction steel will be released in increasing quantities, for much needed industrial and commercial building construction here at home. It will include highways, bridges, railroads, public and private buildings. It will involve modernizing of plants and facilities, eventual reconversion of many to peacetime manufacturing. We also believe many factories will be relocated to meet current economic and population changes.

"The steel construction industry has a capacity of 5,000,000 tons of building a year. Its facilities will be ample for postwar demands, just as they proved in the war emergency."

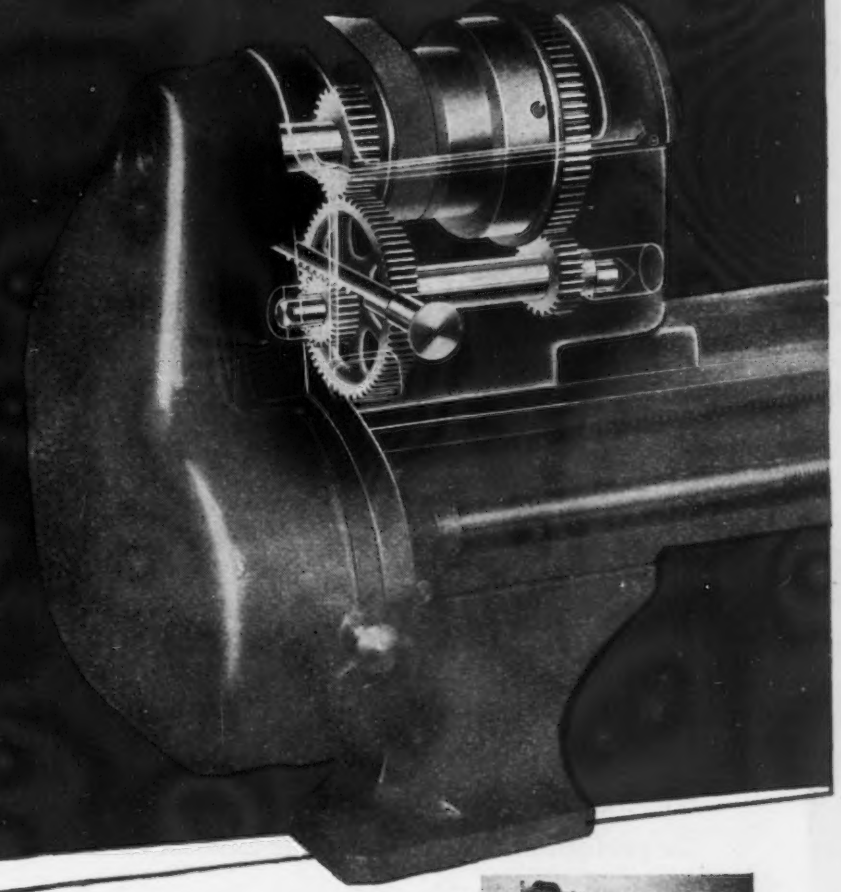
BACK GEARS ENCLOSED IN HEADSTOCK

With Patented Shifter Rack

Finger Tip Control for Easier, Faster Back Gear Shifting



The advanced back gear design permits placing the patented back gear shifter rack where it belongs . . . at the operator's finger tips. No longer is it necessary to reach over the headstock to operate the lever which shifts power to back gears. Not only is the position of the back gear shifter rack safer and more convenient, but it also saves valuable seconds every time the shift is made. Finger tip accessibility of the back gear shifter rack is just one of many reasons why you find Logan Lathes in shops with outstanding production and safety records. Note the wide and durable semi-steel back gears. Write today for information on all models of Logan Lathes.

Brief Specifications: **Swing over bed, 10½" • Between centers, 24" • Bed length, 43⅛". • Spindle hole, 25/32" • Precision ground ways; 2 prismatic V-ways; 2 flat ways • 12 spindle speeds, 30 to 1450 r.p.m. • Protected by ball-bearings or self-lubricating bronze bearings.**

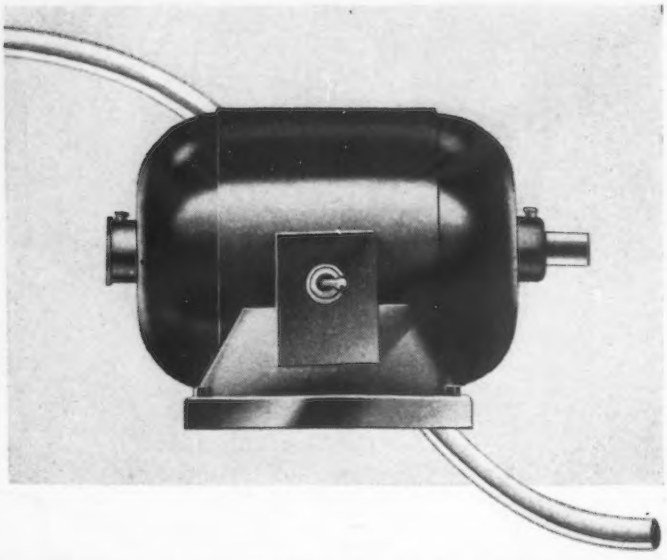
PAGE *Stainless Steel* WIRE



BINDING WIRE FOR ARMATURES

may be one of the prosaic uses of **PAGE STAINLESS STEEL WIRE**. But its higher tensile strength and non-magnetic qualities have added no little to the performance of modern war-time AC motors.

Tensile strength, corrosion resistance and non-magnetic qualities of Page Stainless Steel Wire have called for its use in Aircraft Control Cables in planes for the American air arm and for our allies.

And **PAGE STAINLESS STEEL SPRING WIRE** controls the mechanism of one of the most effective of modern small arms.

Yes, the **PAGE** mill has been producing a large volume of Stainless Steel Wire for years and has acquired priceless data on the working qualities of "Stainless." Keep this in mind when planning ahead. We will be glad to cooperate with you at any time, even if current capacity is available only for war production.

25 YEARS AGO...

—WE SAID: *"Labor is just as efficient as management plans for it and gives it tools with which to work."*

This is one of the basic principles upon which our business was founded 25 years ago . . . principles which, like the laws of physics do not change.

Evidence that these principles have held through the years . . . that they still continue to operate . . . is found in the fact that our organization has satisfactorily consummated over 6,000 assignments for 500 clients since 1919.

And there is every reason to believe that such principles will just as efficiently apply 25 years hence and far into the future.

Management Engineering has not been successful because of spectacular planning or fly-by-night ideas, but because basic principles have been developed which not only govern labor controls, but inventory and material controls, planning and scheduling controls and all quality controls . . . and then, because these controls have been practically and wisely applied to all production processes.

The notable stepping-up of war production which has resulted from the application of these time-tried controls gives assurance of even greater successes in American production when the war years have passed.

STEARNS-MAGNETIC
MILWAUKEE

THE GROWTH OF MAGNETIC ENGINEERING

Stearns Magnetic Milwaukee represents an institution founded by R. H. Stearns that has grown from a humble beginning in a small shop to a great plant with extensive facilities for research and development.

Constant study and improvement of magnetic methods through excellent laboratory and engineering facilities to efficiently and economically apply the forces of magnetism for separation and other commercial purposes, including power transmission devices, has given Stearns Magnetic an enviable predominating position in the widespread use of magnetic equipment for all practical purposes.

Our complete engineering and laboratory facilities are at your service and you are invited to make use of them without obligation.

KEYSTONE *Wire*

Heavy war demands for all types of industrial wire are still taxing our steel and wire mill production to the limit . . . thousands of essential parts for guns, tanks, planes, ships, equipment. Of course, the wire for these essentials has the right of way.

Wartime production has revealed untold new uses for wire . . . new fabricating techniques that will be of real value to peacetime production. So, we'll be ready, after VICTORY, to make definite contributions towards supplying a tremendous civilian demand.

TIME IS NOW to consult Keystone Engineers regarding the use of Wire in *your* postwar products.

Rex-Flex Stainless Steel Flexible Tubing

C. M. H. STAINLESS STEEL BELLOWS
Available for all industrial applications.

For industrial maintenance applications involving extreme corrosive conditions, chemical conveying problems, high temperatures, great flexibility and accelerated flexing fatigue, Rex-Flex Stainless Steel is the ideal flexible tubing for the job. This tubing is light, strong, gastight and manually bendable in multiple planes. It is available in long lengths, in 5 wall forms, unbraided or braided for high pressure uses. Sizes range from 3/8" to 5" I. D. inclusive. Fittings are resistance seam welded to form uni-metal assemblies.

If you have a problem involving flexibility, vibration or kindred service, we have a flexible metal hose that will solve that problem. Write for our engineering recommendations.

Wire

FOR WARTIME PRODUCTION OR PEACETIME PLANS

Perhaps you have never considered Continental a source for a great many different types, sizes and finishes of low carbon wire. That's why we show on this page a few samples of the hundreds of different kinds of Continental wire. Possibly, one of these special shapes or finishes may mean savings or advantages to you.

Steel from Continental's own furnaces and rolling mills is made into wire from 34 gauge to ½ inch . . . in many standard and special shapes . . . and a wide range of finishes. Call on Continental for wire to fit wartime production or peacetime plans.

Pumping Started in Steep Rock Lake Six Months Ahead of Schedule

Cleveland

• • • **With the water** inflow diversion completed by re-routing a river through a chain of lakes to the north of Steep Rock Lake, actual pumping has started to free the iron ore deposits under the lake. This inflow diversionary work was originally scheduled to require 15 months but has been completed in nine months, thus enabling the shipment during 1944 of what the Steel Rock Iron Mines, Ltd., terms as a "substantial" tonnage of ore.

Steep Rock ore reserves, one of the richest recent finds in the Lake Superior region, are proved in excess of 10,500,000 gross tons with more than 14,000,000 tons additional believed to be available. Of this 24,500,000 tons total, about 21,000,000 tons can be mined by open pit methods and the remainder by underground operations.

As compared to the price of $4.75 per ton delivered lower Lake Erie ports for Old Range Bessemer ore of standard grade and of $4.60 per ton delivered lower Lake Erie ports for Mesabi Bessemer ore, it is believed that the initial sales price per ton of Steep Rock ore delivered Lake Erie ports will be at least $5.30 per ton. Regular annual production contemplated is in the neighborhood of 2,000,000 tons. Tests of Steep Rock ore by the Battelle Memorial Institute indicated that ore of the quality of the Steep Rock deposits should be a "first quality open hearth charge and feed ore," suitable for use as an initial charge ore or as a feed ore added during the heat in open hearth steelmaking. Steep Rock ore runs very low in phosphorus, manganese, and silicon.

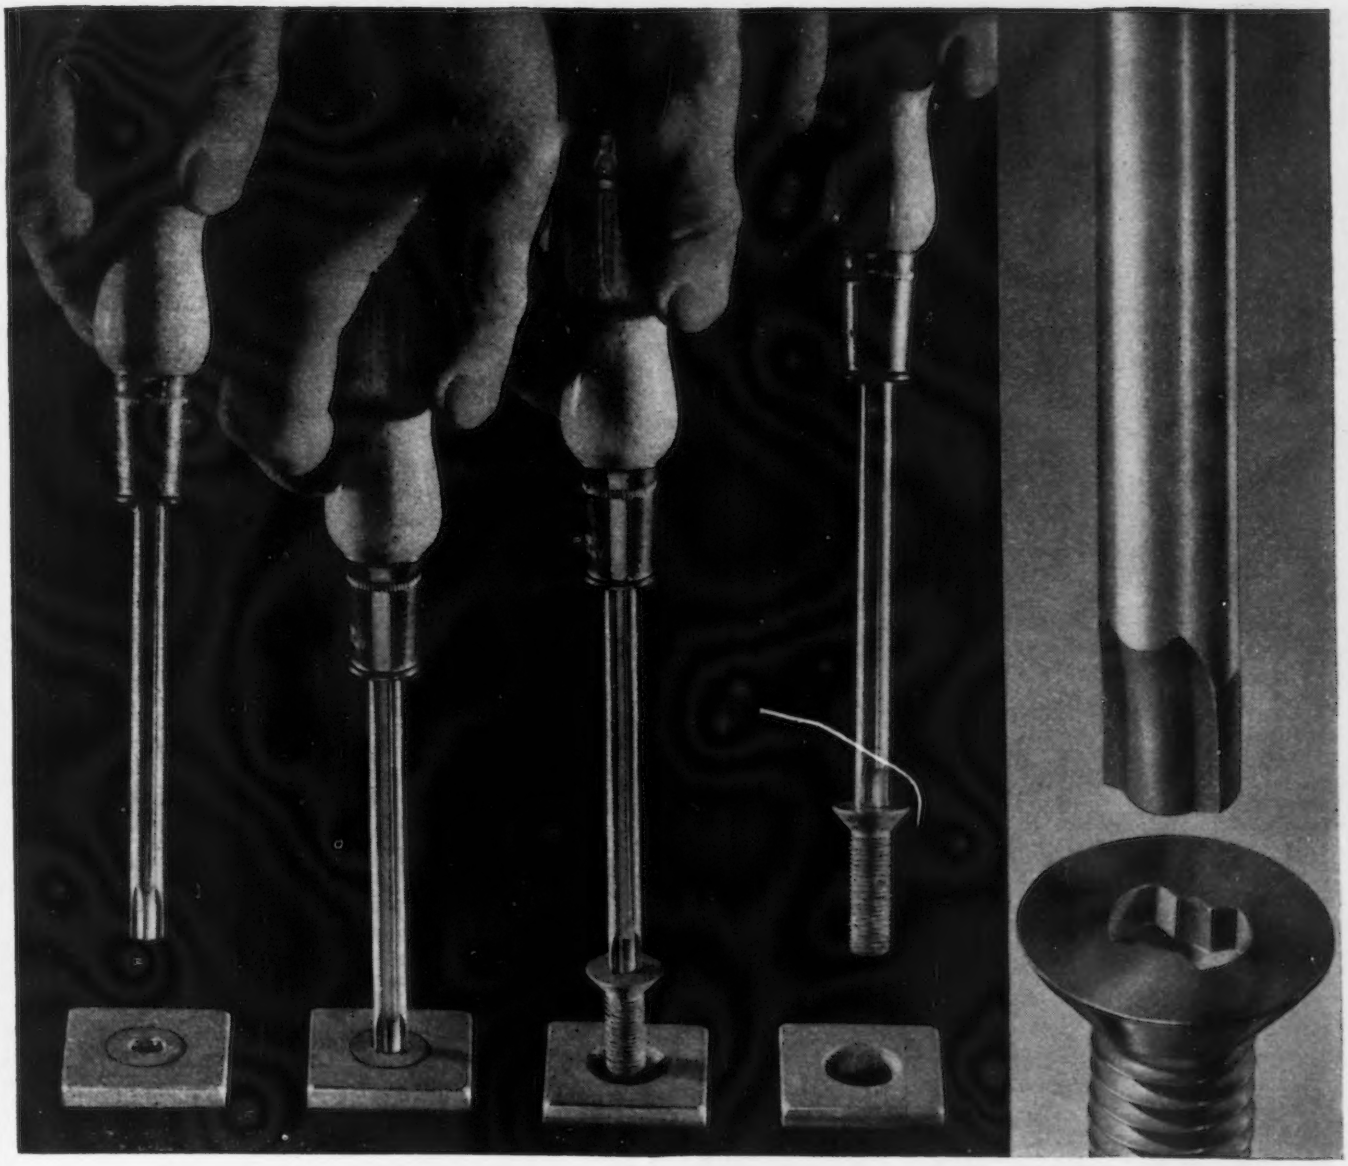
The Canadian government appropriated some $2,500,000 to be used by the Canadian National Railway for the construction of a spur line from Atikoken, Ont., to the mine and for the construction of loading and unloading facilities at Port Arthur. Surveys are now being made at Port Arthur for the construction of a high level pocket type loading dock, similar to those at Duluth and Superior.

The government of the province of Ontario, through the Hydro-Electric Power Commission of Ontario, completed in 180 days on Nov. 28 a power line from Port Arthur to Steep Rock. For the construction of this 120-mile power line, $1,000,000 was appropriated. Furthermore, the entire project was given the blessing of both the United States and Canadian governments for obtaining, as required, necessary machinery, equipment, and materials for mine development.

In pumping dry the lake, 14 Ingersoll-Rand centrifugal type pumps, mounted on seven steel barges are used. The combined pumping capacity of these units is 322,000 gal. per min. Steep Rock Lake is really two lakes connected by a narrow channel. These two parts are called the east and west arms. The channel connecting them is dammed, and it is the eastern arm that is being emptied. The water pumped from the eastern arm is discharged into a collecting basin that is connected with the west arm of the lake by a tunnel, so that the water will drain into the west arm. The barges on which the pumps are mounted are steel, completely housed and heated. The collecting basin can be covered over and heated to prevent freezing of the water during pumping.

The pumps are arranged for parallel operation and each barge installation can operate individually. Thus, as the lake level lowers, the pumps can operate in series, with one pump acting as a booster for another. It is estimated that 125,000,000,000 gal. of water will have to be pumped out of the lake for complete drainage, but mining operations on the largest ore body, designated the "B" ore zone, will commence when about 60 per cent of the water is removed.

MIGHTY MIDGET: *This aircraft heater weighs only six lb. yet heats the largest airplanes when outside temperatures range to 70 deg. below zero. Manufactured by Surface Combustion, Toledo, Ohio, it is already being used in United States and Canadian aircraft.*



When the job has to be "Un-buttoned" . . .

. . . when screws painted-in, rusted-in, or "frozen-in" have to be *removed, saved, and used again* . . . here is a tool that eliminates this serious problem of field maintenance. This rugged Center Pivot hand driver, as used with CLUTCH HEAD Screws, is the answer. Note its structure; its careful engineering to make a deep dead-center entry to engage the straight walls of the Clutch with a powerful torque that breaks the "freeze" of any screw for straight, easy, and *undamaged* withdrawal. More than that, this simple tool *saves the screw for re-use* because the withdrawal action automatically unites the screw and driver as a unit . . . to prevent trouble and possible danger arising from dropped and lost screws. In addition to speeding and simplifying normal field adjustments, this positive Lock-On feature frequently saves disassembling surrounding units by furnishing dead-sure access *to and from* these otherwise impossible or hard-to-get-at spots.

CLUTCH HEAD SCREWS

For closer personal understanding of this and other exclusive CLUTCH HEAD *features, may we send you an assortment of screws and a sample Center Pivot Bit . . . along with illustrated Brochure on* CLUTCH HEAD *Screws?*

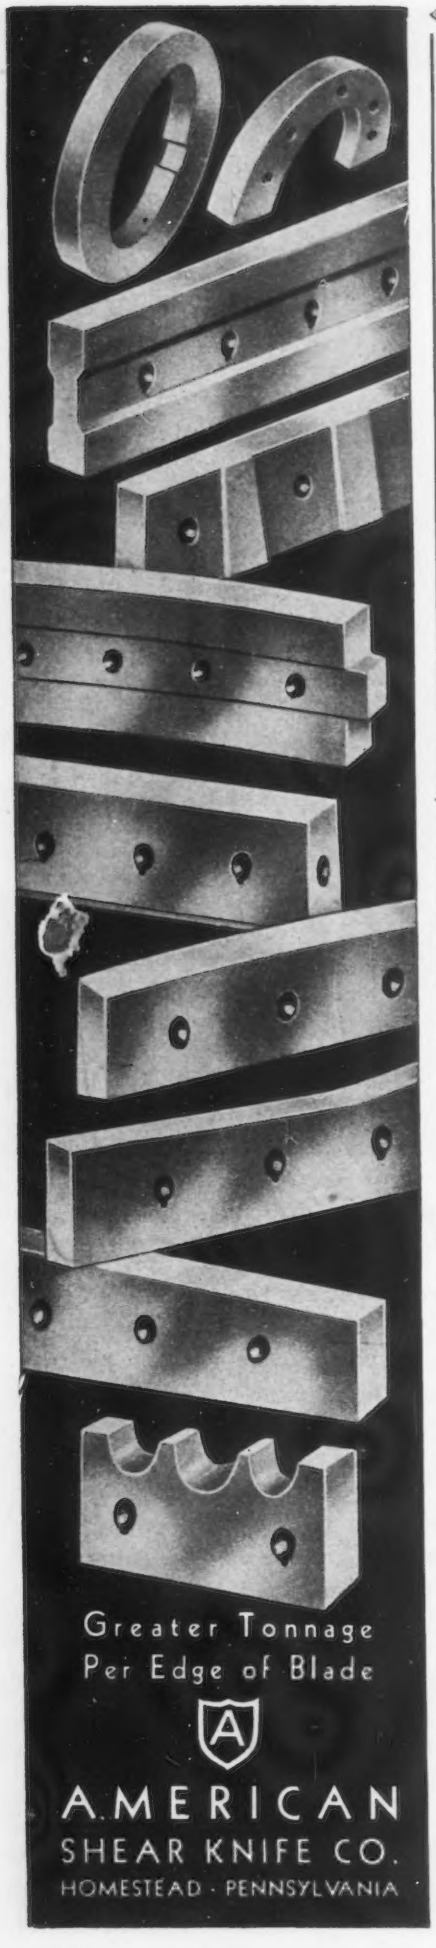
CHICAGO CLEVELAND NEW YORK



Omnibus Contract Termination Bill Proposes Settlement Director in OWM

Washington

• • • **A preliminary outline** of an omnibus contract termination bill calling for a Director of Contract Settlement under the Office of War Mobilization was submitted in the Senate last Tuesday by Senator James E. Murray of Montana, Senator Harry S. Truman of Missouri and Senator Chapman Revercomb of West Virginia. The bill outline is part of a report made to the Senate Committee on Military Affairs by a war contract subcommittee composed of the above Senators.

Three general conclusions are set forth: First, an omnibus contract termination act is called for—instead of "a host of separate, conflicting and ill-related acts. Second, the importance of constant Congressional vigilance over the administration of the legislation is stressed. Third, the legislation must be based upon "a declaration of policy that imposes upon the Government and the executive agencies the following responsibilities:

A. "To provide all business enterprises having claims arising from terminated war contracts, whether prime contracts, subcontracts or purchase orders, with (1) the opportunity to obtain quick, equitable final settlements and (2) adequate interim financing during the period between termination and final settlement;

B. "To protect the interests of small business in contract termination;

C. "To protect the Government's interest by preventing over-payments, recovering excess payments and vigorously prosecuting all cases of fraud."

The bill outline sets forth in great detail the powers and responsibilities of the Director of Contract Settlement. These include the formulation of all major administrative policies, the promulgation of uniform termination clauses for both prime contracts and subcontracts, the promotion of company-wide settlements, the establishment of appeals machinery, consultation with industry and the submission of quarterly reports to the Congress.

The existing authority of the contracting agencies to negotiate final settlements is clearly defined. The personal liability of contracting officers, in the absence of fraud, is removed. The General Accounting Office is given the power to avail itself of all records and the responsibility of reporting all cases of suspected fraud to the Congress, the Department of Justice and the agency involved. It may not withhold payment of funds.

With regard to subcontractors' claims, the contracting agencies are instructed to encourage the prime contractors to negotiate the bulk of the settlements. Where this is not feasible, the contracting agencies—with the consent of the prime—are to deal directly with the subs. Where, for one reason or another, the prime's consent cannot be obtained, the contracting agencies may purchase the claims of the subs.

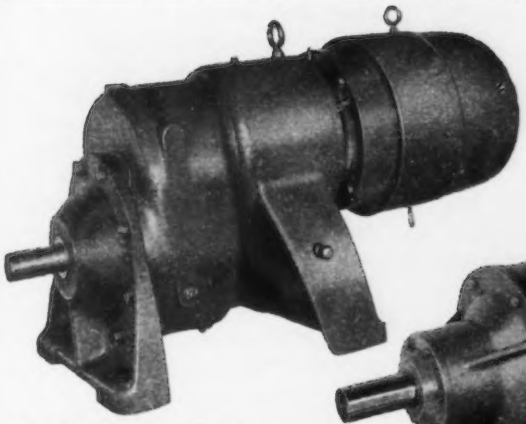
Policies to be followed with regard to materials on hand and goods in process are outlined in detail. Registration of released manpower with the United States Employment Service is required. Provision is made to coordinate contract settlement with renegotiation, to maintain the responsibilities of sureties, to protect the rights of assignees and to handle the problem of informal or defective contracts.

Mandatory advance payments of at least 75 per cent of the amount certified are to be paid to prime contractors within 30 days after application. The Director of Contract Settlement is to decide upon the information required in the applications and upon the type of investigation to be made by the contracting agencies before payment. Any overpayments are subjected to penalty interest rates. Both direct and guaranteed loans are authorized.

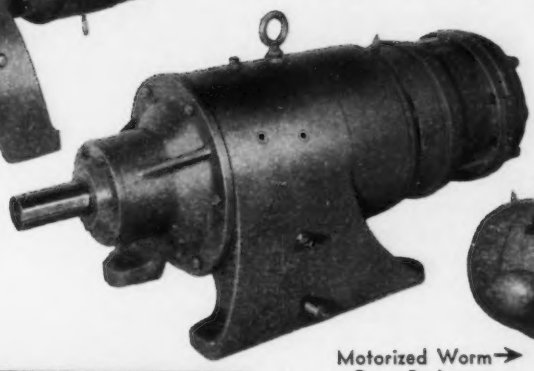
In order to implement the declaration of policy on protecting small business, the Smaller War Plants Corp. is given specific powers and responsibilities. These include the purchase of contract termination claims from small companies; the making or guaranteeing of termination loans.

A VISUAL GAGE, *manufactured by the Sheffield Corp., Dayton, Ohio, will measure dimensions of less than two millionths of an inch. C. H. Reynolds, vice-president of the company, watches while an operator checks one of the three original sets of master gage blocks made by the late Carl Johansson.*

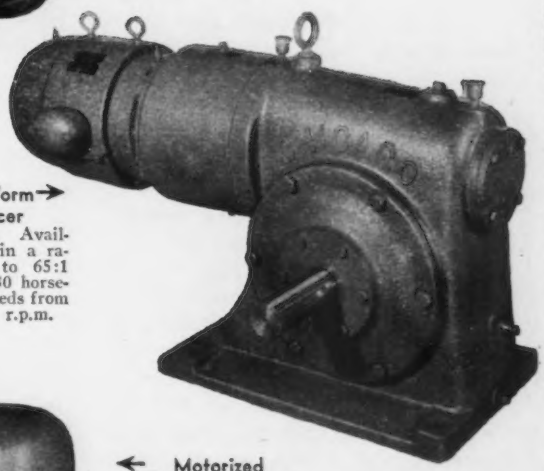
Your power saving requirements are capably handled by an organization making every type of gear reducer.



Motorized Helical Reducer
Horizontal drive. Available in 8 sizes in a ratio range of 1¼ to 9:1 and from ¾ to 50 horsepower. Driven speeds from 1458 r.p.m. to 128 r.p.m.



← **Motorized Planetary Reducer**
Horizontal drive. Available in 35 sizes in a ratio range of 10 to 1200:1 and from ¾ to 75 horsepower. Driven speeds from 172 r.p.m. to .74 r.p.m.



Motorized Worm Gear Reducer →
Horizontal drive. Available in 11 sizes in a ratio range of 6 to 65:1 and from ⅛ to 30 horsepower. Driven speeds from 310 r.p.m. to 25 r.p.m.

MOTORIZED REDUCERS

Motorized Worm ← Gear Reducer

(CONTINUED FROM PAGE 70)

dustrial mechanism has a frightening load removed and life is pumped into commerce and the industrial recovery of other nations, particularly those nations already sentimentally tied to the U. S.

Since the froth of rich iron ore in this country has gone pretty flat under the impact of war, strategic stocking could well involve some millions of tons of iron ore from abroad, or, better yet, large quantities of synthetic scrap, or steel ingots based on the refining of the increasing accumulation of war scrap abroad. In other metals, the story is again one of liquidation of basic mineral resources at a deplorable rate, particularly in copper, and to a lesser degree in lead and zinc. Of tin the country has no output, and practically the same applies to tungsten, and the situation in chromium and manganese has been such that the bulk has continued to be imported despite the numerous difficulties involved in war-time ocean transport. In petroleum the serious inroads on reserves is now common knowledge, and inasmuch as synthetic rubber is based on petroleum, a natural rubber reserve might be more economically defendable than retention of all the new synthetic facilities.

So, in all the metals mentioned, the country could accommodate a protective reserve accumulation, and in oil attention could be given the possibility of importing large quantities for repumping into the natural storage reservoirs of dry wells.

Then comes the motif of the U. S. post-war dream world (6), which like a Phenix is going to rise on the wings of technology from the ashes of loss and cost engendered by the war. The era of dew and sunshine, the brave new abundant world of no diet deficiencies, no dishes to wash, no walking, no bugs, no deterioration, no accidents, no work, no-run hosiery, no cleaning, no wrinkles, no worries, no impotence, no thinking, no anything. So say the past year's advertising, in four colors, as harried copy writers with one hand tinkered around with the intricacies of electronics and synthetics and all the other fascinating flashing lights of the laboratories, and with the other hand probed into the innermost corners of technicians' imaginations.

Despite the great volume and the fantasy of the technological proselytizing, there is merit to the fundamental thought that in the 50 years of normal technological development compressed within several years of warfare the country possesses its most powerful lever for reconstruction. Perhaps the highlights of the dreams won't be filled in for a long time, perhaps there are a large number of moral and ethical values to be dusted off or rededicated as handmaidens to the new technology, perhaps technology was no stranger in 1932 when millions were without bathtubs or cars or sufficient food. But the dream itself is important, and a powerful catalyst indeed. Technology is miraculous, technology did lift man from the ragged edge of fighting for sheer existence, technology does offer the only answer to more and more employment, and the unexploited miracles of war technology are at hand to fuse the ambitions of business, of labor and of the entire nation if they are not abused or misused excessively. Any other conviction means economic death.

In the depression year of 1886, the first U. S. Commissioner of Labor insisted that the then existing set of "economic tools" were in overabundant supply. But, ahead of him were the bicycle, electric light, automobile, refrigerator, airplane, radio, and a multitude of other products to multiply the work and raise the standard of living of an expanding nation. In the depression year of 1933 President Roosevelt opined that "our industrial plant is built," and the retreat of everyone from reality was such that only the impact of war served to reinvigorate industry and release a flood of new inventions and application possibilities. Again, it is heard that the industrial plant is overbuilt, and perhaps a temporary period of digestion will be necessary to assimilate the tremendous burgeoning of effort of the past several years. But, there should be no retreat from the desire for new outlets for action, no retreat from the realization that idle plants are an economic drag, that idle men are nothing but downright economic waste. (The loss in manpower during the depression amounted to over $300,000,000,000; more than the entire war debt!)

Along with the general expectation of the flowering of technology after the war and intertwined with thoughts of the overbuilding of industrial capacity insofar as a peacetime economy is concerned, there always arises in the metals industry a discussion of the relative developments in steel, aluminum, magnesium and plastics. This set-up usually is referred to as the battle of materials, or the coming attack and counterattack for market supremacy.

With the distortions of war-use removed, all these materials will without doubt revert to practically the same relative positions of the prewar period. There will be little capturing of new markets for any one. Each, by a combination of cost, physical properties and fabricating characteristics, will reign supreme in certain areas of usage, and in those overlapping areas of competition with other materials the relative loss and gains through the interplay of technology and merchandising will have less over-all effect than a few points rise or fall in the Federal Reserve industrial index.

As for the metal group—steel, magnesium and aluminum—the relative post-war capacities will be some 90,000,000 tons for steel, 1,000,000 tons for aluminum, and 350,000 tons for magnesium. The weight-cost ratio of each will likely hold to an equivalent level, and any large cost reduction for any is unlikely in view of the certainty of high tax loads and probability of maintenance of wage structures. The price of steel will be in the neighborhod of 2 + c. a lb., magnesium alloy ingots of "A" purity around 20c. a lb., and aluminum ingots close to 14c. a lb. The great deal of talk regarding violent shifts in cost relationships after the war is founded primarily on guesswork. All the new magnesium plants in particular are devoid of a common denominator on which to determine production costs, what with figures in DPC and Government subsidized plants involved in political or regional ramifications, and with amortization policies varying according to who built the plant. Some rumor has it that a particularly low cost plant will offer magnesium after the war for as low as 9c. a lb., but the writer remains unconvinced and believes the price will shake down to about 15c. for the primary grade and 10c. for the secondary. Aluminum may drop as low as 10c. for the primary grade and around 6c. for the secondary. The tremendous post-war flow of secondary aluminum holds possibilities for

If the Men Who Make WELDING ELECTRODES Only Had to Use Them!

SMITHway Electrodes in Action
Welding a Diesel Engine frame. Like all jobs at the Smith plants these days, this is a war job. The machine in the background is the SMITHway AC Welder.

IF the men who make welding electrodes only had to use them — many of your shop problems would cease to be!

Why? *Because welding electrodes are production tools!* To build a good production tool, a man must *know* the problems of using that tool. We make the SMITHway Certified Welding Electrodes that we offer you. They are the same electrodes we use in our shops. SMITHway electrodes, therefore, are *shop tested* in one of the world's largest welding plants . . . where thousands of pounds of electrodes are used every day . . . where *all kinds of welding* is done on a big production scale.

When we tell you that SMITHway Certified Welding electrodes will give you *better welding results* at lower costs, we are stating a *fact* that can be demonstrated in *your* plants.

Mild Steel...High Tensile...and Stainless Steel
WELDING ELECTRODES
made by welders . . . for welders

SMITHway Welding Monitor *cuts the time of training welders as much as 33⅓%!*

SMITHway AC Welding Machines *reduce spatter, completely eliminate "arc blow."*

OFFICES AT NEW YORK, PITTSBURGH, CHICAGO, TULSA, HOUSTON, LOS ANGELES, SEATTLE

being troublesome to primary producers (or producer), as secondary technology has improved to the point of making the metal a reliable product. In magnesium, the secondary problem is of no moment.

To compete energetically with the primary light metals in overlapping spheres of application, brass ingot may have to be offered as far down as 3c. a lb., and cast iron in the neighborhood of 4c. If the competition is with secondary aluminum, as well it might be, brass ingot may have to move at 2c. and cast iron at 2 + c. Where the stainless steels and the low-alloy steels will elbow their way into this picture is hard to say at this time, but the steel industry has little doubt but what they can hold their own price-wise.

The plastics outlook can in no way be said to approximate the fantasies woven by Sunday supplements. Plastics right now are losing ground to metals as the latter come into more plentiful supply. Plastics capacity is at best 300,000 tons. The molding of plastics requires expensive presses, the largest single nozzle injection press has a capacity of less than 20 oz. and costs close to $1,000 per oz. of capacity. Compregnated wood may have some of the characteristics of mild steels, but for a specific gravity of 1.3 costs over 50c. a lb. All these factors are such as not to occasion much concern in the metals industries. Rubber, which may be considered a plastic, may have an output rate of 750,000 tons yearly late in 1943, but costs will be high, and this synthetic will have its own competitive troubles with the natural product unless the Government adopts a protective attitude through subsidies. And, if this is done, the effect on international trade and in turn on industry in general could well be serious.

(7) Evidence is abundant that popular imagination is again being kindled by the spirit of initiative and resourcefulness displayed by industry, and its willingness to take on a forbidding job of re-employment and readjustment under the banner of an unshackled free or private enterprise. Quite obviously the reaction to a decade of futility and lack of objectivity culminating in the limited "statism" of the past several years is of such proportions as to set a sympathetic stage for one more chance of private industry to create the luxuries of life as well as guarantee the basic security minima of food, clothing, shelter, health and education for all those able and willing to work.

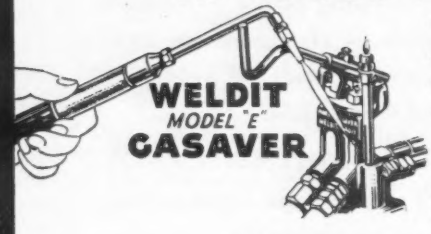
Industry's superb ability to perform has been obvious to even the least discerning over the past year. What's of far greater importance, however, is industry spokesmen today are talking a two-syllable language of mutual benefit, understandable to all, and not discoursing in clever ambiguities insinuating a return to the status quo ante of the capitalism of complete laissez faire, eschewing collective bargaining and justifiable public regulation of competitive conditions, and striving for low wages, high profits and minimum turnover.

Gone is the inclination to dwell to a state of exhaustion on minutiae, to go flailing after every imaginary or actual spot of red, to dissipate energies in futile ideological witch-hunts. Rather, industry is learning to establish its premises on the basis of common gain, of boring through mazes of minor technicalities and conflicting factors to establish with clarity certain reasonable obligations. In return there is demanded a freeing of capital restrictions and contract, an elimination of confusion in capital markets, a chance of reward in relation to risks involved, clarification of certain long-range principles regarding the operation of a mixed economy of private and public enterprise thereby permitting establishment of certain assumptions and valid forecasts. Such a system of free choice can thus provide for social security and, despite certain vices of such a "capitalism," the animating principles and humanistic values involved are infinitely superior to some capricious form of collectivism which fuses labor and capital equipment at the end of a secret police truncheon.

The tenacity of certain existing bureaucratic controls in hanging on long after their need passes must not be overlooked. There is plenty of effort being expended in various quarters in preparing the ground for perpetuating the rudiments of the existing planned war economy into the peace economy. Frequently heard and frequently accepted is the statement that allocation of supplies, control of marketing and all the other interferences, either actual or implied, in the 800 or so limitation orders of the War Production Board will have to be extended through some long and indefinite transitional period of post-war readjustment. And it cannot be denied that many a man in industry has gotten so used to and flaccid under con-

Safe Welding

AT LOWER PRODUCTION COSTS



The Weldit Gasaver shuts off the welding flame when not in use. . . . Conserves essential materials by cutting oxygen and acetylene consumption as much as *fifty* per cent. Prevents injury to workmen—or sudden fires—from dangerous idle torch flames. . . . Adjustment remains unaltered between welds.

When the Weldit Gasaver has been installed, you simply hang idle torch on the handy lever rod. Weight of torch pulls rod down, thus automatically shutting off supply lines. Relight instantly by passing torch over Gasaver pilot light. No bother. . . . No time lost. . . . *No readjusting required.* . . . Price $10.00 at Detroit. Order today.

Better Soldering, Annealing and Heating Jobs

The Weldit Model CW Blowpipe is in daily use by many foremost industrial plants. . . . Built in accordance with the recommendations of leading fabricators of sheet metal products. . . . Operates on either natural gas, manufactured gas, or other low temperature fuel gas and compressed air. Stands up under rough shop use. . . . Send for literature.

Complete Protection Against Rust

NOX-RUST

The Master Rust Preventive

Meeting all Government specifications for rust-preventives to be applied to metallic materials, NOX-RUST is available in a wide variety of formulae and viscosities. This means NOX-RUST meets all requirements of protection and application.

NOX-RUST

Overseas Kote

Officially approved under Army Ordnance Specification AXS 1015, NOX-RUST OVERSEAS KOTE is a highly refined sealer for use as an over-all, vapor resistant, water-shedding protective compound for reinforcing shipping wrappings or cartons.

NOX-RUST

Overseas Wrapper

Designated by type as Army Grade C, NOX-RUST OVERSEAS WRAPPER is a chemically treated, reinforced fabric applied directly over the rust preventive coating to provide additional mechanical protection and weather resistance for storage or shipment of machined metal parts and products.

trols over the past two years that, pronouncements to the contrary, they are exerting no particular pressure to ease them. Now that there are growing surpluses of raw materials it might be well for industry to insist that the WPB lift many M and L orders and permit greater and greater return to free enterprise just so long as no phase of the war effort is jeopardized. This freeing of certain limitation orders, now, may require a great deal of desk pounding as the Office of Civilian Requirements seems to be squaring away to a lot of elaborate, slow and futile market research to determine precisely how many bobby pins, flat irons, bath tubs, ad infinitum, are to be made and by whom. This use of war limitation orders to permit an agency, in this case not even a very skilled one, to entrench itself in a civilian economy has dangerous possibilities that would better be recognized. The actual and inferential controls written into the Controlled Materials Plan are a lot tougher than are generally realized, and in fact are a lot tougher than ever were necessary. The scope and complexity of CMP in this country are such to have shocked Sir John Duncanson, creator of the British CMP, and the sooner industry is free of it the more certain will be attainment of the professed desire to return to free enterprise.

Labor, of course, will have a major role to play in the post-war trial of free enterprise. The seeking of excessive protection without obligation could hamstring the whole endeavor. In a continuance of and extension of labor-management committees there may be the key to the ironing out of the multitude of minor irritations that ultimately fester into major flare-ups of trouble. A prominent military labor trouble-shooter in a major ordnance district recently stated that during the past year over 65 per cent of the work stoppages and wildcat strikes in his area was the fault of management, 20 per cent was the fault of labor, and 15 per cent were sparked by a multiplicity of outside influences. Management has probably never fully realized that it is the small misunderstandings and unfairnesses that alienate labor rather than the occasional large and more dramatic tests of power along the line of major wage increases and participation in policy control. Carefully selected men armed with authority and understanding may be able to function through labor - management committees to kill off many disturbing irritations at the source.

Still another factor that post-war free enterprise could give serious consideration would be a continuance of the current extensive sub-contracting. The war served to correlate the activities of thousands of small and scattered business enterprises into the framework of large corporation mass production. A retention of a wide base for mass production rather than a return to the conventional concentration of all facilities under one roof, could have many labor and social benefits. The fusing of the small entrepreneur with the mammoth mass producer has worked well in wartime, and if cost factors are not too out of line an extension of the practice into the peacetime economy could be of incalculable benefit to all involved.

Output of Steel in U. S. Far Exceeds Axis, Tower Says

• • • **Meeting** the needs of a nation at war, the steel industry of the United States in 1943, for the fourth consecutive year, exceeded all previous records for total steel production, according to Walter S. Tower, president, American Iron and Steel Institute.

"Approximately 89,100,000 tons of steel ingots and castings were produced in American steel mills last year—about 70 per cent above the estimated 1943 steel production in Axis Europe and Japan," he said. "Our production in 1943 was nearly 3,500,000 tons above our 1942 record and was 80 per cent greater than output in the best year of the first world war.

"October proved to be the high month for steel production in 1943, and may even turn out to be the peak month of the entire war period.

"Looking ahead, there are definite indications that military demands for steel in 1944 will be less than they were in 1943. Production of combat tanks and small arms ammunition has already been cut back, reflecting the virtual completion of those two programs. Cut-backs in these and certain other programs, notably steel for Lend-Lease, have been reflected in cancellation of some steel orders, and a few steel furnaces have actually gone out of production for lack of business."

PERFORATED METAL

INDUSTRIAL and ORNAMENTAL

Any Metal • Any Perforation

● **The uses of perforated metal are numerous and increasing. Industry requires it for a thousand purposes.**

In the preparation of war materials, metals, food, rubber, chemicals, perforated metal is required to perform an important role.

rown up again! And how!

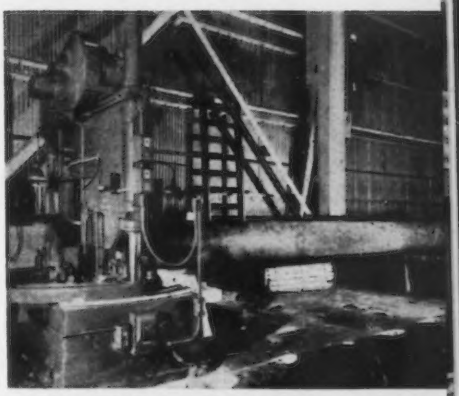
MARVEL Hydraulic Hack Saw No. 24

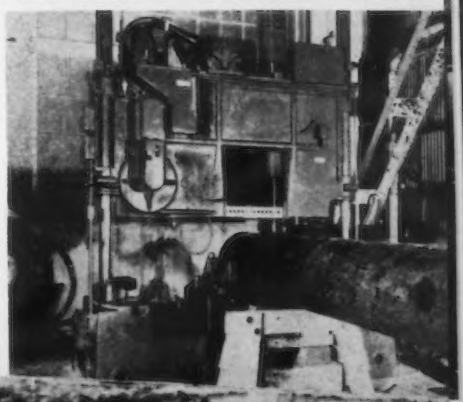
You can now cut off large billets, forgings, die blocks, etc., up to 24 inch round or square, with the same degree of economy as you have been cutting off your smaller size work. Yes, the new No. 24 MARVEL is actually a "hack saw", in spite of its mammoth size, since it employs a reciprocating blade. Of course, the blade it uses is much larger than any hack saw blade heretofore available (36" long, 4½" wide, ⅛" thick); but even its large blade is still an "inexpensive hack saw blade" compared to the cost of large capacity circular cold saw blades. And because the hack saw blade is comparatively inexpensive, users of the new giant No. 24 MARVEL machine will not hesitate or worry over cutting off the modern tough alloys in big sizes —a problem that has caused so many headaches heretofore, when only circular cold saws were available for such large size work.

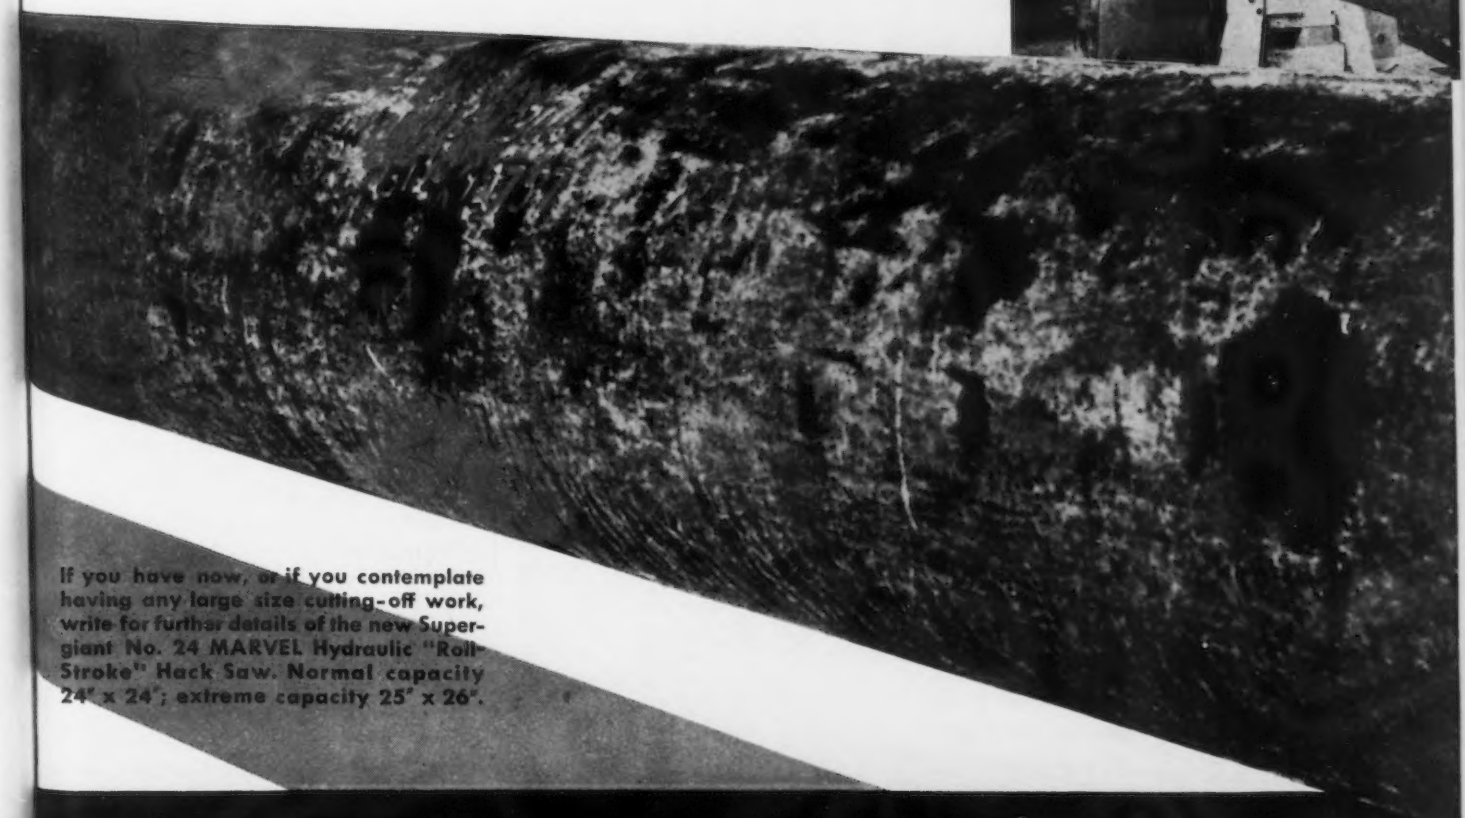
The photos shown herein were taken in the plant of Mesta Machine Co., Homestead, Pa.—one of the finest-equipped and most modern "heavy" machine shops in the world. The machine is shown cutting off a gigantic 24" round forging. Mesta now has three identical No. 24 MARVEL machines, and are very well pleased with them, for they are doing a fine cutting-off job on all sorts of large size alloys faster and cheaper, without "fuss", and without the nerve-racking howling and groaning of their previous circular saw methods.

How big is this machine? Judge from the man in the photo. Its weight, 16,000 pounds —8 tons! Twice the weight of the No. 18 MARVEL that has ***heretofore*** been "the world's largest hack saw!"

This giant saw bears no resemblance to any "small size" hack saw; it follows the modern, basic, exclusively "big saw" design of the No. 18 MARVEL (an 18" capacity "big saw" of which hundreds are in use). Any attempt to "stretch" an old-fashioned "small saw" design to such large capacity would be folly. It takes "big saw" design to incorporate the principles necessary for cutting off steel sections that may weigh many tons.







If you have now, or if you contemplate having any large size cutting-off work, write for further details of the new Supergiant No. 24 MARVEL Hydraulic "Roll-Stroke" Hack Saw. Normal capacity 24" x 24"; extreme capacity 25" x 26".

ARMSTRONG-BLUM MANUFACTURING CO.

Non-Ferrous Metals

[CONTINUED FROM PAGE 85]

supply of ferroalloys adequate to meet the needs of the war and avoid accumulations which would be costly both in dollars and manpower. In this connection, arrangements have been made for reducing the government purchases of certain ferroalloy minerals."

Not to be outdone in the phrase making battle of Washington, S. W., OPA came out on Nov. 3 with specific ceiling prices for various ferroalloys to supersede ceilings based on highest prices of individual sellers in March 1942, as provided by the General Maximum Price Regulation. With supply universally outstripping demand, the new ceilings should not be threatened.

Doin' the Tin Can Stomp

It remained for another second cousin of the steel industry, tin, to become mixed up in one of the juiciest tales of international intrigue of the year. With callouses on their soles from squashing tin cans, American housewives were whisked out of their humdrum existence by the report that this country had acquired a two year tin stockpile by virtue of being end-man in a three-way deal by which Japan had sold tin from its temporary empire to Russia who, in turn had traded it to us in lend-lease. Responsible officials, who should know, deny the story in its entirety, pointing out that Metals Reserve Co. is charged with responsibility for all tin imports, that Metals Reserve records show no such transaction, and that metallic tin does not lend itself to smuggling. There is good evidence, however, indicating that the tale garbled into reverse an actual transaction in which the United States assigned to Russia tin mined in China for which we had no means of accepting delivery. That WPB has become less apprensive over our tin supplies during the past few months is evidenced by easing of restrictions on the use of tinplate containers, high tin solders, and babbit. Despite all the tin cans which loyal Americans have been saving, the improved position is only slightly due to activities of detinning plants, although these plants have more than fulfilled the purpose for which they were intended. In some ways, the tin can salvage has become rather an embarrassment, for the grandiose plans for shredding plants and ballyhooed collection campaigns were in large part intended to furnish cans for copper precipitation. The copper industry, it seems, vastly overestimated its requirements. The shredding plant program has been quietly curtailed with government owned plants at Dallas, Houston, and Kansas City shut down, but so far no one has discovered how to tell the public of the reduced requirements without disrupting collections altogether and drawing the wrath of the bunion pad industry, which has been enjoying a thriving business. Ostensibly, Kansas, Missouri, and Texas cans will be hauled cross-country for detinning as long as the freight can be justified. About 65 per cent of the tin cans collected nationally are utilized by the detinning plant; the remainder are used for copper precipitation only. Contrary to popular belief, the secondary tin recovered from containers is refined to 99.85 to 99.995 per cent purity.

Bombs have not destroyed the Liverpool smelters, so the $6,300,000 Longhorn tin smelter, a DPC plant operated by Tin Processing Corp. never has reached full capacity, officially described as "more than 50,000 long tons of refined tin annually," since its initial operation in April, 1942. Had Liverpool been put out of the picture, the Longhorn smelter could have handled minimum United Nations requirements. The International Tin Committee quota for Bolivia, advanced about a year ago from 46,026 tons to 46,758 tons annually, is a purely hypothetical ceiling, according to the Tin Producers Association. In the past 9½ years Bolivia shipped only 283,742 tons against a quota of 380,511 tons, the Association states, and in only one year, 1941, when 42,209 tons was shipped, did shipments exceed 40,000 tons. Our contract, signed Nov. 4, 1940, calls for Bolivia to supply sufficient ore to yield approximately 18,000 tons of metallic tin annually. Milling technique on Bolivian ores still is far from perfect, present tin losses ranging between 25 and 50 per cent.

Tubular Furnace For Tubular Products Holds Close Temperature Uniformity Over 950° F. Range . . . .

This horizontal cylindrical furnace affords excellent heating uniformity over the entire temperature range between draw tempering and normalizing. It handles steel pipe 2 to 14 inches in diameter.

The contour of the heating chamber, which is more than 100 feet in length, eliminates many of the disadvantages with the conventional rectangular design. Above and below the roller driven hearth, burners fire tangentially into the chamber, providing a rapid, swirling action. These hot gases recirculate around the material a great many times, resulting in uniform and efficient heating without hot spots. . . . To raise the furnace from draw temperature to normalizing temperature requires one hour, and only two hours for the reverse cycle, high to low. When normalizing, the furnace heats about 20 tons of pipe in an hour and 18 tons when draw tempering.

Fuel economy is excellent. Other features include two 100 ft. roller tables at either end; five automatic recording temperature zones in the heating chamber; a rayotube instrument which continuously charts the temperature of all tubes being discharged, and two-man operation.

This new-type furnace, including all auxiliary tables, drives, and temperature controls, was designed and installed by Salem Engineering. We can build any type or size of heat treating furnace to your specifications. Write for complete data.

SALEM ENGINEERING COMPANY

SALEM ENGINEERING CO. · SALEM, OHIO

to England. Production of the Belgian Congo, which is not as large as that of Bolivia but still very substantial, comes to the United States. There is some refining in the Congo, at Elizabethville.

It may be conjectured that brass and bronze has passed tinplate this year as the leading tin use, taking approximately 35 per cent. Tinplate probably took about 25 per cent, babbitt 13 per cent, and solder 13 per cent, with the remainder distributed among minor uses.

Tinplate production for 1944, according to preliminary schedules, approximates that of 1943. Approximately 15 per cent of total production is electrolytic. According to WPB, a silver-lead solder (92.5 lead and 2.5 per cent solder, 5 per cent tin) was used for 40 per cent of 1943 output of tinplate containers for goods, household products, and chemicals, for next year will be used for 70 per cent.

Projects to mine and mill veinlet deposits of cassiterite near Riverside, Calif., and Cima, Calif., continue to rank in the "noble experiment" class, but may be rated worth while if for no other reason but to silence cynics who proclaim loudly that large tin deposits at these points have been undeveloped solely because of efforts of the international tin cartel.

TABLE II

Antimony Supply and Demand 1943-1944

December 31	36,090	28,840

In Case of Fire

The antimony picture is summed up in Table II.

Antimony consumption has been on the upgrade, rising sharply early in 1943. For the first seven months of 1943, 4896 short tons were consumed compared to 2742 short tons in the last seven months of 1942. The big new war use of antimony has been in the form of antimony oxide in flameproofing compounds, used in vast quantities during the past year, but with lesser quantities required in 1944. Batteries, bearings, tubes, foil and castings have been the other big end product consumers, usually in as a hardener of lead.

Bolivia has been the No. 1 ore supplier during the past year, practically its entire output going to America. The Bolivian ore is a sulphide. Mexico has been the No. 2 source, but its ore, an oxide, is more desirable. Texas Mining & Smelting Co. at Laredo, accounts for approximately 90 per cent of total metal production. China, the former world leader, has little hope of regaining its markets in the post-war period.

Yellow Pine mine, the Idaho tungsten bonanza, is the largest domestic antimony ore producer, spewing out from its mill a sulphide concentrate in large quantities. The Sunshine Mine in the Idaho panhandle, long pointed out as one of the few mines producing silver solely, and the Coeur d'Alene Mines Corp. have antimony in their concentrate.

On Dec. 4, OPA translated the existing ceiling of 14c. per lb., f.o.b. Laredo for 99.0 per cent metal, which prior to the general maximum price regula-

tion had been set by voluntary agreement, into maximum price regulation 497, also blanketing in 15 antimony compounds. Antimony will be released from allocation after Jan. 1 through an amendment to WPB order M-112 but quarterly reports of consumption still will be required.

Passing the Axis

Mercury, which on the day war was declared was the only major metal in which the axis (Italy, Spain) held dominance, by the end of 1943 had become so plentiful that consumption controls were relaxed materially. Increased production, completion of Russian requirements and a safe stockpile culminated in amendment of WPB order M-78 opening up the use picture; decision not to finance more domestic mines; and cancellation of substantial Canadian purchase contracts. Turning off the water faucet again, top WPB policy makers wiped their hands on the guest towel, and included in their Oct. 27 announcement statement that "domestic production and imports of mercury for the year 1944 for both private and government purchase are each to be reduced to approximately 70 per cent of the 1943 amount." Government imports can easily be cut back, but it has not been explained just how private purchase of domestic production, which is the normal outlet for the principal mines, will be achieved without a restrictive production directive. Possibly a drop in market price, brought on naturally by abundant supply, will turn the trick.

Domestic output probably slightly exceeded 50,000 76-lb. flasks; Mexico contributed about 25,000, and new discoveries may have boosted Canada's total to nearly 20,000. Minor amounts came from Alaska, Peru, Chile and Venezuela. Of domestic production, California mines undoubtedly ran close to their usual 55 to 60 per cent proportion with Oregon dropping close to the common level of Idaho, Nevada and Texas. Some production came from Arkansas, Alaska and Arizona.

Among the individual producers, the New Idria mine, in a remote area of central California, undoubtedly led the parade, rounding out a production record running back 100 years.

As in former years, over 50 per cent of consumption was for industrial chemicals, principally for paint and medicine (not the least important use of which was for venereal disease control). The next most important use was for production of mercuric fulminate for detonating explosives. This use insofar as ammunition is concerned, has dropped greatly since the last war, being replaced by lead azite, which deteriorates less rapidly.

Heigh-Ho, Mr. Morgenthau

Silver, as is traditional, again was a political football for an East-West Big Game with crowded cheering sections led respectively by Senator Theodore Francis Green (R. I.), dubbed the "silverware senator," and Senator Pat McCarren (Nev.) carrying his familiar title of "sagebrush sage." By spring it had become apparent that the 1943 supply from domestic mines, imports, and secondary sources plus the small reserve stock of Metals Reserve Co. and "silver ordinary" in the Treasury, totalling about 162 million oz., would leave a deficit from the amount needed for essential and non-essential industrial consumption and foreign requirements. Everyone was agreed that Treasury "free" silver would have to be called upon to fill the gap, and the question merely was at what price the Treasury sell to industry. Use of foreign silver, selling in the open market at 44.75c. per oz. is restricted by WPB order M-199 to essential uses, cutting off silverware manufacturers, even for the small amounts they are allowed to manufacture, from their normal source of supply. Since domestic producers are always able to sell to the Treasury at 71.11c. per oz., the price of domestic silver is set at that figure.

When the tussle got hot, in April, a direct commitment had been made to the Army for 245 million oz. in addition to the allocation of 1000 million oz. to Defense Plant Corp. for the manufacture of bus bars, transformer windings and other non-consumptive uses, leaving only 43 million oz., or less than the Treasury's requirements for coinage purposes in the near future, of the Treasury's "free" silver. Everyone was quick to agree, however, that since no one was likely to walk off with a bus bar charged with several thousand volts, these bus bars could be used to back currency, thus leaving more "free silver" for the Treasury to sell than if all monetary backing had to be locked up at West Point.

Senator Green suggested that since essential silver users were paying 44.75c. per oz. for foreign silver they should not pay more than 50c. an oz.

for silver from the Treasury. The westerners threw up their hands at this, pointing out that since the Treasury has paid 71.11c. per oz. for the silver, it should be sold for not a cent less. Senator Green was accused of being a tool of silverware manufacturers anxious to reduce the cost of silver. The westerners, in turn, were charged with attempting to "hold up" essential industry. The 71.11c. price finally was incorporated into the Green bill, and it became law in July. But any hopes the silverware makers may have had were dashed by a WPB prohibition against use of Treasury silver for any but essential purposes.

Under the Green Act, WPB must recommend sale of Treasury silver, and by the first of December authorizations totalling about 25 million oz., a mere bagatelle, had been issued by WPB to manufacturers of engine bearings, brazing alloys and solders, and "official articles."

The Green act expires Dec. 31, 1944, unless extended, for it was intended purely as a war emergency measure. A plan is now being worked out whereby the Treasury will agree to repurchase its "free" silver from industry, subject to certain limitations, upon expiration of the emergency.

Early production estimates of about 40 million oz. of domestic silver for the year, and of 20 million oz. of imported silver, in the form of ore and base bullion for refining in this country, for the last half of 1943, proved to be fairly accurate. But an estimated requirement of 139 million oz. for essential industrial uses turned out to be about 39 million oz. too high. Less essential uses, such as jewelry and silverware, were held to approximately 30 million oz. An original estimate of requirements from 25 to 35 million oz. for engine bearings turned out to be much too high, although this use is increasing.

Silver requirements for coinage in the Middle East, India and elsewhere, due to increased war activity and the presence of large numbers of troops, has increased tremendously.

From Rings to Radar

Platinum and its by-metals—iridium, ruthenium, rhodium, osmium, and palladium — which normally are of prime importance to the bauble business, have turned out to be important war metals, and platinum stands at the very head of the list of all metals in point of scarcity. Platinum was carried up the ladder several rungs by the tremendous expansion of the electronics industry, with tremendous requirements for contact points, and added needs for catalysts, and spinerets for synthetic fibers. No use of platinum in jewelry is currently permitted, of course. Supplies have been shrinking, while production, which normally comes from Canada, Alaska and Columbia placers, in that order, and from the Transvaal hard rock mines, has not kept pace. Russia, incidentally, is popularly supposed to produce 100,000 oz. per year from placers in the Urals.

Osmium and iridium occur as a natural alloy (osmiridium) and are separated at the refinery by a complex chemical operation. South Africa normally is the principal source, with some from Alaska and Columbia, and the normal use is jewelry. But now, iridium is under complete allocation through WPB order M-49. The booming war use? Contact points. Placing of iridium under allocation had the effect of pushing consumers into a more complete substitution of ruthenium for contact points materially easing a tight iridium situation, but iridium is still available for a substantial portion of total magneto contact requirements. Use of ruthenium in jewelry manufacture, still permitted, is under curtailed control through the jewelry production order which limits the use of palladium, with which ruthenium is alloyed.

The rhodium supply position has eased materially during the year and it is hoped that some platinum may be saved by using a higher percentage of rhodium in the gauzes used in nitric acid manufacture. Use of rhodium in jewelry is forbidden. Palladium is in easy supply, and it is hoped to substitute it for platinum in the manufacture of contacts.

The Poor Cousin

WPB, which is charged with overall control of raw material production policy as well as with manufacture and distribution of finished products, has been handicapped on the top policy level insofar as mining has been concerned. A long parade of men have been tossed mining policy as a minor responsibility, usually in conjunction with several types of industrial production varying from steel to airplanes. Too often, lack of education in mining problems has been patched over by bluffing, trying to apply principles pertinent only to

manufacturing, or listening to distorted versions pandered by nasty little boys from financial, insurance, or legal firms—or even from labor unions. Trying to reconcile the peculiar policies which have issued forth is worse than solving a Double-Crostic on Persian verse.

For instance, the first cherry the industry found at the bottom of its glass was the gold mine closing order, L-208, issued in October, 1942, which, by closing the gold mines, was supposed to channel large gobs of manpower and equipment to essential mining. It was a matter of both common and statistical knowledge at the time the order was issued that gold mining was on its last legs and wobbling badly by reason of rising material and labor costs and because of a general exodus of miners to the shipyards and construction work—but apparently the news had not reached Washington. No satisfactory accounting ever was given as to how little equipment was transferred from gold to other mines, and questions as to the number of miners transferred were always embarrassing. Donald Nelson said in April, 1943, that there were 1200, but no one wanted to embarrass him by asking their names. Some mine operators thought they smelled labor union influence in the order, for most gold mines were not unionized, while most base metal mines are.

Badgered for some definite statement of policy on minerals production, Donald Nelson on April 1 testified before the senate small business committee that "small quantities of raw materials are of the utmost importance. . . . Within the limits of our manpower and equipment possibilities, we shall pursue the extent of operating all producers, large and small, to the fullest extent." To carry out this policy he recommended "full detailed production planning with actual investments now of materials equipment and manpower to secure production . . . through the end of 1944, and for some minerals, when the preparation period is very long, for whatever period is necessary." About three weeks later, President Roosevelt personally endorsed a letter from Nelson repeating the same general policies. In this letter Nelson qualified his statement with regard to operating all mines—even the small ones—by stating "so long as existing equipment in operating mines is not fully manned, it is shortsighted to draw more labor from these existing operating mines for use in new projects." Thus, since large existing mines, with developed ore bodies, were gasping for manpower it appeared that the earlier statement with regard to small mines had been cancelled out. That seemed a clear and logical policy reversal. But, almost immediately, Charles E. Wilson, WPB executive vice-chairman, flopped the policy back to its original status:

"The scarcity of labor at this time or in any particular mining district will not be an influencing factor in guiding our policy to bring in new mines which produce metals so necessary in our war effort. The miners required in producing these metals will be made available from some source." Following that bit of abracadabra, Wilson did not bring the miners out of a silk hat, thus disappointing his audience greatly. Another four months passed before the Army, the only government outfit able to produce flesh and blood miner manpower, furloughed 4500 miners, not, of course, to the new mines being opened up, but to those which were operating and able to produce immediately.

By Oct. 27, the production and demand situation had changed to such an extent that, without getting the President to withdraw his endorsement, the plan of "actual investments of materials equipment and manpower to secure production . . . through the end of 1944" was scraped. The announcement of curtailment made reference to "greater need for marginal manpower than for marginal minerals." The reference to marginal manpower, apparently an implication that men released from curtailed mines would trot right over to the essential mines, came almost exactly a year after the gold mine closing debacle!

Fortunately, the actual minerals production men at WPB are experienced engineers, not given to shooting off conflicting policies machine gun fashion. There is no more able mining executive in the country than Howard I. Young, director of the Mineral Resources Coordinating Division. Through pick and shovel work of the individual mineral divisions, requirements have been met.

Button-Up Next Time

Post-war thinking in the industry revolves around the accumulation of national stockpiles of essential minerals so that the United States never

Today, KRANE KARS do a big job handling Air Cargo . . . implements of war that make uncompromising demands on materials-handling equipment.

CLARK

TOMORROW'S ACCURACY TODAY

HARDNESS TESTER FOR "ROCKWELL" TESTING

again will find itself in the same desperate plight as at the outset of the current war in Europe. Senator James G. Scrugham (Nev.), a former professor of mining at the University of Nevada, has introduced a bill by which, in the period following the war, stockpiles sufficient for three years requirements would be acquired by paying smaller marginal domestic mines current premiums for 12 months following the conclusion of hostilities.

Donald Nelson is quoted as having suggested "privately" to the Truman Senate Committee that it would be desirable, if appropriate arrangements could be made with foreign countries that would require them, particularly Russia, to accept our surplus machine tools in exchange for stockpiles of basic minerals.

The chances of success for Senator Scrugham's plan are limited by natural public repugnance towards paying a premium to small producers when the same material can be secured at normal prices from economically justified mines. Nelson's plan is handicapped by the fact that the richest deposits of most scarce minerals are located in southern Asia, South America, and Africa. Unless we want to give every Inca a turret lathe, and substitute a drill press for the Hottentot's bottle of milk, we are not likely to get very large tonnages of minerals. But, then, Nelson probably didn't stop to think of that in his enthusiasm for smashing platters to show his friendship for Russia in the Russian manner.

Renegotiation

[CONTINUED FROM PAGE 93]

ments, the comptroller general should act as a negotiator in preliminary review without power to veto or to audit.

(8) Procurement agencies should be authorized to make final negotiated settlements.

(9) Extensive audits should be avoided where the contractor is responsible and has an adequate accounting system.

(10) Settlement should be final except for fraud.

(11) Comptroller general may participate in final settlements but without veto power.

Suggestions offered by the National Association of Manufacturers provide for uniform policies and procedures to be followed by all major war agencies engaged in the settlement of cancelled war contracts and opportunity for contractors, subcontractors and suppliers to appeal to disinterested tribunals for review of adverse rulings or decisions of contracting officers.

A few industrialists have asked that inventories not cleared in 30 days after termination be turned over to a new and separate government agency with storage expenses met by that body. Some want overall claims settled rather than individual contracts since this would simplify checking of inventory and application of overhead distribution.

The recent appointment of Bernard M. Baruch as postwar adjuster is a hopeful sign that some order will arise from the waves of chaos.

But as the uncertainties of renegotiation recede, the complexities of contract termination will increase in 1944 to perplex the war contractor.

BOTTLENECK BREAKER: *Joseph K. Miller, foreman of the forge shop at the East Pittsburgh Works, Westinghouse Electric & Mfg. Co., inspects some shafts for Navy vessel generators made with a die that he designed. The die broke a production bottleneck and brought a $500 award from the company to Mr. Miller.*

Here is your answer

to these three questions:

1. *How Can I Cut Costs?*
2. *How Can I Save Space?*
3. *How Can I Reduce Accidents?*

The TURNER SYSTEM OF MATERIALS HANDLING

is engineered to do these jobs

In today's production crisis management in every American plant should know how the scientifically designed Turner System provides the most practical solution to important problems. At small equipment cost this remarkable system cuts labor, materials handling and storage expense. It saves up to 50% floor space by its mathematically 100% efficient method of handling and storing. It saves the cost of new buildings and the installation of expensive overhead equipment. It definitely reduces material handling accidents which comprise 40% of all industrial accidents.

Slide Shelf Rack on Movable Transport

Built on the Principle of the Square

Already proved in many of America's largest plants, the Turner System is a completely standardized scheme of interlocking and interchangeable units which can be applied to every plant operation. Its foundation is the perfect square upon which is built an amazingly flexible and efficient materials handling and storing procedure.

Send for Explanatory Book

Factory Service Company will send without charge to established companies its twenty-page book explaining the Turner System. Write for it today.

time lost through attendance at approved evening classes, up to a maximum of three hours per evening or longer in special circumstances, at the discretion of the Works Education Committee. The maximum is three nights a week.

Attendance at day courses is facilitated, at the Committee's discretion, in special instances where a student has attained a satisfactory stage, and payment at time rates for time so spent may be made by the Corporation. One day a week is the maximum, and it must be shown by the student that there are no alternative evening courses.

A most important and interesting point is that tea is provided free to all employees attending approved courses who have worked the full day-shift on the day in question. All these arrangements apply to students of both sexes. Tea, it should be noted, is intended to convey not the mere beverage, but a substantial meal, what is known in Yorkshire as 'high tea.'

One consideration worth noting in this scheme is that the students have the advantage of the experience of the Corporation's administrative and technical staff in deciding what courses it is best for them to take to fit themselves for a particular career in the steel industry.

Recently, for example, the Secretary of the Corporation went to considerable trouble to map out for a young man in the accounting department a course of study to fit him for cost accounting in the plant. The chief metallurgist not only suggested courses in metallurgy suitable to the varied requirements of the firm, but himself gave, from time to time, informal lectures elaborating from the point of view of direct practical application the hard, bare facts learned in the study classes.

Each potential student is provided with an application blank, which he has only to fill in and sign for the machinery to be put in motion. It is also important that not only has the Corporation taken this action within its own sphere, but it is also actively co-operating with civic authorities and industry in planning a comprehensive improvement and extension of the entire city's educational services for young people of the school-leaving age.

Britain is awake to the needs of the future, planning new products, new methods, new skill.

TOUGH METAL FROM POWDER: *Dr. Paul Schwarzkopf examines one of the parts he makes from metal powder at the American Electro Metal Corp., Yonkers, N. Y.*

Construction Equipment for Britain Given AA-1 Preference

Washington

• • • **WPB has assigned** automatic AA-1 preference ratings to the Foreign Economic Administration for repair parts needed to rebuild and recondition used construction equipment to be shipped overseas for use in strip coal mining. Automatic AA-1 ratings are also assigned for spare parts that are shipped with the equipment. This action is taken by Direction I to Order L-192.

Standards Policy Committee Appointed at G.E.

• • • **A General Electric Co.** standards policy committee, headed by L. F. Adams, manager of the standards division, has been appointed by W. R. Burrows, vice-president in charge of general manufacturing matters, and R. C. Muir, vice-president in charge of general engineering matters. The committee will be responsible for the development and maintenance of sound design engineering and manufacturing standards and practices for use throughout the company.

The committee will work with and through existing committees having responsibility in their respective fields. American Standards approved by ASA and other nationally accepted standards developed by the AIEE, ASTM, and SAE will continue to be utilized without change in so far as they are applicable. It will continue to be the responsibility of the company's standards division to edit and distribute all new and revised standards and practices in one of the regular G-E standards series, following approval by the committee.

The membership of the Standards Policy Committee consists of Mr. Adams; H. W. Robb, secretary; P. L. Alger, T. D. Foy, the engineering assistants to the works manager, the general superintendent of each works and a representative of each of the appliance and merchandise, electronics and lamp departments.

NEW STEEL FOR VICTORY: *These rows and rows of steel ingots were produced at Henry J. Kaiser's new steel plant at Fontana, Cal.*

ARMSTRONG

Tool-up NOW for Greater War Production . . . . and Be Tooled-up for Post-War Competition

Equip every lathe, planer, slotter and shaper with a complete set of ARMSTRONG TOOL HOLDERS—with the correct types and sizes for every operation. While the extra strength and ready adaptability of ARMSTRONG TOOL HOLDERS make it possible to "get by" with a minimum of types and sizes the correct ARMSTRONG TOOL HOLDERS will permit greatly increased production on each operation—will permit speeds and feeds often double so-called "Standard" speeds and feeds, without loss of cutting efficiency.

Tool-up completely now with ARMSTRONG TOOL HOLDERS to increase your War Production and you will also be tooled-up for post-war competition, because each ARMSTRONG TOOL HOLDER is a permanent multi-purpose tool that will not only outlast the war, but with the change of a cutter, will be ready to start on post-war production.

Metallurgy

[CONTINUED FROM PAGE 113]

period when there was an alloy steel shortage in war industries. Even today, when alloy production is at its lowest point since the United States entered the war, quality scrap is almost non-existent. It is true that there is a definite surplus of alloy turnings and flashings, so much so that stocks are accumulating all over the country and prices for these items have fallen sharply. However, non-alloyed scrap, billet and bloom croppings and the better grades of uni-alloyed steel scrap are still far below needs and extremely difficult to obtain.

From the electric melter's standpoint, it is believed that bundling and briquetting will become considerably more important as time goes on. However, in the briquetting of turnings, it is extremely desirous to remove the oil on the turnings by burning, heating, chemical cleaning or centrifuging. Such cleaning is necessary because the oil will increase the carbon content of the charge by as much as 10 points per 1000 lb. of turnings charged. Likewise, the sulphur in the oil has detrimental effects.

Trends in electric furnace deoxidation are shaping up with some interesting developments expected. Clean lump ore has been found superior in some respects to roll scale, but the high silica in some of these ores makes the use of excessive lime in the slag blanket necessary. In the use of roll scale, care must be exercised to make certain that it is not contaminated with nickel or chromium unless these types of steel are being made. If stainless scrap is being remelted and contains oil, grease and other carbonaceous material, the roll scale must be pure in order to reduce this carbon. Chateaugay sinter, with an extremely high iron content and very low phosphorus content, has been found to be an excellent deoxidizer.

The year 1943 has been one of major developments and refinements on developments and will have definite and tangible results on the scientific and economic factors of steel making in the future. It is true that many of the developments of the past year or so have resulted from the scarcity of certain materials, for which others have had to be substituted. However, regardless of the reason, new ideas have been formulated, tradition and precedent have been forgotten and new methods have been developed, many of which will vitally affect the metal working industry and lay the groundwork for more progressive and creative thinking for years to come.

Conservation: The Postwar Keynote

PROBABLY because of strikes and threats of strikes, word has gone around that the less said or thought about postwar problems the better. That is true for most of us but it does not, it seems to me, apply to top management in industry.

The higher up you go in the scale of industrial executive position, the farther ahead is the thinking. The man on the job at the lathe or rolling mill thinks and acts in terms of the immediate moment. His foreman thinks and plans as to tomorrow's schedules of production, having finished his planning for today's. The superintendent thinks in terms of next week's labor supply, the purchasing agent in terms of next month's material requirements, the works manager in terms of equipment and plant needs six months from now. When you get to the top officials, a good part of their thinking is one to, perhaps, three years ahead.

It has to be that way to keep industry running, either during a war or after it. The locomotive is naturally way ahead of the caboose; if you try to run them side by side you eventually get a smash up.

Top industrial thinking with respect to production of the great bulk of war materiel was largely completed a year or more ago and put into capable hands farther down the line to be carried out. If Eugene Grace of Bethlehem and his executives had confined their thinking to day to day problems, for example, 380 ships would not have been completed by that company in the 365 days of 1943. No man on the coming invasion front will lack support and materiel because of failure of our top American industrialists to think ahead and plan ahead for victory. Let's hope we will be able to say as much for top labor thinking and acting.

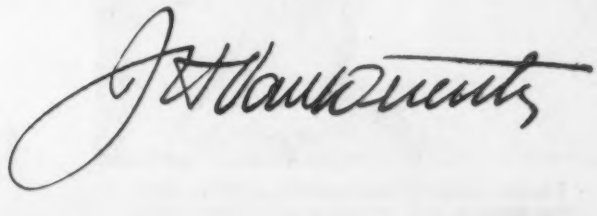
So while most of us must keep on thinking of the tasks of today, these men whose function it is to look forward must think of tomorrow. And here is something for them to think about.

Until the war is won, our chief emphasis in industry must be on saving time. That is the job for the men in charge of production; the present day to day thinkers and planners. For time saved in production and supply means lives saved and days or weeks or perhaps months sooner for victory.

But after the war, the emphasis will change. The coming generation will have as many minutes, hours, weeks, months and years as we have, perhaps more as life spans are lengthened by science. But they will not have the abundance of materials that we have had. The cream is being skimmed from the bottle of our natural resources.

Time is inexhaustible; natural resources are not. The minutes that we are using today will be replenished by Father Time, but Mother Earth will not be as bountiful with our rich ores, our diminishing forests and our flowing oil wells.

Conservation will be the keynote of our postwar America and our forward thinkers would do well to plan for it.



Inland medical staff discussing an X-ray film.

Blood tests often suggest corrective treatments that keep men at work.

The X-ray is extremely useful in preventing the loss of man-hours.

The knowledge of heart action is useful in placing workers and extending their work years.

INLAND CLINIC HELPS SOLVE MANPOWER PROBLEM

The Inland clinic, established long before Pearl Harbor, has taken on added importance during the war by helping to solve the vital manpower problem.

Working closely with the Inland industrial relations and safety departments, the clinic appraises the usefulness of many handicapped people—suggests types of jobs they can perform, —helps find work they can do in the Inland mills to replace workers who have gone to war.

The clinic staff speeds men back to jobs by assisting them in obtaining needed outside medical attention. It recommends and arranges for special treatment. It helps find medical service for workers new in the vicinity and for those whose regular physicians are away at war.

The 24-hour dispensary provides medical attention quickly and keeps many a man producing who otherwise might be absent from work because of slight injury or minor illness.

Finally there is the regular clinical work—free examinations that forestall illness, prevent accidents, speed the recovery of injured and sick employees. Although not compulsory, all but a very small percentage of Inland employees have taken advantage of this service.

Through its important work the Inland clinic has literally added thousands of man-hours to America's war effort, bringing Victory that much sooner.

IRON AGE

JAN. 13, 1944

NEWS FRONT

• Current steel operating rate of, say, 98 per cent of capacity is some three points higher than actual operation, as the activity is figured on capacity as of July 1. New capacity figures will not be ready until end of January.

• New WPB regulation gives C. E. Wilson, executive vice-chairman, authority to direct activities and functions of all officials of WPB, Aircraft Resources Control Office and the Aircraft Scheduling Unit.

• All powers previously held by Nelson have been granted the vice-chairman.

• This seems to be the first move to line up Wilson as director of reconversion activities, as planned by Baruch.

• Evidence is accumulating that the aircraft of tomorrow, a la Buck Rogers, will be driven by squirts and not by propellers.

• Germans, long contemptuous of wooden aircraft, have been so impressed by Russian craft and the British Mosquito as to start production on a large number of wooden front-line aircraft. Numerous advertisements in the Reich and in occupied countries are attempting to flush wood workers for the German aircraft industry.

• Recently, a German radio station mentioned that Focke-Wulf will soon introduce a wooden version of the single-seat Fw 190 fighter. Displaying astounding originality, this plane will be called "Moskito".

• A German war reporter has just described a new Soviet transport airplane, said to be the largest in the world. It is stated that the largest German bomber could be parked under one wing.

• The American soldier's newspaper, Stars and Stripes, published in Cairo, recently said: "Too many Americans are walking around ablaze with bits of colored silk . . . We would like to petition the War Department to spare us some of this shower of silken recognition . . . Our feeling is that the British are perhaps a little too reserved in their treatment of their heroes." The British have issued no battle ribbons in this war so far.

• Bomber strength of the U. S. Eighth Army Air Force (based in England) is now 2500 aircraft.

• In 1942 Admiral Towers, U. S. Navy, said that the Glenn Martin "Mars" (world's largest flying boat) was obsolete so far as performance was concerned. However, figures released on the recent Maryland to Brazil flight of the "Mars", unless they have been fudged, indicate an incredible performance, i.e. cargo weight of 24 per cent of gross weight, against a comparative 6 per cent figure typical of a Boeing 314, the next largest flying boat in regular operation.

• Large inventories of steel disks for cartridge cases, orders for which have been cancelled, will be used mainly for manufacture of steel mortar shells. Uses for smaller disks are as yet uncertain.

• Although Metals Reserve relaxed to accept manganese carbonate ores, no use for these ores has as yet been determined.

• Navy cutbacks during the last six months in ships, aircraft, ordnance, etc., totalled $2,856,000,000. Destroyer escort vessels accounted for $1,370,000,000 of the total.

• Russia is negotiating for the structural mill now being stored in crates at the Columbia Steel plant at Geneva, Utah.

• In a letter to Jesse Jones, WPB recommended the cancellation of funds for four Carnegie-Illinois plants at Munhall and Braddock, Pa., Gary, Ind., and South Chicago. Slow cooling pits, hot topping equipment and soaking pits were to be built.

• Estimates of man-days lost because of strikes in 1943 total 17,317,500. In 1939, there were 17,810,000 man-days of idleness.

• Worried lest aluminum cutbacks shut down West Coast plants, officials there are pointing out that aluminum produced in the Pacific Northwest costs less than 15c. a lb. Shipshaw aluminum delivered to Vancouver for lend-lease shipment to Russia costs the United States about 21c. a lb.

Machining the Wright Cyclone

By H. E. LINSLEY
Wright Aeronautical Corp.

o o o

THE first public announcement of the Cyclone forged aluminum head was made in May, 1942, although the actual development work had begun early in 1938 and in the fall of that same year the first forging dies were purchased. The problem of producing the forging itself is one which has given a great deal of trouble. At the present time three different methods are available, each developed by a different forger and each giving satisfactory results. In general, the process consists of producing a cast billet, either round or rectangular with rounded corners, scalping this to remove scale, cutting off sections to the desired length, and pressing to shape in two or more passes in the forging press or upsetter.

Heat-Treating Cycle

Forgings are delivered to Wright in the "as forged" condition and weigh approximately 65 lb. The first step after inspection is to give the forging an elaborate heat-treating cycle. This is extremely critical since the speeds used in machining are so extremely high that even slight differences in heat treat and material structure will have an appreciable effect on the life of the cutters. Continuous conveyor type combination gas-electric furnaces are used, two furnaces being arranged in parallel with a gravity type conveyor between them for the return of trays. As seen in Fig. 1, forgings are loaded on to two "subway grating" trays, six to a tray, and these trays are moved into the furnace vestibule in pairs by means of a hand crank. Then power driven rollers carry the trays through the gas fired, radiant tube heating section in which the parts are brought to a temperature of 960 deg. F. and then through the electrically heated section where they soak at 960 deg. for 6 hr. When the trays arrive within about 2 ft. of the discharge door they trip a limit

FIG. 1—Loading end of the continuous conveyor type combination gas-electric furnaces used for heat treating Cyclone aluminum cylinder head forgings.

o o o

FIG. 2—Mounted on the column of a Bullard Mult-Au-Matic, this special target fixture assists in truing up cylinder head forgings so as to equalize stock removal in the initial machining operation.

Forged Cylinder Head

. . . After more than five years of intensive and costly research, the Wright Aeronautical Corp. now has its forged aluminum cylinder head program in full operation and is manufacturing these vastly superior engine parts on a quantity production basis. Some of the unusual special purpose machine tools devised to machine this head are described and illustrated in this article, the most interesting of which are the automatic units for milling out the cooling fin slots. Machining time has been increased but a difficult and tedious foundry job has been eliminated.

o o o

switch which opens the door and at the same time starts an electric motor which operates a high speed driving mechanism to convey the two trays out on to the roller conveyor cooling section as quickly as possible.

Rapid cooling is achieved by an air blast directed upwards from under the conveyor, about 25 min. being required to bring the temperature down to 340 deg. F. or lower. During this time the trays move to the loading end of the second furnace where they are picked up by a six-strand continuously moving chain which carries them through the vestibule and through the direct gas fired, recirculating heating section where they are brought to 340 deg. They next pass into the electrically heated soaking section for 8 hr., and finally out on to the strand chain cooling section where they cool for 4 hr.: Still on the same chains the parts next pass through the third furnace, heating to 450 deg. in the direct fired gas section, soaking for 5 hr., and then discharging on the final strand chain conveyor where they cool to room temperature. After the parts are unloaded, the trays return to the loading end of the furnace by the gravity roller conveyor.

FIG. 3—Locating dowel holes are drilled and reamed on this special Allen drill equipped with turnover fixtures to facilitate loading of the aluminum heads which weigh 65 lb. in the rough forging.

The forgings, which now have a hardness of 85 to 95 Brinell (500 kg. load, 10 mm. ball), are snagged and then forwarded to a 16-in., 8-station Bullard Mult-Au-Matic. At the first station the part is loaded into a chuck, resting on equalizing buttons, and clamped on the lower portion of the chucking piece.

Target Fixture Used

It is then trued up by means of targets and flush pins carried on a special target fixture, Fig. 2, which is mounted on the machine column and lowered into place. The outside diameter of the body is finish turned, the flange finish formed, and the first fin groove finish turned. Parts are then transferred to a second Mult-Au-Matic in an inverted position, the chucking piece faced off, and the interior dome rough and finish formed.

Two locating holes are now drilled and reamed on a special Allen drill. This is a three position indexing machine, Fig. 3, having two two-spindle heads and three trunnion mounted fixtures to facilitate loading. Parts are loaded in an upright position, locating on the flange diameter, and targeted on the rocker boxes. After clamping, the fixure is inverted to present the base of the flange to the drills.

Greenlee Transfer Units

Heads are next conveyed to a Cincinnati Hydro-matic rise and fall machine on which the curved upper part is profile milled, after which they are mounted on special carrier plates before passing to the special Greenlee

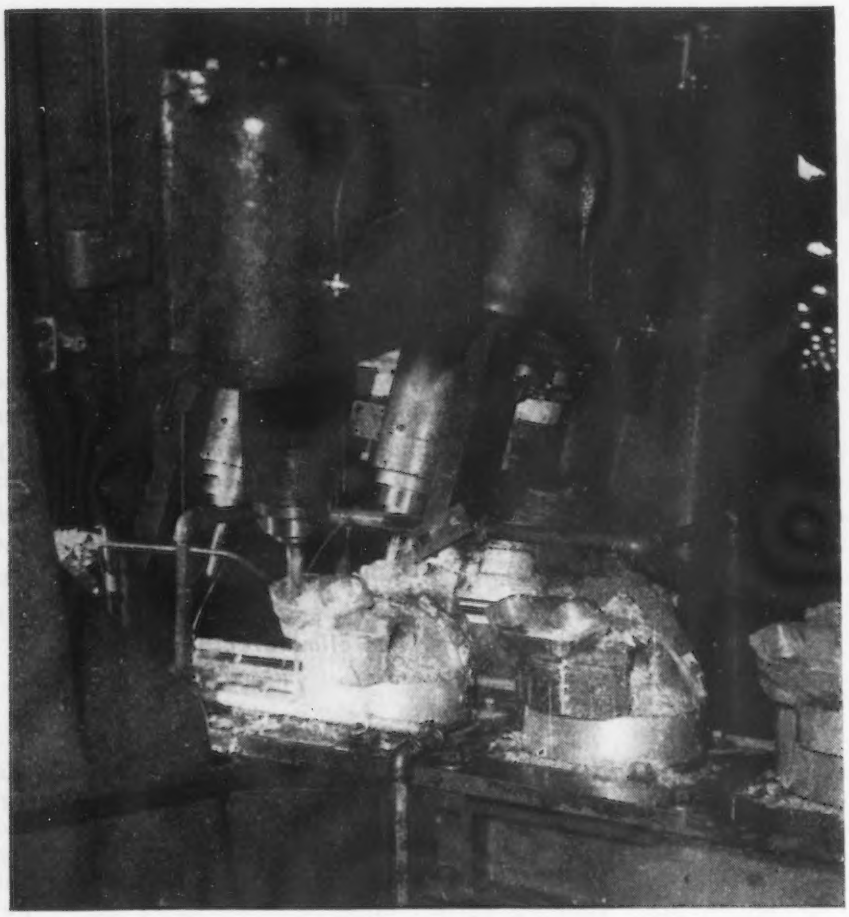

FIG. 4—A close-up view of one of the stations of the Greenlee transfer machine used for roughing out Cyclone cylinder head forgings.

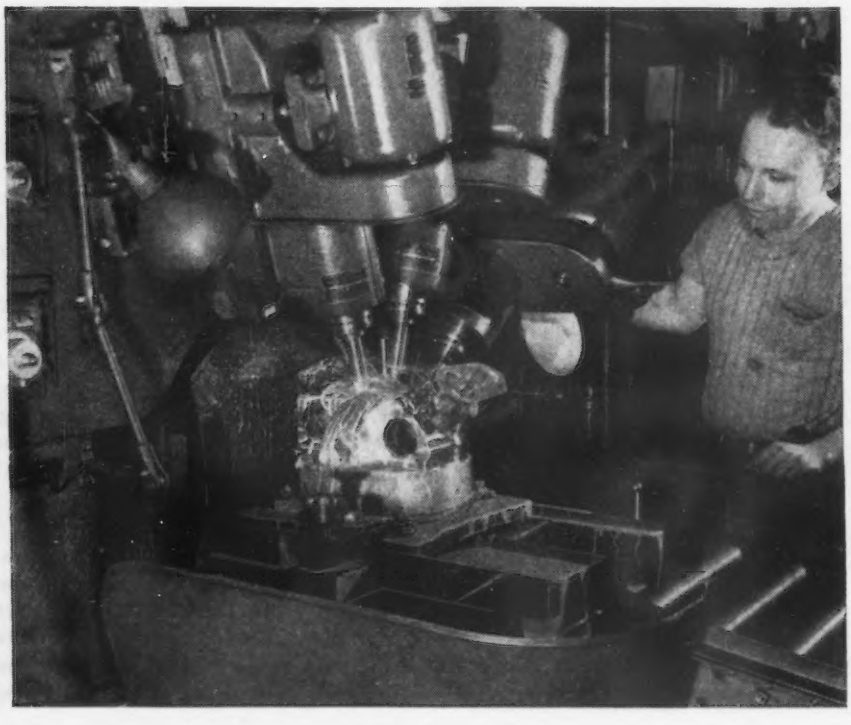
o o o

FIG. 5—Three grooves are milled simultaneously on this special three-spindle Snyder machine. The head is still supported on the same carrier plate as used on the Greenlees.



transfer machine. This machine is very similar to that described in THE IRON AGE for Oct. 9, 1941, except that it is built in three sections and combines milling operations with drilling, counterboring, reaming and tapping operations.* Parts are loaded into the first or 16-station section so that the rear of the head faces the right side of the machine. At the first operation both rocker box faces are rough milled, removing about 3/16 in. of stock with end cutting mills. At the next operation a ½ in. hole is drilled and reamed and then the two spark plug holes are drilled, counterbored and chamfered. A hydraulically operated arm now picks up the head, lifts it clear of the conveyor, tilts it to remove the chips and excess cutting oil and then replaces it on the track.

See also "In-line Machining of Aircraft Cylinder Heads," by W. A. Phair, THE IRON AGE, Aug. 12, 1943, p. 66, detailing the Greenlee units installed at the Studebaker Corp. for producing the Wright cast aluminum cylinder heads.

At this point a manually operated turntable is incorporated in the track to enable the second operator to turn the head a quarter turn so that the rocker boxes face lengthways of the machine. This operator then advances the head into the second or 35-station section where the first operation consists of drilling two 13/16 in. diameter holes near the ends of each rocker box and rough counterboring the valve spring counterbores to 1-25/32 in. diameter, Fig. 4. The valve holes are next drilled ¾ in. diameter through into the dome and finish counterbored to 2½ in. diameter. The opposite or push rod ends of the rocker boxes are then rough and finish counterbored to a spherical radius. A clearance recess is end milled at the valve ends and then the push rod holes are drilled through and counterbored. At the next station the rocker shaft holes are drilled, after which a 1⅛ in. wide slot is milled through the stock between the valve and push rod counterbores. Finally two holes are drilled and reamed for the fin bracing and thermocouple tubes, the latter being also counterbored.

Chips and Oil Dumped

The head is again raised and inverted to remove oil and chips and advanced to the third or 12-station section. Before entering this the part enters a manually operated cage in which it is turned upside down, in

which position it passes through the section for rough and semi-finish counterboring the valve seats. Emerging from here it is again tilted to remove chips, turned right side up and passed through an automatic wash machine.

This one machine comprises a total of 63 stations, of which 23 are active, or operating stations, three are loading, three unloading and the remainder serve merely as bridges between the units to allow access to the tools for setup and maintenance. It has a length of 110 ft., and is equipped with a total of 41 tools to perform 40 operations. These include four milling cutters, 15 drills, three reamers, 17 counterbores and two end mills.

After the heads leave the wash machine, they travel by roller conveyor to a battery of special Snyder mills, Fig. 5, equipped with three inclined spindles each of which is individually driven by its own high speed motor. Parts are located by means of the carrier plate on which they have been passed through the Greenlee and are clamped to a power operated table. The three spindles feed down to the required depth of 0.175 in., and the table then advances to produce the desired 5 in. length of slot. After finning, these slots serve to receive reinforcing strips to brace the fins.

The carrier plates are now removed and the parts passed to special Allen drills, Fig. 6. These machines are provided with a four-position indexing table and three drill heads, each of which carries eight spindles. The cylinder heads are loaded in an inverted position, locating in the dowel holes and the center bore. At the first index the drills start the holes to a depth of approximately ½ in., at the second index the holes are drilled through and at the third are reamed and countersunk. At a later operation anchor tubes are inserted into these holes to serve as fin braces.

Complicated Valve Chambers

The next operation consists of machining out the exhaust valve chambers in such a manner as to leave a central boss, Fig. 7, in the form of a truncated cone whose base blends into a full radius and is in the form of a portion of a helix, so that the height varies progressively from minimum to maximum, and back to minimum. This somewhat difficult form is generated on a special Snyder machine built to Wright designs, Fig. 8. The part is held on a rotary fixture inclined at the angle of the valve guide cone, and is located on the

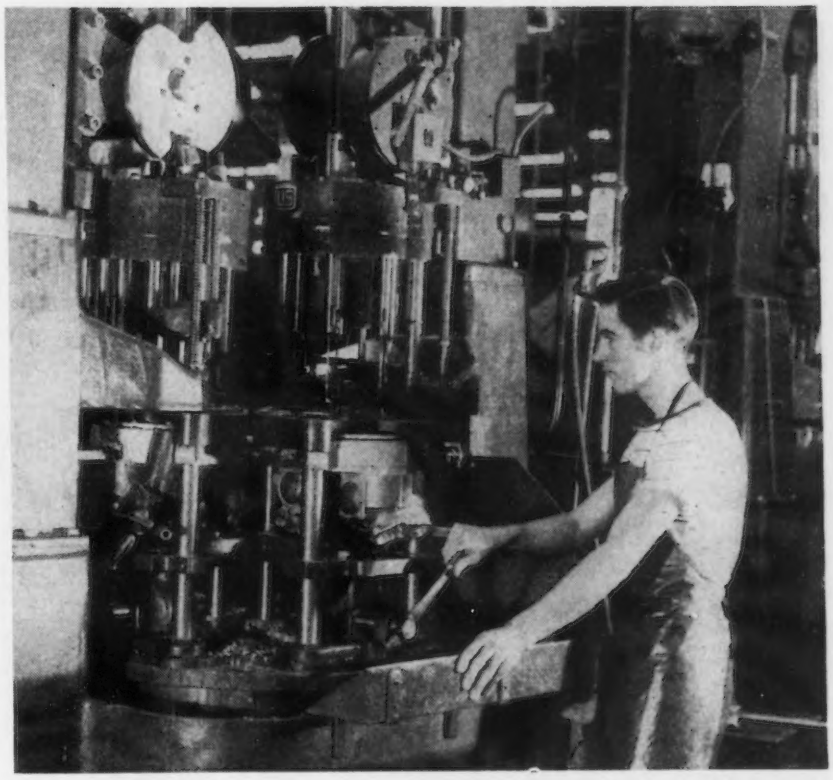


FIG. 6—Eight fin bracing tube holes are drilled, redrilled and reamed on this special Allen drill equipped with three heads and a four-position indexing table.

o o o

FIG. 7—A cross-section through the exhaust port of a Wright Cyclone forged cylinder head, showing the complicated forms to be machine generated in the ports and rocker box.

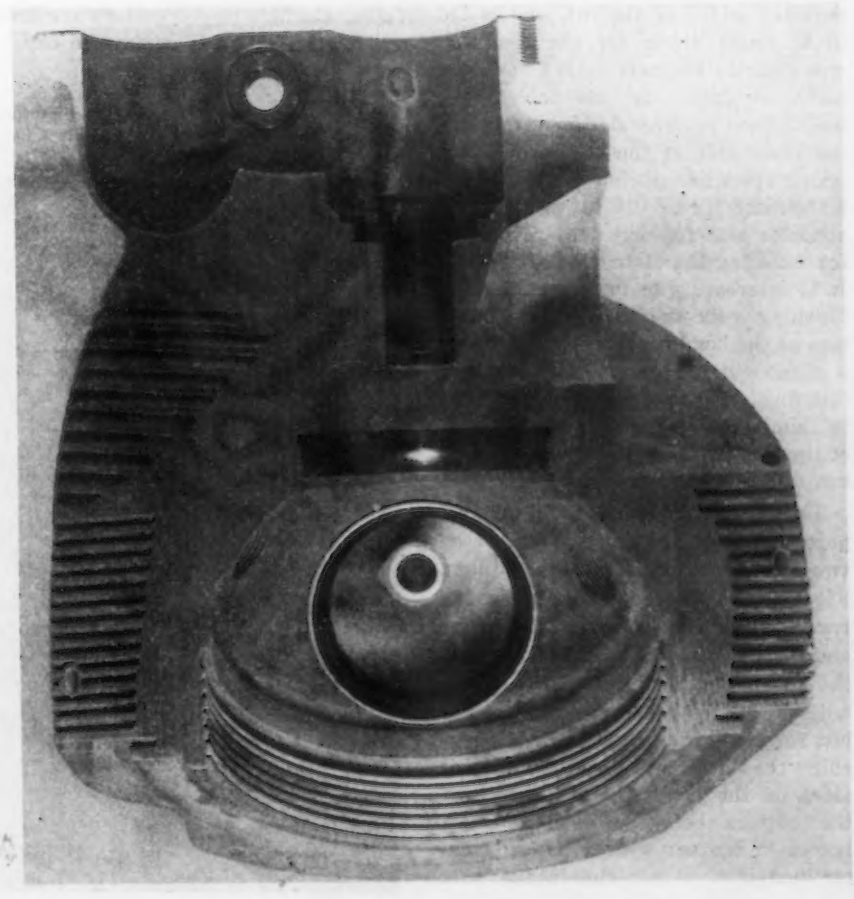

FIG. 8—Special Snyder machine equipped with inclined rotary tables form the complicated intake and exhaust valve chambers. (See also Fig. 7.)

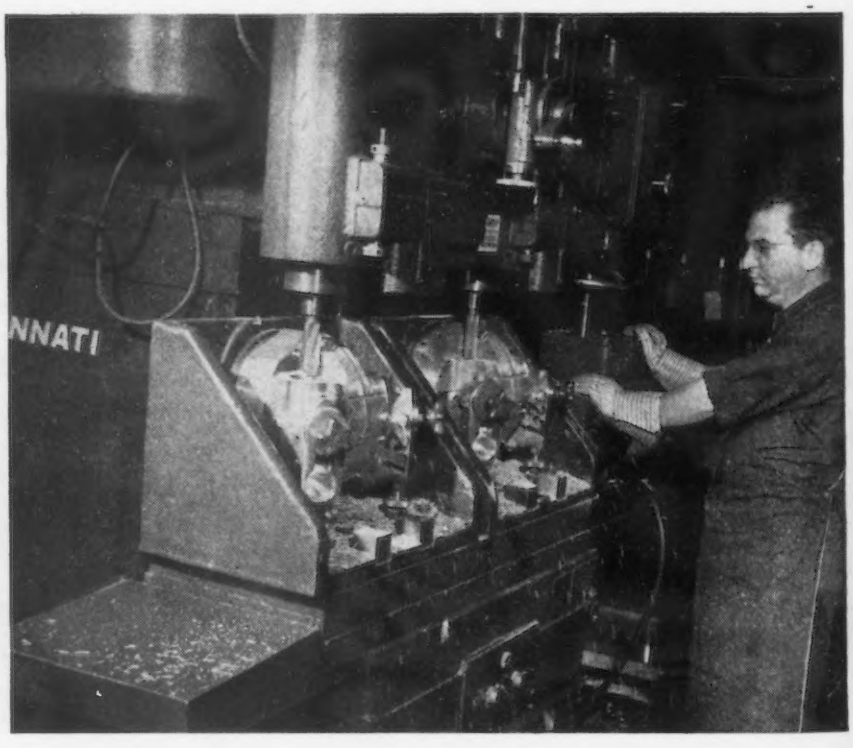
valve spring counterbore and rocker box slot. The form end mill used is 0.030 in. smaller in diameter than the required width of the cut, and is fed in to finish depth for the roughing operation as the part makes one complete revolution on the table. The tool is then set over 0.015 in. towards the inner side of the cut for the finishing operation during the next revolution, and then 0.015 in. towards the opposite side for the final revolution for finishing the other side of the cut. It is interesting to note that for the finishing cuts the direction of rotation of the head is reversed to produce a climb cutting action and obtain a fine finish. The intake valve chamber is similarly machined on Snyder equipment, with the fixture set to suit the different angle.

The faces of the intake and exhaust ports are rough and finish milled on two-spindle Cincinnati profile millers, Fig. 9, on which the heads are loaded two at a time, locating on the flange and dowel holes and clamped through the intake and exhaust valve guide holes by plates bearing on the rocker box faces. Spiral fluted end mills machine the port faces and the adjacent sides of the head, the movement of the cutters being controlled by a tracer in contact with a hollow master template. After the intake port face on both parts has been machined, the tracer is shifted to a second template for machining the exhaust port faces. Carbide tipped cutters are used and the operation is performed dry.

Following this the intake and exhaust ports are milled out to connect into the valve chambers. For this purpose, a special high speed Cincinnati Hydro-Tel milling machine, Fig. 10, is equipped with three individually powered spindles each direct driven by a high-cycle motor at 6900 r.p.m. The power for these is provided by a motor driven high cycle converter. The spindles are inclined at an angle of 15 deg. from the vertical, but the heads feed vertically downwards on the ram face. Three cylinder heads are loaded at one time, location being by means of hardened blocks fitting into the slot in the rocker box. The holding fixtures are linked to a reciprocating bar in such a manner that they oscillate through a small arc. As the spherical cutters feed down into the ports, they travel in an approximately circular path with respect to the work, being controlled by a ball-ended tracer operating in a master form, also attached to the reciprocating bar. The curved passage thus generated is remarkably clean and requires only a smoothing operation with abrasive cloth to remove tool marks and blend it into the opening of the valve chamber. Approximately 15 min. are required to perform the operation on the three heads for the exhaust ports, and a similar amount for the intake ports. In spite of their high speed the spindles may be stopped in about 5 sec.

FIG. 9—The faces of intake and exhaust ports are rough and finished milled on two-spindle Cincinnati profile millers.



by pressing the electric reversing button.

Experimental Unit Built

Milling out the fins constitutes one of the most interesting operations and is achieved by the use of special Cincinnati milling machines designed especially for the job through the joint efforts of Wright and Cincinnati engineers. To establish the method a standard knee and column type miller, Fig. 11, was modified by attaching a harness to the table, and by means of weights and pulleys, reducing the friction load on the feed screws to less than 5 lb. Two Keller attachments were then connected to the table, one for the vertical movement and one for the horizontal, to cause the table to follow a master profile. Although the first heads were successfully produced on this experimental unit, considerable trouble was encountered with the cutters. Gang milling was tried, but proved unsuccessful. Standard milling saws were found to be entirely unsuitable since their harmonic frequency was such that they excited the fins and produced fatigue fractures. Special cutters were therefore designed so that the vibration was dampened and the excitation no longer occurred. These cutters are 13 in. in diameter and have nine carbide tipped teeth, carefully ground and honed to a fine finish. When operated at a surface speed of 4500 ft. per min. and a feed of 70 in. per min. they produce an exceptionally good surface and have been so carefully worked out that the heat generated is virtually negligible; both cutter and work piece remain sufficiently cool to be handled without difficulty.

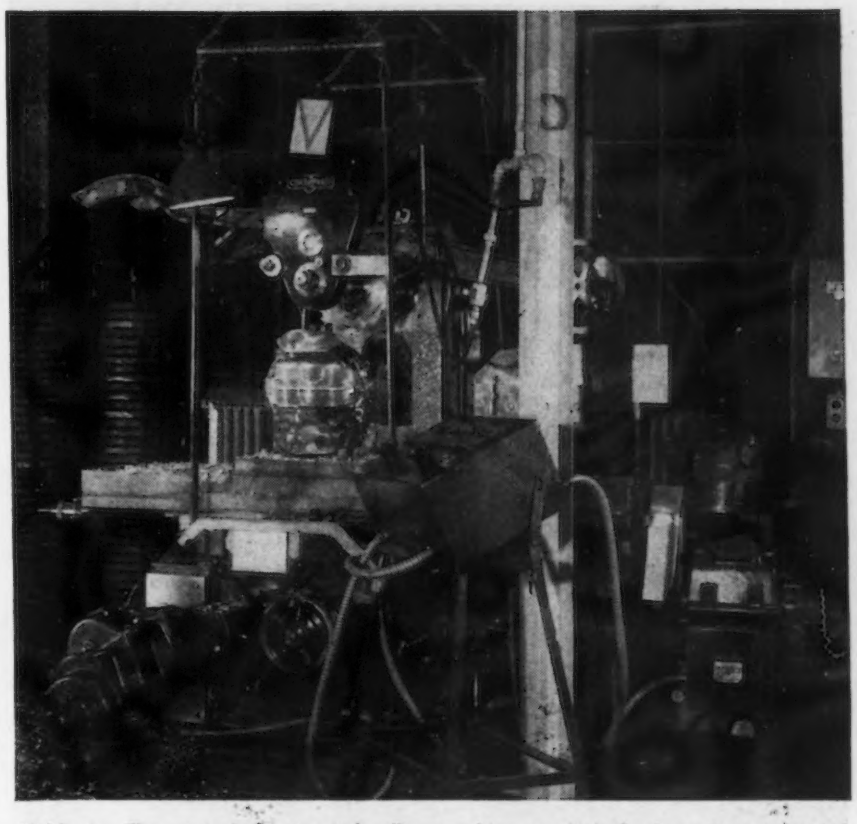


FIG. 11—The original experimental milling machine on which the fin cutting operation was developed. Table is counterbalanced by a system of overhead weights to reduce friction.

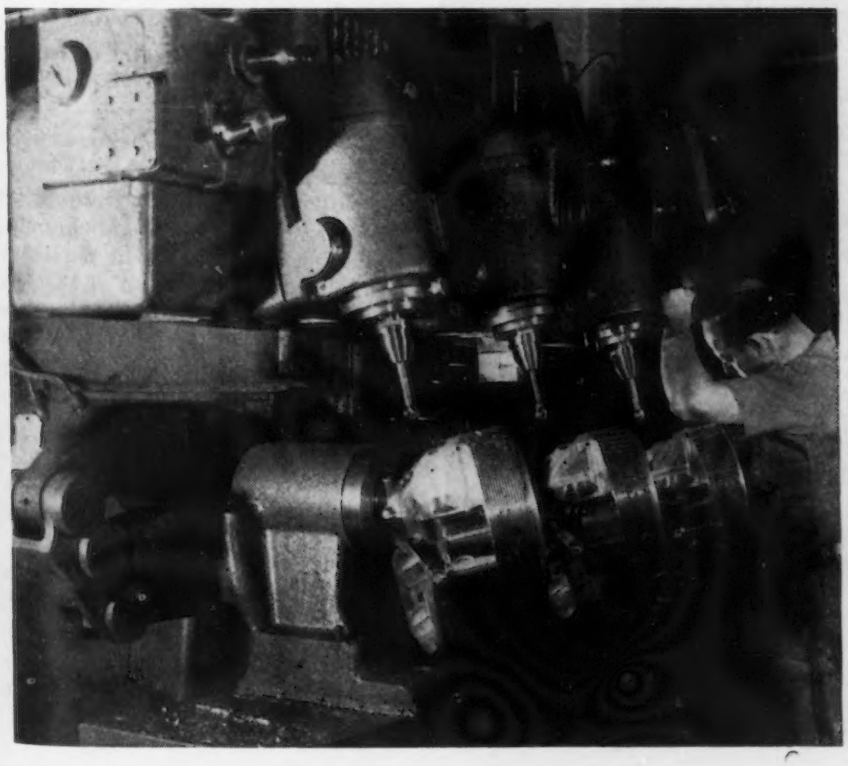
When the machines were first installed it was believed that the centrifugal force produced by the high speed cutters would render it impossible to make any effective use of fluid coolants, and the machines were therefore designed to use heavy tallow as a cutter lubricant. This was fed by compressed air from a container through a flexible tube terminating in a slotted nozzle through which the edge of the cutter passed. An automatic trip operated the air valve to deliver a "shot" of tallow every few seconds. This was satisfactory in so far as cutting was concerned, but proved to be very wasteful of tallow which was soon splattered all over the machine and which could not be readily recovered. Furthermore, it resulted in the parts being heavily coated with grease and made very objectionable to handle. Experiments are now being conducted with fluid coolants with apparently successful results, and all machines will probably be changed to such a type of coolant in the near future.

The first finning operation consists of cutting 14 fin spaces around the lower part of the body. This is done on a Cincinnati Hydromatic with the

FIG. 10—Specially designed high-cycle Cincinnati Hydro-Tel milling machines are used to generate the form of the intake and exhaust ports.



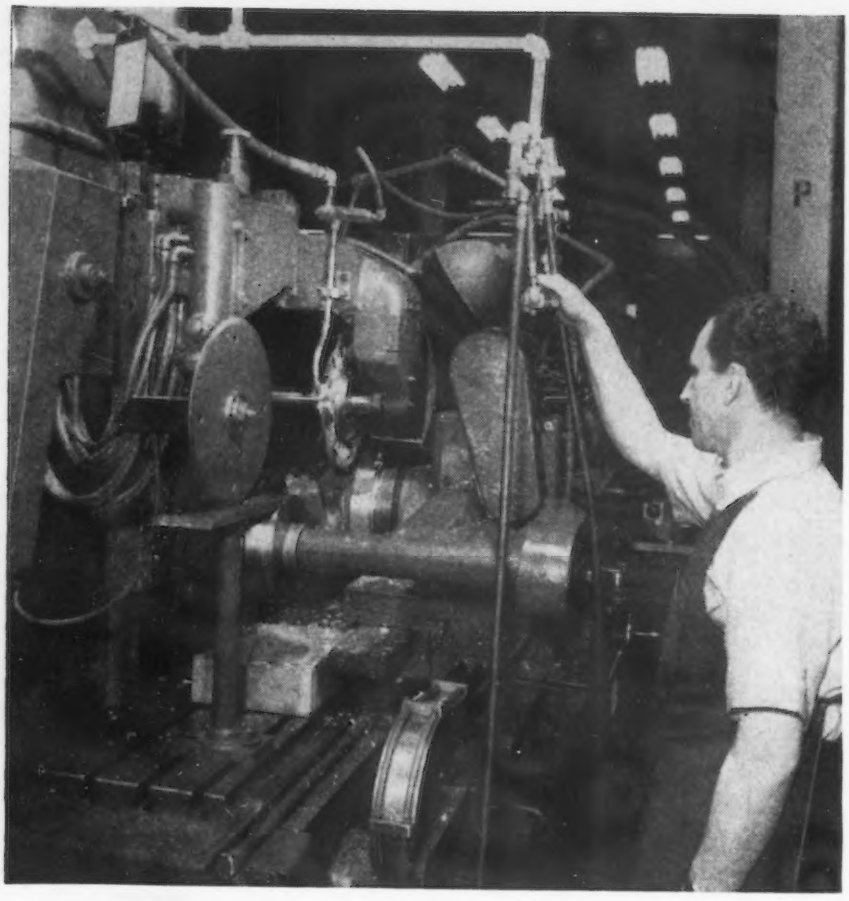


FIG. 12—The nearly circular body fins are cut on a special Cincinnati Hydromatic mill using two saws controlled by a rotary cam and follower. Infeed approach is controlled by the flat plate shown at the upper left.

FIG. 13—Special Cincinnati Hydro-Tel mills are used for cutting the wide fins at the intake and exhaust ports.

cylinder head mounted on a special rotary fixture and located on the flange diameter and the locating pin holes. Fig. 12. The groove bottoms are not perfectly circular nor all of the same contour, and a master cam is therefore used to obtain the necessary rise and fall of the machine spindle. At the start of the cut the cam follower travels along a horizontal plate to feed the cutters in to depth, thereafter it engages the cam which rotates at the same feed speed as the part and produces the required profile. On this operation two cutters are employed, 0.112 in. thick, and spaced at the mean thickness of the fin which is 0.058-0.068 in. The depth of the cut is about 2¾ in. at the deepest part.

Fin Cutting Millers

Parts are now passed to a special Cincinnati Hydro-Tel automatic milling machine for cutting the 16 fin spaces on the exhaust side. As in the case of all the fin cutting machines, this one was built for the particular purpose and was the result of close cooperation between Wright and Cincinanti designers. As shown in Fig 13, it consists essentially of two vertical spindles each carrying a single cutter and operating at 4500 ft. per min., and three rotary tables. One of these carries four identical sets of cams, each of which consists of a series of plates whose contours correspond to the varying profile at the base of each individual fin space. The other two tables are work tables holding four cylinder heads, one on each of four vertical work faces. The in and out movement of the cutters is controlled hydraulically through a follower wheel held in contact with one of the cam plates.

A variable speed feed cam controls the speed of rotation of the parts past the cutters. For the first ¼ in. of cut the feed is at the rate of 15 in. a min., increasing constantly to a maximum of 70 in. at the end of cut of the first head. A rapid traverse of 270 in. a minute then brings the second head into cutting position, whereupon the feed is slowed again to 15 in. After the fourth head has been cut, the rapid traverse is slowed somewhat to allow time for the cam follower to index vertically to the second step of the cam.

A similar machine cuts the five fin spaces on the intake side of the head, after which another similar machine cuts the 38 spaces on the top of the head. This is the unit pictured in Figs. 14 and 15.

Following these operations the parts are washed and inspected 100 per cent, then forwarded to a second Greenlee transfer machine. This comprises a total of 124 stations, divided into three sections, and is similar to the machine used earlier. It performs all the semi-finish and finish milling operations, drills, reams, countersinks and taps all holes, counterbores the valve spring seats, finish reams the valve guide holes, and forms and taps the valve seat counterbores, using carbide tipped taps.

A special Snyder milling machine is employed for forming counterbores and blending radii in the inside of both bosses in each rocker box. The double ended cutters carry a groove around their periphery to act as a journal, and are supported in bronze brackets. After the head has been located and clasped these brackets advance into position between the bosses, and the driving arbors are advanced manually through the rocker shaft holes to engage the cutters. From there on, the cycle is automatic, the cutters feeding to the right to form one counterbore, then to the left to form the other, and finally returning to the center to permit disengaging of the arbors and withdrawal of the support brackets.

The head is now loaded into a Hall Planetary miller equipped with a special lead screw lock. On this machine a recess is cut at the end of the thread diameter and at the junction of the pilot diameter with the dome on the inside of the head. A second machine then rough and finish mills the special modified buttress thread and the pilot diameter simultaneously, using a combination cutter to assure perfect concentricity.

The final operation consists of turning and facing the flange on a Bullard Mult-Au-Matic, the part being held on a special adapter locating on the buttress thread.

With the exception of the fin cutting operations and the machining of the rocker boxes and valve ports, the operations performed are similar to those required on the original cast head, although automatic equipment is employed to a far greater extent than was ever done before. Actual machining time is considerably longer than on the cast head, but this is more than offset by the tremendous savings occasioned by the elimination of the lengthy and tedious foundry operations.

FIG. 14—Milling the fins on the curved upper surface of two Cyclone cylinder heads by means of a special Cincinnati Hydro-Tel milling machine holding eight heads altogether on two rotary indexing fixtures. The table at the right carries four sets of cam plates.

Future of Magnesium

. . . The experience in the use of magnesium that industry is now gaining should give direction to research and subsequent development of new and improved alloys. In this paper which was presented before the Philadelphia Chapter of the American Foundrymen's Association, the author evaluates the properties of magnesium for sand, die and centrifugal casting and suggests what improvements may be forthcoming.

MAGNESIUM has had a potent shot in the arm, because due to war exigencies industry has been forced to use magnesium in such vast quantities and for such a variety of purposes. A splendid background of practical experience in handling the material and of performance under all kinds of service has been created, which otherwise would have taken many years of slow tryouts and watchful waiting on the part of the engineers. Magnesium metallurgists and technologists have a clearer vision of where specific research and development are most needed to build up their fences.

Production of magnesium is now about 600,000,000 lb. a year, where in 1939 it was about 10,000,000 lb. for all purposes. Production of magnesium now exceeds consumption so that a good deal of it goes into a stockpile. Undoubtedly, however, after the war some of the producing plants will go out, since their production costs, at least as it appears at present, will not be competitive with other producing processes for magnesium.

It should be noted that at present about 25 per cent of the total magnesium production goes into aircraft; the other 75 per cent probably largely into incendiary bombs, etc. It may be assumed that after the war practically all of the bomb business and a large part of the aircraft consumption will have to be taken by new commercial applications, which will have to be worked up gradually.

The established advantages of magnesium are:

(1) Light weight. Magnesium weighs 0.065 lb. per cu. in. compared with aluminum 0.1 lb.; cast iron 0.260; steel 0.285; brass 0.307 and copper 0.322.
(2) Excellent machinability.
(3) Excellent damping characteristics (reduces amplitude of transmitted vibrations). It is better than aluminum, and useful for radio and communication work.
(4) High fatigue strength.
(5) Non-sparking.
(6) Non-magnetic.

Definite disadvantages of magnesium are:

(1) Modulus of elasticity is 6.5 million lb., against 10 million for aluminum and about 28 million for steel. Where stiffness against deflection is needed, magnesium must be about 17 per cent thicker in sections or must be stiffened by ribs or other means. Low modulus when coupled with relatively high elastic limit, as in magnesium alloys, is sometimes a distinct advantage as to resilience.
(2) Thermal expansion of magnesium, 0.000016 in. per deg. F., is greater than that of aluminum, 0.000013 in.; steel, 0.0000066 in., and cast iron, 0.000006 in.
(3) Commercial magnesium products have pretty good corrosion resistance to ordinary atmospheric influences, unless submerged or kept wet in sea water, or exposed to tropical, humid climates. Magnesium alloy castings exposed for several years near the seacoast of Point Judith without special surface protection, have not shown any noticeable decrease in strength or surface deterioration. There is considerable variation in different compositions. New developments have brought out compositions in which the most injurious elements, nickel and iron, are kept to low limits. In commercial purity alloys, the loss when tested by alternate immersions in seawater, varies from 5 to 100 mg. per sq. cm. a day, showing the great variations in the compositions. The high purity alloys lose 0.15 mg. per sq. cm. per day, $\pm$ 0.05, which is considerably better and more uniform. However, in the same test, copper loses about 0.12 mg. which considering the weight ratio means that the depth of corrosion of high purity magnesium is still about six times that of commercial copper. The loss for tin bronzes is only half that of commercial copper.

From a corrosion standpoint, even the high purity magnesium alloys should not be used where it is immersed or constantly wetted by salt water, or where exposed to humid, tropical climates. Protective coatings are a help, but only effective as long as they are not broken.

(4) While subnormal temperature has no marked effect on the physical properties of magnesium, a temperature above normal reduces the properties more than is the case with aluminum. Magnesium should not be used where exposed to temperature above 300 deg. F. for any great length of time.
(5) Magnesium is particularly susceptible to the effect of concentrated stresses as caused by notches, sharp corners, etc. In designing magnesium alloy parts, it is highly important to avoid points of concentrated stress by distributing loads and pressures over larger areas, rounding off all corners, liberal filleting, and very gradual change of section.

There are certain other properties which are not exactly disadvantages or advantages such as magnesium, being a softer material than aluminum, is apt to show somewhat lower creep value, but due to the rapid work hardening of magnesium, the initial primary creep period is finished within two days, after which the secondary creep starts with a straight gradual increase. Creeploads within the elastic limit impose elongation usually within the permissible limits of the design.

The shock resistance of magnesium alloy parts is somewhat less than that of aluminum for shocks by external forces, such as hammer blows, projectiles, etc., but better than aluminum due to lower weight for shocks due to dropping magnesium alloy parts.

Casting Characteristics

Magnesium alloy castings are subject to two primary considerations:

(1) The low thermal capacity on volume basis (specific heat) makes possible rapid and economical melting, but it also makes for rapid cooling in the mold so that in sand as well as in metal molds it is important to get the metal into the mold and to fill the mold completely as quickly as possible. Furthermore, the low specific gravity of magnesium means that molten magnesium does not differ greatly in weight from non-metallic inclusions and that the pressure of the pouring head is relatively low.
(2) Some type of inhibitor must be present in green as well as dry sand to prevent reaction between moisture

Castings . . .

Schenectady, N. Y.

and molten magnesium, also to produce a non-oxidizing atmosphere within the mold cavity. This means a synthetic sand should be used.

These two points are disadvantageous in that they add somewhat to the cost and make manufacture more difficult. There are, however, some compensating features.

Magnesium alloy castings differ from castings of most metals in that there are definite and positive means of controlling the grain size (by superheating) so that the coarse structure often encountered in heavy sections, for instance in aluminum, is largely eliminated. For this reason the properties of test specimens cut from magnesium alloy castings approach more closely those of separately cast test bars.

Although there is some difference in grain size between heavy and light sections in magnesium alloy castings, the difference is not nearly so marked as that encountered for instance in aluminum and other metals. In fact the presence of micro-shrinkage (intergranular shrinkage cavities) is about the only marked reason for a difference in properties between specimens cut from a casting and separately cast test bars. Even in castings which contain the normal amount of micro-shrinkage, it will generally be found that the average of test bars cut from a casting will be about 80 to 85 per cent of separately cast bars. On other material such as aluminum the ratio is considerably lower.

Micro-porosity unfortunately is hard to avoid in magnesium alloys. It will vary with the alloy, those compositions high in aluminum are less subject to it than those lower in aluminum. Micro-porosity cannot easily be detected by X-rays, due to the low density of magnesium and the lessened contrast between metal and voids. On the other hand, micro-porosity becomes structurally dangerous only when it is visible to the naked eye. Fractures of sample castings will give a reliable indication. Micro-porosity can be controlled to some extent by gating and chilling. Magnesium alloy sand castings are not so susceptible to so-called pinhole porosity as for instance aluminum.

Magnesium alloy castings when heat treated do not air-age into the final condition with higher tensile and lower elongation as rapidly as do aluminum alloy compositions. With aluminum it takes about three months to reach the final conditions with simple air aging, whereas with magnesium alloys it takes years, so that in many cases the magnesium alloy castings can be used in the solution treated condition (heat treated but not aged) with the much higher elongation, greater shock resistance and greater deformability without fear of losing these properties after a short time. When subjected to elevated temperature, the air aging of magnesium alloys progresses more rapidly, so that under such conditions fully aged castings should be used.

In general an average figure for the yield of magnesium alloy sand castings compared with aluminum, primarily due to the effect of low thermal capacity, requiring more and larger gates and risers, is 2¾ lb. poured to each lb. of good castings in aluminum (for the most commonly used alloy with 4 per cent copper, and 5 lb. poured to each lb. of good castings for magnesium). Of course, these figures vary quite a good deal for different jobs. In spite of this, another comparison can be made by taking the average cost per lb. of good aircraft castings which, at least in the G. E. foundry, is about $2.55 for magnesium alloy (heat treated) against $1.75 for aluminum (heat treated), which indicates that considering the weight ratio of 2 to 3, the cost of magnesium alloy sand castings is not far from aluminum. These figures may vary somewhat, but the differential for magnesium castings is surprisingly low. There is a good chance that the cost of magnesium alloy castings may still come down farther as practices in foundry and new metallurgical developments are perfected.

Due to the rapid work hardening and the low modulus of elasticity of magnesium alloys, magnesium alloy castings which require considerable machining may need more care in machining than aluminum or other materials to prevent deflections and distortions. Careful supporting and in many cases strain relief after rough machining and straightening may be necessary. Strain relief is usually carried out at about 400 to 500 deg. F. for 3 to 6 hr. depending on the casting.

At this point, some statistical data about the tremendous increase in magnesium alloy sand castings (and in comparison of aluminum alloy sand castings) may be of interest.

Sand Castings

	Magnesium, Lb.	Aluminum, Lb.
1939	1,321,080†	.....
1941	1,753,000	.....
1942	32,763,000	207,488,000
1943*	26,337,000	142,446,000

*First six months.
†Includes permanent mold castings.

The physical properties of magnesium alloy sand castings for the two most common alloys are shown in the table below.

By comparison, the physical properties of the most common aluminum base casting alloy with 4 per cent copper are:

Heat treated but not aged = 29,000 tensile, 6 per cent elongation.

Heat treated and aged = 32,000 tensile, 20,000 yield strength, 3 per cent elongation (all minima).

There is a steadily increasing use of permanent mold magnesium alloy castings, which require less machining, a particularly favorable factor where production is not high enough to justify the expensive dies of die castings but high enough to permit the cost of permanent molds to obtain castings. From about 20,000 lb. a month in the latter part of 1941, permanent mold magnesium castings increased to about 300,000 a month, exclusive of bombs, during the first part of 1943. Magnesium alloy perma-

Physical Properties of Magnesium, Alloy Sand Casting

	Min. Tensile Strength	Min. Yield Strength	Min. Elongation, Per Cent
Al 6 per cent, Zn 3 per cent, heat treated and aged	32,000	10,000	7
Al 6 per cent, Zn 3 per cent, heat treated but not aged	34,000	16,000	3
Al 9 per cent, Zn 2 per cent, heat treated and aged	32,000	10,000	6
Al 9 per cent, Zn 2 per cent, heat treated but not aged	34,000	18,000	1

nent mold castings can be heat treated and also superheated for grain refinement like sand castings.

Magnesium alloy ingots of "A" purity cost now about 20 to 21c. a lb., aluminum alloy ingots about 15c. Considering the weight ratio, the prices of aluminum and magnesium alloy ingots are kept pretty much balanced.

A great deal of talk has been going on about postwar prices. Of course, it is not known exactly what is going to happen but there seems to be a general feeling among metal producers, that after the war, the price of primary aluminum ingot will be around 10c. a lb., secondary aluminum around 6c., primary magnesium about 15c. and secondary magnesium around 10 or 11c. This adheres pretty closely to the weight ratio.

If these figures are correct, and it should be reemphasized that so far they are only guesses, following again the weight ratio and competing with primary magnesium, brass ingot would have to sell for about 3c. a lb., and cast iron about 4c. Competing against secondary aluminum which is being used in ever increasing quantities in the foundry, brass ingot would have to sell for about 2c. and cast iron for about 2.3c. and magnesium for about 9 cents. Of course the metal cost is not the only factor determining the cost of the casting.

Increased Use of Die Casting

Pressure die castings of magnesium alloy are finding many applications due to the fact that many jobs in war time are used in such quantities that in spite of the high die cost, die castings become commercially feasible. Furthermore, pressure die castings offer the shortest and most direct route from the raw material to the finished product with the greatest saving of strategic material, man-hours and machine hours in casting and machine shops. Magnesium alloy pressure die castings do not lend themselves to heat treatment and cannot easily be superheated, like sand or permanent mold castings, but some improvement in physical properties is obtained from the rapid chilling of the metal die bringing them to about the same figure as for fully treated and aged sand castings. Magnesium alloy pressure die castings have increased from about 60,000 lb. per month in the last few months of 1941 to about 250,000 lb. per month in 1943.

It may be assumed that after the war, when production quantities will be materially reduced, the use of magnesium alloy die castings will decrease, temporarily at least, unless die costs can be greatly lowered. There will, however, be many new applications for commercial products such as portable sewing machines, typewriters, business machines, portable tools, vacuum cleaners, floor polishers, radios, transportation (automotive, railroad, transport planes, etc.) reciprocating machinery, rotating apparatus and many others. The same die casting machines may be used for aluminum and magnesium, also generally the same dies with possibly some changes in gating.

o o o

BENCH molding department of the American Magnesium Corp.'s Buffalo foundry.

Centrifugal Castings

Magnesium and aluminum are not very well adapted to centrifugal castings. One of the greatest advantages of iron and brass centrifugal castings is the so-called self-cleaning action which due to the centrifugal force throws the heavier base metals toward the periphery and holds the oxides and non-metallic inclusions in the center section which is usually machined out. The remaining metal section is thus clean of the non-desirable elements.

In magnesium and aluminum, the oxides are heavier than the base metals and therefore the non-desirable elements are thrown towards the outside periphery so that the most valuable part of the casting where the structure is most attractive due to the high centrifugal force, must be machined off.

New developments in magnesium may bring forth new alloy compositions to shorten the solidification range, so as to reduce danger of micro-porosity and to yield high physical properties without high tem-

perature heat treatment. Improved corrosion resistance of magnesium alloys, especially against salt water and tropical humidity may also be expected as well as improved protective coatings. Improved die casting techniques and alloy compositions for pressure die castings so as to make possible high temperature heat treatment with corresponding properties (improved structure and density) may be other future developments. Additional improvements may include fluxes which are less destructive to steel work in magnesium plants and an adaptation of magnesium alloys to the plaster of paris process as now used for brass and for aluminum.

Tightening up on precautions and handling routines in castings and machine shops to eliminate the absolutely unnecessary fires and explosions which prejudice users against magnesium are other improvements to look forward to. Also, bearing and sliding wear properties of magnesium alloys should be established.

Simple Method for Etching Metals

AN English process, on which a patent is pending, provides a cheap and simple method of etching on the surface of metals. The method is rapid and simple to operate and gives pleasing results, particularly on hard or stainless alloys such as high speed steel, stainless steel, stellite, etc. It can be applied to brass, nickel, indeed to any metal.

It enables a number of small articles to be etched in the same time as taken for one article. It has no limitations in the complexity of the design which can be transferred, provided only that a stencil can be cut. Awkward shapes lend themselves particularly to etching by this method. No tools are required and, beyond the cost of the stencils and etching solutions, the running costs are negligible.

The process is electrolytic and makes use of a standard waxed paper stencil, such as is used on a duplicating machine, on which is typed or printed the required words or designs. This is placed between the metal article, which forms the anode, and an absorbent pad containing the etching fluid, which is connected to the cathode of a 15-volt d.c. circuit. All the equipment and the etching fluid are obtainable from Griffin & Tatlack Ltd., Kemble Street, Kingsway, London, W.C.2.

An illustration of the main features of the apparatus is shown in Fig. 1. It consists of a unit comprising transformer, rectifier and output controller, which gives a potential of 15 volts d.c. from the 200/300 volts a.c. supply. The illustration also shows the blocks used as anode and cathode for the etching. B is a graphite base plate connected to the negative terminal of the d.c. supply. On the surface of this block rests a pad C, which may be a few layers of ordinary blotting paper. This pad is damped with the etching fluid and the typewritten, or hand drawn, or otherwise imprinted stencil D is then placed face downward upon it. The metal object F which must have a flat, but not necessarily polished, surface is then placed face downward upon the stencil. Electrical contact and pressure is provided by placing on top of the metal the weighted graphite block A which is connected to the positive terminal of the d.c. supply.

The current is then turned on for a period varying from 5 sec. for a small design to 10 sec. for a larger one, or even 30 sec. where, say, 20 metal objects are being etched at once. The current varies from 2 amp. up to approximately 10 amp. for a large number of articles. It is important in the latter case that sufficient mechanical pressure is maintained to ensure good contact with each specimen.

In placing a specimen upon the stencil no part of it should touch the bare pad, otherwise it will become etched. It is not necessary for the surface of the metal article to be free from grease before engraving since greasy surfaces etch quite well. When etching stainless or corrosion resisting metals, each cut in the stencil is good for at least 15 etchings, the life being limited by the tendency of the stencil to become burned, and the etching to become blurred. The life of the stencil is reduced to about 10 engravings with less corrosion resisting metal such as mild steel, as the dielectric properties then become impaired.

The normal depth of the engraving is about 0.0005 in. and an important feature of the process is that in no way is the structure of the adjacent metal altered, nor is the surface of the metal embossed, but remains perfectly flat. The etching appears as a silvery color on mild steel and is more brilliant on stainless metals. It can be filled afterwards, if desired.

Round or curved articles can be rolled over the stencil while in contact with the top block, or alternatively, awkwardly shaped or large articles can be etched by fitting the waxed stencil to the curved face of a hand blotting pad and making the necessary electrical connections to the metal body of the hand blotter and the article.

The method is particularly useful for marking toolroom products, such as small tools, tool bits, form tools, name plates, etc., as the etching can be carried out after the work has been completed. The operating cost is very small, as a large number of markings can be typed on one stencil.

Welding Organization and

By C. W. JOHNSTON
Assistant Superintendent of Welding, California Shipbuilding Corp., Los Angeles

o o o

IN the intervening months since Dec. 7, 1941, problems of industrial management peculiar to the times and to all production programs have arisen and been met by industry in such a manner as to materially contribute to future welding organizational and welding production practices.

To a certain extent, in pre-Pearl Harbor days our personnel problem had been solved by the War Production Training Program of the United States Department of Education, through the institution of short term (200 hr.) vocational training as a substitute for a long and extended trade apprenticeship training for skilled workers. In common with other new shipbuilders, the California Shipbuilding Corp was almost solely concerned with the acquisition of material for the complete utilization of those pre-employment trained workers. It was not until our production of ships was fully under way did we understand or have a clear conception of the importance of welding organization and training made necessary by welded ship construction.

It had originally been planned to draw on the worker output of the War Production Training Schools for the welders required and to use the facilities available in our own personnel training department for the further training of employees in blue print reading, shipfitting, layout, etc. Then with the gradual entrance of the yard into a shipbuilding program there would be the absorption of newly trained welders from the outside schools in such a manner as to fully adapt them to working conditions. At the same time there was to be the gradual building of a welding organization through the development of supervisory personnel from the more promising workmen.

But with the entrance of this country into actual participation in warfare all production schedules were stepped up, making it necessary for Calship to increase its welding personnel to between 6000 to 7000 employees. This figure represents more welders than had been actively employed at any one time in the entire area west of the Mississippi River on any previous occasion. This increase in welder requirements, plus the erection of additional shipyards in this area, created such a drain on the War Production Schools that they were unable to fill the local demand. Furthermore, the increased production schedules made it impossible to allow for an adaption period between time of employment and effective placement on production welding.

So we found ourselves precipitated into an organizational and personnel problem to which too little thought had been given, namely the immediate organization and placement on the job of a volume of welders who as a result of their schooling and booth training were able to pass the tests qualifying them as shipyard welders, but who had no previous experience in welding, nor were accustomed to the adverse welding conditions of emergency work.

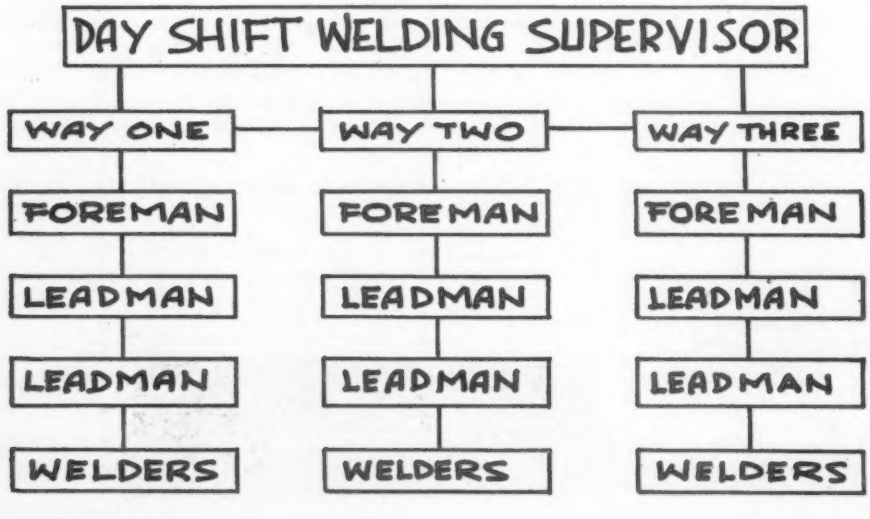
Survey Made

The first phase of a welding department training program was started among the welding foremen and leadmen by Ted Warne of personnel training and consisted of a complete Job Instructor Training course to acquaint the welding supervision with the qualifications and basic practices of an instructor. At the same time the hull and yard department, under the management of J. S. (Jumpy) Sides, began a survey of welding conditions and training requirements on the shipways. This survey produced the following conclusions:

1. *Insufficient Supervision:* A proportional increase in welding foremen and leadmen had taken the majority of qualified and experienced welders from productive to directive positions. The available supervision had an ample background of welding experience, but were taxed to capacity with supervisory duties and had no time for the actual welding instruction of men under them.

2. *Conflicting Supervision:* The organizational arrangement (see Fig. 1) was such that it contributed to considerable confusion through the confliction and overlapping supervision of the various shifts. Each shift had a welding supervisor whose authority extended over three shipways. As a result three entirely different welding practices were being used on one shipway during the course of all three shifts and led to considerable lost time through re-assignment of welders each shift and the inability of any one supervisor to accurately arrange

FIG. 1—The original organizational setup was such that considerable confusion and overlapping of supervision resulted. Each shift had a welding supervisor whose authority extended over three shipways but there was no real coordination between the three shifts.



Training

. . . When the war skyrocketed welded ship construction on the West Coast, a dual problem was created: Setting up an efficient welding organization and training welders, the latter phase being aggravated by the fact that all the skilled men were immediately made supervisors. What changes were made in both organization and training to meet this emergency and to make competent welders out of men who had picked up faulty habits in outside welding schools are related by the author.

the working continuity of three separate shipways.

3. *Production Losses:* Tangible reasons for production losses such as time lost due to power failure, machine movement, etc., were easily accounted for. But the greatest production loss was created by the chipping and rewelding necessary to repair faulty work of inexperienced welders. The tempo of construction was so fast and the number of men involved in one operation was so great that no accurate repair order and accompanying check of lost time could be made. However, a fairly accurate survey showed that as much as 40 per cent of welding footage was being lost through repair work.

Of approximately 5000 welders employed at that time, only about one in every hundred had any prior experience and the rest had acquired faulty welding habits in the course of their booth training. It was evident that these faulty welding habits were the main contributing factors to this unnecessary loss of production footage.

That portion of the survey covering training requirements disclosed that the faulty welding habits were:

1. Improper arc length
2. Improper rod manipulation
3. Improper rod angles
4. Faulty machine adjustment
5. Improper speed of travel.

These habits were a result of the faulty training practices of instructors who had not been guided by a curriculum of weld training, nor had the instructor qualifications necessary to the transmission of their skill to the trainee.

Bad Habits Taught

Typical of this training were the conditions relative to the growth of the habit of improper rod manipulation. It was found that in the "fly-by-night" trade schools the instructors were either devising their own individual training programs or were presenting programs formulated and supervised by men whose educational backgrounds were unquestionable, but whose welding experience and background were rather vague. The success of each program was dependent upon the trainee's ability to pass test plates qualifying him for ship welding, so his booth practice was entirely upon short lengths of plate similar to the tests to be taken. The resulting accumulation of heat in the short practice plates led to over-manipulation as a substitute for lowering the heat adjustment of the machine. Consequently the trainees had this manipulation firmly established as part of his practices by the time he became employable. In fact quite a number of men were found who had received their welding instruction from the same instructor; each of these men had a forward and backward, dabbing and move-away rod movement of at least 6 in. on vertical and overhead welds. Continual practice in applying a bead in this manner had led to every one of them being able to deposit a surface bead so fine in appearance that the superficiality was disclosed only by subsequent checking.

During the course of the training survey several hundred newly trained welders were closely questioned as to the training practices used by the various instructors. This was done in order to segregate good and bad training practices before too much time and expense were expended upon a training program and to assure definite rather than haphazard results.

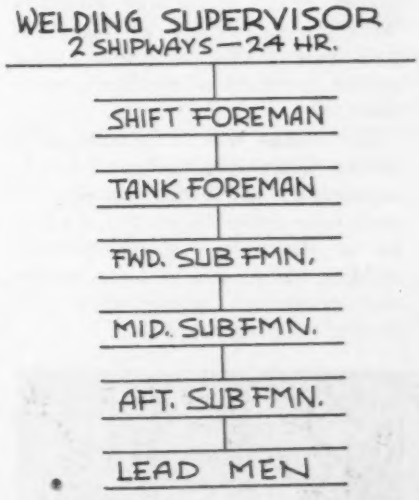


FIG. 3—The third phase of organizational changes. Welding supervisors were confined to two shipways and each shift welding foreman was given three subforemen for separate sections of the hull. By this time the use of special on-job instructors was dropped.

FIG. 2—To a great extent the addition of roving instructors to the supervisory force relieved the foreman of instructional work and gave tangible results in reduction of repair welding. This was an intermediate phase of the organizational changes (See Figs. 3 and 4).

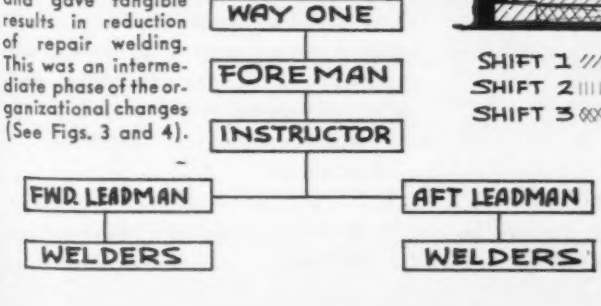

FIG. 4—Shift assignment of foremen to areas shown are for pickup and final completion only. Production is worked progressively throughout. There is a similar shift assignment of tanks (dark areas).

Where the instructor had an ample background of practical experience, it was found that he had imparted a certain amount of skill to his students. However, a more or less self-education in welding and a self-conceived knowledge of the science of welding by the instructor contributed to a misinterpretation of the technique of welding and on the part of the student to an exaggeration of the instructor's manual practices.

Variety of Presentations

Where a number of skilled welders had been gathered together into an instructional group and were teaching essentially the same practices, it was found that the lack of a curriculum of training for welding instructors and an accompanying standard weld training procedure led to a variety of presentations of the same subject by the various instructors and also contributed to a misinterpretation and misapplication of manual procedures.

As a result of this training survey the following training requirements were established:

1. One welding instructor was to be placed on each shipway. His duties would in no way interfere with the supervision of the work and were to be performed under actual production welding conditions.

His status was to be that of a roving instructor; his instruction to supplement the booth training of each new welder in such a manner as to eliminate any questionable welding habits and to acquaint the new production welder with productive welding practices.

FIG. 9—Tackers are periodically sent to training booths for special instructions and practice away from job noises.

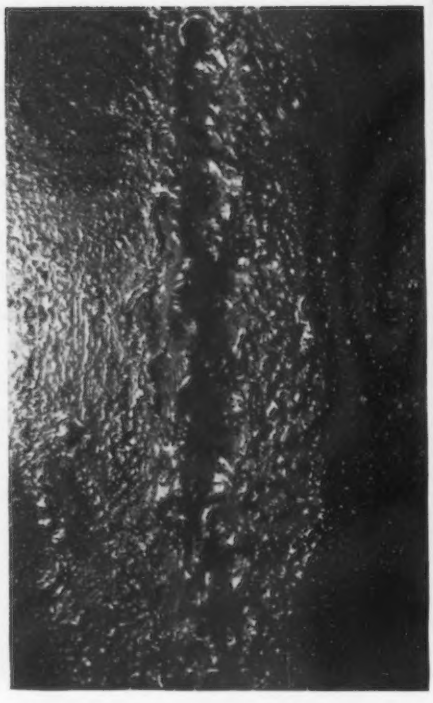

FIG. 5—"Private" welding schools mushroomed overnight in shipyard localities. This test plate represents the result of 200 hr. of poorly supervised training.

FIG. 6—An additional 32 hr. of supervised training and the trainee shows evidence of developing a certain amount of skill.

2. In lieu of a curriculum for instructors, each man employed as an instructor was selected from a list of recommended and reputable production men whose background showed a minimum of 12 years experience. Their assignments were to be made in such a manner as to allow no duplicate or overlapping instruction.

3. Each trainee was to progressively advance through the following steps:

1. Tacking
2. Flat production welding
3. Vertical production welding
4. Overhead production welding
5. Horizontal production welding.

Each progressive step was to be followed up by the instructor and the trainee specialized until he had mastered that position.

The addition of instructors to the supervisory force altered our organizational chart from that shown in Fig. 1 to that of Fig. 2 and to a great extent relieved the instructional burden of the welding foremen and left them free to organize, plan and supervise their work. As a result an increase in the skill and producing ability of our welders was evidenced by an immediate decrease in repair welding (present loss is approximately 1 per cent).

42 Instructors At Peak

At the peak period of our on-the-job training program there were 42 welding instructors employed on the shipways alone. These instructors represented the highest degree of welding skill obtainable. Through an analysis of their individual welding and training practices it was possible to standardize on the actual manual practices of a skilled welder. The research necessary to develop even a semi-standardization of manual practices was quite extensive. Briefly it was found that:

Of the instructional group under observation one-fourth were exceptionally skilled welders, and the results obtained from their instruction was much more satisfactory than was the work of the others.

The individual welding practices of this most successful group were identically the same, although they came from various fields of welding application such as pipe shops, plate shops, boiler and tank work, and pipeline construction jobs.

Even though their backgrounds were entirely different, the identical skill and practices of each were derived from a common source. This common source proved to be mutual experience in the various phases and cycles of welding progress such as:

1. Acetylene welding—forehand technique
2. Electric welding—bare electrode
3. Acetylene welding—backhand technique

FIG. 7—The trainee successfully passed his flat plate test after 54 hr. of training and was started on vertical practice. This is his first attempt at positional welding. At this stage the trainee either develops rapidly or evidences inability to master positional welding.

FIG. 8—Upon completion of 48 hr. of vertical training the trainee was able to pass his vertical plate test. He was immediately assigned to production work under close supervision. After 144 hr. of combined work and training he was able to make the above plate. Summarized, the total training time was:

200 hr. "private" training
54 hr. supervised flat welding training
48 hr. supervised vertical welding training
144 hr. flat and vertical production welding
446 hr. total

o o o

4. Electric welding—coated electrode.

From these four stages of welding practice they had each developed certain techniques and practices which, when combined, tended toward a definite and standard coated electrode welding technique.

Hence the conclusion was reached that it was entirely possible to present a welding instructional course based on the mechanics of a standard technique in much the same manner as is training done in the entirely mechanical skills.

With this in mind a welding instruction program is being developed which includes a standard presentation and explanation of the following:

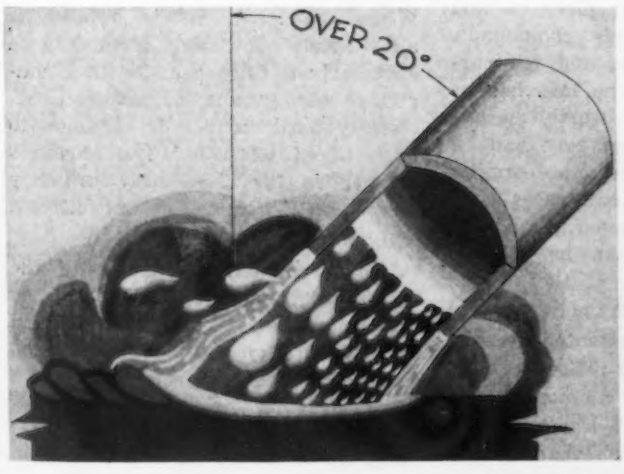
1. *Arc length*
   Action and visible characteristics.
2. *Arc stream*
   Action and visible characteristics.
3. *Metallic upset*
   (a) Crater depth
   (b) Extent of fusion
   (c) Effect of arc on base metal.
4. *Heat cycles*
   (a) Fluid areas
   (b) Solidifying areas
   (c) Chilling areas
5. *Electrode coating*
   Flux flow and appearance
6. *Electrode manipulation*
   (a) Flat
   (b) Vertical
   (c) Overhead
   (d) Horizontal.

The program itself is based on the following equation:

CORRECT CURRENT SETTING *plus* NORMAL ARC LENGTH *plus* REGULATED MANIPULATION *plus* NORMAL RATE OF TRAVEL *plus* POST HEAT TREATMENT *equals* A WELD OF UNIFORM QUALITY AND APPEARANCE.

It is hoped that this is a step to-

(CONTINUED ON PAGE 134)



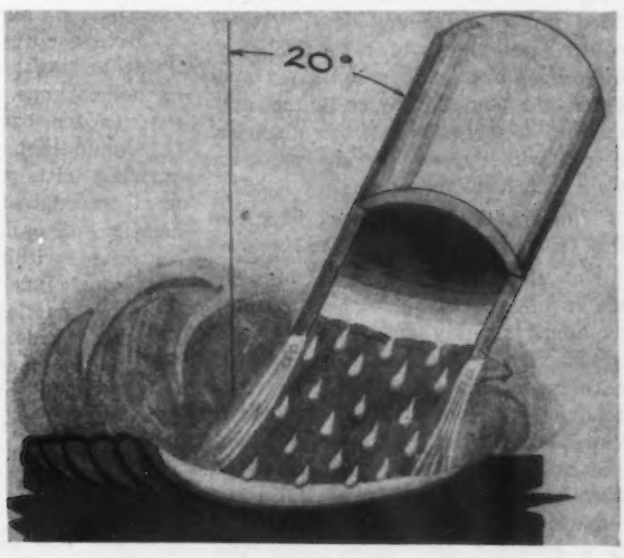


Fig. 10—Types of diagrams developed for use in a standard explanation of arc stream action.

(Left): With excess angularity of rod and improper machine settings:
1—There is an excessive spatter loss.
2—The globules are larger and more irregular in shape.
3—The burnoff of coating is irregular and can be seen leaving the electrode in larger particles.
4—The puddle is more fluid because of the added resistance heat and will be correspondingly harder to control.
5—The crater will be somewhat shallower due to the lessening of arc blast pressure.
6—The arc stream will be wavery and accompanied by irregular explosive sounds.

(Right) When the rod is held at the proper angle and machine settings are correct:
1—There is an even regulated flow of small sized globules.
2—The burnoff of flux, or coating, is also even and regular, i.e., the coating seems to be melting and dissolving into the arc stream in small particles and the burnoff rate is evenly distributed around the electrode.
3—Spatter loss is slight and is confined to minute bits, popping sparklike out of the arc stream.
4—There is a sputtering, hissing sound with a staccato crackling of the arc.

. . . Modern Heat Treating

By A. S. EVES
Chief Field Engineer, Perfection Tool & Metal Heat Treating Co., Chicago

° ° °

THE waging of war is largely a contest between the tools and toolmakers of the countries involved. No one can say that the mechanics of this country are not doing a superior job; the successes of our boys overseas speak for themselves. But there is a way in which those who design and produce machines and parts can achieve still more success and that is by keeping informed as to new and better methods and equipment for heat treating.

Long ago when the men who made tools did their own hardening, there were broadly speaking just two classes of steel: First, low carbon steel which must be cyanided or carburized, and second those steels which contain high enough carbon to permit straight heat treating. The equipment for both of these was simple and low in cost.

Today, however, all this has become far more complex. There are thousands of steels, hundreds of treatments, and many special furnaces and other expensive equipment designed to treat each job in the one best way. Regardless of how carefully steel may be alloyed and refined in the furnace and forged, rolled and annealed at the mill, or how much thought, time, money and pains are poured into designing and making a tool or part, the ultimate result will depend largely on how well it is heat treated.

What good, for example, is a die that is improperly hardened?

Now there are lots of good hardeners in manufacturing plants. But let us admit frankly and honestly, two things. First that no such man, regardless of his skill, can produce a good job with poor tools; and second, that he cannot take advantage of new and better heat-treating methods if they are not known or available to him. Most tools now are heat treated in a different department from the one in which they are made, or are sent outside to a professional heat treating plant. A gap exists between the producer and the heat treater. When handing over a job, it is always good practice for the former to tell the latter all details as to the kind of steel each tool is made of, and the use to which each will ultimately be put.

On the other hand, how many producers are actually well enough informed in this age to be safe in taking it upon themselves also to tell the heat treater *how* that work shall be done? The greater the variety of steels added to an already imposing list and the more progress made along the lines of better treatments, the greater danger that something worthwhile may be overlooked.

I know no better way to make this clear than to sketch some changes which have taken place in recent years, and mention some new treatments which are available:

Case Hardening: Not just one, but quite a number of different baths are now found in a modern hardening plant. Instead of being limited to about 0.003 in. case, we can increase both the hardness and the depth by choosing the particular salts best fitted to each job.

Carburizing: The old bone-dust method is gone. In its place we find (a) modern carburizing compounds, (b) liquid carburizing, and (c) carburizing with gas. The last has at least one advantage worth special mention. The depth of case can be controlled within very close limits. Also, parts such as ball races that often are partially copper plated for selective hardening can be treated with far less chance of the copper spreading and spoiling the job.

Chapmanizing: A patented process for producing a wear-resistant case on mild steels with ammonia gas. Claims are somewhat higher hardness and less distortion than occurs with conventional case hardening compounds.

Nitriding: An extended ammonia gas process for case hardening special nitralloy steels to moderate depths. Object: To avoid warping and achieve somewhat more than usual surface hardness.

Liquid Nitriding: A reliable manufacturer of case-hardening salts now is marketing a compound for liquid nitriding. The claim is made that it is 300 per cent faster than the dry ammonia gas process, yet the results are equivalent.

Aerocasing: Special salt bath treatment for casing lightly mild steels without danger of surface decarburization or scale.

Ihrigizing: This is an impregnation process, similar to carburizing, using amorphous silicon carbides, for case hardening low carbon steels. The resultant surface will resist nonviolent corrosion. A solid round so treated can be laid in acid, and when all of the untreated portion has been eaten away, a perfect cylinder remains—composed of the case only.

Although the surface hardness reads only about 50 Rockwell C, it has a peculiar "soapy" feel, which aids materially in reducing friction and prolonging wear life. Malleable chain links under arduous service, for example, wear at least 25 times longer when so treated.

Scottsonizing: Still another kind of case hardening which materially increases the life of wearing parts made from stainless steels (completely finished). Such parts remain non-magnetic and non-corrosive. When the treatment is applied to alloy steels containing from 0.35 to 0.50 carbon, fully heat treated, machined and ground to size, an extremely hard surface is obtained to a depth of 0.005 in. The hardness claimed is far above any ordinary treatment. There is no size change.

Hy-Speed Case: With this process, cutting tools made from any of the various high speed steels—after they are completely heat treated and finished—are immersed in special salts and held at 1050 deg. F. (a mere drawing temperature). The hardness is not altered, but the tool takes on 0.001 or 0.002 in. of very hard skin without appreciable growth, which often improves the cutting edge. Tools can be re-ground if done in a manner which would leave the case on the cutting edge. Otherwise, they must be retreated after each sharpening. This treatment is sometimes termed Nitriding.

Takes a Lot of Know-How

. . . There are so many processes for hardening tools and machine components that a heat treater must be well posted if he is not to overlook the ideal choice for a particular job. In this short article, Mr. Eves summarizes all the tried and untried proprietary and non-proprietary methods of heat treatment that have been introduced in recent years.

o o o

Hard-Cote: A secret method of impregnating high speed tools, similar to Hy-Speed Case, to claimed depths as great as 0.020 in. Not yet widely used.

Carbide Case: A formula has been developed, but is still untried, for putting a cemented carbide case on mild steels. If successful, long tools such as broaches, drills, etc., would be like any other carbide tipped tools, but because of their tough core would be virtually unbreakable.

Nusite Hardening: A unique way of hardening high speed cutting tools. The process results in a hardness throughout the tool of 65 to 67 Rockwell C, which is a couple of points harder than ordinary. Strangely enough, however, instead of sacrificing toughness, this method achieves a molecular cohesion which makes such tools considerably tougher and more resistant to abrasion and shock. Tools so treated will usually stand more top rake and hold a keener edge in "hot" jobs, with fewer grindings necessary. Such tools are fine for tough, stringy jobs but are not recommended for sandy castings.

Selective Hardening: This is too broad a subject to discuss fully here. Suffice it to say that there now are many ways in which tools and mechanical parts can be hardened, leaving one or more portions soft, or vice versa.

Induction Heat Treating: Often accomplishes hardening tasks in a few seconds that would otherwise take hours. Useful for selective hardening of higher carbon steels, where the portions to be treated do not lend themselves to ordinary methods.

Flame Hardening: Heat is applied to one spot at a time for a predetermined period, followed by a stream quench. Gears, for example, can be hardened one tooth at a time. Generally speaking, each job requires a different flame tip.

Martempering: A heat-treating operation, whereby martinsite is produced in alloy steels with a minimum of residual hardening strains.

Austempering: This process holds some promise for the future, although it is not yet widely used. High alloy steels up to about ½ in. section have been raised to file hardness, but did not break when bent at an angle of 45 deg.

"Silver Finish" Hardening: A bright-hardening process which permits steels to be heat treated up to 1900 deg. F., without any discoloration. It avoids oxidization, consequently there is no scaling or discoloration. Burnished pieces retain their sheen. Engraved dies, die casting blocks and inserts, and threaded tools all come out clean, hence the name, Silver Finish. The treatment enables the rescue of many a job that otherwise would be scrapped. Dies or tools can be annealed to permit changes or additions and then be re-hardened without loss of surface or change in appearance.

Quench for Mild Steel: Known as the Nelson process, this is a way of boosting tensile strength of mild steel higher than ever before. When such steel is heated to 1750 deg. F. and water quenched, a tensile strength of about 175,000 lb. per sq. in. can be attained in a bar, say 1 x ¼ in. But if the quenching medium is a solution of potassium hydroxide, the tensile strength is said to be more than 12 per cent higher. The author has not as yet had occasion to test this out in his plant, but it has obvious possibilities.

Deep Freezing: Here the heat treater leaps from the skillet into the refrigerator: Fully heat-treated tools and parts are carried down from room temperature to as much as 120 deg. F. below zero. This low temperature gets rid of retained austenite, frequently improving the quality of tools. It provides a positive means for quick aging and stabilizing such items as gages and has added to the life of high speed steel cutting tools, since it often boosts the hardness several points without increasing brittleness. Deep freezing is a very handy method of shrink-fitting, too.

It should be perfectly plain to the reader that some of these processes call for special equipment and some also need more than one furnace. In this regard, it is not quite so obvious (yet nevertheless it is a fact) that no man can get the same results out of a piece of high speed steel, for example, if he has but a single furnace at hand, that can be achieved in a jobbing heat-treating plant where two furnaces would probably be used for preheating that piece, still another to harden it, and two more for drawing it—all five at different temperatures.

Moreover, for doing quantities of items like small springs, a modern commercial heat treating plant usually has continuous furnaces, with complete uniformity that cannot be achieved by the batch method. The same plant has press quenching machines for holding parts between dies so they cannot distort while cooling, besides special furnaces and devices of other kinds to do certain individual jobs.

The average manufacturer does not, as a rule, have enough work of every kind to justify the purchasing of much special equipment. Often, he has but one or two furnaces and in few instances are they equipped with automatic time and temperature controls; still less often is any machine available for hardness testing.

Regardless of all the skill his hardener may have, lack of information about the newer and better methods and lack of sufficient equipment must reflect themselves in the ultimate performance of his tools and production parts of any manufacturer. For best results we must add to the hardener's ability the best in equipment, modern heat treating practice and the new processes which spring up and prove themselves from year to year.

Mass Production Casting of Bombs

MASS-PRODUCTION of greensand molded 500-lb. bombs, using a maximum of steel scrap and a minimum of ferro-silicon is described in a recent issue of the British Foundry Trade Journal. The unquestionable success of the system was based on a new theory for the operation of the side-blown converter; the synchronization of mold assembly and other jobs with the time taken to pour a predetermined number of castings and a new system of sand cooling.

The theory postulates the quite tenable and now well proved notion that silicon as a constituent of the charge is unnecessary, provided the metal is superheated to a temperature equivalent to that existing in the vessel when the carbon begins to react with the oxygen of the bath. In the case cited, this superheating of the cupola metal is carried out in pulverized fuel fired rotary furnaces. The equally important systems of synchronization in manufacture and sand cooling will be dealt with later.

For the manufacture of these 500-lb. bombs one foundry used 20-ton per hr. cupolas; 12½-ton rotary furnaces; and a battery of 3½-ton capacity side-blown converters. The scrap is unloaded by 7½-ton electric overhead magnet cranes into stock bins or into the cupola charging buckets mounted on bogies running on a narrow gage track. These bogies are propelled by means of a battery-operated locomotive. The skips are of the drop-bottom type, and are lifted from the bogies by a 7½-ton electric overhead cupola charger. The coke and the limestone on arrival are dumped into track hoppers at the wharf, and are then taken by belt conveyors to conveniently situated bunkers. From here, the coke is loaded as required into a scale car, which discharges into specially designed charging buckets of the drop-bottom type.

The cupolas are blown by blast supplied by electrically driven positive displacement blowers, each unit in the battery having a capacity of 18,000 cu. ft. per min., at a maximum pressure of 54-in. water gage. With the object of securing a wide range of speed variation, each blower is provided with a modern type of a.c. commutator. The cupolas are fitted with a tunnel type of anti-glare spark arrester.

The cupolas are not provided with receivers but with a deep well to facilitate carbon pickup from the coke bed. Low-phosphorus material not being essential for this particular production, the iron produced by these cupolas has the following average analysis: C, 2.7 to 2.8 per cent; Si, 0.1 to 0.2; Mn, 0.3 to 0.5; S, 0.12 to 0.15; P, 0.06 to 0.07 per cent.

Using 30 lb. of soda ash per ton, the sulphur is reduced to an average of 0.035 per cent, but can be reduced still further when required. The accompanying silicon loss is small and is not important to the process. The ladles in which this process is effected are firebrick lined. The metal is transferred by one of the 10 overhead cranes to the rotary furnaces, which are fired by pulverized anthracite. In the rotary furnaces the temperature of the metal is raised by 400 deg. F. without change in composition. The technique of lining conservation has been so improved that one furnace had treated no less than 4000 tons and was still in commission. Apart from superheating, these furnaces also act as mixers, and iron out any slight variations in cupola practice. From the rotary plant the metal is transferred to the side-blown acid converters.

The vessels are provided with electric tilting gear actuated by remote control. They are blown by electrically driven positive displacement blowers giving an output of 5000 cu. ft. per min. at a maximum pressure of 6½ lb. per sq. in. Like the cupola blowers, these also have modern variable speed commutators, so as to give a wide range of speed. The hoods surmounting each converter are movable to facilitate the removal of the vessel from the blast ring for relining in specially prepared pits, located adjacent to those used for preparing the bodies of the rotary furnaces. The composition of the steel leaving the converters will average: C, 0.23 to 0.25; Si, 0.3; Mn, 1.3 to 1.4; S, 0.03 to 0.04; and P, 0.06 to 0.07.

Teapot lip pouring ladles receive the metal from the converters, and are transported to the overhead hot-metal runway. Here, they are weighed and then taken to the pouring position alongside the mold conveyor.

The metal losses registered are about 5 per cent in the cupola, and 5 to 7 per cent in the converter. Using the new technique, it was found that there was a fairly heavy erosion round the tuyeres of the vessels, and on the teeming side, owing to the absence of silicon in the charge. However, this was soon cured by the addition of a few shovelsful of sand. The tensile properties of the metal are about 83,000 lb. per sq. in., with 27 per cent elongation in 2 in. Before machining, the bombs are subjected to a heat-treatment consisting of raising them to a temperature of 1750 deg. F., soaking between this temperature and 972 for 2½ hr., and cooling down over a period of 5½ hr.

Sand Handling

Between 21 and 25 per cent of new sand has to be added to maintain physical properties, and to replace

sand taken out for coremaking, when mixed with 4 per cent bentonite. The mixture of old and new sand is fed into rotary coolers. From the coolers the sand is fed to mills for preparing molding and core sand. The sand hoppers serving the mills are designed to furnish a definite quantity of sand into each mill automatically. As provision is made at each mill for the accurate measuring of loading material and water, absolute control is maintained over the physical properties of the sands used.

After milling, the molding sand is conveyed by underground belt to a storage hopper situated well below ground; from here, by a feeder and a long inclined belt, the sand is conveyed to the hoppers feeding the Sandslingers. These hoppers are furnished with push-button controlled endless belts, so that the operator can start or stop the flow of sand to the impellor head. Surrounding the machines is a grating through which surplus sand falls to feed an underground belt; this discharges into an elevator feeding the belt supplying the Sandslinger hoppers. Excess sand is led by a chute and a short length of belting onto the spillage belt.

The core sand is taken away from the smaller mills by a belt conveyor running to the opposite end of the battery on the molding sand, where it feeds an inclined belt which delivers the sand into hoppers. These hoppers have a disk as their base to prevent sticking. The sand is ploughed off this disk to fill the working hoppers. Beneath each station is a grating, so that sand dropping through it can be returned to the main supply belt by means of a spillage belt, and a short cross belt.

The core knock-out station is comprised of two stationary grids, beneath which are chutes discharging the sand on to an inclined belt conveyor. This elevates the sand to a position outside the shop to fill a 10-ton hopper located over the railway sidings.

Core Making

For core making circular turntables are used, on which are disposed three sections of the corebox. The first section deals with the placing of the prepared core bar into the lower part of the corebox, a short portion of which is rammed by hand. In the second position, a specially designed machine rams the main body of core, the process involving the rotation of the corebox by means of a piston clutch. At the third point on the turntable the upper part of the core is rammed by means of a small pneumatic rammer. These three processes are carried on simultaneously, rendering the system continuous.

This account of a highly mechanized foundry describes the casting of 500-lb. bombs with maximum steel scrap and minimum ferro-silicon. Particularly interesting is the fact that the foundry uses a satisfactorily-working, well synchronized triplex method for preparing its metal.

When the completely rammed core reaches the first position, the corebox is opened, and the core is transferred by a specially designed jib crane, carrying a balance weight equal to the weight of the core, to a circular plate from which the cores are suspended. The plate is attached to a rotating tube mounted on a mild-steel bogie. Each bogie carries ten cores, and the three women manning each station fill one every 40 min.

The perforated tubular core bars are mechanically wrapped with wood wool on a battery of vertical machines. The wrapped bars are then suspended on an overhead chain conveyor and singed. The conveyor, which has a 538-ft. circuit, takes the bars within easy reach of the coremakers.

The bogies carrying the cores are pushed through continuous drying stoves by an electically-operated pusher gear, conveniently situated beneath the track at the front end of of the stoves. The stoves are gas and hot air continuous recirculating type, and operate at a maximum temperature of 410 deg. F. Each stove, which has a capacity of 3 bogie loads per hr., is divided into three zones, preheating, soaking, and cooling. The preheating zone extends over five bogie lengths, the soaking zone eight, and the cooling zone two.

For the preheating zone, waste heat from the hot castings is used, but provision has been made to assist this by coke oven gas which is burnt in refractory-lined combustion chambers. The burners used are of the low-pressure turbulent type, in which the air and gas are premixed in the burner body before entering the combustion chambers. The hot air employed, which is drawn from the continuous cooling ovens used for the handling of newly-made castings, is supplied under pressure from a low-pressure blowing fan. Additional hot air, as required, is admitted to premix the products of combustion, prior to entering the high temperature recirculating fan. By using the waste heat from the cooling castings, a saving of at least 1,000,000 cu. ft. of gas per week is effected. Some of the concerns mass producing iron castings might with advantage, study the possibility of using the heat given off by newly made castings as a post-war economy.

For the stoves under review, the products of combustion, together with the preheated air, are churned in the high-temperature recirculating fan, and are delivered to the preheating and soaking zones. This hot mixture of gases and air is then delivered under pressure to the distribution chamber extending the whole length, and formed between the arch and the roof of the stove, thence out through louvred parts in the roof of the chambers it is circulated round the cores through the perforated base of the bogies to the flues and the steel exit chimney.

The temperature of the combustion gases is automatically pyrometrically controlled. Hot air for recirculation is drawn by the fan from the cooling zone, and is premixed as noted above at the burner nozzle. An indicating controller is fitted, and a motor and reduction drive is arranged to operate the air and gas valves.

An electrically operated dividing door is installed between the preheating and soaking zones, thus preventing the ingress of moisture to the soaking zone, and permitting close temperature control. Control levers operated from the outside of the oven are disposed along the whole length of both zones. As indicating controls are fitted at regular intervals, the flow of hot gases through any section can be regulated. Vertical ducts,

centrally disposed at either side of the zones, convey the waste gases to the flues, thence to a steel chimney.

An electrically operated dividing door is located between the soaking pit and cooling zones. This insures that both uniform temperature and correct pressure balance are maintained continuously in the soaking zone.

The system is so perfected that it is practicable to control the temperature to within +10 deg F. In the cooling zone cold air is admitted to the underside of the bogies. It passes around the cores, and is sucked from the top of the chamber to the inlet side of either the recirculating fan or the blowing fan. Swing doors of the hinge type are fitted at the discharge end of the oven. The bogies continue to a transfer track, and go back to the front of the core-making stations along tracks. The dried cores are lifted from the bogies on the transfer track to an overhead electrically driven chain conveyor carrying spreader bars suspended from two chain trolleys. The spreader bars carry brackets for accommodating two bomb cores at 18 in. centers. This conveyor, which is continuously moving at the rate of 5 ft. per min., serves as an auxiliary cooling medium, and also transfers the cores to the coring-up station. When manufacturing thin-wall bombs, the cores are, by means of small tools, cut sometimes vertically in three places, or spirally; the incisions thus made are lightly filled in with core sand. This brings about increased collapsibility during the period the steel is freezing around the core.

Molding and Casting

For the making of the molds a battery of Sandslingers is used, each in combination with a pair of down-draw molding machines. Half of the stripping plate machines are used in making of drags, and half for the copes. These are of simple construction. The patterns are drawn down through a stripping plate 2 ft. 9 in. x 1 ft. 9 in. to a position low enough to clear the molds. The ram on these machines is operated by compressed air at a pressure of 80 lb. per sq. in., through an oil cylinder, 8½ in. in diameter, which is fitted with dash pot and regulating valve. The control and adjustment of these machines is commendably simple.

Air hoists traveling on telpher joists are used for transferring the drag parts to the mold conveyor. The cores are placed in these molds by small double-armed jib cranes mounted on a platform. These cranes pick off pairs of cores and lower them simultaneously into the molds. The molds are closed by placing on the copes by means of double-armed jib cranes which transfer this part of the mold from the stripping plate machines onto the drag. The cores are centered by a jig and wedged in position by the insertion of three sections of centering rings made up as oil sand cores. The molds are clamped, completely assembled with runner bushes and centering cakes on the mold conveyor, the operator working on an elevated platform, where supplies reach him by a conveniently disposed overhead pendulum type conveyor.

The centering rings, runner bushes, and test-piece molds require a special plant for their production from oil sand. The centering rings are made on molding machines of the turn-over draw-down type made by the foundry itself. The down-draw table is controlled by air pressure operating through an oil cylinder. For the runner bushes and test-piece molds, No. 1 Ajax jolt turnover and pattern draw machines are used. The machine table is lifted pneumatically prior to turning over, and the coreboxes forming the runner bush are stripped by means of a side-drawing mechanism, which is also operated pneumatically. The sand for the machines serving this section is obtained from overhead hoppers, kept full by Rotoil mixers situated beneath hoppers receiving their supply from the main conveyor. The products of these small molding machines are conveyed from the molding station on a pendulum conveyor, and placed in a vertical hot-air drying stove, after which they are placed on the conveyor and passed along to the mold assembly station.

Casting is carried out from a platform erected at the side of the mold conveyor. The ladles of molten steel are received on a platform dial type weighing machine, and are conveyed to the casting station by means of 7-ton electric telphers running on an endless telpher track 192 ft. long.

The mold conveyor is a complete articulated train of 58 steel chassis, each of which carries a series of cast-iron mold carrying plates in four sections, having a total length of 9 ft. 8 in. x 4 ft., designed to carry two molds. The conveyor is intermittent in action, and is stationary while the following operations are being carried out: (1) Four drags being placed on the conveyor; (2) eight cores being lowered into position; (3) four copes being set on the drags; (4) four boxes being clamped and assembled; (5) four copes being stripped and knocked out; (6) eight castings being removed from the molds; and (7) four drags being knocked out.

Heats are timed to arrive continuously at the casting platform, so that no break occurs. The casting platform is 48 ft. long, and is sufficient to allow for one heat of 16 bombs to be cast, if necessary, without any movement taking place.

The corebars are withdrawn approximately two minutes after casting by means of small overhead travelling air hoists. From here the mold conveyor takes its load into a tunnel, wherein the fumes and gases are extracted by an exhauster fan. On emerging, the castings are stripped and molding boxes knocked out by a battery of 5-ton overhead cranes serving the knock-outs previously referred to.

For knocking-out the copes and drags, jolt grids are used, while for the actual casting, stationary grids are sufficient. The overhead cranes deliver the empty boxes onto a gravity roller conveyor along which they move to the back of their respective molding stations. Here they are picked up and placed on the stripping machines. The hot castings are placed on specially constructed bogies travelling on two tracks, each bogie carrying eight bombs which are propelled through two cooling chambers.

These chambers accomodate about 25 bogies; air is drawn from beneath the bogies at the center of the furnace, and is taken to a large blowing fan at the discharge end, where it is picked up by exhaust ducts situated at the side of the chambers, leading to a common main at the top of the chambers. The hot air so generated is led for use with the core stoves as described earlier.

On discharge from the cooling chambers, the bogies containing the now cooled bombs are transferred crosswise to a track beside which are positioned the core knock-outs. Their load removed, they are passed forward and mechanically conveyed by a single strand continuous moving chain floor conveyor of the drag type to another transfer at the end of the track, bringing the bogies again into circulation to the knock-outs on the track by the mold conveyor.

The core sand being removed, the bombs in pairs as cast pass through

(CONTINUED ON PAGE 134)

Tool Steel Identification System

A SYSTEM for classifying and identifying domestic high speed steel cutting tools has been agreed on by the three major automobile companies in Detroit. Other concerns, including some outside of the automotive field, have indicated interest and a decision to go along with the program.

Standards of General Motors, Ford and Chrysler are being set up to facilitate such identification. A simple three-part code, to be stamped on each tool, will identify it as to formula and producer.

With this information marked on all high speed tools, users will obtain

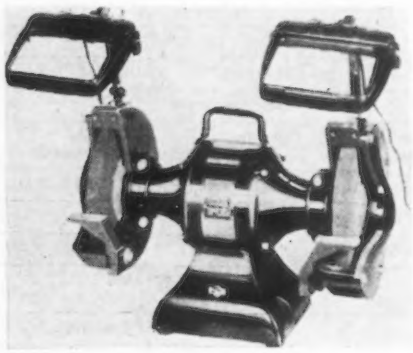
New Equipment . . .

Recent developments in small tools and accessories, marking devices and numbering machines are described in the following pages.

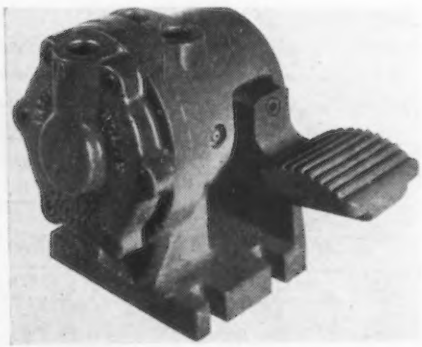
A NEW model of Marvel grinder shield that provides properly directed light and protection for the face and eyes from flying particles has been announced by the *Boyer-*



Campbell Co., 6540 Antoine Street, Detroit. The frame is molded from a high impact resisting, plastic material and the electrical parts are in a completely insulated chamber and mounted on an adjustable bracket. The window is of non-shatterable glass and the lamps, of the bayonet type, are vibration resisting and set in flush with the frame. Illustration shows dual installation.

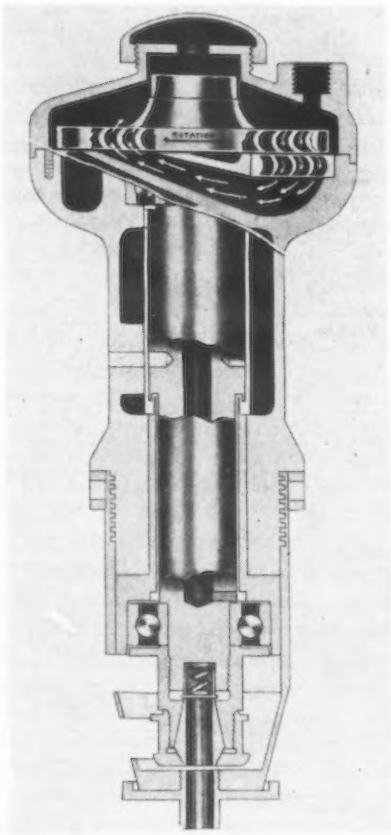
Foot-Operating Valve

A FOOT-OPERATING valve, designed for general use on pneumatic equipment, is offered by *Anker-Holth Mfg. Co.*, 332 S. Michigan Avenue, Chicago 4. It is of the disk type and is made in sizes from ¼ to ½ in. When the pedal of the valve is pushed down and the foot removed, the pedal is returned to neutral by means of a spring, but the work is not released until the pedal is again pushed down.



Air Turbine Rotor

OPERATING on an impulse reaction principle, the solid milled rotor with bucket-type impeller blades, developed by *Onsrud Machine Works, Inc.*, 3913 Palmer Street, Chicago, employs an air feed-back system. The expanding air, plus patented "Metered Mist" lubrication, hold unavoidable wear to a minimum. Rotors of this type are used in Onsrud air turbine motors. Motors ranging from 1/6 to 3 hp., operating at speeds of from 15,000 to 100,000 r.p.m. are available.



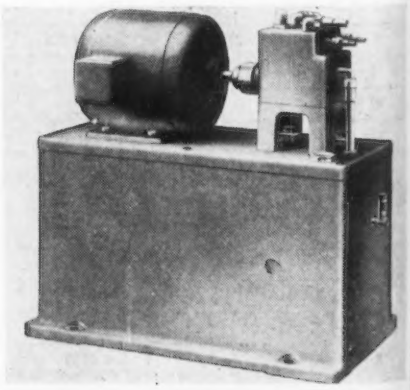
Coolant Cooler

DESIGNED to provide automatic temperature control of coolants and lubricants in machine processing,

Model 75-AC coolant cooler has been announced by *Frostrode Products*, 19003 John R Street, Detroit 3. Coolant temperature is selected by setting a dial on the panel of the cooler. Uninterrupted flow of coolant is obtained by a single steel tube evaporator coil construction. Rated capacity is 18 gal. of coolant per min. when cooled down to 20 deg. F. below room temperature. The model is a compact, self-contained, portable unit.

Supercharged Hydraulic Pump

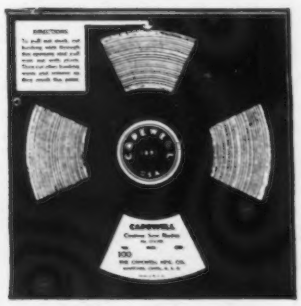
A SUPERCHARGED combination high and low pressure oil hydraulic power unit, the Hi-Po, has



been placed on the market by the *Anker-Holth Mfg. Co.*, Port Huron, Mich. Three thousand lb. line pressure is quickly delivered with the use of a ½-hp. motor using a supercharger to preload the piston chamber. Pump and motor are mounted directly on the oil reservoir. Low-pressure by-pass control having a range up to 300 lb. is built into the pump body. Both high and low pressure can be controlled individually on the power lines or through automatic control.

Contour Saw Blade Box

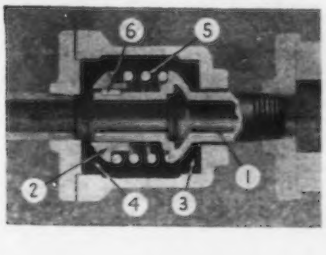
THE CAPEWELL MFG. CO., Hartford, Conn., has brought out an indestructible box for its 100-ft.

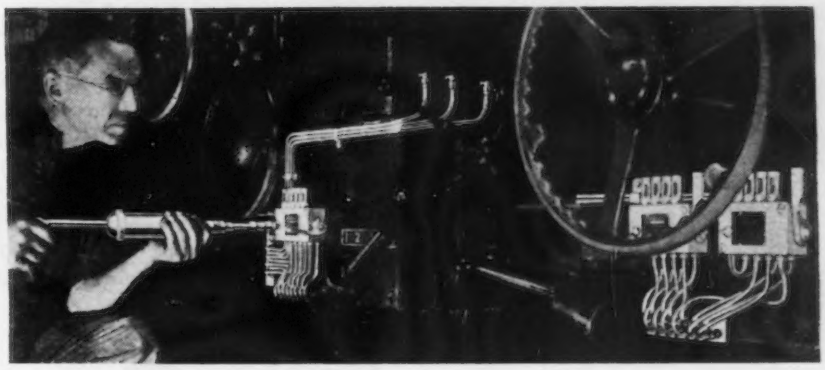


coils of contour band saw blade stock, which utilizes an ingenious method to keep the narrow stock from becoming tangled. The saw stock is withdrawn as needed and flows freely. This contour stock is used on Doall, Grob, Walker-Turner, Thiel, Oliver, Tannewitz, Laidlaw and other machines.

Rotary Pressure Joint

BY means of a special rotary pressure joint, manufactured by the *Johnson Corp.*, Three Rivers, Mich., oil is admitted inside the spindle of a turret lathe. It passes through the spindle and is conducted directly to the tools at the working end, providing oil at the exact spot required and serving to wash away most of the cuttings and turnings. The joint is a packless type of stuffing box or steam fit. Two self-lubricating carbon graphite rings, of special composition, eliminate any need for packing. Pressure within the joint keeps it automatically sealed.





Lubrication System

POSITIVE lubrication of all bearings on machine tools and similar equipment may be had through the Multival system made by the *Farval Corp.*, 3250 E. 80th Street, Cleveland. Oil or grease under pressure is delivered to the distributing blocks by means of a manual or power-operated portable gun which serves as a central pump. Complete equipment consists of multiple valve blocks, each serving 2 to 10 bearings, lubricant lines leading to individual points and suitable fittings to accommodate practically any type of bearing connection.

Grinding Compound

MICROGRIND No. 132 has been brought out by by the *Quaker Chemical Products Corp.*, Conshohocken, Pa., for use on grinding, honing, lapping or super-finishing operations. It is a dark, heavy bodied liquid that when mixed with water in proportions ranging from 1-3 parts up to 1-75 parts makes a translucent, permanent solution which is stable in hard or soft water. It is claimed that glazing and loading of abrasives is eliminated and recirculation of chips is prevented. It is non-injurious to skin and to metals and is odorless and non-foaming.

Hone for Carbide Tools

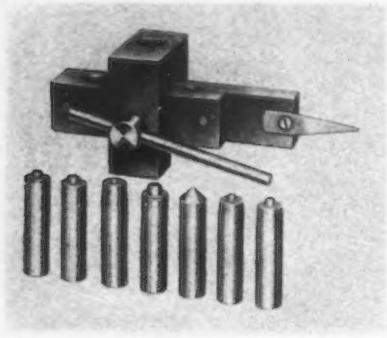
IN the Tamaloy diamond hone introduced by the *Tungsten Alloy Mfg. Co.*, Newark, N. J., a matrix of tungsten carbide holds the diamonds securely in place, preventing displacement when they contact a hard surface or edge. The hones come in three grades—rough, medium and fine. The company has also developed Speedaloy, which is a cast tungsten-chromium-cobalt alloy which is said to fill the gap between high-speed steels and tungsten carbide. It is available in solid tool bits, flats and a variety of tipped tools.

Handle Wheels

THE GIBBONS MFG. CO., 11 Gordon Street, Worcester 4, Mass., offers a safety handle wheel for all types of wood and metal working machines. It is especially recommended for rapid traverse machines where handle wheels or cranks are in fast motion. The wheel keyed to the shaft allows necessary adjustments without the use of the safety handle.

Flaring Tool

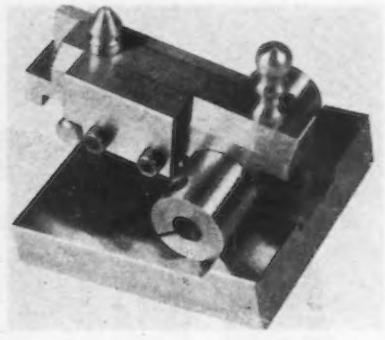
A HEAVY duty portable flaring tool, the Flaremaster, which produces a double-lap flare on steel and non-ferrous tubing, has been developed by *Everhot Product Co.*, 2055 W. Carroll Avenue, Chicago, Ill. It was specially designed to produce the correct 45 deg. double-lap flare for SAE flare type and inverted flare-type connections on Bundy, Bundyweld and Bundyflex steel tubing. It consists of a pair of holding jaws and a U-shaped clamp with a built-in vise.



Jaws are counterbored to provide exact length of tubing to insure correct double flaring for each size. The company also makes Bundyflex copper fused steel tubing, a satisfactory replacement for ordinary copper tubing.

Angle Wheel Dresser

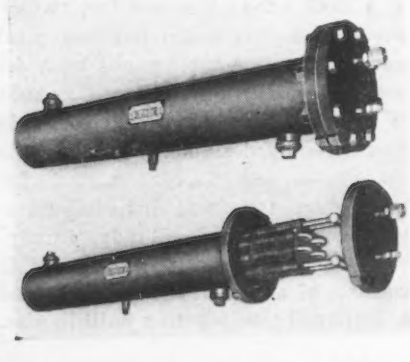
THE FLORIAN MFG. CO., Plansville, Conn., announces the sine angle grinding wheel dresser. By its use and with the aid of standard gage



blocks or adjustable parallels, wheels of surface grinders may be dressed to any angle from 0 to 90 deg. The bearing surfaces are hardened, ground and lapped.

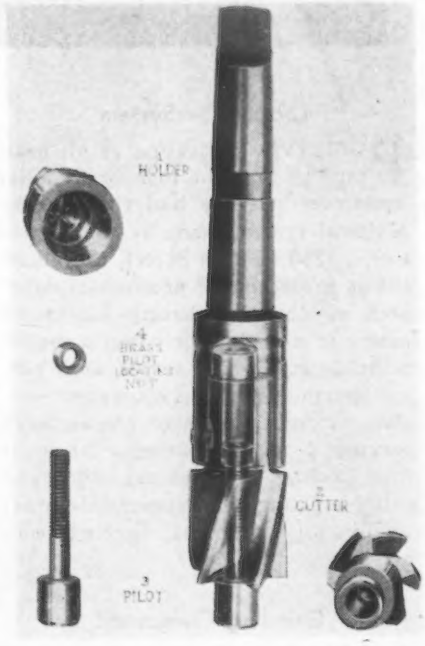
Coolant Cooler

KRAMER TRENTON CO., Trenton, N. J., has put on the market a coolant cooler of the shell and fin tube type. It consists of a spiral fin cooling coil inserted into a steel shell. The unit is provided with a bolted flanged lid for easy removal of the cooling coil for cleaning. The coolant circulates at properly designed velocities by means of spaced baffles. Water, brine or direct expansion refrigerant may be used.



Counterbore Drive

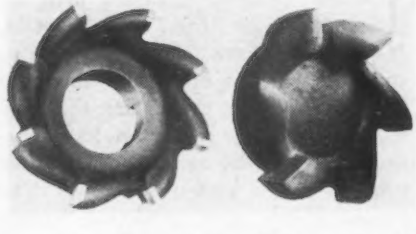
UTILIZING the eccentric principle to equalize the torque load on the holder and the mating driving



member of the cutter, *Moreland Tool Co.*, 16935 W. McNichols Road, Detroit, has put on the market a counterbore drive in sizes up to 3 in. diameter. The driving member of the cutter fits into a special off-center hole in the holder. Concentricity of the unit is held to close tolerances by means of a "stick taper." The angular notch is so positioned as to assure full contact of the driving members.

Milling Cutter Bodies

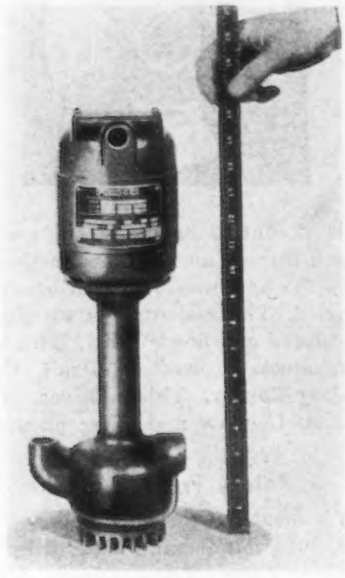
FARREL-BIRMINGHAM CO., INC., Ansonia, Conn., has developed milling cutter bodies of Meehanite which can be machined for carbide



or cast alloy tips within a broad range of rake and spiral angles. The user faces, bores and slots the hub to suit his requirements, mills the tooth seats and brazes on the desired tips. Carbide tips may be applied where a high grade finish is required and cast alloy tips used for heavy roughing operations. Meehanite has a coefficient of expansion that is closer to that of carbides than is steel.

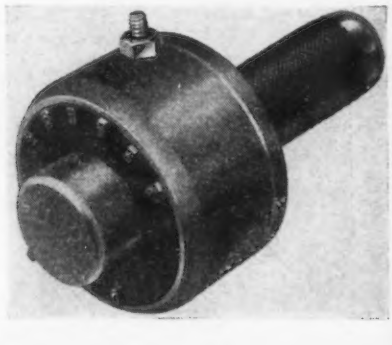
Sealless Pump

A SMALL-SIZED sealless pump, Model MVA, has been designed by the *Pioneer Pump & Mfg. Co.*, 19650 John R Street, Detroit, for hand mills, surface grinders, internal grinders, drill presses, tapping machines and the like. Described as a submerged type pump, this model is intended for machines having a coolant sump in their base or for machines provided with separate coolant tanks. In the case of the latter, brackets and flanges are available for mounting pump on the edge, side or top.



Gear Marking Holder

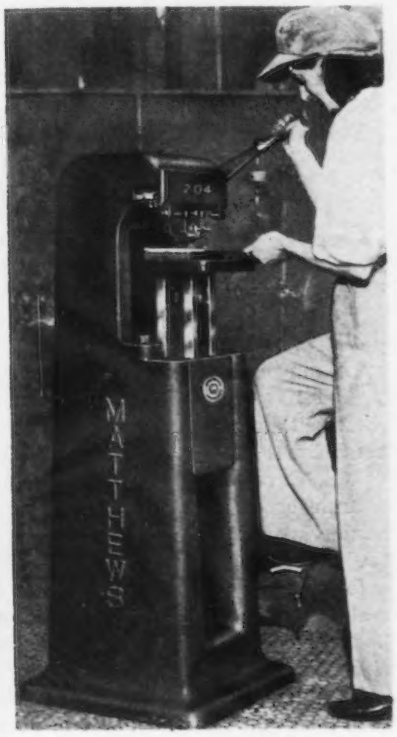
A SAFETY hand model gear marking holder has been developed by *M. E. Cunningham*, 115 E. Carson Street, Pittsburgh 19. The new type plate is cut out for the exact number of characters and letters desired, with straight type used instead of tapered type. A special method of holding the type characters



in place prevents them from flying off or falling out of the holder. The pilot designed to suit the hub of the gear, allows perfect positioning of the letters.

Hand Operated Marking Machine

THE No. 204 general purpose marking machine, put on the market by *Jas. H. Matthews & Co.*, 3942 Forbes Street, Pittsburgh, may be used for marking almost any flat



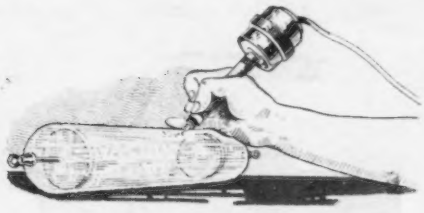
or round product and can be furnished with a motorized unit or with a pneumatic attachment. Flat parts are marked legibly by means of solid or mortised roller dies and interchangeable segment type. Round parts are marked with flat dies or interchangeable steel type.

Petroleum Sulfonates Substitute

ACCORDING to the *Curran Corp.*, Malden, Mass., difficulties caused by shortage and the diversion of petroleum sulfonates of "mahogany" soaps may be avoided in the manufacture of war-scarce emulsifiers and soluble oils by the use of Gunk Concentrate P-96. Stable milky emulsions for cooling and grinding operations are said to be obtained by diluting the concentrate with approximately three volumes of a suitable mineral oil and extending the soluble oil further with water as needed. It is claimed that the presence of alkyl phenols form cooling and grinding compounds which are free of bacteria and eliminate the problem of skin infection or dermatitis.

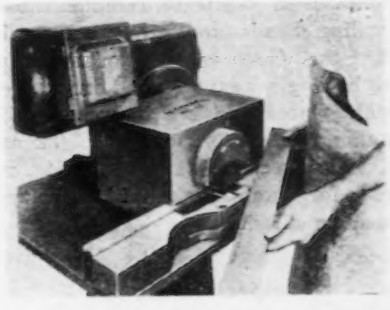
Electric Writing Tool

FOR permanent marking of brass, marble, tile, glass, plastics, wood, hard rubber, aluminum, steel and bronze, an electric writing tool of special design has been announced by the *Breuer Electric Mfg. Co.*, 5100 N. Ravenswood Avenue, Chicago. It operates like a pencil and provides more than 7000 cutting strokes per min. Made in different models for light or deep etching, it operates on 115-130 volts, 50-60 cycle a.c.



Power Marking Machine

CONTINUOUS automatic marking of metal strip or easy roll marking of flat parts is accomplished with the No. 52 power marking machine brought out by the *Acromark Co.*, 341 Morrell Street, Elizabeth, N. J. The flat stock is fed in, the marking roll slides it to the left as it rolls in the mark, and it is automatically ejected. Interchanging of marking dies in the holder is accomplished by removing the feed guard and loosening the rotary holder, in which separate pieces of type or full roll dies can be used.



Freehand Electrical Marker

A DEVICE for placing numbers, symbols and identifications on soft or hardened steel, alloy steels, wrought and cast iron, designed primarily for freehand marking, has been announced by *H. P. Preis Engraving Machine Co.*, 157 Summit

Street, Newark, N. J. It consists of a special transformer with 10 voltage stages controlled by a rotary switch, a hand-held marking pencil, a ground plate for use with small work and a ground clamp for large work. Any desired depth of marking may be obtained. Use of this device is said to eliminate the necessity for stamping parts before heat-treating them and to overcome the disadvantages involved in acid marking.

Gusher Pump

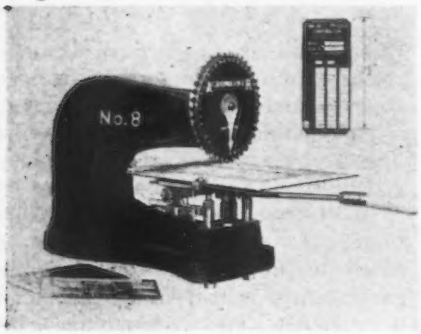
THE immersed type motor-driven gusher pump developed by the *Ruthman Machinery Co.*, 1819 Reading Road, Cincinnati, is equipped with integral flange bracket for reservoir cover of bed-plate mounting. The unit, known as model No. 9040, is designed for installation interchangeability with Gusher model 1-Pc pump, and is available in any current characteristics, including 25 cycle, 1, 2 or 3-phase. It is made in two lengths. The dimensions from the mounting flange to the bottom of the pump are 6-7/16 and 8-7/16 in. respectively, and can be had with either ½ or ¾-in. pipe size discharge.

Level Glass

STANLEY TOOLS, New Britain, Conn., has introduced a level made with red glasses for quick declivity readings in ship construction and with green "Cat's Eye" glasses where a level and plumb are required. Red glasses can be set individually to any pitch or declivity up to and including 2 in. to the foot. Black dots and arrows on both sides of the level indicate the end or edge to use for declivity readings. Glasses may also be set in pairs to any degree in the circle.

Heavy Duty Marking Machine

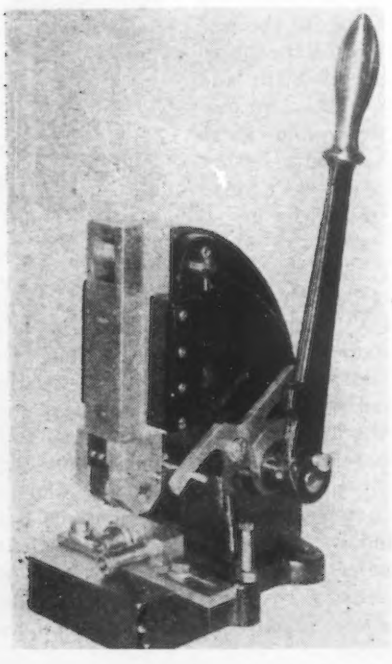
FOR stamping numbers and letters into steel, brass, zinc, plastic, fiber and pressed wood parts, the *Acromark Co.*, 341 Morrell Street, Elizabeth, N. J., has brought out the No. 8 Acromarker. The device stamps parts in any position up to 9 in. from the top, and takes pieces up to 2½ in. thick and as large as 10 x 12 in. Au-



tomatic advance moves part in a level plane to the left after each character is stamped, spacing each letter evenly. Powerful screw, operated by hand lever, lifts table with work against heavy duty marking dies. Die heads of sizes ranging from 1/16 to ⅜ in. are available for quick interchanging. Deep throat and long stroke permits assembly of special fixtures to hold irregular shapes for stamping.

Serial Numbering Unit

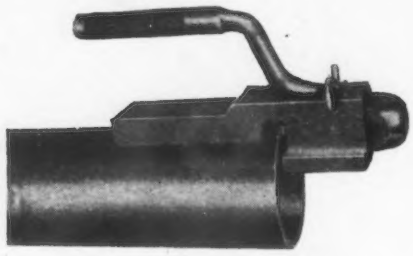
WM. A. FORCE & CO., 216 Nichols Avenue, Brooklyn, N. Y., has developed serial numbering machines for numbering two or more mating small parts. The hand bench



press is fitted with an automatic numbering head with special trip cam arranged for consecutive, duplicate or any required type of numbering. The modified toggle lever movement enables the operator to exert considerable pressure for marking hard parts, or to control the pressure so that extremely delicate watch and instrument parts can be numbered or marked without harm.

Shell Marking Holder

A BOX type shell marking holder, manufactured by *M. E. Cunningham Co.*, 115 E. Carson Street, Pittsburgh 19, has been designed for marking on ends of hot, rough, turned shells. A sturdy outside box with safety handle includes a grooved



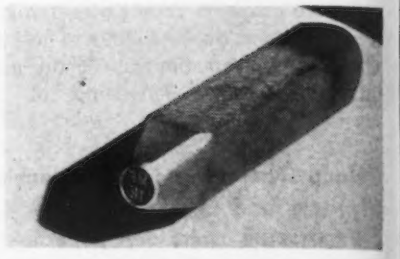
guide which holds a type holder in the correct position to give a complete, clear impression. A solid, one-piece safety steel type holder, said to resist spalling and mushrooming, is held in place by a special shepherd hook pin which is easily removed for changing type inserts.

Rivet Gun Kit

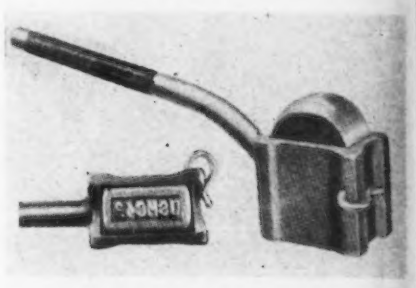
A RIVET gun kit to aid field service and repair men in heading up Cherry blind rivets has been put on the market by *Cherry Rivet Co.*, 239 Winston Street, Los Angeles. It contains a complete complement of pulling heads and other accessories for the G-10 hand gun, including right angle adapter used in inaccessible places and six interchangeable pulling heads for sizes ⅛, 5/32 and 3/16-in. standard diameter rivets, one each for countersunk and brazier type head in all sizes.

Inspectors' Stamps

A SPECIAL line of inspectors' stamps for Magnaflux work has been announced by *New Method Steel Stamps, Inc.*, 147 Jos. Campau Street, Detroit 7. The letters Mf, together with a numeral or letter, are incorporated with a circular, oval, square or triangular shaped border. This design not only indicates that the part has



been magnafluxed, but also permits ready identification of the operator who has passed the part through Magnaflux inspection.

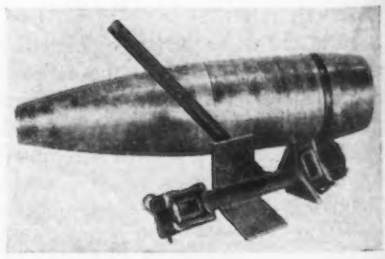


Safety Box Type Holder

AN improved safety box type holder for marking round or square pieces either hot or cold is being marketed by the *M. E. Cunningham Co.*, 115 E. Carson Street, Pittsburgh 19. A reinforced outer box, to which handle is welded, levels the holder on the piece being marked and acts as a safety guard by preventing pieces of scale or chips from flying out from under holder. The steel type holder rides freely inside of the box, but cannot fall out because of special shepherd hook pin which holds it in place. It can be made in numerous sizes and number of characters.

Shell Marker

TO meet requirements for a versatile and practical shell marker, the *M. E. Cunningham Co.*, 115 E. Carson Street, Pittsburgh 19, has made available a dual purpose box type holder. It is of special design for stamping identification marks on end



and side of semi-finished 155 mm. shell forgings in one operation. Guide plates level both type holders to assume clear, uniform markings. Use of the device eliminates separate handling required for each marking.

It is one of the most fascinating riddles of our time. For powerful telescopes have brought to light a strange network of "canals" on the planet's surface . . . Magnifying a celestial spark to the size of the moon, the power of light and a lens reveals facts never before suspected.

We have a parallel to make that is likewise interesting, and may be of importance to you. We manufacture an industrial instrument known as the Jones & Lamson Optical Comparator. It, too, consists primarily of light and a lens. Its purpose: rapid, accurate inspection.

Now this machine—by means of an enlarged shadow—reveals facts about the nature and the accuracy of parts that are often unobtainable by any other method of gaging.

It makes possible the measurement and inspection of complex surfaces faster, more reliably and more *easily* than is possible with any other form of gage.

Because of this, Jones & Lamson Optical Comparators are in use today by leading producers in virtually every line of production . . . and the record of these machines in helping to cut costs and speed production is the important part of the story.

In the change-over ahead, Jones & Lamson Optical Comparators are going to be of tremendous value. Why not get ready now to meet—and beat—fierce postwar competition? Jones & Lamson Inspection Engineers can help you. Call on them now.

JONES & LAMSON

Profit-producing Machine Tools

Assembly Line . . .

STANLEY H. BRAMS

• Tool and die companies are worried over postwar business and renegotiation; corner-cutting starts . . . Prime contractor checks their financial status . . . Packard plans for postwar era.

DETROIT — Tool companies are beginning to pull in their horns. There are a number of reasons —collections from government contracts continue slow, as they have been; renegotiation is a specter of extremely worrisome proportions; and the end of the war, together with its resultant uncertainty, can be imagined if not seen in the not too far distant horizon.

Above and beyond these ordinary considerations coming into play today, a number of tool companies overexpanded at the beginning of the war program and thereby started up a train of circumstances which may be disastrous for them. Some of these overexpansions were innocent, motivated by patriotism, while others were greedy. It appears now, in retrospect, as though a common fate may descend on many of these over-enlarged operations.

Considerably enlarged facilities brought with them the necessity of maintaining the facilities at work. There were plenty of subcontracts to be had, of course, and selling was not at all difficult. But obtaining manpower to sustain these operations then became an increasingly complicated problem.

Confronted with this dilemma, many of the tool companies could do no more than enlarge their headaches. They hired production workers accustomed to close tolerances, reclassified them as tool and die craftsmen, were thereby enabled under War Labor Board regulations to pay them higher hourly wage rates, and thus maintained their working forces. Or, they took upgraders, started them at the basic rate, raising them in accordance with Detroit area regulations at a progression of 5c. a month. That way, also, they obtained sufficient help.

But the sum and upshot of such programs was that production workers and learners graduated at dizzy speed into the highly select pay ranks of the tool and die craftsmen. For instance, an upgrader begins on a machine at 85c. an hr. In 15 months he has risen to the maximum for, as example, a grinding operation. For 15 months' work he is obtaining the pay rate customarily given to men with 8000 hr. apprenticeship behind them.

This simple qualification of a production worker or a 22-year-old for $100 a week jobs is well and good for the worker, but not so good for the employer. There is, after all, a basic reason for the payment of high hourly wages, and that reason is the ability of the help to deliver its money's worth. There is no short cut on experience any more than there is on anything else of stated dimensions. The tool companies employing such practices, necessarily employing them to maintain their machines, have not obtained the production from those machines they could normally expect; and the shortened output has become a factor in their problems of today.

INDICATING the broad interest which is being manifested in this general picture is the action of one of the major automobile companies in recent months, in making a complete survey of its wartime vendors to see which ones will be maintained as suppliers after the war—and during the war.

This company is making a comprehensive and formalized file of its delivery experience from each contractor, of the quality of the work as measured by rejects, and of the financial standing of the concern, procured by consultation with banks.

Where this company has experienced cutbacks, it has passed them along in the greatest bulk to the subcontractors which scaled in the lower brackets on the grading sheets. Some concerns have been stricken from the supplier lists entirely.

It is by on means unusual to measure supplier performances by delivery promises and quality of work, but the inclusion of a financial factor seems new. A top executive of the automobile company introducing this factor is quoted, in explaining the plan to a friend, something like this: "We absolutely are not going to do business with anybody who is not in financial order. We don't care whether he is an alley shop with 12 employees or a big company listed on the New York Stock Exchange—all our suppliers from now on have to have their books in good order."

This cannot be construed as a simple manifestation of morality in the automobile industry. It reflects rather a decision that companies with their financial housekeeping clean are better to do business with them than fiscally shaky firms.

Along this same line, one of the top aircraft companies is circularizing its suppliers with forms seeking fairly complete information not only on their productive facilities but on their financial ability to handle commitments.

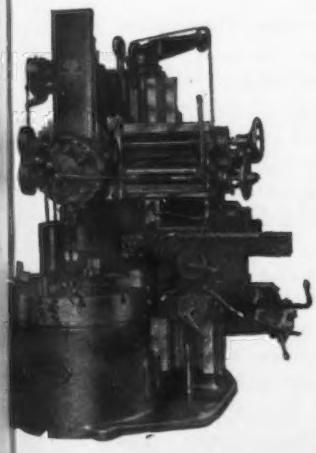
Returning to the Detroit tool and die shops, the early part of the Winter has not brought any change of consequence in their order situations. Delivery promises for gages, jigs and fixtures appeared to have lengthened somewhat, while those for cutting tools have been slightly reduced.

Average delivery is available today in slightly over four weeks on jigs and fixtures, and in about 3½ weeks on gages. Cutting tools can be obtained in fairly short order, within 2½ weeks from the average tool shop. Inasmuch as these figures represent very little change from the comparative levels prevailing at the start of the fourth quarter of 1943, it would indicate that the rather precipitate decline experienced by the Detroit area tool companies during the earlier part of last year had shaken them down to a rather stable plateau of activity.

MEANWHILE postwar automotive planning continues apace. Last week saw Nash and Packard anticipations brought to light.

Packard officials are going on the rosy assumption that there will be a release of civilian car production during the first half of this year. Knowing their facilities are jammed with war work, they have all but completed arrangements to lease space, install a

2 HEADS ARE BETTER THAN ONE



FEW indeed are the manufacturers who are making the same products today that they will make after the war is won.

In production for peace as in production for war the Vertical Turret Lathe offers exceptional advantages. Its two heads—main and side---(as illustrated) work simultaneously to perform several operations with one set-up, at marked savings in time. Its rigid design insures accuracy. Its outstanding versatility is shown by the ease with which scores of V.T.L.s shifted from valves, flanges, and compression parts to building airplanes and tanks. They will be equally ready to turn back once their present tasks are done. And their speed will offer an even greater advantage when comparative costs must win markets against stern competition.

THE BULLARD COMPANY

BRIDGEPORT 2, CONNECTICUT

limited amount of machinery, and get out any authorized passenger car output. Whether such makeshift arrangements could produce a profit is open to question, but it would give Packard dealers something to sell along with their competitors. The additional Packard space will be in Detroit area, but it is not exactly defined yet. Packard first sought idle Hupp Motor Car Corp., but Briggs also had its eye on those facilities and won the race to the landlord this week. So Packard is still looking.

Nash has a solidly based postwar program ready to start in motion the minute the Washington light turns green. Like General Motors, this independent has placed orders with machine tool companies for required equipment, to give it places near the top of the order books when these facilities are authorized to produce. Its entire tooling program is set up on paper—it represents expenditures probably four times or so the normal allotment for year-to-year model changes.

EXPECTING a tremendous postwar market, Nash is planning on the basis of annual overall 6,000,000-car-production for some time after the war. As regards Kelvinator and Leonard operations in Michigan, important sheet steel outlets, president George Mason said the first postwar year's goal is a cool million units. This probably represents an increase of 50 per cent or so above "good year" projections of this company.

There are some grounds for belief, too, that Nash's contract with United Aircraft to produce Army helicopters may have postwar ramifications. Company officials, enthusiastic about this project, constantly talk of its after-war possibilities.

o o o

Cutbacks $2,856,000,000 in 6 Months

• • • **None** of the curtailments in war production to date has been based upon plans for resuming manufacture of civilian goods, announced the Office of War Information last Friday, asserting that "no considerable curtailments for that purpose can be scheduled during 1944 unless the war in Europe should take an early decisive turn in our favor, ending hostilities not later than June or July."

Beyond the 2,000,000 electric irons and 50,000 bathtubs recently authorized by WPB, any return to civilian manufacture probably will be in goods necessary to maintain the civilian economy, such as transportation equipment, it was stated. Some refrigerators and stoves for war housing may be scheduled later this year.

Chief cutbacks during the coming months will come in small arms and ammunition, tanks, certain types of anti-aircraft equipment, non-combat aircraft, and artillery fire-control equipment.

The Navy says that its portion of the over-all program for 1944 will be almost one-third greater than during 1943—totaling nearly $16,000,000,000 as against $12,000,000,000. The Navy has projected plans for plane production into 1945 and for its shipbuilding program through 1947.

In the past six months the Navy has made cutbacks in ships, aircraft, ordnance and other items amounting to $2,856,000,000. Material eliminated was to have been produced during 1943-1946. Cutting back was largely a paper transaction because, with some exceptions, fabrication had not actually started. While $1,370,000,000 of the total cutback figure represents destroyer escort vessel construction, this reduction is offset, the Navy says, by greatly expanded landing craft construction.

WPB cautions against the conclusion that an end to metal famine in war production will mean ability to swing at once into civilian production.

WASHING MACHINE: *A Pratt & Whitney aircraft engine machining plant of Chevrolet Motor Div. of General Motors reclaims about 850 gal. of cutting oil daily with chip spinners. Approximately 22,000 lb. of aluminum chips and 3000 lb. of magnesium chips pass through machines like this one daily.*

558 Contracts Ended In Chicago District

Chicago

• • • **Contracts** let during the first 11 months of 1943 by the Chicago Army Ordnance district totaled $1,465,000,000 compared to contract terminations for that period of $955,000,000, according to Brig. Gen. Thomas S. Hammond (I.N.G., Ret.), district chief.

The district, which is the country's largest in number of contracts, has terminated 558 contracts. The terminations figure for the first 11 months of 1943 of $955 million is based on the uncompleted portions of the terminated contracts. It includes both terminations on which final settlement has been made and those on which final settlement is still pending but on which production has already been stopped.

The tempo of ordnance production in the district almost tripled during the period, amounting to $1,834,881,000 during the 12 months ended Nov. 30, 1943, compared to $668,900,000 for the preceding 12 months. Measured tonnagewise, shipments for the 12 months' period ended Nov. 30, were 2,557,214 tons against 1,040,733 tons for the 12 months ended a year earlier.

Wickwire Spencer Shuts Down For Plant Improvements

Buffalo

• • • **Long-deferred** because of the pressure of war business, a $200,000 improvement program will be executed at Wickwire Spencer Steel Co., during the week of Jan. 23 when all steel production will be stopped. The project includes installation of a preheating furnace, enlargement of soaking pits, relining of drives in blooming and billet mills, and rewinding one of the large electric motors in the plant.

Rather than accumulate ingots, the three working open hearths will be shut down for the entire week, according to Robert T. Dunlap, general manager of the Buffalo works. The rod mill and two blast furnaces will remain in production. Most employees affected will be used in speeding the improvement job or in other departments.

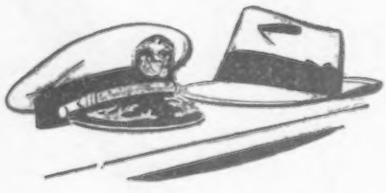
Washington . . . L. W. MOFFETT

• Two war years show record of 5438 strikes, 21,500,000 idle man-days, and 4,991,500 strikers . . . Government blames organized labor . . . Rep. Smith recommends guilty unions be deprived of maintenance of membership rights.



WASHINGTON — Labor's "no strike" pledge in 1943 meant 2470 strikes, causing the loss of 11,545,000 man-days of war production and involved 2,769,000 workers in the eight months of the year for which the Labor Department has records.

By projecting the average of the eight months for each statistic, the figures for 1943 will be an estimated 17,317,500 man-days of idleness, 3672 strikes, with 4,153,500 workers involved. Thus, in the war year just ended, labor almost equaled its 1939 record when there were 17,810,000 man-days of idleness. However, in 1939, there were only 2613 strikes and only 1,171,000 workers out.

In the two years ended December, 1943, when the no strike pledge was in effect, labor's strike record has been: 21,500,000 man-days of idleness, 5438 strikes and 4,991,500 striking workers. The foregoing figures are those of the Bureau of Labor Statistics, with estimates for four months in 1943.

BLS says it does not have figures for July, August, and September, 1943, because the compilation was based on OWI's newspaper clipping service which was discontinued for that period when Congress denied OWI funds for this purpose. December's figures have not been completed.

Recently, Chief of Staff General George C. Marshall is credited with saying that the threatened railroad strike, which caused the government to take over the roads had been used by the Nazis as propaganda demonstrating chaotic conditions in the United States. The steelworkers strike was used also as propaganda by the Germans to show that this country is disorganized.

It was charged that the propaganda was effectively prolonging the war and causing the loss of life because underground groups have hesitated in revolting against Nazi troops. The revolts were supposed to be timed with Allied invasion plans.

A CIO official called the remarks "filthy propaganda." AFL President William Green has characterized the statement as "irrational, uninformed and inflammatory," and has challenged "General Marshall, or anyone else to prove that the report of America's soldiers of production provides an effective propaganda weapon for the enemy."

"On the contrary," stormed Mr. Green, "the fact is that American workers have silenced Hitler's propaganda guns and have shortened the war by turning out tremendous quantities of planes, ships, guns and ammunition in record time."

Like John L. Lewis, Mr. Green's gratitude for the Administration's coddling was a denunciation.

Said Mr. Green: "I hereby charge that the responsibility for the prolongation of these disputes rests entirely upon the bungling, fumbling and incompetent handling by government officials and agencies."

Mr. Green may be right about government bungling, but his searing rebuke for the Administration's long-time policy of extreme leniency deserves examination. Reports hint that the President backs General Marshall and that temporarily, at least, organized labor will have to take the rap for the results of the Administration's labor policy.

FURTHERMORE, the "liberal" press is calling for a National Service Act, and for the government to "do something" along the lines of a universal draft. The War Department has long been on record as approving a universal draft. Donald R. Richberg, the ex-New Deal NRA General Counsel, now a private attorney, has recently advocated "drastic labor controls" to stop wartime strikes.

This sudden criticism of organized labor and its leaders by Administration leaders all may be a smokescreen designed to conceal the simple truth that labor could never have made its wartime "no strike" record without the government's tacit consent.

The President has never appealed to public opinion for the disciplining of labor unions. It is generally agreed that if he had done so before this, organized labor would not have dared to buck mobilized public opinion.

IT is true that the Nazis have used strikes as propaganda against this country and that the propaganda has probably been damaging, as supported by OWI. But, it is equally true that labor is not entirely to blame for its strike-born damage to war production.

American workmen whether organized or not, are out-producing the Axis during the war. No one can detract from the thousands of production records American workers have hung up, in spite of a sordid strike record.

Government action to prevent strikes to be perfectly fair would not be to put labor in a straight jacket. To punish labor alone for its actions when those actions were partly government-inspired and sanctioned would be the height of inequity.

National Service legislation is not needed in America. Firm government policy is needed. The strict regimentation of millions of workers in trade unions would be as un-American, as the complete socialization of industry (direct government control) which so far has not been necessary. The dan-

Offer to Aid Soldiers Turned Down by Union

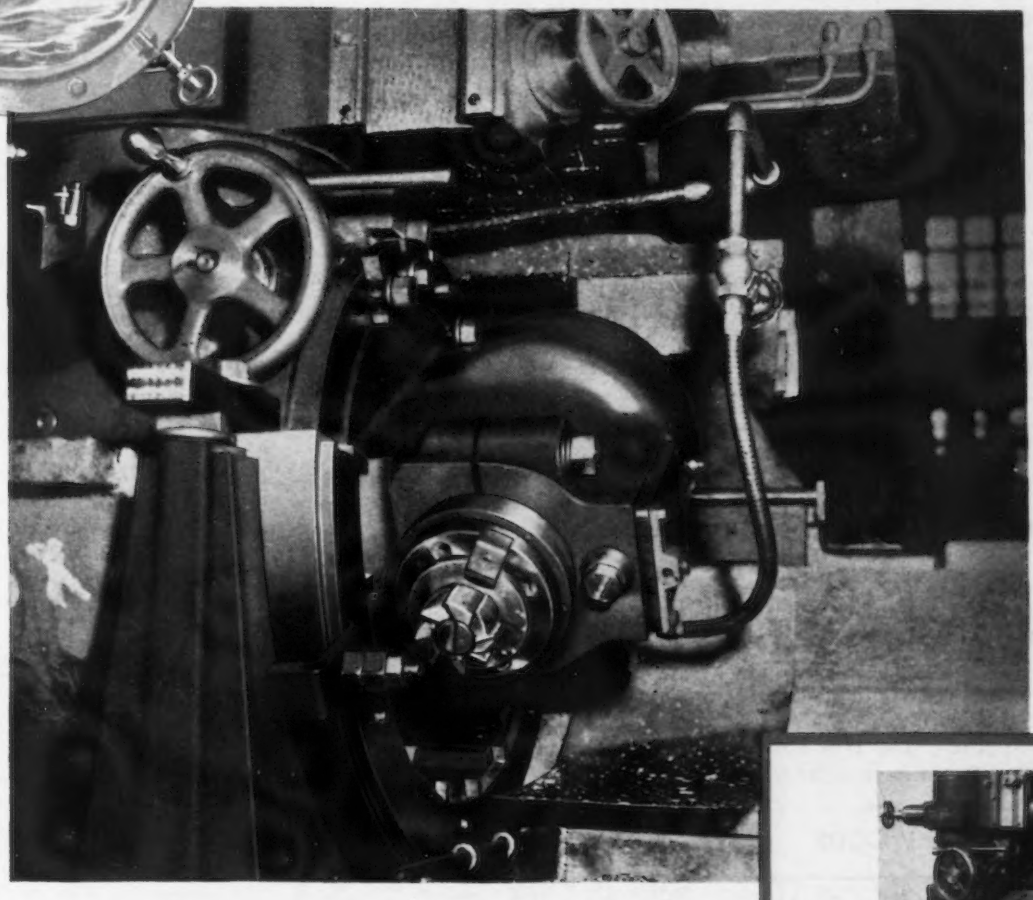
Canton, Ohio

• • • During recent negotiations between the United Steel Workers of America and the Timken Roller Bearing Co. here, the company offered as a counter proposal the granting of an extra day's seniority for each day its employee spent in the armed services. This gesture apparently grew out of the company's recognition of its employees' services to the country.

The union turned down the proposal, reportedly on the basis that other employees not in the armed service would be opposed to such a set-up.

Take a Tip from the Ship Yards

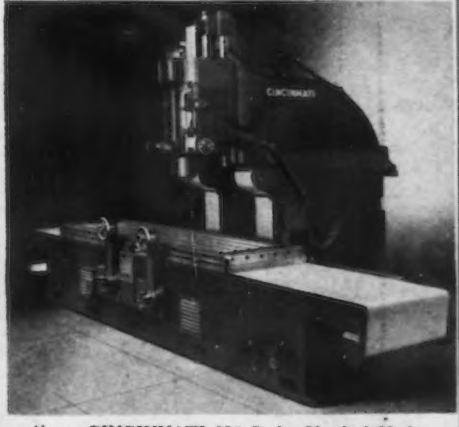
ON MACHINING SLOTS INSIDE HALF-ROUND BEARINGS



The slots in bearing struts always presented one of the most difficult machining jobs in shipyards. Two or three years ago when production was of little consequence, there was no urge to change, but with the requirements for more and more ships, something had to be done about speeding up this operation. A CINCINNATI engineered Universal Index Milling Attachment, on a CINCINNATI 28″ Series Vertical Hydro-Tel Miller, solved the problem. The machine has the capacity and power for milling these large parts, and the attachment is designed so that it may be indexed to several milling positions within a radius of 180 degrees. This method of machining the slots is much faster than the previous method . . . *the work requires only one setting and the attachment may be quickly indexed from one cut to the next.*

The attachment is a typical CINCINNATI Service Engineering development for more rapid production through the use of the right machine, fixture, and cutters. Talk over your milling jobs with this group of authorities; they may find a more profitable and productive method for handling your milling operations.

Above: Universal Index Milling Attachment. It has No. 50 standard taper hole; quick change collet; 1¼ to 1 speed ratio, index plate for locating angular position of attachment spindle.



Above: CINCINNATI 28″ Series Vertical Hydro-Tel Milling Machine. Specification catalog M-1018-2 gives complete information.

TOOL ROOM AND MANUFACTURING MILLING MACHINES . . . SURFACE BROACHING MACHINES . . . CUTTER SHARPENING MACHINES

ger of such policies being continued after the war cannot be over-emphasized.

The stringent methods now proposed by those who seek legislation to force a man to take a particular job and retain it so long as the government wants him to, or to imprison the leaders of striking unions are discarded by Representative Howard Smith of Virginia.

REPRESENTATIVE SMITH, who is co-author of the Smith-Connally anti-strike act, and who has been called an "enemy of labor" and a "labor baiter" told THE IRON AGE that he would merely have the government deprive unions of their maintenance of membership rights, or at worst provide that the government could order that a new bargaining agent be chosen at a struck plant.

While asserting that the maintenance of membership clauses which the War Labor Board has caused to be inserted in collective bargaining contracts against the will of the employers are illegal and in contravention of the Wagner Act and the Smith-Connally Act, Mr. Smith says that WLB could discipline striking unions "where it hurts" by withdrawing the foregoing rights.

Said Mr. Smith: "The War Labor Board says that it grants maintenance of membership clauses to unions in exchange for their promises not to strike. Why wouldn't it be fair for WLB to forbid a union which strikes from further enjoying maintenance of membership privileges when it violates its 'no strike' pledge?"

TO illustrate how unions abuse privileges granted them by WLB, Mr. Smith described the case of James Huffman, a member of a CIO local at the Gambrinus Bearing Factory of the Timken Roller Bearing Co. WLB had given the union maintenance of membership rights.

In March, union members and management officials met to discuss the terms of a contract which had been tentatively agreed to by the company and CIO officials. The employee group which was protesting the terms of a new agreeemnt was represented by Mr. Huffman.

Mr. Huffman asked the government presiding officer, a conciliator from the Labor Department, what steps the group he represented should take to have a new election and secure a new bargaining agent. As a result of this question, Mr. Huffman's membership in the union was revoked and I. W. Abel, CIO sub-regional director, requested Huffman's dismissal under the terms of the WLB-generated maintenance of membership clause.

Timken was forced to comply. Mr. Huffman's fellowworkers immediately struck in sympathy. They went out on April 2 of last year and did not come back until April 11. Approximately 36,875 man hours were lost in the plant of an important industry.

MEANWHILE, Mr. Huffman, who asserted that he had been put out of the union in a manner forbidden by the union constitution, appealed to the international union which reinstated him. Mr. Smith says that evidence shows reinstatement was made recently only to permit the local union to constitutionally discharge him. Mr. Huffman was discharged, and now, according to Mr. Smith, Timken fears another sympathy strike.

Clearly, if WLB had assumed jurisdiction and ordered the Timken workers back on the job immediately under penalty of loss of maintenance rights, there would have been no loss in production time at Gambrinus. Nor would Mr. Huffman have been discharged in the first place.

THE BULL OF THE WOODS — BY J. R. WILLIAMS

Resources Depleted By War Must Be Replaced, Says Batt

Chicago

• • • **Further evidence** that the Administration has set a pattern for postwar international trade calling for the acceptance of imported raw materials in exchange for American exports were given here recently when this suggestion was made by William L. Batt, WPB vice chairman and United States member and representative on the Combined Raw Materials Board and Combined Production and Resources Board.

Addressing the Chicago Association of Commerce, he said that if the principle of a balanced trade budget is accepted as the essential, a novel means of approaching this balance is the acceptance of raw materials from abroad in exchange for American exports. It was proposed that this country sterilize or freeze the surpluses over and above normal import needs, retaining these materials in a stockpile not to be touched except in case of national emergency.

Mr. Batt said the important thing is that this country would be replacing those resources which are being exhausted and would be tending to bring the United States back to an economy of abundance as distinct from an economy of scarcity. Of all the questions that are most difficult, he said, is the matter of disposing of war surpluses.

WEST COAST . . . .

OSGOOD MURDOCK

• "Cut back any aluminum plants but ours," cry West Coast Congressmen and public power purveyors . . . Developments at Bremerton . . . Superlative achievements by warplane builders.

SEATTLE—"Aluminum Pots are Cooling" warned recent headlines in the *Oregon Journal* and "U. S. Cut-back Aluminum Alarms State" worried the *San Francisco News*. Down in southern California "Aluminum Plants Face Three Months Shut-down Here" dreaded headlines in the same baleful tone.

So far there have been no actual cut backs or shut downs on the West Coast, but the suspense is proving dreadful. It all seems to have started when Washington reports told of a growing surplus and balanced budget in the aluminum account and indicated curtailment of certain plants dependent upon coal for fuel. On the West Coast all reduction plants and pot-lines depend upon hydro-electric power, and since principal power sources for aluminum production are either federally owned, as from Bonneville, Grand Coulee and Boulder Dam, or municipally owned as from San Francisco's Hetch Hetchy project which powers the DPC Riverbank reduction plant in the San Joaquin Valley, political pressure was immediately exerted.

From the Pacific Northwest resistance to any present reduced output was headed by Senator Homer T. Bone (D., Wash.), Congressman Homer D. Angell (R., Ore.), and Congressman Walter Horan, of Washington, all of whom were credited with fronting the stalwart defense. Officials of the Bonneville Federal Power Administration have been breathlessly in touch with Washington also, through Secretary of the Interior Harold L. Ickes, since a major portion of the 600,000 kilowatts of Columbia River power now utilized for northern aluminum production is at stake in the rumored cut backs.

It is understood here that WPB may shut down as much as one-third of the nation's aluminum producing capacity. The West Coast delegation points out that aluminum produced in the Pacific Northwest costs less than 15c. per pound because of the low hydro-electric rate. There is particular jealousy and resentment of the Shipshaw Canadian plant financed with U. S. funds with a capacity of 320,000 tons per year, approximately the same as that of the 22 United States pot-lines which it is understood are planned to be closed. It is pointed out that the cost of Shipshaw aluminum delivered to Vancouver, B. C., for Lend-Lease shipment to Russia costs the United States about 21c. per pound, approximately 50 per cent over the cost of aluminum ingots produced in the Pacific Northwest.

Since manpower requirements in aluminum production are extremely modest, since most of the plants are away from metropolitan areas where manpower and housing are scarcest and because of the constant and growing demand for aluminum by the aircraft industry on the West Coast, there seems reasonable basis for the plea to continue the bubbling of these comparatively new but promising far western pot lines.

THE largest forging press west of the Mississippi has just been installed and set to work at the Bremerton Navy Yard on Puget Sound. This 2200-ton press with its squeeze of 2,000 lb. per square inch was once headed for Japan and was fortunately awaiting shipment at Portland when the belated embargo on materials for Japan was placed.

Bremerton Yard is still short 8,000 civilian workers, and in addition to the recruiting drive, Secretary of the Navy Frank Knox has established a Navy manpower survey board for the Pacific Northwest district to check all Navy manpower in shore installations in Oregon, Washington, Idaho, Montana and Wyoming in the hope of diverting unnecessary labor to Bremerton.

There is even a possibility that Bremerton may, after all its years of ferrying visitors, workers and terminal freight from Seattle for 20 miles across the Sound, get a mainland railroad terminal connection. Bremerton itself is on a promontory finger pointed northeast and connected by a narrow neck to the Olympic Peninsula. The prospective railroad will be a 40-mile extension of the Northern Pacific Elma-Shelton branch line, west of Olympia, and circling the southern and western shores of Puget Sound. One of the most difficult rail freight deliveries in the country are now to Bremerton Navy Yard because of the barging of all cars, the necessity of awaiting favorable tides, the menace of storms and the limited barge docks, ferry accommodations and 16-car team track at Bremerton. The contemplated mainland rail connection would break the bottleneck, but by the time these 40 miles of rail are in, the pressure will probably be off.

CLIMAXING months of negotiations, appeals, strike votes and deferment of decision, 800 foundrymen from Pacific Car & Foundry Co., Olympic Steel Works, and Western Steel Casting Co., Inc., were out on an "unauthorized" strike on Jan. 7. Members of the Tacoma local were meeting to decide on effecting their strike, voted some weeks ago. War Labor Board had recommended an increase of eight cents per hour for unskilled workers, up to nearer the aircraft, unskilled shipyard and foundry helpers minimum in California. Union requests had included also a corresponding increase for journeymen and other classifications, to remove an historic differential between the Pacific Northwest and California scales, and to allow classifications equal to the California basis on all grades.

Philip G. Johnson, president of the Boeing Aircraft Co., was acclaimed "Seattle's first citizen" at an annual civic banquet sponsored by the Seattle Real Estate Board on Jan. 13. Graduated in mechanical engineering from the University of Washington, he started to work as a draftsman in William E. Boeing's one-year-old Boe-

ON THEIR WAY THE MINUTE YOU SAY "RACO 11 ELECTRODES"

For Now We Can Guarantee You Immediate Delivery of RACO 11

That means you can have at once the electrode the Welding Foreman of one of the largest shipyards calls "the best my crew has worked with ... it's the electrode that assures X-Ray clean welds free from gas pockets and slag inclusion."

RACO 11 has proved the hard way—top-flight performance on thousands of jobs—that it is the ideal utility electrode. On AC or DC it gives superior results on mild steel in all positions. And it complies with the following specifications: A.W.S.—A.S.T.M. Filler Metal Specifications A233-42T Classification E6011; Navy Bureau of Ships Specification 46E3, Grade III, Classes 1, 2, 3; American Bureau of Shipping Specifications HIG and BIG; A.S.M.E. Boiler Code, Paragraph U68.

Immediate delivery of RACO 11 Electrodes means you can profit right away from their many advantages. Write NOW for NEW CATALOG and samples. We'll send along complete information on RACO Electrodes for every welding job.

The **REID-AVERY COMPANY**

DUNDALK BALTIMORE 22 MARYLAND

ing Airplane Co., May 4, 1917. Johnson also heads the Kenworthy Motor Truck Corp.

Production economies and greater labor utilization through mass production and assembly line methods have reduced its price of planes to the government aproximately 50 per cent, Boeing reports, so that refunds on a single contract amounted to $120,000,000, the cost of 400 planes at $300,000 each. In addition there has been a 27 per cent increase in wages paid workers. Present rate of production is ten times that of November, 1941, and 92 per cent greater than at the start of 1943.

CORRESPONDING gains in productive efficiency and volume of output are reported at the close of the year for all West Coast warplane builders. The seven major Pacific Coast plants turned out 141,480 tons of warplanes in 1943 which is a 72.31 per cent gain over 1942's total of 82,106 tons. The goal for 1944 is to be 225,000 tons, a 56 per cent increase over this year. In units, the 1943 output reported for the members of the Aircraft War Production Council was 26,636 whereas in 1942 it was 17,694. This indicates that the average plane last year weighed 5.3 tons whereas the average for the previous year was 4.66 tons. Since West Coast plants produce 60 per cent of the nation's heavy bombers, the trend is unmistakable. In sharp contrast to the custom tailoring methods of 1940, it develops that for every 100 workers then required to build an attack bomber only nine are now necessary, only five on an interceptor and only ten on a medium bomber. But turnover of workers is still the biggest obstacle for 17,000 workers leave their jobs in these far western aircraft plants every month. Although this is better than the former average of 20,000 per month, it is still a restless, irresolute indictment of too many civilian workers in the battle for survival.

Douglas Aircraft Co. is justifiably proud of its own world's record output of 48,223 tons of combat planes in 1943 valued at a cool billion dollars. Direct manhours per plane were reduced by this company more than 50 per cent and in some instances as much as 71 per cent, the company reports. Furthermore, the company decreased its per unit cost to the military an overall 22 per cent and paid out more than $50,000,000 in taxes to Federal, state and local government.

o o o

Full Employment Set at 54,000,000 by Brookings

Pittsburgh

• • • **In a comprehensive** study on post-war re-employment by Karl T. Schlotterbeck, published by The Brookings Institution, Washington, D. C., the following conclusions were presented by the author:

Demobilization will be gradual rather than precipitate in character. It will extend over a period of two to three years—depending upon the time required to liquidate the Japanese after the Nazis are defeated. Industrial reconversion and re-employment are even now under way and the process will be rapidly accelerated after the termination of the European conflict, and from 6 to 7 million war workers and service men may well be demobilized before the end of the Asiatic conflict.

During the transition years the employment problem will be eased somewhat by the fact that the total number of potential workers will be appreciably smaller than in 1940. This results from the fact that substantial numbers will still be in the armed forces, while at the same time there will be a bulge in the number of schools and colleges.

In a dynamic society "full employment" does not imply complete employment of the labor force. Several millions would, for one reason or another, not be working at any given moment. A state of reasonably full employment at the end of the transition period would be realized with an employment level of 54 millions. This would mean an increase in employment over 1940 of about 8,000,000, or roughly 17 per cent.

The additional employment required will have to be found not in manufacturing alone but in all the major fields of economic activity, including transportation, public utilities, mining, agriculture, construction, trade, and service activities. Since there is good reason for believing that the level of production and employment will for some years be substantially above that of 1940, the outlook for satisfactory employment is distinctly encouraging.

Bolivia Increases Tungsten Output for U. S. War Effort

• • • **Bolivia is producing** increasing quantities of tungsten, a strategic metal needed by the United Nations for high-speed tool steel, armor plate and other war purposes. The country's tungsten production for 1943 is estimated at about 3600 metric tons. This compares with 3363.2 metric tons in 1942 and 2676.3 metric tons in 1941.

Before the war China was the leading source of tungsten, and the metal has continued to come out of that country by plane. The war, however, has increased the need. Bolivia and other American republics stepped up their production as part of the wartime program of inter-American cooperation.

Bolivian production has been stimulated by United States loans to miners for purchase of equipment and development work, the loans being returned through deductions from payments for tungsten produced.

Bolivia's economy long has been dependent on tin exports, but greater development of other metals and products is being sought as a means of diversifying and strengthening Bolivian economy.

WHY EXTRA SCRAP IS NEEDED AGAIN!

The morning news flash reads: "Another beachhead was established. . ."

Sounds matter-of-fact, doesn't it? Yet back of every successful new landing are weeks—even months of preparation. Thousands of troops must be trained; thousands of tons of steel fighting equipment must be ready.

Steel must provide the spearhead and protect precious lives. But the plain fact is *there won't be enough steel* unless American plants overcome the normal "winter lag" in scrap collections. It is estimated that an additional *15 million tons of scrap* will be required.

This is not an appeal for the ARMCO furnaces alone. Actually, every steel mill in the country must go full blast all winter if military requirements are to be met. And the only assurance of this will be a flood of millions of tons of *extra* scrap.

You "did the job" last winter. This year, with a second front in view, the need is even more critical. Get your salvage committee back in action. Collect everything that doesn't serve a useful purpose. Separate the ferrous and non-ferrous metals and then call the scrap dealer.

Remember, every ton of scrap you collect will help win a battle —*and save lives.* The American Rolling Mill Company, 381 Curtis St., Middletown, Ohio.

TURN IN ALL YOUR SCRAP

Fatigue Cracks . . .

BY A. H. DIX

Alien Interpolation

Did you hear what happened to a certain publisher—a windy fellow—who addressed a meeting of engineers in an Eastern city a few weeks ago? He was reading from a manuscript he had apparently not taken the precaution to proofread, and which must have been a terrible struggle for the typist. His words were something like this:

> *"The American businessman is tired. He has worked long and hard in the war effort. He is tired mentally, and he is tired physically. But he isn't a bit more tired than the poor stenographers who have to type eyewash like this."*

He had been reading mechanically. When the audience expressed its delight, he shouted indignantly, "I never wrote that!" It was the high point of the meeting.

—*S. H. Brams*

Aptronym—Once Removed

Right next door to the office of the Forest Service official in charge of forest fire prevention is Burnham Asch.

—*Berryman Davis,*
Federal Trade Commission, Washington

Curves in Your F.F.J.

• • • We had considered the Postmaster General's withdrawal of *Esquire's* second-class mailing permit as no concern of ours, but the *Philadelphia Record* pitchforks us into the controversy with this editorial:

> The Postmaster General says his action is taken on the ground that Esquire fails to meet the requirements of being "originated and published for the dissemination of information of a public character or devoted to literature, the sciences, arts or some special industry."
>
> If Esquire can be banned on such broad grounds, then Walker could ban almost any magazine in America with the possible exception of the National Geographic, Editor and Publisher and The Iron Age.

The editorial writer weakens his point by including the *National Geographic,* as that magazine frequently contains photographs of tropical belles who are no better insulated against drafts than is the Varga girl. Which leaves just us and *Editor and Publisher.* The latter publication can speak for itself, but as for us, the advent of women into our segment of the industrial field has brought voluptuous arcs into even our ordinarily monastic pages. As evidence, we offer this fragment of an illustration in one of last month's issues:

Not knowing how far the Postmaster General plans to go — or, for that matter, the brains department — we feel it wise to begin gnawing at this fetter on the freedom of the press. We think the Postmaster General exaggerates the potentialities for harm in Varga's airbrushed delicacies, and that he is to be criticized for failing to give due weight to Varga's contribution to the improvement of the species by providing a new ideal in chassis design.

Iron Negative

• • • Speaking of annealing, W. G. Conant, G. E. works laboratory metallographist, was recently examining a specimen of "educated" cast iron. Some fortuitously placed ferrite lines give a direct answer to the question of whether the specimen had been annealed.

Ferrous Sofa

CANADA RELAXING ON STEEL

—*Iron Age headline*

In the annealed state, of course.

Greeleys in Case Lots

This is the way I heard it: When Horace Greeley, who insisted that the word "news" is plural, was a cub reporter he received an out-of-town assignment.

Not having heard from him for several days, his editor wired "NO WORD FROM YOU. NO NEWS?" Greeley replied, "NO. NOT A SINGLE NEW."

—*Carl D. Anthony,*
Continental Screw Co., New Bedford, Mass.

The story is doubtless apocryphal, as Greeley was a great newspaperman and there are always news. Which gives us a good opening to clap hands over the harvesting job being done these days by your favorite family journal's Greeleys. The news crop is of bumper proportions, and the brains department is depositing in your lap every sound sheave.

To our biased eye, the reporting job done in last week's Annual Number is the most brilliant in our history. Some of its features establish new high marks in industrial journalism. As a whole, the book will be as useful to you as an X-ray machine is to a bonesetter.

Polar Parallel

In John L. Keenan's excellent book, "A Steel Man in India," which George R. (R. S. Stockvis & Sons) Woods gave us for Christmas, contains this chilly simile:

He had a manner as cold as snow on a convent roof.

Timing Is Everything

Your story about the speaker with the Phi Beta Kappa key reminds me of something that happened to me. I was doing some work for the old ....., which had hired one of those professional spellbinders to come in and needle the sales force.

The president, who was very enthusiastic about the guy, said to me, "He's conducting a sales meeting up on the top floor now. Why don't you go up and listen to him for a while?" So I went. The elevator, although I didn't know it, opened directly into one side of the meeting room. So when the elevator audibly stopped and the doors opened, everybody's head turned to see who it was. The speaker also stopped.

Like any gentleman invading a man I sort of oozed in on tiptoe so as to disturb things as little as possible. My arms were full of overcoat, briefcase, etc., as I sidled along the wall toward a seat.

I'll never know what he had just been telling them—I suspect it was something about Milquetoasts—but there was a roar of laughter from the assemblage that shook the window panes. I got red, completely blew my top, stood up and said, "Any you guys want to go outside?" But they only howled louder.

—*Deac*

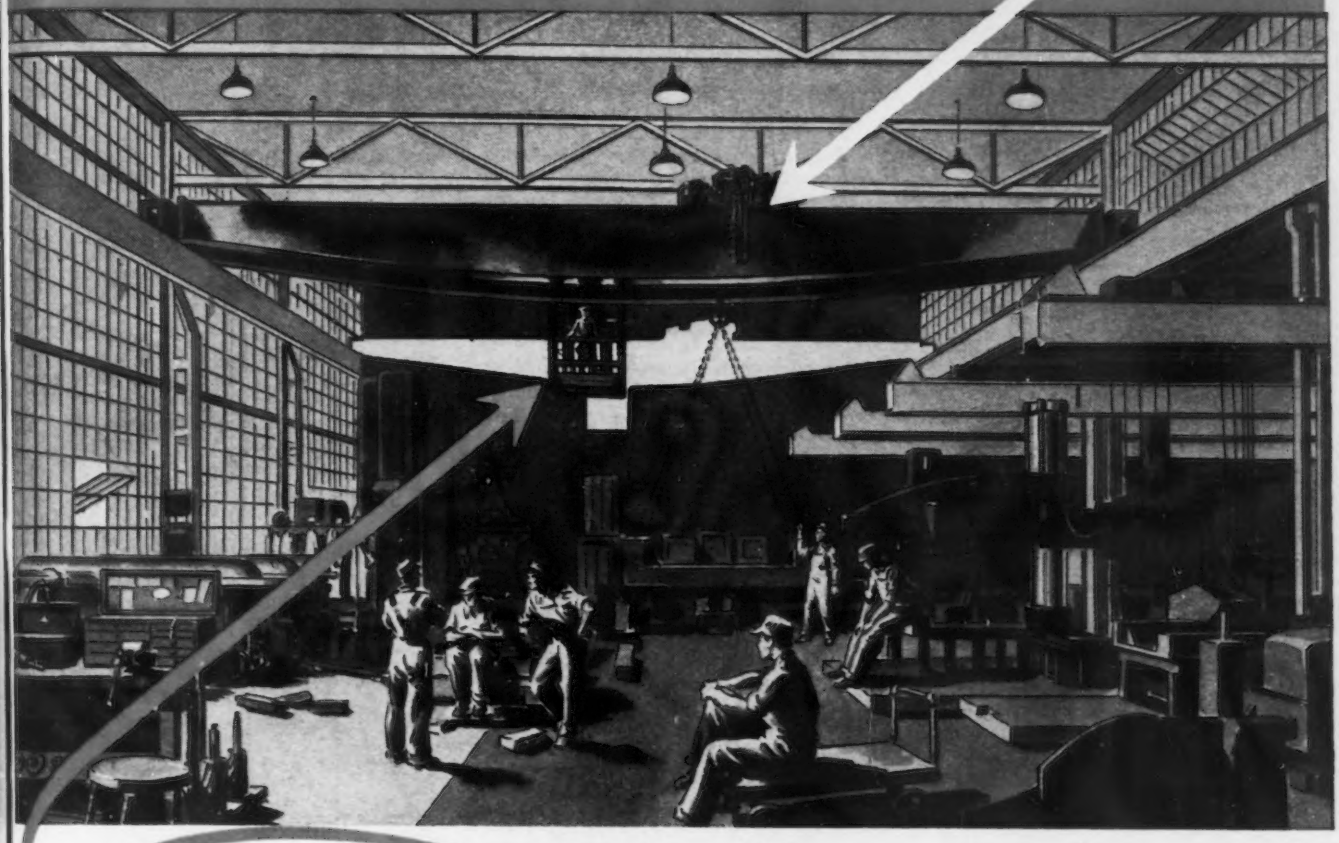
Puzzles

Last week's wind blew at 7½ m.p.h.

Four minutes should do for this:

Find a three-digit figure whose digits total 18, and subtract from it a three-digit figure whose digits total 12, and for a result get a three-digit figure whose digits total 6.

WAITING FOR THIS CRANE LOSES LOTS OF MAN HOURS



AN EXTRA Northern CRANE Would Save Them

Maybe they wait only a few minutes—but if they do it many times a day, plenty of man hours are lost—and you pay for them.

Moreover, the whole production schedule is slowed—time is lost everywhere—costing money and impeding your part of the war effort.

An extra Northern Crane on the runway will save all these countless minutes now being lost. Also, if you have an extra crane you need not fear breakdown—it won't tie up your shop.

Investigate the time saving possibilities of an extra crane.

Northern Cranes are fast, powerful, strong, have fine control. They are the fine machine tools of material handling.

Northern ENGINEERING WORKS

General Office: 2607 Atwater St., DETROIT 7, MICH.

NORTHERN CRANE & HOIST WORKS Limited • WINDSOR, CANADA

OFFICES IN PRINCIPAL CITIES

Dear Editor:

FEWER BONDS, MORE TAXES

Sir:

For quite a while now I have been reading of warnings of impending inflation in various columns of your journal. Which is fine.

Now, the other day I received a card from the Treasury Dept. asking me to help out during the Fourth War Loan. Maybe you did, too. Which is also fine.

But maybe it would be better, from the standpoint of stopping this inflation—if that time which I might spend vending bonds were spent in spreading the word—in whispers of course—that it would be much better for all of us if we have heavier and heavier personal income taxes *now*—not later!

If you know of any organization of one or more that is working on this, could you pass the word along? I would like to sign up.

ROBERT A. BEUTTLER
53 Annapolis Terrace
San Francisco 18

● We know of no group, not even Congress, dedicated to fewer bonds and heavier taxes. —Ed.

DUO-LIFE

Sir:

Could you give us the name of the steel company who makes a steel called "Duo-Life," which is used for making stamps for marking steel?

E. W. NESTOR
Reiff & Nestor Co.,
Lykens, Pa.

● Duo-Life is unknown to us.—Ed.

STELLITING

Sir:

We are very much interested in the article in your Dec. 23 issue, "Extending Gage Life by Stelliting."

We would appreciate your advising us of any outfits in Long Island City or vicinity who do this work.

LOUIS S. KROTO,
Asst. Treas.
Phoenix Machine Tool Corp.,
41-38 37th Street,
Long Island City 1, N. Y.

● Frank Roth Co., 4278 Park Ave., New York, and Weldrite Co., 29-23 40th Rd., Long Island City, N. Y.

PLASTER MOLDS

Sir:

On a recent trip to the United States the writer heard rather briefly of a process of making non-ferrous castings in plaster molds.

We should like to know if any information has been published on this subject.

JOHN GODDARD,
Experimental Engineer
The Frost & Wood Co., Ltd.,
Smiths Falls, Ontario, Canada

● See "Plaster Molds, Capaco Process," in Oct. 9, 1941 issue, and "Antioch Plaster Process," Apr. 9, 1942 issue.—Ed.

ANDERAN

Sir:

In your Dec. 9 "News Front" reference was made to the new word "Anderan," coined by Dr. E. J. Abbott.

We are interested in learning more about this unit of measurement. We would also like to receive the address and affiliation of Dr. Abbott.

JOHN L. FULLER,
Experimental Engineer
The Reliance Electric & Engineering Co.,
1068-1088 Ivanhoe Road,
Cleveland 10

● Dr. Abbott can be reached at the Physical Research Laboratory, Ann Arbor, Mich. "Anderan" was first mentioned in his talk at the A.S.M.E. annual meeting. You may be able to get a copy of it from A.S.M.E., 29 W. 39th St., New York.—Ed.

CHARCOAL IRON

Sir:

I liked Ralph Sweetser's article on charcoal iron in your July 1 issue. I know of no one better versed in how to run a charcoal blast furnace.

Charcoal is a farm crop and can be produced by man, while coke when burned is lost forever.

In my younger days there were 800 charcoal furnaces in the U. S. As a boy, with my father, the late P. L. Weimer, I saw about 600 of them.

EDGAR A. WEIMER, SR.,
Consulting Blast Furnace Engineer
245 Seneca St.,
Harrisburg, Pa.

VIBRATION TEST

Sir:

On page 90 of your Dec. 9 issue we noticed a paragraph concerning a paper by Benjamin J. Lazan entitled, "Some Mechanical Properties of Plastics and Metals Under Sustained Vibrations."

We are anxious to secure several copies of this paper.

D. D. BARBOR,
Asst. Chief Metallurgist
Kaiser Company, Inc.,
Iron and Steel Division,
Box 217,
Fontana, Calif.

● Write to Benjamin J. Lazan, Sonntag Scientific Corp., Greenwich, Conn.—Ed.

SEAPORCEL

Sir:

Can you tell me who manufactures the coating material referred to as Seaporcel in the "News Front" of Oct. 21?

J. H. BULL,
Chemical Engineering Dept.
The Dow Chemical Co.,
Texas Division,
Freeport, Texas

See below.—Ed.

Sir:

We note from your Dec. 16 issue that A. E. Flowers of the DeLaval Separator Co., Poughkeepsie, N. Y. is interested in knowing where Seaporcel can be obtained.

Seaporcel is our product.

M. J. SALTZMAN,
President
Porcelain Metals, Inc.,
38-20 Borden Ave.,
Long Island City 1, N. Y.

SEIZED PATENTS

Sir:

Enclosed is 24c. Please send set of reprints of seized patents covering metal products as published serially in THE IRON AGE.

KEN BROOMELL,
Purchasing Agent
Archer & Smith, Ltd.,
125 North Eastern Ave.
Lexington 34, Ky.

Sir:

Please send the 22-page reprint of seized foreign patents. If there are any future lists, please forward them.

H. MANDEL,
President
Wickman Corp.,
15533 Woodrow Wilson Ave.,
Detroit 3

● The 22-page reprint includes seized patents published up to and including the Nov. 25 issue. For additional lists see every subsequent issue except Dec. 30. The list in the current issue begins on page 154.—Ed.

NE STEEL CHART

Sir:

You published on May 6, 1943 "THE IRON AGE NE Steel—Standard Steel Chart." We have found this chart quite useful and if possible would appreciate receiving an additional two or three copies.

GEORGE L. BOND
Darby Corp.
Kansas City, Kan.

● Twenty-five cents each.—Ed.

TOOL STEEL DIRECTORY

Sir:

We are interested in your Tool Steel Directory. Please send us a copy at $1.

GLENN D. EASTON,

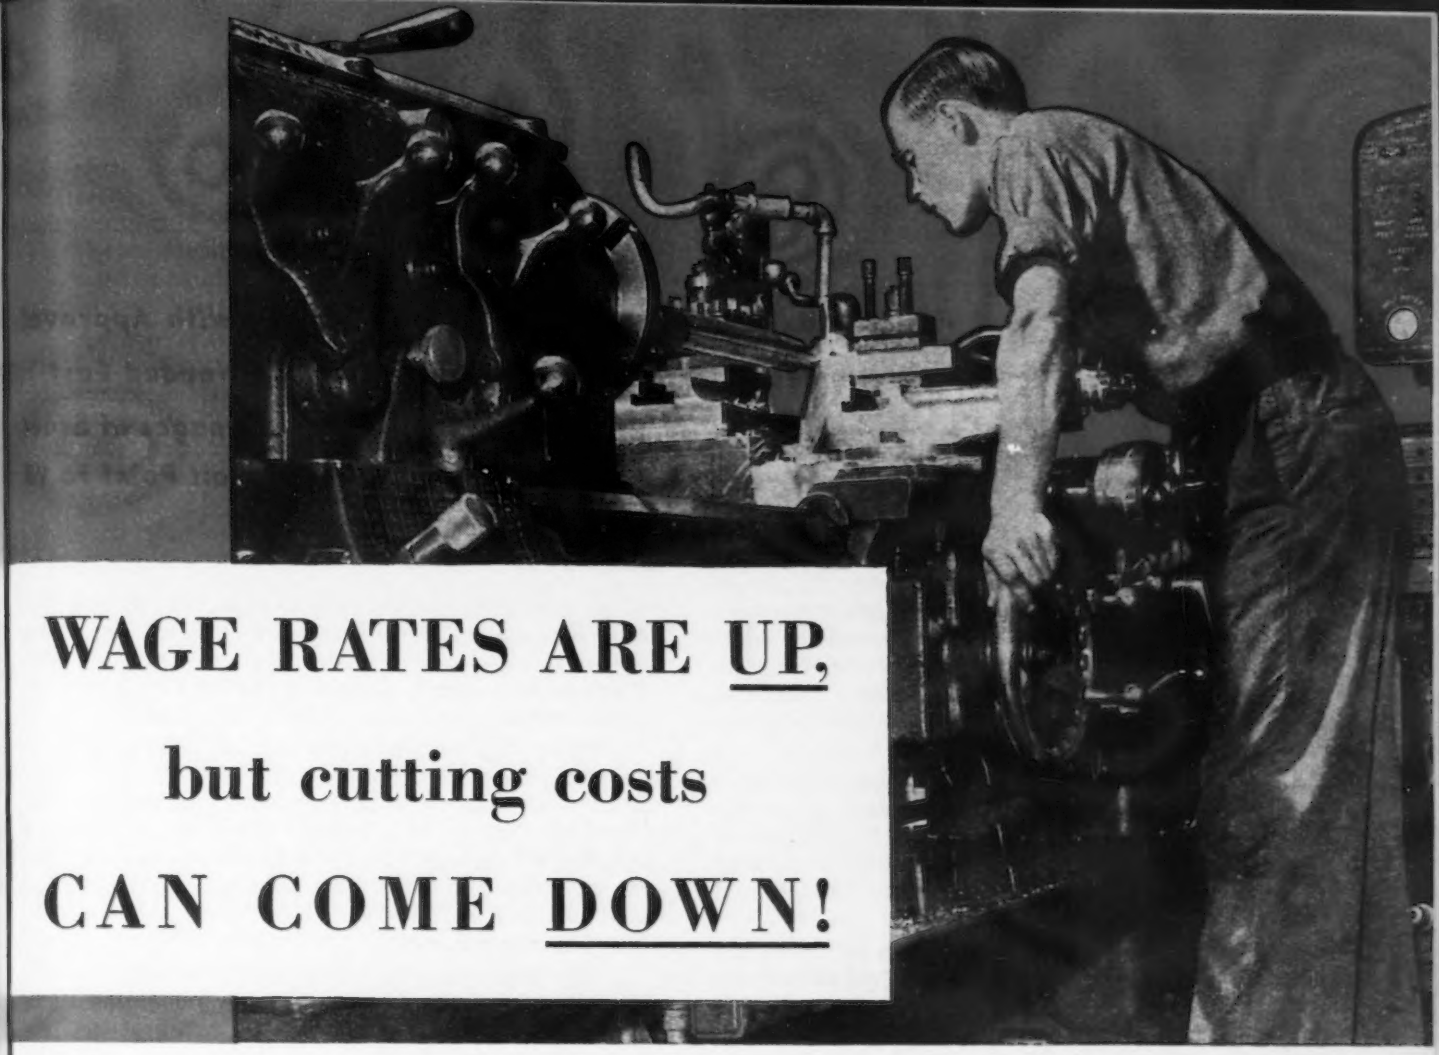
Technology Department
Pittsburgh 13



WAGE RATES ARE UP,

but cutting costs

CAN COME DOWN!

★ Sound postwar planning will include a searching analysis of mechanical equipment, to be sure no opportunity is lost to lower production costs. Only this way can the price of postwar commodities be kept within the reach of everyday buyers. Otherwise, sales will be scarce, production low, and "full employment" cannot be attained.

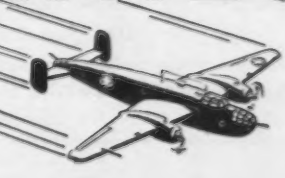
The use of modern machine tools in increased numbers, and at their highest efficiency, is one of the surest ways of cutting costs. For instance, Monarch lathes cut production costs and produce more parts with greater precision and fewer rejects. Such tools should be "musts" on your reconversion timetables.

It is time, now, to make your machine tool surveys. Monarch engineers can help you. Under the pressure of war production, they have devised many turning shortcuts that can be applied equally well to peacetime products. Our practical experience in utilizing the many timesaving features of Monarch lathes is at your service, to help you produce more goods for more people, at lower cost.

THE MONARCH MACHINE TOOL COMPANY · SIDNEY, OHIO

MONARCH LATHES

Save Time



This Industrial Week.

- **Baruch Uniform Termination Clause Greeted with Approval**
- **Steel Industry Expedites Invasion Equipment, Needed Fast**
- **Railroads and Can Makers Getting Heavier Tonnages of Steel**
- **National Steel Ingot Production Rate Up One-half Point to 98**

MANY uncertainties were cleared away this week for metals producers and users with the adoption of the Baruch-Hancock Uniform War Contract Termination clause, framed in less than two months following a long controversy between procurement agencies.

There is gratification among industrialists over the fact that a start has been made toward solving the intricate termination problem which still holds many ramifications. The fact that competitors will be treated similarly and with a minimum of delay has aroused favorable comment.

Meanwhile, the steel industry with its operating rate higher this week, is driving hard to expedite items needed for invasion equipment in increasing quantities and faster than expected. At the same time, heavier tonnages of steel for railroads and can-makers are indicated.

Steel for 10,000 domestic freight cars to be made in the first quarter has been provided for and material has been assigned for 10,000 more cars for second quarter. Passenger cars may be built in third quarter and close to 40,000 freight cars may be purchased for use abroad. Rail orders are heavy and mills look for a 20 per cent increase in output this year over 1943. With controls revised through Order M-81, output of tin plate in second quarter will exceed last year's output and may be 100,000 tons above estimated production this quarter. The tentative setup for second quarter calls for about 720,000 tons.

REPORTS that are considered reliable say that the President has promised the Russian government equipment and facilities to increase its steel capacity by 8,000,000 tons. The equipment, it is said, is to be furnished after the war ends, according to a Russian protocol in which the agreement is reported to appear. On the whole, the tonnages now being mentioned are lower than some market experts expected. British Dominions have been requesting new capacity also. This is said to have caused consternation to English Cartel Planners who oppose increasing the steel independence of the various parts of the United Kingdom.

Steel plate shipments, which set a new peak in December and rose to an all-time high mark of 13,382,390 net tons in 1943, are continuing heavy. The Maritime Commission's current inventory is estimated at 2,500,000 tons, or about five months' supply. By the end of June shipyards may have all the steel they need for 1944, and they may be thinking about disposing of excess material.

The steel plate situation is worthy of attention not only because it is one of the few remaining tight spots, but because of its widespread ramifications. As has happened previously in other items, demand may drop when the supply of plates begins to gain, because buyers will no longer feel it necessary to maintain high inventories. Then plate orders in many sizes can be removed from high speed continuous mills freeing the latter for strip and sheet output.

Last year's record production of 88,872,598 net tons of steel ingots, up nearly 3 million tons from 1942, will stand undisturbed for a long time, acording to all present indications. Excess ingots are just as great a problem now as they were two or three months ago. Four steel plant expansion programs have been cut back recently because they are not necessary for the war effort, and other projects are being reviewed for possible termination. About 480 beehive ovens have been blown out recently due to slackened demand for this type of coke.

INFLUENCED by the easier situation in steel products other than flat rolled, some consumers are beginning to shift their orders for a variety of reasons including unwillingness to pay higher than ceiling prices which a few producers are allowed to charge with OPA aproval, or desire to save on transportation costs. The policy of the WPB itself is to withdraw directives where prices have been above the ceiling, provided the material can be obtained elsewhere. A full return to normal steel distribution and selling practices obviously cannot take place until the war is over, but a partial return is likely.

With the industry on the brink of financial deficits, OPA has started a comprehensive study of steel prices, that is expected to be completed speedily. A price increase may be granted before the WLB acts upon demands of the steel union for higher wages. In the event of a wage boost, it is generally assumed OPA

would recognize the necessity for a further adjustment in prices. Meanwhile, negotiations between steel companies and the union were continuing—with a good possibility that the union might drop its demand for a supplemental contract. It is believed that the WLB will soon be handed the union's demands. Several companies have indicated rejection of the wage demands.

An annual wage guarantee appears to be the demand that the steel union considers most important. In view of the severe depths to which steel operations plunge during depressions, granting an annual wage guarantee would be exceedingly difficult in the opinion of steel executives.

IMPORTS of scrap from battlefields have mounted to large proportions at Atlantic ports. It is becoming a question in the minds of some authorities whether the movement should be continued on such a scale, in view of the numerous accidents that have been caused by unexploded ammunition and "booby traps." Close to 100 shells were reported found in a single carload recently despite the fact the scrap had been screened once by prisoners of war at New York working under the supervision of the United States Army. Thousands of tons of battlefield scrap are piled on docks and barges at East Coast ports and in railroad yards. Storage costs are said to be sizable. Those who are inclined to favor curtailing the imports contend the scrap should be held abroad until after the war, when minute examinations can be made to preclude loss of life and personal injuries, damage to ships and other transportation equipment, as well as damage to valuable steel production facilities.

With some steel companies the subject of freight equalization or absorption on out-of-district orders is an important question now, since its use may have bearing upon proof of the need for higher prices.

Warehouses anticipate an early lifting of the WPB restriction under CMP-4 limiting orders to less than 40,000 lb. unless special permission has been obtained to take a larger order. It is said this amendment also would raise the maximum orders which a warehouse can take without a controlled material allotment from $10 to $25.

Other highlights of this week include: Revelation by Maj. Gen. Lucius D. Clay that production of small arms ammunition during 1944 will be about 36 per cent below 1943; and circulation of reports to the effect that the Government may order aluminum sheets for landing mats, displacing some of the 1,600,000 tons of steel scheduled to be delivered this year for this purpose.

WITH demand for merchant pig iron much easier and allocations scheduled to be removed at the end of this month, conjecture centers around the possible fate of several high cost blast furnaces as well as the disposition of DPC stacks which still are to be blown in. The sale and possible disposition of the Sharpsville furnace may be a straw in the wind. The Mystic furnace in the east will abandon its OPA-approved above-ceiling prices effective Feb. 1 and will operate at least until its present ore supply is used up.

WPB faces an even bigger job this year than it did in 1943. It must grapple with the danger that regulations may not be altered quickly enough to make them realistic with new conditions immediately. Undue delay of this sort would result in the adoption of rules breaking practices by some firms, loss of business by others, and needless confusion for all.

THIS week's national steel ingot rate increased half a point to 98 per cent of rated capacity. Increases by districts include: Pittsburgh, up one point to 97.5 per cent; Youngstown, up two points to 97.5 per cent; Cleveland, up one to 93 per cent; and Buffalo, up three to 102.5. Chicago operations declined one and a half points to 102 per cent and output in the Wheeling district fell off one point to 95 per cent. At Detroit the operating rate dropped half a point to 103.5 per cent while in Cincinnati the rate fell two points to 95 per cent. Eastern district operations dropped to 85 from 95 per cent the previous week. Unchanged from last week are Philadelphia at 91; Birmingham at 99; and St. Louis at 104 per cent.

Annual Wage Guarantee Seen Union's Most Important Demand

NEWS ★ OF ★ INDUSTRY

• • • When the War Labor Board has the steel labor demands shoved in its lap soon, the most important one, from the union's standpoint, will be the request for an annual wage guarantee. Phil Murray regards this issue as something which the union should keep alive until it, or some form of annual wage guarantee, is won.

The annual wage guarantee demand, according to responsible union sources, springs from the experience of steel workers during depression periods. In 1932, it is said, the annual earnings of the average steel worker amounted to about $926. In the past several years, union research staffs have been keeping an eagle-eye on annual wage figures. Murray's request, which is believed to represent the views of the CIO, as well as the CIO affiliate, the United Steel Workers of America, is the first one of such a nature to be made upon a large scale industry.

The steel industry, while turning down any discussion of this union demand, is known, unofficially, to be greatly opposed to the whole idea apparently because it is one of those industries most severely affected by depressions. So much so is this the case, it is said, that the steel rate often drops as much as 10 to 20 points within a short time, and the records show that during depression periods the average ingot rate was hardly more than 40 per cent of rated capacity.

This "prince and pauper" existence, it is said, would prevent "beforehand" knowledge of how many employees would be needed, and thus make impractical the establishment of an annual wage. Over-simplified, the problem is: If the steel mills don't have the business, how can they operate? And, if they can't operate, how can they lay out money for a guaranteed annual wage?

Phil Murray, on the other hand, believes that no conclusions on the relative value or workability of an annual wage guarantee can materialize until the union has an opportunity to negotiate the demand with the steel companies. Since this request has been

o o o

By TOM CAMPBELL
Pittsburgh Regional Editor

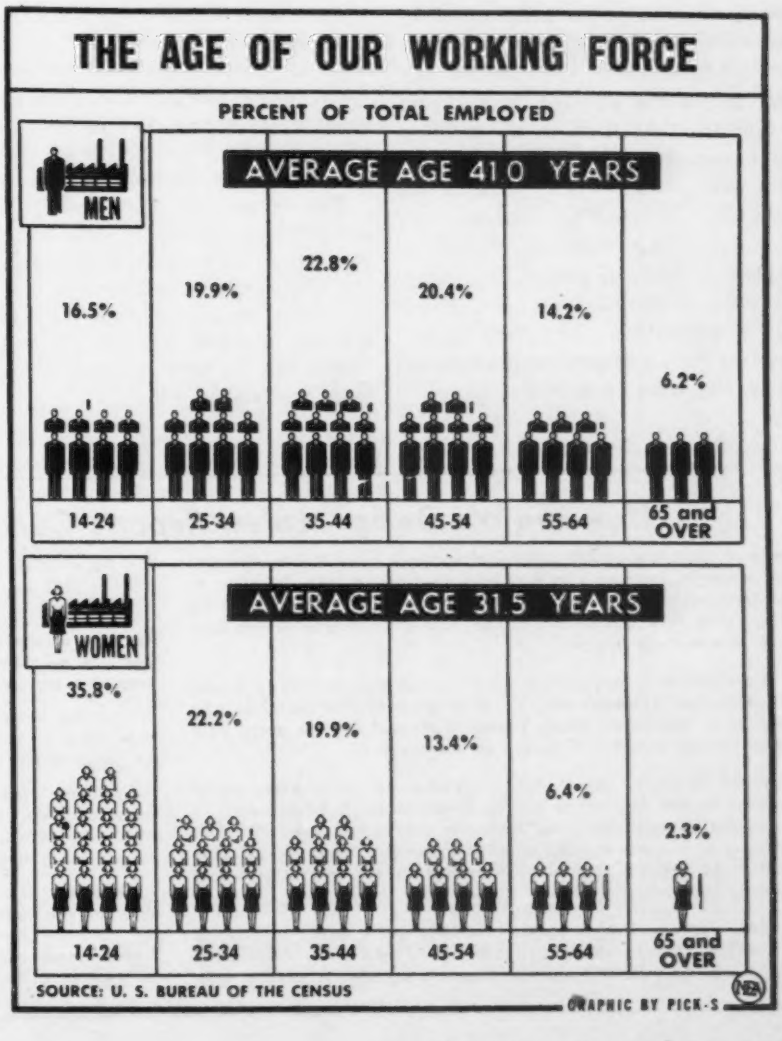
o o o

turned down, Murray will, in all likelihood, pose a serious question for the WLB by not only submitting the proposal to it, but by asking it: "Does this violate the 'Little Steel' formula?"

It is believed, on good authority, that the guaranteed wage envisioned by Murray is not a guaranteed wage for every worker in the steel industry, but a guaranteed wage for those workers for whom there is work. The basic principle, apparently, is that those for whom there is work should be allowed to receive a payment sufficient to supply a living wage, rather than spread the work among so many people that there is insufficient earnings for any.

This attitude of the union, apparently, is in direct contrast to the support given during the last major depression to the method known as "spreading-the-work." Murray believes that this is more "spreading-the-poverty" than anything else. His attitude, further, is believed to be that under the "spread-the-work" era the competition among the unemployed for jobs that require two or three days a week is so strong, that it not only brings down the wage rates but encourages cut-throat competition as well.

Just how the union would be able to negotiate a satisfactory figure, representing the maximum number of employees who would come under an annual guaranteed wage, is certainly not clear at this time. The union is working on the assumption that a guaranteed wage would remove uncertainties relative to security, and thus encourage an expanding purchasing



power, which, the union claims, would iron out some of the peaks and valleys in American industry. Apparently, the whole question is loaded with dynamite, and would require a considerable length of time before both sides even agreed to the principle of the plan. Steel men privately say that it won't work, and that the steel industry is subject to so many severe and sharp economic effects that it would appear to be the least likely one to initiate such a program.

The demand for an annual guaranteed wage involves so many complex matters, that no one steel company could grant such a request if the others did not. For that reason, it may be that the problem, itself, will not be a topic of mutual negotiation, until and unless Murray succeeds in dealing with the steel industry on an industry-wide basis, rather than company by company. The steel union has been after this type of negotiation for the past few years, but has made no headway. Some steel companies are believed to favor industry-wide collective bargaining.

The fact that the steel industry is already petitioning for price relief, to take care of accumulated raw material and labor costs, even before any wage increase is granted, would seem to indicate that it is in no position now to consider an annual wage guarantee plan which would increase its labor bill. If the WLB decrees that the annual wage question should be negotiated, then, of course, the union will have battered down the initial wall of opposition. The road to negotiating such a demand appears to be a long and winding one.

Steel Expansion Program Being Cut Back

Washington

• • • **Because** steel production for the war effort has become ample, further cutbacks are being made in the expansion program and additional ones are expected to be announced soon.

Under a procedure to be followed in all cases in the future, WPB last week in a letter to Jesse Jones, Secretary of Commerce and director of the Defense Plant Corp., recommended cancellation of fund grants for four Carnegie-Illinois Steel Corp. plants, located at Munhall and Braddock, Pa., Gary, Ind., and South Chicago, Ill.

These cancellation plans, details of which are to be worked out by DPC and Carnegie-Illinois, relate to slow cooling pits and hot topping equipment and in some cases to soaking pits and involved $1,658,000. These facilities, construction of which has not been started, were to have been installed to step up open hearth production of alloy and high quality carbon steel by 41,000 tons annually.

Cancellation of these four projects follows the recent termination of construction of the structural steel mill of the Geneva Steel Co., government-financed United States Steel Corp., subsidiary, at Geneva, Utah. Other government-financed steel expansion projects not yet completed, WPB officials pointed out, are being reviewed.

o o o

OPA Starts Detailed Study of Steel Prices

Washington

• • • **Looking to** both the present situation as well as the effect of a further wage increase, OPA has begun a comprehensive study of steel prices covering all products and all producers. Cooperating with the Government price agency the industry is making its entire cost records available following three meetings with the Steel Advisory Committee.

The industry contends that its present earning position is poor and that it justifies higher prices regardless of the CIO United Steelworkers demand for higher wages. Should WPB grant a wage increase, whether all or part of the 17c. an hour demand, a higher price rise will be asked.

It is understood that preparations for the study have been so carefully made that it can be completed within a relatively short time. In the event of a price increase before WLB action on wage demands, it is assumed that OPA would recognize the necessity for further adjustment should labor be granted higher wages.

There has been no important change in published steel prices since June, 1938. OPA froze steel prices in 1942 on the basis of 1941 quotations. Steel companies, however, were enabled to gain a certain net increase under OPA approval by the allowance of some extras which were more or less dormant and also by the so-called emergency freight rate allowances.

How Are We Doing? Latest Reports Concerning War Output

• • • Sixty-five aircraft carriers of all types, some of them intended for lend-lease, were built in American shipyards in 1943, according to Undersecretary Forrestal. Included were six 27,000-ton carriers of the Essex type, nine light carriers of the 10,000-ton converted cruiser type and 50 escort carriers.

Development of jet-propelled fighter aircraft was revealed in a joint U. S.-British statement Jan. 6, which indicated that the craft soon will be in production. High altitude flight and extreme speed have been attained in tests. Propellers are eliminated.

In 33 months to Dec. 1, 1943, lend-lease aid to the Allies totaled $18,608,000,000. Up to the end of November the program took 13.5 cents out of every dollar of American war expenditures. Through October Russia was supplied with 7,000 planes, 3,500 tanks and 195,000 motor vehicles. Munitions comprised 48 per cent of lend-lease exports to Britain.

The American aircraft industry in 1943 set a record in building 667,000,000 lb. of military airframes, nearly two and one-half times the weight made in 1942 and about eight times 1941 production, says the Aeronautical Chamber of Commerce. Average weight of planes built in 1943 was nearly double that of 1941.

Iron ore production last year in the U. S. amounted to 113,554,000 net tons, according to the Bureau of Mines preliminary report. This was a 4 per cent drop from 1942. Shipments at 111,548,000 tons dropped 6 per cent.

American factories produced 8,802 planes in December to make the year's total 85,946, an increase for the year of 80 per cent in numbers as compared with the figures of 1942.

December production of wheeled tractors, used principally on farms, was the largest for any month in two years—in excess of 20,000 as compared with 4200 in December, 1942, according to Donald M. Nelson.

The Navy has received 20,000 landing craft ranging from 450-ft. ships to amphibian tractors, according to Undersecretary Forrestal. An additional 45,000 are being built in addition to 15,000 miscellaneous small craft, rubber boats, etc. More than $5,000,000 will be involved in building landing craft, exclusive of their ordnance.

Many Beehive Ovens Blown Out As Coke Shortage Disappears

Pittsburgh

• • • **Demand for** Beehive furnace coke in the Connellsville region has fallen off sharply in the past few weeks, and this is directly responsible for close to 480 ovens being blown out recently. Apparently coke, which was a bottleneck several months ago, is now relatively plentiful, and there will be no shortage in the near future.

In addition to this definite trend toward easier supplies, the largest consumer of furnace coke for blast furnace production has notified its suppliers that it will take no shipments on Saturdays and Mondays. This move is expected to affect about 1,000 beehive coke ovens in the Connellsville region, and will probably reduce the coke yield from 66 per cent to 60 per cent, due to burning off over the week-end.

Another development is the action of several large steel companies, in making commitments for beehive furnace coke on a monthly instead of a quarterly basis. This is believed to be due to increased by-product coke production, coupled with cutbacks in pig iron output.

The easiness in beehive coke supplies comes at a time when the OPA had just granted price relief, due to increased wage costs, for hand and machine drawn plants. The higher price has already resulted in less demand at those plants where quality has not been up to par.

Last week it became known that the OPA had granted a $1.00 a ton increase on machine drawn beehive foundry coke, and a $1.25 a ton on hand drawn beehive foundry coke. These increases, however, included the 50c. a ton which was granted some months ago on foundry coke. There is very little, if any, foundry coke which is machine drawn. The action makes the present price of hand drawn beehive foundry coke at Connellsville, $8.25 a ton.

Union May Drop Contract Demand

Pittsburgh

• • • **Steel companies** and the United Steelworkers of America were still negotiating early this week, but it is believed that the union will not further press its demand for a supplemental contract, extending the old one and making reference to the War Labor Board decision on a retroactive date. Apparently, the refusal of steel companies to sign a supplemental contract, because they believed the WLB order was sufficient, has caused the union to drop its effort for a signed supplemental agreement. Apparently, both sides believe that the WLB decree is sufficient protection for both the union and the steel company.

It is believed that the WLB soon will be handed the steel union demands by Phil Murray. Three large steel companies have already definitely turned down all demands which involved an increase in the average wages paid. Other steel companies in their negotiations with the union have, it is understood, made it clear they are also opposed to granting any wage increases whatsoever.

Engineering Firm to Study Steel Job Rate Classification

Pittsburgh

• • • **The complex** and exceedingly great number of wage rates for specific jobs in the steel industry may soon come in for a complete overhauling, with the view towards simplification and coordination. Several steel companies have been studying job analysis and simplification of job rates for sometime. Others have started recently.

It is understood that a national engineering concern may soon open offices in the Grant Building, here, for the purpose of conducting a study and coordination of specific job rates, to be submitted to them by several steel companies. Apparently, some effort will be made to set up a master job rate list, the purpose of which would be to iron out, or eliminate, inequalities or duplications in titles or wage rates in the same or closely allied jobs.

Last year, an attempt along this line, involving the steel union, was made, when the United States Steel Corp. and the United Steel Workers of America formed a joint commission to study rate inequalities, etc. After several months of meetings and negotiations, the plan was thrown out of the window and the joint commission dissolved. The reason for the failure of the commission to reach satisfactory conclusions is believed to have been the inability of both parties to arrive at a wage rate which would be somewhere near the middle of those which were higher and lower for the same or similar work.

COMING EVENTS

Jan. 10 to 14—Society of Automotive Engineers, Detroit.
March 14, 15—National Association of Waste Materials, Inc., New York.
April 2 to 5—The American Ceramic Society, Inc., Pittsburgh.
April 12 to 15—The Electrochemical Society, Inc., Milwaukee.

Cut in Small Arms Ammunition Scheduled

Washington

• • • **Maj. Gen. Lucius D. Clay,** director of materiel, Army Service Forces Production revealed on Monday that the production of small arms ammunition during 1944 will be approximately 36 per cent below the 1943 total.

The United States produced approximately $2,000,000,000 worth of small arms ammunition in 1943, according to WPB officials.

"Monthly schedules are already in process of reduction in anticipation of the reduced objectives and production is scheduled to proceed at a relatively uniform monthly rate throughout 1944," General Clay told THE IRON AGE.

Said the General:

"Overall production of ground force equipment in 1944 as now scheduled isn't likely to differ materially from total production in 1943.

"There have been cutbacks among individual programs, such as in tanks, anti-aircraft materiel and small arms ammunition, but these are offset by increased production required during 1944 in other programs.

"On a monthly basis, production of ground force equipment during 1944 is scheduled to reduce somewhat from the peak attained during the last quarter of 1943, and will level out at approximately the third quarter, 1943 rate. This represents a drop of between 7 and 8 per cent from the average rate during the last three months of 1943."

Byrnes Adopts Baruch Clause Making Profit on Unfinished Work 6 Per Cent

By DONALD BROWNE
Washington Staff

Washington

• • • **Bernard M. Baruch** and John Hancock put out their uniform contract termination article and a statement of principles for determinations of allowable costs in final contract settlements, last Saturday. At the same time, Justice Byrnes, director of the Office of War Mobilization, issued a directive making the clause and the cost policy effective in all contracting agencies.

The Baruch clause and cost policy which has been agreed to by the joint contract termination board composed of representatives of the War, Navy and Treasury departments, the RFC subsidiaries and foreign economic administration differs from the existing War Department clause in four major respects:

1. A profit formula providing for a maximum of 6 per cent on work begun but not completed and 2 per cent on unprocessed inventory where the inventory is allocable to the contract.
2. Direction to contractors to assign to the government all of their interest under orders of contracts terminated. This opens the door to merged settlements of a number of contracts with the manufacturer, separate settlements with subcontractors where it is deemed proper and for subrogation of the contractor's rights to the government wherever the contractor settles with the supplier under the terms of the uniform clause.
3. Permission is granted to contractors to apply to the procurement agency for leave to charge higher prices to compensate for increased cost of doing business where it is directly attributable to partial terminations.
4. A greatly liberalized policy with respect to allowable costs.

In general the termination article sets forth two things: (1) The obligations imposed on a contractor when the government tells him to stop work; (2) the method of finding out how much money is coming to him.

Nine steps are provided for the contractor to follow when his contract is terminated:

1. Stop work on the date specified.
2. Place no further orders for materials, etc., except that required for unfinished work, which will be completed.
3. Terminate all orders and subcontracts on the contracts halted.
4. Assign to the government all right, title and interest in such contracts.
5. Settle all claims arising with subcontractors in the discretion and at the direction of the contracting officer.
6. At the contracting officer's direction, transfer all title and deliver to the government fabricated and unfabricated parts, work in process and plans, drawings, connected with the work.
7. Sell inventories and work in process at the direction and under the approval of the contracting officer at the best price obtainable. The contractor is not required to extend credit and may purchase the property himself.
8. Complete unterminated work.
9. Take any action necessary to protect and preserve property in which the government has an interest.

The amount due the contractor may be determined in two ways. He may negotiate his settlement with the contracting officer, including a reasonable allowance for profit, or he may resort to a profit formula. Negotiated settlements will be preferred by the Army, at least.

The formula provides for three elements. They are:

1. The contractor shall be paid "forthwith" for completed articles delivered and accepted at the contract price.
2. He shall be reimbursed for certain items of cost plus a fair and reasonable profit allowance not to exceed 6 per cent of a portion of such costs.
3. He may receive the reasonable cost of taking care of government property, plus any expenses incidental to the settlement.

The cost items to be allowed under the second element are:

1. The cost of unfinished work, including amounts paid or payable to subcontractors.
2. The cost of settling any claims arising out of the termination of subcontracts.

To these two cost items would be added two elements of profit, which are:

1. Up to 2 per cent of unprocessed inventory allowable to the particular contract.
2. A fair and reasonable percentage of the remainder of the unfinished work.

The aggregate of these two, however, may not exceed 6 per cent of the cost of the unfinished work.

The following costs were listed as allowable: common inventory, common claims of subcontractors, depreciation, experimental and research expense, engineering developmental and special tooling costs, losses on facilities specially acquired for performance of the contract, advertising, special leases, interest, expenses connected with the termination settlement, costs of protecting government property.

In addition, properly apportioned non-recurring initial costs, such as labor training, excessive rejections and unusual overhead will be allowed.

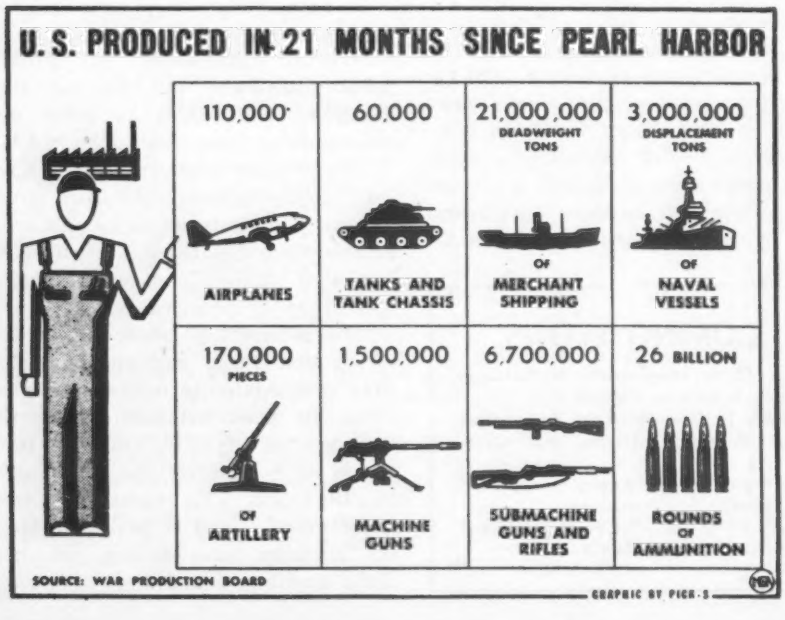
Costs which are not allowable are as follows: reconversion, other contract losses, expenses of reorganization or recapitalization, tax or anti-trust litigation, expenses losses on investments and premiums for insurance on the contractor.

While the procurement agencies concerned may agree with OWM's new policy, criticism is expected from the General Accounting Office and certain Congressional factions.

The GAO complains that the extent of the record to be made in settlement for audit purposes has not been set forth. The members of Congress who are critical say that this is one more case of where the executive is trying to usurp the prerogatives of the Congress.

Some WPB officials say that while they do not disagree with the clause and cost policy, they were disappointed that the report did not cover more territory. Yet the arrangement is not rigid nor too detailed, all parties agree. Regulations will have to be worked out.

Baruch and Hancock in their letter of transmittal to Justice Byrnes said that their first recommendations cover merely a part of the vast termination picture. Such problems as the keeping of adequate records, the special prob-



BERNARD M. BARUCH

lems of subcontractors, payments, loans, appeals, company wide settlements, the disposal of property and the need for legislation will be subjects for further reports.

The policy expressed by Baruch and Hancock has four objectives: Application of the termination article to subcontractors, quick payment of what the government owes, provision for adequate records to prevent and detect fraud, and the clearance of government-owned machines from war plants within 60 days. If contractors wish to incur the risk, they will be permitted to remove machinery and material before 60 days elapse after the filing of inventory lists, if they assume responsibility therefor.

The plan for the merging of the claims of major prime contractors, not as yet announced by OWM, is expected by other agencies to come out soon. Under this plan major prime contractors would not pay off their subcontractors. The suppliers would get paid directly by the government and the Baruch clause seems to be pointed this way through the provision for assignment of all claims of subcontractors to the government.

The merging of claims would obliterate contract lines and make it possible for the government to settle with 1650 contractors for 90 per cent of all contracts and 85 per cent of all the money owed by way of termination charges, some procurement agency officials think. Suppliers' claims, while numerically large, would represent relatively little money. The plan has been likened to PRP, using money.

Three important new costs which will be allowable are experimental and research expenses, engineering, developmental and special tooling costs, and loss on facilities where the machinery was specially acquired for the performance of the war contract and represents a loss on a peacetime basis.

These preliminary costs in fixed price contracts, while included in price, will fall heavily on the contractor where the contract is terminated when say 66 2/3 per cent complete. The allowance is based on the relation of the remainder of the contract to be finished to the portion complete. In other words, the contractor is reimbursed for the part of the cost which would have to be allotted to the unfinished part of the contract.

The steel industry will benefit by the cost embracing loss on facilities.

o o o

Fears Are Allayed by New Clause

New York

• • • **War contractors** have greeted the Baruch-Hancock report as a uniform measure for settling contract terminations equitably and with a minimum of delay by government agencies.

Although the fixed profit limitation of 6 per cent on goods in process has been termed arbitrary by some, it does reassure contractors that all will be treated similarly. Any fears that competitors will have received more favorable treatment are allayed.

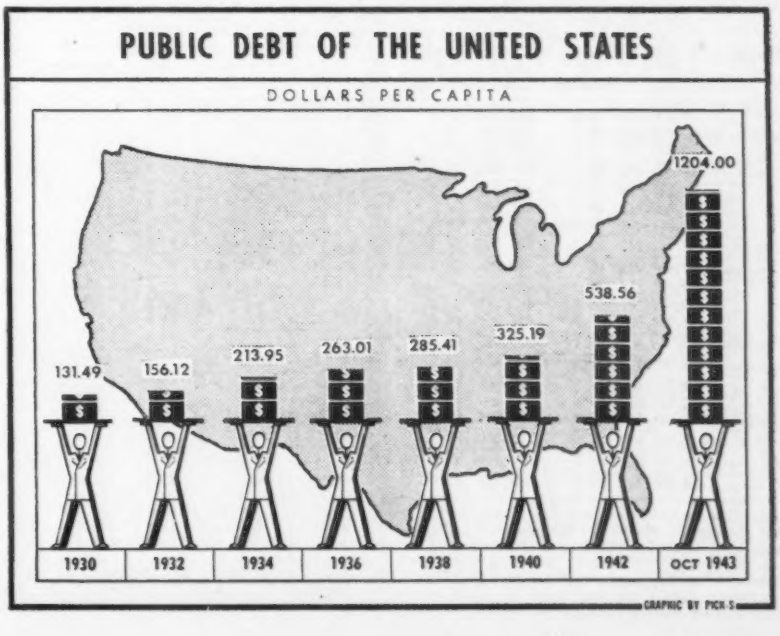
The recommendation that two per cent be allowed on raw material inventories is regarded as more generous than the procedure followed by the War Department under PR 15. These profit limitations will considerably reduce the time consumed in negotiation of settlements.

Under this provision, contractors will be reimbursed for expenses involved in setting up inventories, contacting subcontractors and other charges directly connected with the performance of the contract. However, the contractor must "use his best efforts to sell in any manner, to the extent, at the time, and at the price or prices directed or used by the contracting officer" completed parts or supplies acquired to fulfill the contract. Thus, contracting officers will still play an important role in the disposal of surpluses until a central agency is established to perform this function.

Since a profit ceiling of six per cent is established, contractors would very much like to see written into termination procedure a clause precluding termination settlements from future renegotiation. Now that a legal ceiling has been set up, it is thought that contracting officers would feel free to allow such a clause.

Whether subcontractors' claims are included in the 6 per cent ceiling is still not very clear and it is believed at present that such claims will have to be segregated and submitted separately.

The question of surpluses and subcontractors' problems still have to be settled, George Renard, executive secretary of the National Association of Purchasing Agents said. When these problems are solved, "everyone will be pretty well satisfied."



Mills Make December Plate Record

Washington

• • • **The nation's steel** mills hung up a new record of 1,169,196 tons in the last month of 1943 for plate production.

The previous monthly high production of plates was 1,168,000 tons in March, 1943.

December's all-time high in plate production came at a time when the industry suffered an output loss through strikes equal to an additional 20,000 tons, according to Steel Division officials.

(Total steel plate production for 1943 was 13,382,390 tons. This compares with output of 11,809,938 tons in 1942.)

The biggest factor in the plate demand situation is the huge requirement of the Maritime Commission. Steel Division records show that Maritime now has enough plates to build an additional 8,000,000 tons of shipping without receiving another ton.

This Maritime stockpile is estimated to amount in overall plate tonnage to 2,500,000 tons, or five months' supply. By the end of June, when Maritime will have received all the steel needed for the 1944 ship program, Maritime will have received another 3,300,000 tons of plates.

What perplexes WPB officials is how Maritime proposes to get rid of excess steel it will undoubtedly possess when the 1944 program is completed if the same rate of delivery is maintained by the steel companies throughout the first half of this year.

Maritime officials on the other hand deny the yards working for it have any surplus steel stocks.

In an OWI release last Friday, it was stated that Maritime's tentative 1944 program calls for the building of 20,000,000 deadweight tons of new ships in 1944, against about 19,000,000 tons built in 1943.

Inland Steel Co. produced during the 12 months ending Dec. 31 a total of 3,597,975 net tons of ingots, an increase of 170,464 net tons over the 1942 total. In the same period it shipped 2,727,398 net tons of finished steel, 116,674 net tons more than were shipped during 1942. A new all-time monthly high in plate shipments is represented in the 91,693 tons shipped in December.

Bethlehem Steel Co.'s all-time record of 13,000,000 tons of steel produced in 1943 included 1,938,952 tons of plates, 1,661,387 tons of alloy steel, and 300,325 tons of forgings.

Steel Employees Fewer

• • • Employment in the steel industry continued to decline in November, according to the American Iron and Steel Institute, reporting that 611,000 employees were on the payrolls in November, down 4000 from October. Payrolls during November amounted to $141,467,000.

Earnings of wage-earning employees in the industry averaged 116.1 cents per hour during November, highest on record.

Wage earners worked an average of 44.8 hours per week in November.

1943 Ingot Production Set at 88,872,598 Tons

Beginning July 1, 1942, the percentages of capacity operated are calculated on weekly capacities of 1,500,714 net tons open hearth, 128,911 net tons Bessemer and 81,049 net tons electric ingots and steel for castings, total 1,710,674 net tons; based on annual capacities as follows: Open hearth 78,247,230 net tons, Bessemer 6,721,400 net tons, Electric 4,225,890 net tons.

Easier Pig Iron May Doom High Cost Stacks; Fate of DPC Furnaces Posed

Pittsburgh

• • • There is a probability that a few high cost merchant blast furnaces may be blown out in the near future, in view of the easier situation in the supply of pig iron. The sale and possible demolition of Pittsburgh Coke & Iron Co.'s Sharpsville plant to the Hetz Construction Co., Warren, Ohio, appears to be a straw in the wind.

It is believed the Pittsburgh Coke & Iron Co.'s furnace was sold primarily because of its high cost operations, and because it was apparent that as long as consumers could obtain pig iron at ceiling price they would be reluctant to pay higher than these quotations. This same situation is expected to influence other merchant furnaces in the western Pennsylvania and northern Ohio area, and the trade looks for further curtailment by the second quarter in the operations of steel company owned furnaces as well as merchant stacks.

The Hetz Co., in case it cannot find a buyer for the Sharpsville, Pa., furnace, will attempt to sell the plant for dismantlement, to be re-erected in other sections of this country or possibly South America.

While some pessimists look for large scale shutdowns in merchant blast furnaces, present market conditions do not seem to entirely support this viewpoint. While it is true that some furnaces have had to charge an OPA-approved price higher than the ceiling price, the taking of pig iron off allocations may enable some companies to go back to their normal practice of supplying consumers relatively close to the stack. This will not help plants which have unduly high costs, however. The blowing out of stacks owned by steel companies, because of lack of business, appears to definitely indicate a downward trend in pig iron production, and probably poses a difficult problem concerning the disposition of DPC stacks which are still to be blown in.

Mystic to Abolish Premium Price Feb. 1

Boston

• • • **Despite the fact** the WPB will discontinue pig iron allocations Feb. 1, and MRC financial support will be withdrawn on the same date, plus the fact that Mystic Iron Works has been operating in the red even with government financial support, that furnace will continue to operate at least until its supply of high priced Lake ore has been liquidated.

In announcing this decision the furnace informed the trade that effective Feb. 1, its prices will revert to their former basis. In other words the base price on foundry iron will be lowered $2 to $25 a ton, and on malleable to $25.50, delivered basis. The revised prices will apply to all undelivered allocated iron, as well as to new contracts.

The furnace has sufficient unliquidated ore to keep it in operation for several months and in addition has a modest supply of pig iron in stock. In acting as it has, the furnace assumes that domestic business conditions will be sufficiently improved by the time its present Lake ore supply is liquidated to warrant continued operations.

U. S. Steel Shipments 20,244,830 Tons in 1944

• • • **Shipments** of finished steel products by subsidiaries of United States Steel Corp. in 1943 amounted to 20,244,830 net tons, subject to year-end adjustments, compared to 20,615,137 net tons in 1942, a decrease of 1.8 per cent.

In December shipments amounted to 1,719,624 net tons, compared to 1,660,594 in November and 1,849,635 in December, 1942.

WPB Authorizes Production of More Than Million Trucks and Truck Trailers

• • • **The WPB** on Jan. 4 issued Limitation Order L-1-E providing for the production of more than 1,000,000 trucks and truck trailers for military and civilian use during 1944. A direct result of this order, however, is the prohibition of manufacture of truck, truck trailers or other vehicles unless specifically authorized, but authorizations have already been issued by WPB establishing production schedules for the year.

Terms of the order provide that production and shipment of these vehicles must be made without regard to preference ratings or directions of any governmental agency other than WPB. These schedules will be reviewed monthly and revised when necessary.

In order to secure production on time of various components going into trucks and trailers and other products using automotive type components, the order provides that WPB, as the necessity arises, will issue specific directions to suppliers of components which will fit the timing of their production into the schedules for the end products.

No producer or supplier will be permitted, except when authorized by WPB, to accept an order for any product, the production of which will delay or interfere with his "frozen" schedule under the order, nor may any producer or supplier place an order with another supplier for a total quantity of any component in excess of his actual requirements. The order also assigns a preference rating of AA-1 to producers of motor trucks and truck trailers and suppliers of components for material entering into the production of these items.

Simultaneous with the issuance of this order, WPB announced the revocation of Limitation Order L-1-G. Truck trailers will hereafter be produced under the terms of the new order.

CMP Developments

• Dir. 40 to Reg. 1 rules that railroad frogs and switches will be Class B products, rather than controlled materials beginning Jan. 1. (Release No. WPB-4764)

•

• Dir. 41 to Reg. 1 spells out special directions for filing applications for allotments of controlled materials needed to make two classes of products required for ship repairs. (Release No. WPB-4765)

•

• Dir. 43 to Reg. 1 orders aluminum producers to remove from their production schedules by Jan. 1 all authorized controlled material orders bearing a 1943 CMP allotment number which are not in production by Dec. 31, 1943. This does not include orders for fourth quarter which have not been produced or entered into production because of inability of the producer to meet his production schedules.

C. E. Wilson Given Broad WPB Powers

Washington

• • • **The gradual shift of** power over the WPB from Chairman Donald M. Nelson to Executive Vice-chairman C. E. Wilson became concrete on Jan. 3 with the issuance of WPB Reg. 1 as amended which in effect assigned all of the powers of the chairman to Mr. Wilson, with certain exceptions. The exceptions were those powers delegated to the chairman by the Smaller War Plants Act. The new order, which became effective Dec. 31, virtually empowers Mr. Wilson to take full charge of WPB.

In part, the powers assigned to C. E. Wilson included the authority to direct the activities and functions of all officials of the WPB, Aircraft Resources Control Office and Aircraft Scheduling Unit; denial powers over allocations of material and assignment of preference ratings, or administrative and appeal actions.

Full powers were also given Mr. Wilson over other agencies and officials operating with or for the WPB as well as authority over directives, new orders and similar powers previously enjoyed only by the chairman.

WPB Increases Types of Rotary Files to Be Produced

• • • **The quantity of** special (nonstandard) rotary files that a machine tool accessory manufacturer may make was increased Jan. 4 when WPB issued an amendment to Schedule IV of Limitation Order L-216.

The quantity that the manufacturer may make in any month was increased to 25 per cent of his total file production in the preceding month. The previous figure was 10 per cent. The increased quota had been recommended by the Rotary File and Burr Industry Advisory Committee because the lower quota caused a hardship to the industry. The amended schedule also permits a manufacturer to supply "chip breakers," or tranverse grooves, in the cutting section of a rotary file.

Razors and Blades Given Open Steel Quota

Washington

• • • **Production of razors** and razor blades in 1944 will be limited only by the amount of materials that can be allocated for the purpose under CMP or are available outside CMP, the WPB announced Jan. 4. The order L-72, setting forth these restrictions, has been revoked.

It has become possible for WPB to take this step because the facilities required for the manufacture of razors and blades, generally speaking, are not needed to produce war items. Also, since the production of both razors and blades is a highly mechanized process, labor is not a factor.

Amended MPR 188 Establishes Refractory Pricing Method

• • • **To relieve manufacturers** of undue burden and delay in establishing maximum prices for certain essential refractory (heat-resisting) products, the OPA on Jan. 6 authorized a specific pricing method for the products. The action is covered in Amendment 23 to Order A-1 under MPR 188.

Items affected include fireclay, super duty fireclay, high alumina, silica, and insulating refractory shapes.

Price Briefs

• Amdt. 2 to MPR 77 authorizes producers and distributors of beehive oven coke to add $1.00 for machine-drawn and $1.25 for hand-drawn coke produced in the Connellsville, Pa., district.

•

• Amdt. 1 to MPR 465 provides that sellers of installed used vessels, such as underground gasoline and fuel oil storage tanks, be compensated for a portion of the original installation cost when that cost was in excess of $100. (Release No. OPA-3750)

•

• Amdt. 23 to Order A-1 of MPR 188 relieves manufacturers of undue burden and delay in establishing maximum prices for certain essential refractory products by authorizing a specific pricing method for the products. (Release No. OPA-T-1604)

•

• Amdt. 72 to SR 14 establishes maximum prices for sales of used airplanes powered with a single engine of not more than 500 hp. (Release No. OPA-3736)

22 New Items in '44 Can Pack Quota; 1,900,000 Tons of Prime Plate Allocated

• • • On Jan. 4 WPB announced a list of 169 different products that may be packaged in metal containers this year, in making estimates of 1944 quotas. The list of quotas contains 22 items that could not be packaged in metal containers last year. The action was taken by the issuance of Conservation Order M-81, Schedules I, II, and III, as amended. The schedules of the amended order have been correlated with glass container order L-103-b, permitting increased packs in some cases.

To make possible the 1944 packs, an estimated total of 1,900,000 tons of prime plate has been allocated, as compared with 1,550,000 tons of prime plate used in 1943.

The 22 new items to be packed in metal containers are: Alcohol, inflammable cleaning fluid, hydraulic brake fluid, movie film, polishes and waxes, roof coatings, turpentine, lubricating oils, motor oils, putty and caulking compounds, lacquers, shellacs, liquid disinfectants and germicides, antifreeze, varnishes, liquid insecticides and fungicides, varnish remover, lemon juice, sweet syrups, cranberries, pimientos, and boned chicken.

This year there will be a small quantity of orange juice and blended orange and grapefruit juice packed in cans for U. S. civilians. None was packed in cans last year for their use.

Steel Warehouse Allotments to Continue

Washington

• • • WPB intends to continue its practice of designating which dealer in steel products may be considered a warehouse and to receive warehouse privileges under such classification. Only those so designated may obtain allotments of steel for replenishment of their stocks. The notice sent to warehouses by J. T. Whiting, director of the Steel Division, reads:

Enclosed herewith is a copy of Form GA-996, "General Steel Warehouse Certificate and Base Tonnage Record." This form replaced Forms PD-83-b and PDL-2228 and represents your authorization from the War Production Board to conduct warehouse operations with respect to General Steel Products under Order M-21-b-1.

You are required to send a copy of the front page of this form to each of your producer sources of supply. Since a coming amendment to Order M-21-b-1 will omit any further reference to Forms PD-83-b or PDL-2228, it is suggested that you do this promptly in order that any steel scheduled for shipment to you when the amendment is issued can go forward without delay.

On the back of Form GA-996 is a record of your base tonnage of General Steel Products. All carbon steel figures, except tool steel, originally reported on Form PD-83-a, or as adjusted by WPB, have been rounded off to the nearest net ton. All alloy steel figures, except stainless and tool steel, have also been rounded off to the nearest net ton. It is these figures which you should report as your base tonnage when filing your quarterly report on Form WPB-2888 with the Bureau of the Census.

New WPB Forms

WPB-1229—Diamond dies: Consumers' report on stocks, receipts, and requirements of dies and shipments of wire drawn through small dies.
WPB-3433—Aluminum critical castings: Foundry's semi-monthly report.
WPB-3424—Plugs and flanges: Closures and fittings for steel drums. Manufacturer's monthly report of production.
WPB-3442—Report of disposition and stocks of materials under allocation.
WPB-3159—Copper-base alloy ingot operations: Ingot maker's report.
WPB-3009—Copper wire mill warehouse: Shipment report.
WPB-3449—Laboratory equipment: Manufacturers' monthly report.
WPB-1041—Application for authorization to contract or arrange for importation of strategic materials.
WPB-1039—Application for authorization to dispose of or process imported strategic material pursuant to General Imports Order M-63.

WPB Amends E-10

Washington

• • • General Preference order E-10 was amended to provide that antifriction bearings may be disposed of to fill any order rated AA-5 or higher placed by the armed services of their prime or sub-contractors who "will incorporate the bearings into or will deliver them as spare bearings with a product being manufactured by him."

Priority Changes

E-10—Amended order more strictly defines the type of prime or subcontractor to whom surplus anti-friction bearings may be sold. (1-4-44)

•

L-30-d—Int. 1 rules that small hardware used with curtain rods and fixtures is to be regarded as joining hardware under the terms of the order. (1-5-44)

•

L-42—Dir. 1 authorizes production of 50,000 cast iron bathtubs for war housing projects. (12-30-43)

•

L-54-c—Revised order lifts some restrictions on output of office machines. (1-5-44)

•

L-74—Revised order frees dealers' stocks of oil burners for new installations provided that PAW has approved in writing the delivery of fuel oil for such a burner on the premises in question. (1-4-44)

•

L-79—Revised order adds oil burners to the list of exceptions from control, under specified conditions. (1-4-44)

•

L-123—Amended order extends to Feb. 1 permission for farmers to purchase fractional horsepower motors and certain other items of general industrial equipment on a farmer's certificate declaring that the equipment is needed for farming pursuits. (1-4-44)

•

L-140-b—Amended order rules that the quarterly production quota assigned to each flatware manufacturer in a local area designated as being critical by WMC may not be greater than the manufacturer's average production in the third and fourth quarters of 1943. (1-6-44)

•

L-187—Amended order provides for production of cast-iron boilers during 1944 equal to 100 per cent of the number produced in 1940. (1-1-44)

•

L-216—Amended order increases the quantity of special (non-standard) rotary files that a machine tool accessory manufacturer may make. (1-4-44)

•

L-252—Amended order grants permission to use either brass or bronze in making nuts for several categories of valves. (1-6-44)

•

M-1-i—Amended order permits the use of aluminum in the manufacture of collapsible tubes. (1-7-44)

•

M-11-b—Amended order relaxes controls on the use of zinc. (12-31-43)

•

M-29—Order revoked. (12-30-43)

•

M-39—Amended order removes restrictions on the delivery and sale of cobalt. Vendors of more than 1000 lb. of this material in any one month will be required to report all sales during that month. (12-30-43)

•

M-81—Amended order sets up quota on cans for food packs. (1-3-44)

•

M-261—Amended order permits appeals on restrictions of metal strapping for shipping containers to be filed in regional WPB field offices. (1-7-44)

•

M-293—Dir. 1 rules that without specific authorization from WPB no manufacturer is permitted to begin production of certain types of stationary boilers, boiler units or auxiliaries if he believes the product will be held in stock by a wholesaler or dealer rather than shipped directly for installation. (1-6-44)

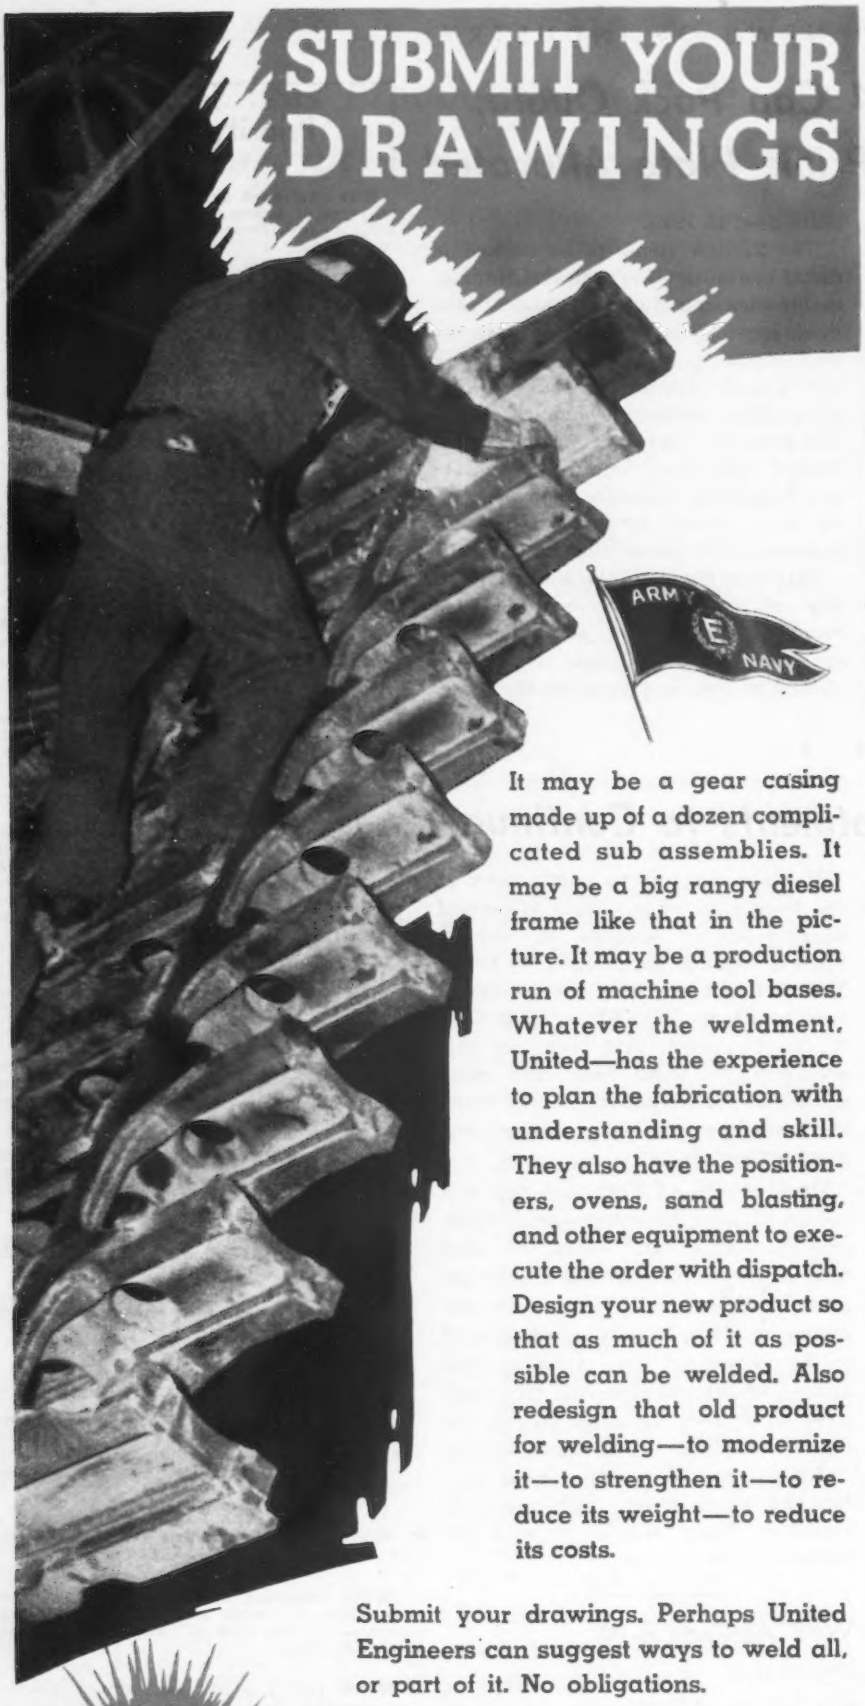
•

Int. 8 to Reg. 3 rules that blanket MRO ratings may be used to add stations to an existing wire intercommunicating system to bring it to its designed capacity. (1-6-44)

•

Reg. 11 and **11-a** have been revoked. (1-6-44)

SUBMIT YOUR DRAWINGS



It may be a gear casing made up of a dozen complicated sub assemblies. It may be a big rangy diesel frame like that in the picture. It may be a production run of machine tool bases. Whatever the weldment, United—has the experience to plan the fabrication with understanding and skill. They also have the positioners, ovens, sand blasting, and other equipment to execute the order with dispatch. Design your new product so that as much of it as possible can be welded. Also redesign that old product for welding—to modernize it—to strengthen it—to reduce its weight—to reduce its costs.

Submit your drawings. Perhaps United Engineers can suggest ways to weld all, or part of it. No obligations.

Warehouses Study Marketing Policies

Cleveland

• • • **At the annual** meeting of the Steel Products Warehouse Association in Chicago a short time ago, members of the Warehouse and Jobbers Section of the Office of Price Administration and the WPB Steel Warehouse Branch made several references to coming changes in policy and procedure that will affect warehouse and mill sales.

OPA wants the industry to consider the desirability of extending the zone price structure to rejects and secondary steel products sold through warehouses. The foundations for such a system would be the mill base prices for rejects, wasters, waste wasters, etc. Freight from governing basing point to destination would be added to the base prices. The spreads mght vary for each zone and might be the same as provided in the prime schedule, and present extras for rejects and seconds might continue.

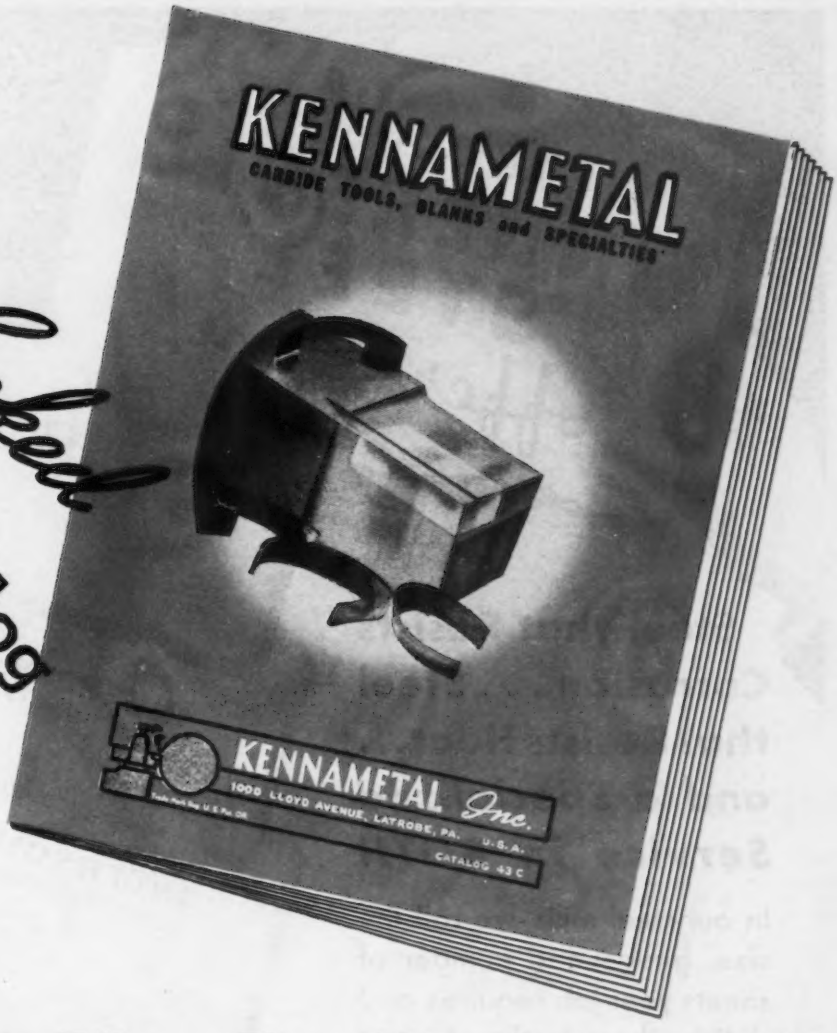
Dislocated tonnage provisions would apply only on inter-zone shipments. A preliminary survey by the OPA has shown that the level of maximum prices would not be generally affected, otherwise OPA would not be interested. It remains to be determined whether any change would give greater facility in calculating prices.

Ore Supply Ample

Cleveland

• • • **November Lake Superior** iron ore consumption of 7,409,213 gross tons by furnaces in the United States and Canada pushed ore consumption during 1943 to 81,518,593 gross tons. This compares to the 1942 consumption up to Dec. 1 of 78,466,094 gross tons. Iron ore stocks on hand at furnaces in the United States and Canada and on Lake Erie docks on Dec. 1, 1943, were 49,371,030 gross tons, as compared with stocks of 53,703,458 gross tons of a year ago. These stocks must carry the steel mills through the winter and into the spring when lake shipping is again possible. However, with the greatest monthly consumption 7,765,174 gross tons (January, 1943) and the average monthly consumption 7,410,781 gross tons, it can be seen that for the coming six months ending May 31, 1944, there will be a little over 8,000,000 tons a month available.

You Have Looked at our New Catalog



But Have You Really Seen It?

★Yes . . . it is a good looking piece of trade literature, bound in an attractive, orange cover with a large KENNAMETAL carbide tipped tool spotlighted in the center—*but that is not the point.*

There is valuable information *inside* this new KENNAMETAL Catalog and it will pay you to make full use of it—information that will increase the efficiency of your machining operations and help you maintain maximum production.

The greatest cutting performance in any given operation can be reached only if the correct grade and style of carbide tool are employed. Catalog 43-C covers in detail the characteristics and recommended applications of the entire line of standard and typical KENNAMETAL tools—for example:

- ★ How to select the proper grade
- ★ How to specify and order tools and blanks
- ★ When to use chip breakers
- ★ Proper grinding instructions
- ★ How to avoid grinding cracks
- ★ How to braze blanks to steel shanks
- ★ Milling steel with KENNAMETAL tipped cutters

Do you have *your* copy?—and are you taking full advantage of its helpful features?

SUPERIOR CEMENTED CARBIDES

Steel that Resists Corrosion . . . Steel that Resists Heat... *and a Specialized Service in BOTH*

In our steel mills, we roll the size, gauge and number of sheets your job requires and deliver them in the shortest possible time under present day conditions.

Since we produce both IngAclad Stainless-Clad Steel and Ingersoll Solid Stainless and Heat-Resisting Alloys, we are in a position to make unbiased recommendations as to the material best suited to, and most economical for any job.

It will pay you to use this Ingersoll Steel service. Your inquiry entails no cost or obligation.

Standard Certification Special Jobber Forms

Cleveland

• • • **Wider use of** the standard certification form originally applicable only to certain types of CMP orders will result from a recent revision of Priorities Regulation 7 as applied to warehouse and jobber steel sales. The standard form of certification may now be used instead of various special forms called for in WPB orders except as follows:

(1) The standard form may not be used if its use is specifically prohibited in a WPB order. It cannot be used instead of a WPB form which is required by any regulation to accompany a purchase order. This means that a standard certification cannot be used in place of WPB-2444. (2) It cannot be used in the case of WPB orders enumerated in List A of PR 7. There are about 40 orders included in List A. For example, the standard form may not be used to place a warehouse order for distress stock under M-21-b-l or M-21-b-." Also, it cannot be used on an order placed with a warehouse by a dealer under either of these regulations. (3) It cannot be used on a Canadian order. On the other hand, apparently the standard form of certification again is valid on orders placed with the warehouse under paragraph (d) (4) of CMP Regulation 4.

When the standard form of certification is used—and most warehouse customers probably will use it—the allotment number or symbol must also be given as much other information required by the regulations which are applicable to the customer.

If a warehouse receives an order without a certification, in many cases the certification may be written in if it is certain that the customer is authorized to make the purchase. In that case the warehouse must sign the certification and assume responsibility for it. Changes must be made in the form of the certification so that it will apply to the seller rather than the buyer. However, an allotment number or symbol to a customer's order may not be added except on his written authority. Also, in a few cases specified in List B of PR 7, a certification may not be written in for a customer.

List C of PR 7 enumerates 20 WPB orders for which a certification has to be presented to a supplier only once.

JOMAC HEAT-RESISTING, LONG-WEARING GLOVES

They are proving themselves in hundreds of shops where workers must handle metals too warm to touch. The remarkable Jomac Fabric is a loop-finished cloth with air-cell "cushions" which allow breathing-space and an easy dissipation of heat. Jomac's loop finish gives extra protection to hands, extra *long wear.*

JOMAC REGULAR INDUSTRIAL GLOVES

A modern work-glove that is semi-heat resisting and gives as much as *7 times the service* of ordinary work gloves. Jomac Fabric and its hidden lock-stitch keep the thick pile in place and provide extra strength and wear. Jomac Gloves can be washed repeatedly, *kept clean* . . . and thus minimize the dangers of dermatitis and other skin infections.

TEST THEM!

Just try JOMAC GLOVES on your stiffest jobs. Test them for heat-resistance, for wear, for washability, for economy, for *increased production.* Write for full details.

Annual Farm Tool Allotments Granted

Washington

• • • **Firm allotments** of 100 per cent of farm machinery manufacturers controlled materials requirements have been made for all four quarters of 1944, and as a result, such manufacturers will not be required to file Form CMP4-B applications for the second quarter of 1944, the WPB announced Dec. 31. This action, is a part of WPB's over-all program to reduce paper work.

•

New Application for Magnesium Deliveries

• • • **A new application** form, WPB-3462, has been issued for users of magnesium castings, forgings, sheet and extrusions, who must fill it in by Jan. 15 to obtain authorization for April deliveries.

Aircraft consumers must also file the form, which replaces Form ASU-13, with the Aircraft Scheduling Unit, Wright Field, Dayton. Other consumers must file with the Aluminum and Magnesium Division, Washington, 25.

•

Wheels Defined by WPB

• • • **The term "wheels,"** as used in Order L-158, does not include hub caps, wheel caps and wheel trim rings which are used as ornaments. Hub caps which serve as grease retainers, however, are considered components of wheels.

This clarification was contained in Int. No. 2 of the order which provides for the production and distribution of replacement parts and components essential to the operation of automotive vehicles.

•

Tinned Scrap Order Changed

• • • **WPB has issued** an amended order M-325, regulating the collection and disposal of tinned and detinned scrap. Because of the lack of sufficient plants, the original order provided different methods of disposing of scrap in the various states. The amendments affects the distribution only in the counties of Kansas, Missouri and Texas heretofore listed in Schedule A. These have now been deleted and those states added to Schedule C, where the order provides for the delivery of scrap to detinning plants just as has been the case heretofore in the East.

DUSTLESS DENSE
SODA ASH No. 2-10

...IT'S GRANULAR!

A new form of SOLVAY Dustless Dense SODA ASH created especially for desulfurization is now available.

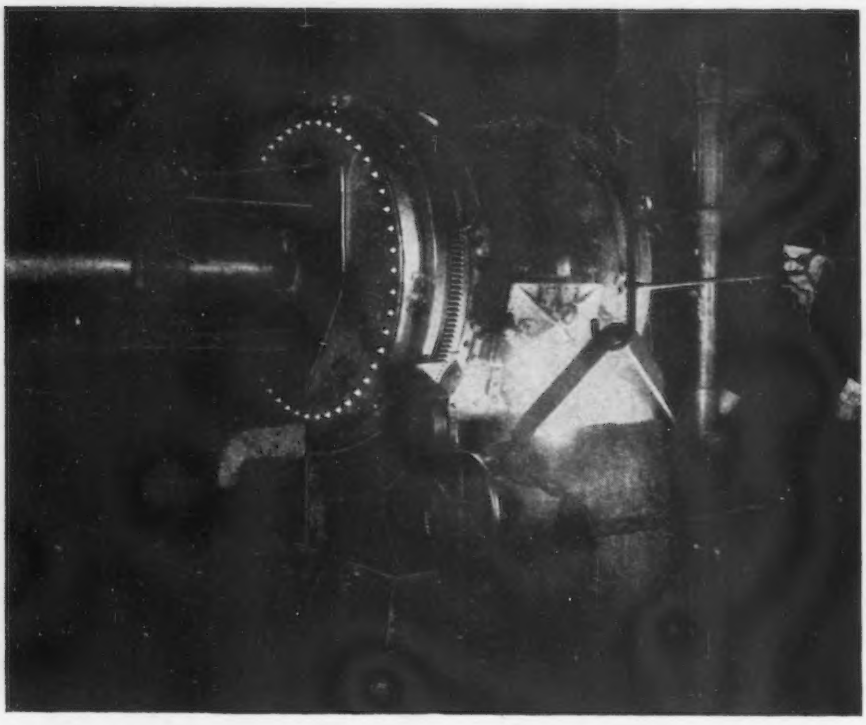
Designated as No. 2-10, this product has been made granular to further facilitate handling.

Immediate delivery of No. 2-10 can be made. Inquiries are invited.

SOLVAY SALES CORPORATION

Alkalies and Chemical Products Manufactured by The Solvay Process Company

40 RECTOR STREET NEW YORK, N. Y.



8 FERROUS HEATS OR 16 NON FERROUS HEATS IN ONE EIGHT HOUR DAY

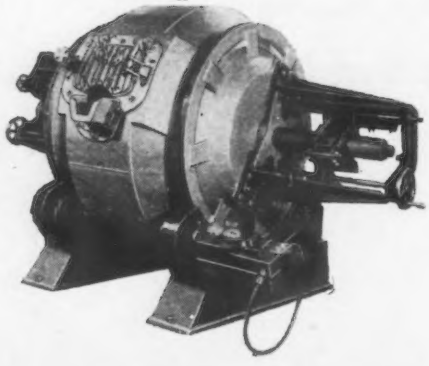
Because of their high melting speed you can produce as many as eight ferrous heats or sixteen non-ferrous heats in one eight-hour shift with a Detroit Rocking Electric Furnace. And you pour these heats with a minimum of dirt, fumes and hard work.

Detroit furnaces assure superior metallurgical results, even with unskilled labor, because of their automatic stirring action under non-oxidizing conditions and their precise control of time, temperature and composition.

Built in sizes from 10 to 8000 lbs. molten metal capacity there is a Detroit Furnace to fit every foundry need. Write today for facts and prices.

QUICK FACTS ABOUT DETROIT ROCKING ELECTRIC FURNACES

- Faster-melting
- Lower metal losses
- Higher average quality of product
- Less machine shop scrap
- Saving in floor space and molding equipment
- Use of cheaper raw materials
- Less labor
- Saving of alloys



DETROIT ELECTRIC FURNACE DIVISION
KUHLMAN ELECTRIC COMPANY • BAY CITY, MICHIGAN

Army Carbine Passes Major Campaign Test

New Haven, Conn.

• • • **The Army** has a new .30 cal. carbine, light in weight, equal to the Garand rifle in speed of fire. It met its major test in the Sicilian campaign.

The carbine weighs little more than half as much as the Garand, is only three feet long, and each of its 15 shots is fired with only a pull of the trigger. It can be fired with one hand, like a pistol, if necessary.

It is a new weapon for paratroopers, rangers and other shock troops and for the 60 per cent of American soldiers, engineers, signal corpsmen, officers, and the like, who previously did not carry rifles.

The new bullet is .30 caliber, slightly less than one-third of an inch in diameter.

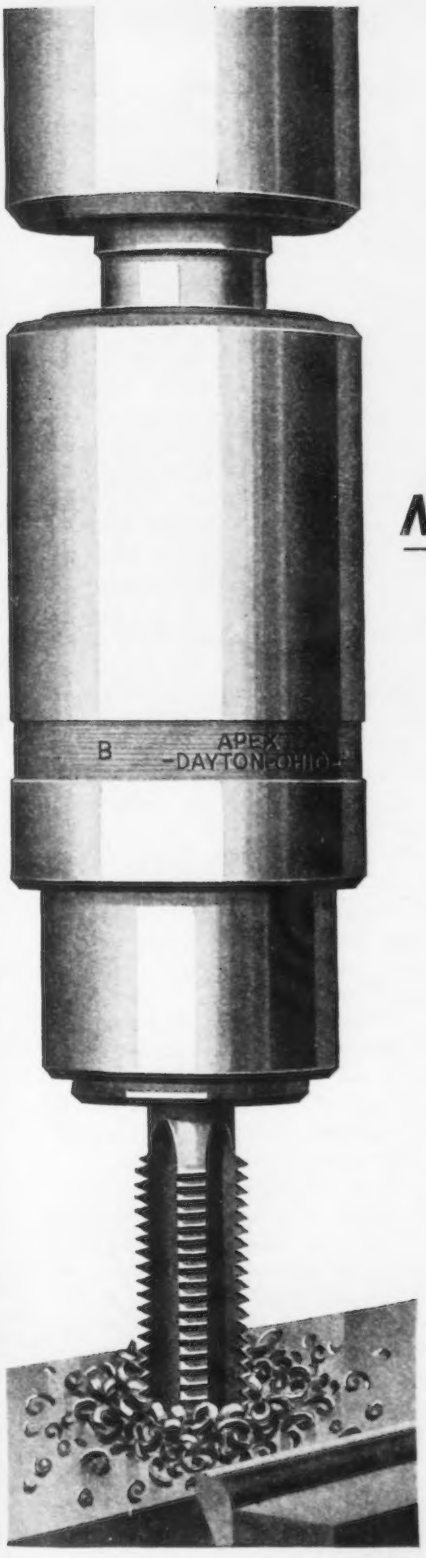
The job of making the cartridge was given to the Winchester Repeating Arms Co. here, a division of the Western Cartridge Co. The specifications were an effective range of 300 yd., a muzzle velocity of about 2000 ft. per second. This is not as fast as standard .30 caliber government ammunition, but is about 500 ft. faster than the ammunition used in the Japanese Arisaka rifle.

Next the Army asked gun inventors to tackle the problem of a weapon to shoot the cartridge, and six designers participated. The Winchester Co. was not at first among them, but when sample guns were submitted in June, 1942, Winchester made some suggestions and the Ordnance Department then asked Winchester also to work on a model. The company made a model gun in thirteen days, beginning Aug. 1. One of the parts for this gun was borrowed from a peacetime sporting rifle.

At Aberdeen, in competition with six other guns, the carbine was the choice of the Army board of judges.

New WPB Forms

WPB-2447—Platinum metals: Refiners' estimate of 1944 production and imports.
WPB-2889—General steel products: Steel warehouse report. Quarterly.
WPB-1228—Diamond dies: Suppliers' report on production, shipments, receipts and stocks.
WPB-1122—Beryllium: Quarterly application for allocation pursuant to M-160.
WPB-3462—Magnesium products: Consumer's application for allocation.
WPB-2892—Merchant trade products: Steel warehouse report.
WPB-1770—Ferroalloys: Detailed request for permission to use.



Green Help produces *More, Faster* with Apex Safety Friction Tapping Chucks!

Even inexperienced operators work *faster* and *better* with Apex Safety Friction Tapping Chucks.

These chucks minimize tool breakage because they practically eliminate the hazard of overloading. Taps work safely, accurately, at top speeds on through or bottom holes.

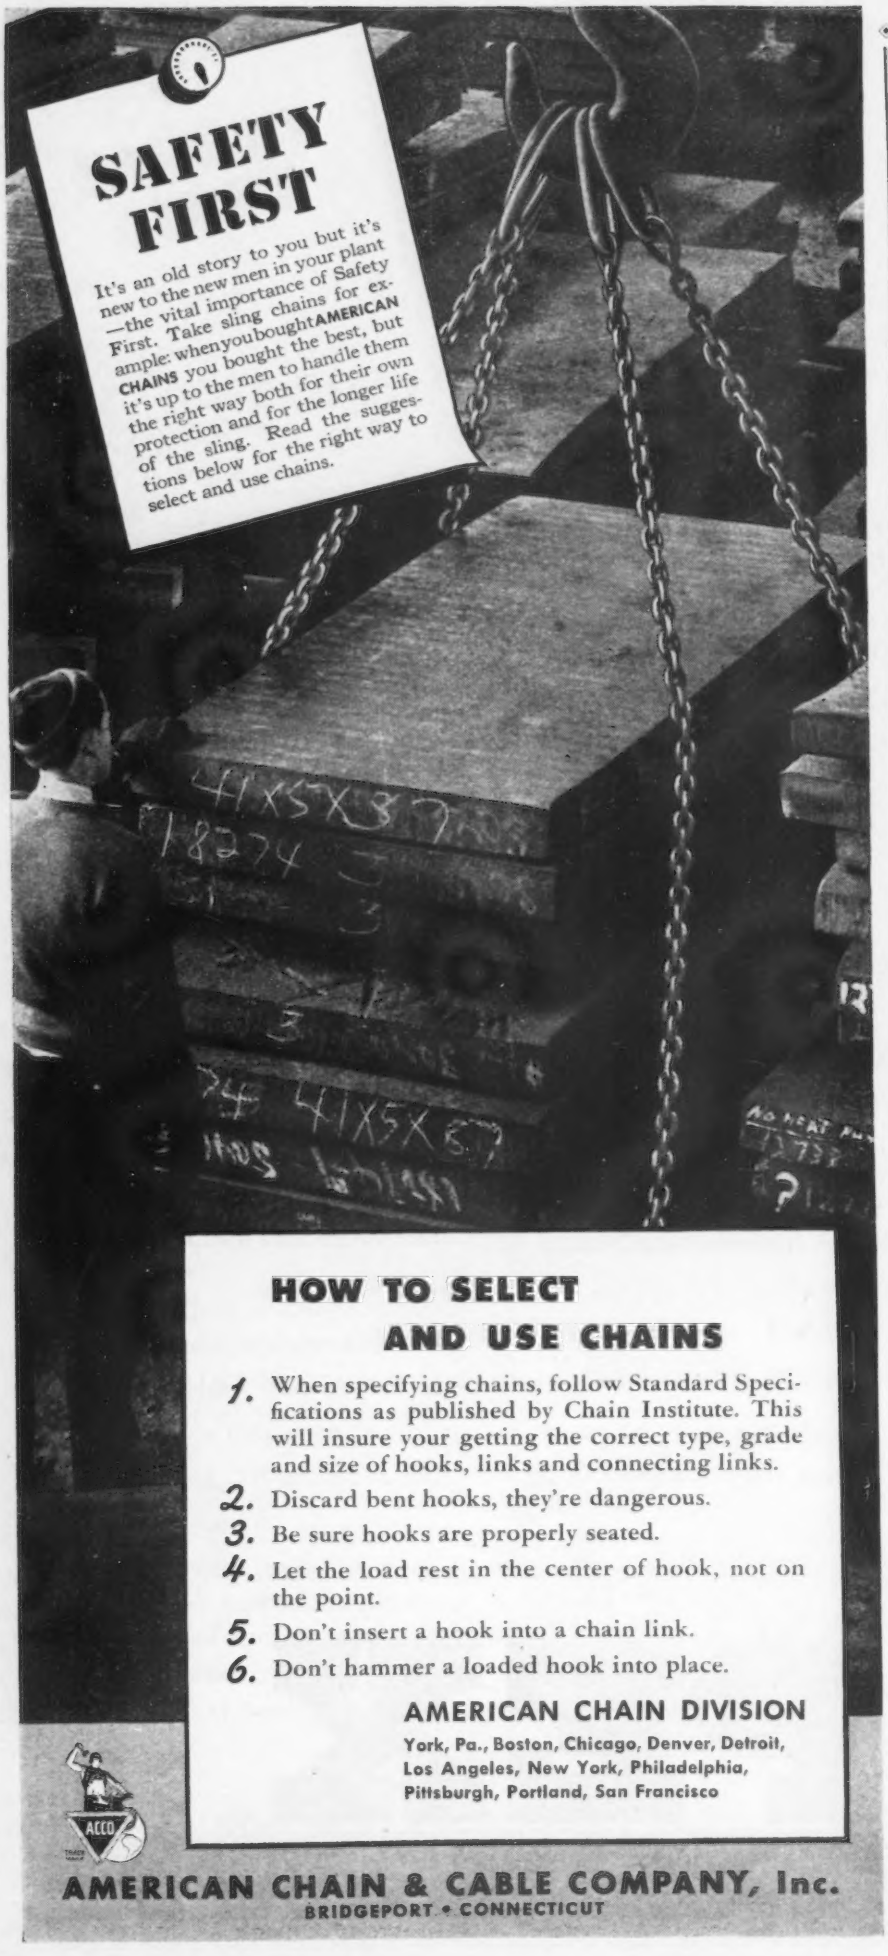
Chucks are easily adjusted for different sizes of taps and, once adjusted, maintain proper tension over long periods. End thrust set up by tapping or pressure exerted by operator on spindle does not affect friction setting. Multiple friction discs have large area and long service life.

Use these chucks on reversible drill presses, radials, handscrews, etc., and save cutting tools. Catalog No. 14 on request.

APEX

THE APEX MACHINE & TOOL CO., DAYTON, OHIO

Manufacturers of Safety Friction Tapping Chucks, Quick Change and Positive Drive Drill Chucks, Vertical Float Tapping Chucks, Parallel Floating Tool Holders, Power Bits for Phillips, Slotted Head and Clutch Head Screws, Hand Drivers for Phillips and Clutch Head Screws, Aircraft Universal Joints, Plain and Universal Joint Socket Wrenches.



Answers to Steel Jobber Questions

Cleveland

• • • **A question** and answer summary, issued by the Steel Products Warehouse Association, Inc., outlines procedures of warehouses and jobbers on some of the more difficult phases of OPA and WPB rulings.

A warehouse is forced to cancel a mill order. It then wishes to place a new order supported by the same sales as the original order, but due to the lapse of time, some deliveries which had been used originally were older than the maximum 90 day limit. Is there any way in which a warehouse can use such deliveries to support replacement orders?

Yes. Apply to the WPB Warehouse Branch for special permission. If warehouse is unable to replace deliveries older than 90 days because of conditions beyond control, permission may be granted to use these old deliveries to support a replacement order.

The Canadian government has relaxed control of secondary steel products. What effect does this have on orders for seconds, placed by Canadian customers with American warehouses?

No effect. American warehouses are governed by WPB regulation and cannot sell steel except as directed by that agency. So far as this country is concerned, secondary steel remains a controlled material.

(a) A manufacturer produces a part which is sold for MRO purposes. The manufacturer receives an MRO order from his customer for this part. He extends the MRO symbol to a warehouse in order to obtain the material needed for the manufacture of the part. Is this permitted by CMP Regulation No. 5?

(b) The same manufacturer, instead of extending his customer's MRO, uses his own MRO symbol to obtain material needed to fill an order from a customer. Is this permitted by CMP Regulation No. 5?

The answer to both questions is "No." The following explanation is given:

"A manufacturer of a part to be sold for MRO must apply for the material needed to make it on Form CMP-4B as provided in paragraph (k-1) (2) of CMP Regulation No. 1. The material needed to make the part is clearly production material and is not MRO either as to the manufacturer or as to his customer. For the

GET THESE FREE BOOKLETS

● Here is a set of five new bulletins which illustrate and describe an unusual variety of metal working production solutions. Machining operations include boring, facing, drilling, reaming, milling, honing and tapping. Each machine represents an economical solution of a problem involving one or more of these operations. Deep-hole drilling machines, Unit-type machine tools performing multiple operations, and boring and honing machines are but a few covered in these five bulletins. Machines for low, moderate and high production requirements are also included. These booklets may give you an idea for a more profitable approach to *your* metal-working problems. Write for them today. Ask for bulletins 144.

★ ***HOW YOU CAN GET A SPECIAL MACHINE TOOL TO SUIT YOUR JOB*** is illustrated and described in this set of 8 bulletins. Each bulletin traces a machining problem from the preliminary survey to the final machine design. Each may suggest a more productive tooling set-up that you can use today. Write for bulletins J4.

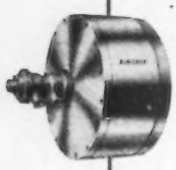
At Least 25% more output

Production will go up at least 25% when you install "Airgrip" Chucks and Revolving Cylinders. You will get more power than you need—holding power that will not fail up to the limit of machine power and tool endurance—power that means you can work every "Airgrip" equipped machine at its absolute maximum.

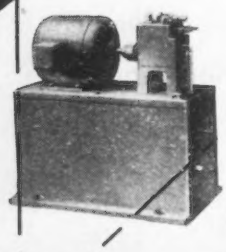


"Airgrip" Chucks, made in both two-jaw and three-jaw types, permit heavier cuts, coarser feeds—faster production—more parts per hour—at lower cost per unit.

"Airgrip" Revolving Air Cylinders embody the features which make for top performance and minimum maintenance.

Install "Airgrip" Devices now! Produce more for war and be ready to enter peacetime markets faster and at competitive prices.

Anker-Holth engineers are fully prepared to help you now with your pneumatic and hydraulic problems.



• *This is the new Hi-Po super-charged hydraulic pump that delivers smooth, chatter-free power at 3000 lb. pressure. It is driven by a ½ hp. motor.*

Anker-Holth Mfg. Co.

332 S. Michigan Ave. Chicago 4, Ill.

same reason, the manufacturer of the part cannot use his own MRO symbol to buy material needed to make a part which he sells for MRO. Again, the material needed to make the part is production material and is not bought for MRO purposes."

Is any special form used to apply for deferment for a foreman or other worker in one of the 149 critical occupations?

Use the regular 42-A form. Be sure, however, to indicate that a critical occupation is involved. The Local Board is then supposed to ask USES to check whether or not the applicant for deferment is actually doing the job it is claimed he is doing and whether or not there are any replacements for him available locally. If the local board fails to follow through in accordance with their instructions an appeal should be filed.

A carload shipment of primes consists of two or more items which are priced from different basing points. How is the recent pro-rata interpretation applied?

When a carload shipment is composed of products from two or more basing points, freight charge is prorated only on the tonnage from one basing point, and only then when the quantity involved is sufficient to warrant pro-rating procedure.

A warehouse which sells material to an exporter for his own account is permitted to charge the delivered price applicable at exporter's location. What does the phrase "exporter's location" mean?

The exporter's location is his assigned port of exportation. When a warehouse sells material to an exporter (for exporter's own account), it should charge the maximum delivered price applicable to a domestic customer at that customer's destination. The "customer's destination" in the case of an exporter obviously would be the port of exportation.

It has been stated that warehouses could apply to WPB for permission to make a trade with a customer of one size of hot-rolled sheets for another size of hot-rolled sheets. What about a trade involving two different products or different gages of the same product?

WPB Warehouse Branch will consider applications for permission to make such trade if equal tonnages are involved and if the warehouse has a base tonnage for the product it would receive in trade. You must give WPB the whole story—including the reasons for the trade and the names of all parties in the transaction.

FOR YOUR REFERENCE FILES

THESE BULLETINS COVER CIRCUIT BREAKER APPLICATIONS OF EVERY TYPE AND SIZE

WHICH OF THESE BULLETINS DO YOU NEED FOR YOUR FILES?

#3200 Industrial Multi-breakers. 15 to 100 amperes, 230 volts A.C., 2 and 3 Poles.

#3500 Industrial and General Purpose Circuit Breakers. 10 to 600 amperes, 115 to 600 volts A.C., 125 to 250 volts D.C., 1, 2 and 3 Poles.

#4000 Multi-breaker Load Centers. 1 to 16 circuits, 15 to 50 amperes, 115-230 volts A.C., 1 and 2 Poles.

#4500 Multi-breaker Lighting Panelboards. 15 to 50 amperes Branches, 115-230 volts A.C. Mains, 1 and 2 Poles.

#5000 Circuit Breaker Lighting Panelboards. 10 to 50 amperes Branches, 125-250 volts A.C. or D.C. Mains, 1 and 2 Poles.

#5200 Multi-breaker Type MH Distribution Panelboards. 15 to 100 amperes Branches, 230 volts A.C. Mains, 1, 2 and 3 Poles.

#5300 Square D Type ABH Circuit Breaker Distribution Panelboards. 10 to 50 amperes Branches, 230 volts A.C., 125 D.C. Mains, 2 or 3 Poles.

#5500 Square D Form W—Circuit Breaker *Convertible* Distribution Panelboards. 15 to 600 amperes Branches, 600 volts A.C., 250 volts D.C. Mains, 1, 2 or 3 Poles.

#3000 Square D Switchboards. 575 volts A.C. or D.C.

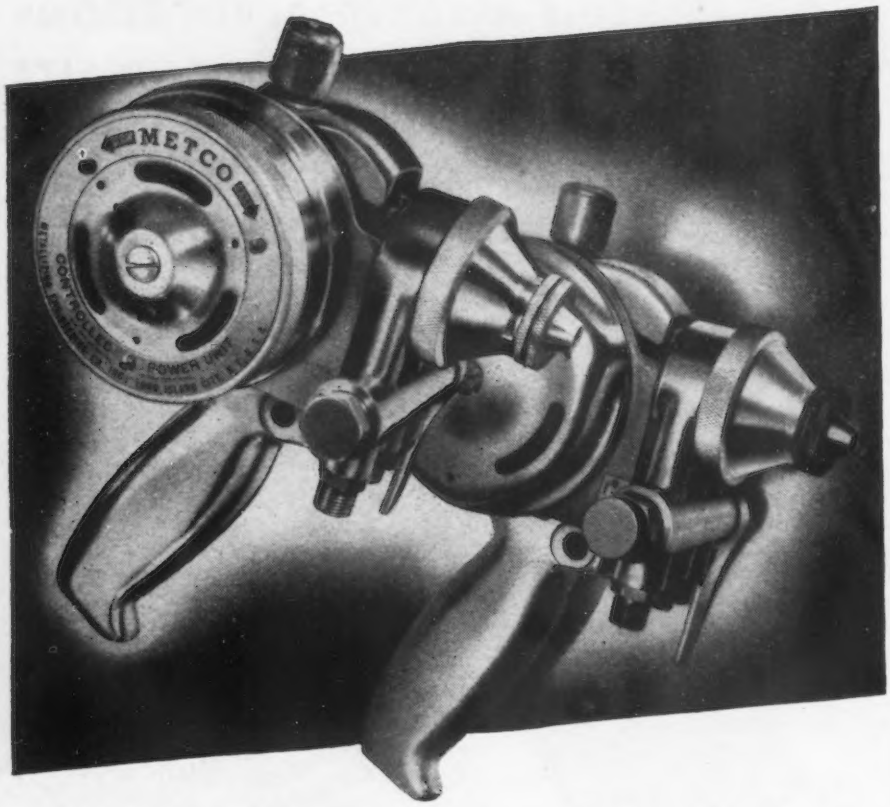
Gunning for Waste?



METCO Metallizing Guns bring savings you've never known before!

NEW PARTS eliminated completely . . . costly rejects quickly salvaged . . . critical metals replaced by cast iron and carbon steel . . . manufacturing time reduced . . . green labor trained in a few hours . . . equipment paid for itself on the first job . . . these are typical reports from plants using METCO Metallizing Guns for production or maintenance. Two models—Type E and Type 2E—meet *your* price and priority needs.

Send for New Catalog

Describes METCO Guns, Wires, Surface Preparing Tools and other Accessories in detail . . . tells how sprayed metal coatings are helping to save materials and manpower in the production and maintenance of war-needed parts and equipment.

WORLD'S FINEST METALLIZING EQUIPMENT

Army Stops Building Springfield Rifle

• • • The Army has discontinued the manufacture of the modified "Springfield rifle," designated as the M1903-A3, it was learned at the War Department.

Col. Frank J. Atwood, Chief of the Rochester Ordnance District, explained that the Remington Arms Co. will continue through August, 1944, in the manufacture of spare parts for the rifle. This company also will continue to produce the Army's long-range sniper rifle, the M1903-A4, which is the same weapon equipped with a telescopic sight.

New Super Dive Bomber Perfected by Curtiss-Wright

• • • **Designed by** Curtiss-Wright engineers in response to the Navy's demand for a super dive-bomber that would carry a greater bomb load faster and farther than any similar aircraft type in the world, the Curtiss (SB2C-1) Helldiver is a two-place, all-metal, low-mid-wing monoplane "plus a lot of striking power." It is powered with a high-output Wright Cyclone engine and equipped with a three-bladed Curtiss electric "full feathering" propeller. Split flaps give good braking control in power dives.

The Helldiver incorporates advances and combat lessons learned about dive-bombing in the current conflict. Possessing maximum striking power at extreme range, it is fast enough to keep up with the Navy's speedy new fighter escorts and thus hit the enemy with a maximum of surprise.

The initial design of the Helldiver was completed just before the Japanese attacked Pearl Harbor. As a result of combat experience Curtiss engineers completely redesigned combat equipment and combat loading features; 150 lb. of armor plate were added behind the pilot and around the gunner; self-sealing fuel tanks and protected fuel and oil lines were installed.

Radio equipment was changed numerous times. The flap mechanism was completely re-designed to enable a pilot to open or close the flaps three times faster than on the early experimental type Helldiver, a tremendous advantage in the split-second timing of combat flying. Other major changes of a restricted nature were made.

ASK the opinion of any production man who is using Super Carboloy Tipped Milling Cutters and you'll hear some enthusiastic comments. He will tell you of Super Performance, Super Accuracy, Super Economy.

He will talk about faster milling that decreases the cutting time on some jobs as much as 200%. He'll mention feeds in cast iron and nonferrous materials of .002" to .005" per tooth and in steel of .0005" to .0025" per tooth at surface speeds of 400 to 800 feet per minute. He will tell you, too, of the greater accuracy that results from these faster speeds because of less work distortion. And when you ask about finishes, he will show you finishes that compare favorably with ground surfaces.

Then ask about Economy. That's when his eyes will *really* sparkle! For the prices on these milling cutters permit their use on short as well as long run jobs. And they are designed to be used for plain milling, slotting or side milling without alteration. Try Super Carboloy Tipped Milling Cutters once and you, too, will say they're "Super." Write today for descriptive folders and prices.

WARTIME APPLICATIONS

PLANES — removes chips and rivets, cleans before painting. Cleans hangers, equipment, hulls, wings and tanks.

INSTRUMENTS — bench work, assembly, inspection, vacuum for schools and testing.

CHEMICAL — cleans goods, prevents explosions in alcohol, paint, TNT, asbestos, and synthetic rubber plants. Reclaims lime, rubber, flux and valuable dusts.

METALS — reduces danger of explosions of magnesium dust, eliminates health hazard, removes chips, scale and abrasives. Collects ores, conveys slag, recovers metals.

SHIPS — Saves manpower, from bench work to final inspection. Removes sand blast and shot, cleans before painting.

Look what the War did to SPENCER VACUUM!

We show the pre-war applications for Spencer Vacuum above because we are not yet allowed to secure photographs of the many new and revolutionary applications listed at the left.

In all cases Spencer has speeded up operations with less man-power required for the job.

Some say that bench and assembly cleaning is the most valuable use of the Spencer. Others point to the reclamation of materials, reduction of fire and health hazards, or the fact that Spencer provides a new conception of stream-lined production where cleaning between operations is necessary.

POST-WAR production will find these applications a necessity in order to compete with other plants that already have Spencers installed. Why not ask for the bulletins?

SPENCER HARTFORD VACUUM CLEANING

Here's Latest List of Patents Seized by U. S.

• • • **Starting** with the issue of Nov. 4, lists of seized patents have been appearing in this magazine week by week, except for the Dec. 30 issue. Seized patent applications were listed July 8. The patents are grouped in classes, with sub-class number appearing in parenthesis. Date patent was issued is at end of each item.

Class 219—Electric Heating

(1) **1,619,627.** Method and apparatus for electrically-cutting metal. O. Neiss, Germany. 3-1-27.

(1) **1,891,831.** Machine for manufacturing twist drills. M. Okochi, and M. Okashi, Japan. 12-20-32.

(2) **1,978,363.** Method and apparatus for electric riveting. G. Fuchs and H. Spath, Germany. 10-23-34.

(2) **2,203,099.** Art of bonding metal to insulation. W. Osenberg, Germany. 6-4-40.

(3) **1,692,327.** Electric upsetting or jolting machine. F. Brero, Italy. 11-20-28.

(3) **2,113,583.** Upsetting appartus in which the chuck and the press ram are used both as current conductors for the electric resistance heating of the piece work. H. Finzel, Germany. 4-12-38.

(3) **2,203,100.** Art of bonding metal to insulation. W. Osenberg, Germany. 6-4-40.

(3) **2,247,979.** Method and appartus for hot shaping magnesium alloy plates. W. von Tannenberg, Germany. 7-1-41.

(4) **1,636,676.** Electric welding apparatus. R. Mack, Germany. 7-19-27.

(4) **1,663,137.** Electric spot-welding machine. R. Mack, Germany. 3-20-28.

(4) **1,762,085.** Apparatus for jointlessly welding rails. C. Stedefeld, Germany. 6-3-30.

(43) **1,792,390.** Electric heating apparatus directly attached to the bottom of an enameled iron kettle for boiling water and food, etc. T. Okamoto, Japan. 2-10-31.

(4) **1,801,805.** Apparatus for the production of wire gratings by electric welding. V. Dobrick, Germany. 4-21-31.

(4) **1,995,001.** Flash butt welding apparatus. M. Ito, Japan. 3-19-35.

Copyright, 1944

(4) **2,137,909.** Double spot welding. G. Hagedorn, Germany. 11-22-38.

(4) **2,155,095.** Electrowelding of wire nettings. W. Kramer, Germany. 4-18-39.

(4) **2,183,908.** Manual spot welding tool. W. Gladitz, Germany. 12-19-39.

(4) **2,213,136.** Electric welding pliers. W. Gladitz, Germany. 8-27-40.

(4) **2,217,468.** Welding appartus and more especially to means for connecting by welding large workpieces which are difficult for a single man to handle. W. Borstel, Germany. 10-8-40.

(4) **2,222,906.** Electric welding apparatus. F. Hentzen, Germany. 11-26-40.

(4) **2,228,867.** Device for forming a permanent juncture as by riveting or welding. W. Borstel, Germany. 1-14-41.

(4) **2,232,450.** Method and apparatus for resistance welding. G. Hagedorn, Germany. 2-18-41.

(4) **2,233,526.** Apparatus for double spot or seam welding. G. Hagedorn and W. Hass, Germany. 3-4-41.

(4) **2,238,419.** Apparatus for electric spot welding. W. Hass, Germany. 4-15-41.

(4) **2,263,038.** Welding appliance comprising an electrode roller adapted for the spot welding of, for example, sheet metal objects on a word-supporting electrode. G. Heim, Germany. 11-18-41.

(6) **1,626,524.** Device for the electrical welding of seamed tubes. P. Gedien and K. Schwade, Germany. 4-26-27.

(6) **1,692,245.** Electric machine for welding metallic tubes or pipes. F. Brero, Italy. 11-20-28.

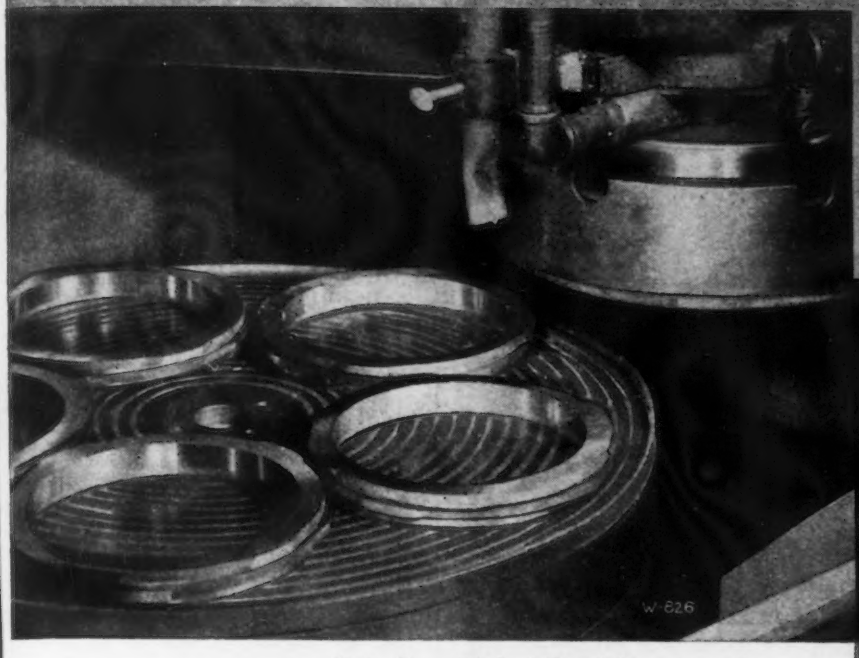
(6) **1,748,551.** Electric pipe-welding apparatus. C. Helle, Germany. 2-25-30.

(8) **1,732,900.** Apparatus for welding the tie-plates to steel ties. L. Kuhl and C. Ritz, Germany. 10-22-29.

(8) **1,935,593.** Method of and means for converting the electric arc into an elongated flame. E. Wist, Austria. 11-14-33.

(8) **2,028,780.** Method and apparatus for electric arc welding. M. Ito, Japan. 1-28-36.

"PUT IT ON THE BLANCHARD"



BLANCHARD

Grinding Nickel Steel Cams on the No. 18 Blanchard Surface Grinder

These nickel steel Cams are finish ground on the No. 18 Blanchard Surface Grinder.

.040" to .060" of stock is removed from one side of these cams to limits of ±.001". 109 pieces are produced per hour.

This is only one of the many airplane engine parts ground on the Blanchard. Some are held in fixtures; magnetic, hand-clamping or automatic.

Send your blueprints for production estimates.

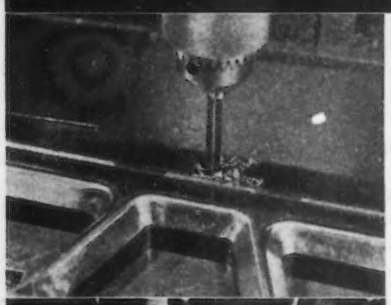
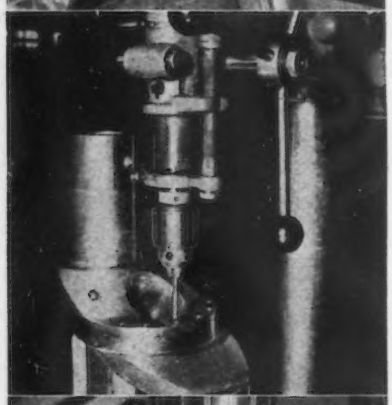
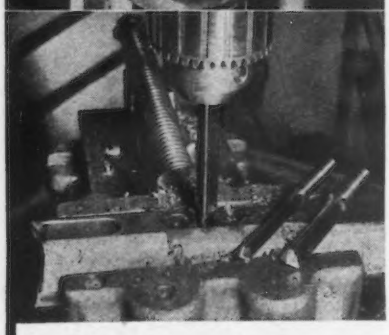
A Vital Aid to PARTS RECOVERY— "HARDSTEEL" DRILLS



SAVES DIES. On a crimping die for making aluminum mess trays for the Navy, the diemaker forgot to drill for the gage pins before final hardening. On the stamping die he neglected to drill a vent hole before the die was hardened. All holes were drilled after hardening with "HARDSTEEL" drills and two expensive dies were saved.



SAVES MACHINED PARTS. "HARDSTEEL" drills are now regularly used to remove broken taps in blind holes in Wright engine crankshafts without defacing the threads. This method requires only 2 to 2½ hours—saves 6 hours compared with the former grinding method and results in 100% parts recovery. Hardness of the taps is Rockwell "C" 60-65.



SAVES TOOLS. This big broach broke through the slot while in service. It was full high-speed steel—yet with "HARDSTEEL" drills it was found possible to drill three half-inch holes through the shank and the broach was quickly placed back in service.

"You Harden It . . . We'll Drill It"

Parts recovery saves labor costs, machine costs and critical material. Having "HARDSTEEL" drills on hand for emergencies may mean the difference between meeting a production quota and falling behind.

No charge for "HARDSTEEL" Operator's Manual telling how to drill steels hardened by any process.

TO BE CONTINUED

Behind every FIRING *Line* there MUST be a PRODUCTION *Line*

Official U. S. Signal Corps. photo

AMERICA'S production lines are backing her fighting men with the greatest armada of naval vessels in the world—with thousands upon thousands of the best bombers and fighter planes she can produce—and with all the other vital materials of war in such staggering quantities that a complete Allied victory is the only answer.

When victory is won, Industry's task is only half accomplished. Industry must turn its tremendous resources to backing up America in winning the peace.

Today, The McKay Machine Company is producing machinery for making guns, tanks, and jeeps for war time; but, in peace time America these machines will be employed in making products for better living.

Broad Brook, Conn. Oct. 19, 1904

40 Years of Proof!

Sirs,
Will you send me particulars of your rolling doors, including the cost of doors, installing them etc.
We want a couple of doors which would be suitable for our boiler room and we would like to know if rolling doors would be durable in such a place and how they would stand snow and ice in the winter. The doors would have to be opened and closed a dozen times a day. The doorways are 10 feet wide by 10 feet high.
Yours truly
Benj S Hanson. Engineer
Box 221
Broad Brook Ct

1904

1944
its 40th year!

Also still on the job is Benj. S. Hanson, Engineer who instigated the original purchase of the Kinnear Door in 1904.

40 years of daily service . . . maintenance costs nil . . . and still on the job with highest efficiency! 40 years of savings in floor and wall space . . . of extra protection against fire, theft, wind and weather! Here again is dramatic proof of how ruggedness and economy are combined with smooth time-saving convenience in Kinnear Rolling Doors. Many similar records in the Kinnear files tell of such long, low-cost efficiency. The *coiling upward action* of the famous interlocking-steel-slat construction (originated by Kinnear), plus skilled engineering and fabrication by door specialists, are reasons for the record performance of Kinnear Rolling Doors. They are the right answer to every service door problem! The Kinnear Mfg. Co., 1760-80 Fields Ave., Columbus 16, Ohio.

SAVING WAYS IN DOORWAYS
KINNEAR ROLLING DOORS

News in Brief

• The Boston store in Milwaukee, one of the city's leading department stores, has petitioned the Civil Aeronautics Board at Washington for permission to inaugurate a delivery service to cover most of Wisconsin by means of helicopters that would land and take off from the top of the store's parking station.

•

• *Col. Merle H. Davis, chief of the St. Louis Ordnance District, announced Dec. 30 that a considerable number of ordnance contractors in the 8½ states comprising the district had during the last month made substantial voluntary reductions in the unit price of ordnance items, or had made substantial voluntary cash refunds on their 1943 contracts. Col. Davis pointed out that this surge of reductions and refunds was due to the fact that most companies have fiscal years which end Dec. 31 and that these companies were about to close their books on 1943.*

•

• Domestic bookings of electric industrial trucks and tractors during October, 1943, totaled 402 units, according to the Industrial Truck Statistical Association, Chicago. The net value of chasses only booked during October totaled $1,896,-921.20.

•

• Unanticipated profits over and above original estimates made possible the voluntary return of $20,000,000 to the Government by Western Cartridge Co., according to E. W. Taft, treasurer.

•

• The Austin Co., industrial builders, announced that its industrial building cost index advanced from 115 to 119 during 1943 as a direct result of the concentration of plant construction in critical labor areas.

•

• The U. S. Supreme Court on Jan. 3 denied the Alliance Brass & Bronze Co., Alliance, Ohio, permission to institute proceedings—without going first to lower courts—attacking the constitutionality of the War Department's authority to renegotiate war contracts.

•

• Another unit in the new expansion of steel producing facilities built under DPC sponsorship by the Copperweld Steel Co. at its Warren, Ohio, plant is a new 24-21 in. rolling mill. Flexibility of operation is a feature of this new mill. In the 24 in. train there are three stands side by side spaced 14 ft. and 12 ft. 7 in. apart. These stands are driven by a 1400 hp., 405-600 r.p.m., 2300 volt Kramer drive through a gear set of 5.2:1 ratio. The roll passes on the first two stands which are three-high and have roll faces of 66 in., while the third stand which is two-high, uses a roll with a 54 in. face. The 21 in. train, which consists of four stands side by side is spaced 130 ft. from the end of the 24 in. train. The first three stands are in line with the three stands of the 24 in. mill. They are three-high with rolls of 60 in. face.

New DPC Awards

Washington

• • • **Defense Plant Corp.,** RFC subsidiary, has authorized the following contracts:

National Smelting Corp., Cleveland, to provide plant facilities in Cuyahoga County, Ohio, at a cost in excess of $825,000.

Aeroquip Corp., Jackson, Mich., to provide equipment and machinery at a plant in Jackson County, Michigan, at a cost in excess of $100,000.

Peoples Transport Corp., Muskegon, Mich., to provide facilities at a plant in Muskegon County, at a cost in excess of $90,000.

Republic Steel Corp., Cleveland, to provide equipment at plants in Cuyahoga, Mahoning and Trumbull Counties, Ohio, and Beaver County, Pa., at a cost in excess of $450,000.

Federal-Mogul Corp., Detroit, to provide equipment and machinery at a plant in Fresno County, Cal., at a cost in excess of $100,000.

American Cyanamid & Chemical Corp., New York, to provide additional equipment at a plant in Nueces County, Tex., at a cost in excess of $190,000, making a total commitment of more than $840,000.

Pettibone-Mulliken Corp., Chicago, to provide equipment at a plant in Cook County, Ill., at a cost in excess of $100,000.

General Motors Corp., Detroit, to provide additional equipment at plants in Mercer County, N. J., Westchester County, N. Y., and in Baltimore, Md., at a cost in excess of $275,000, making a total commitment of more than $11,100,000.

Willys-Overland Motors, Inc., Toledo, Ohio, to provide additional equipment at a plant in Lucas County, Ohio, at a cost in excess of $150,000, making a total commitment of more than $3,630,000.

American Radiator & Standard Sanitary Corp., Pittsburgh, Pa., to provide additional equipment at a plant in Loraine County, Ohio, at a cost in excess of $45,000, making a total commitment of more than $660,000.

American Locomotive Co., New York, to provide machinery and equipment at a plant in Schenectady County, N. Y., at a cost in excess of $400,000.

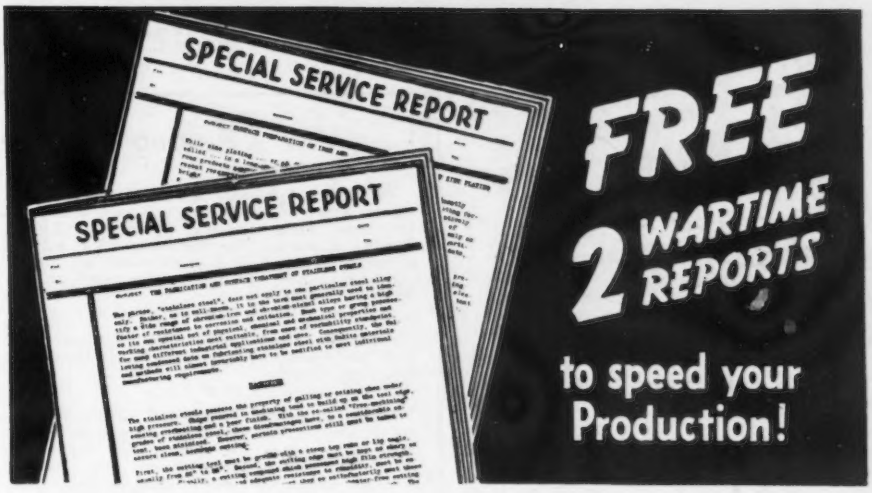
George T. Stagg Co., New York, to provide machinery and equipment at a plant in Bullitt County, Ky., at a cost in excess of $140,000.

Olds Lauds American Industry; Sees Break in War

• • • **American** industry today faces new problems as the United States enters the decisive phase of the war, according to a year-end statement by Irving S. Olds, chairman, U. S. Steel Corp.

"The men and management of America's mines, factories and transportation facilities have demonstrated the vigor and resourcefulness of our industrial system," he said. "The battle of production has been won, and we can look forward hopefully to a favorable termination on the European phase of the war in the not too distant future.

"We of the steel industry feel that there is reason for pride in that industry's accomplishments during the past two war years. In 1943, approximately 90,000,000 tons of steel ingots have been produced in the United States. Of that quantity, about 30,000,000 tons were produced by the men and women of the U. S. Steel.



COMPLETE yet concise, these reports describe Oakite materials, methods and techniques now being successfully used to simplify and expedite a wide range of essential degreasing and related operations required in ordnance, munitions, aircraft, electrical manufacturing, automotive and other war plants.

Fabrication and Surface Treatment of Stainless Steels

In this 4-page Special Service Report, you will find much valuable information on the fabrication and surface treatment of stainless steels. Gives data on EIGHT different jobs . . . machining, grinding, forming, drawing, cleaning before welding and annealing, pickling, removing soldering fluxes and cleaning parts before assembly or shipment.

Preparing Iron and steel for Bright Zinc Plating

Here is a timely, 6-page technical review of surface preparation procedures for bright zinc plating. It describes still tank, cathodic cleaning and anodic degreasing methods employing Oakite alkaline materials that provide the chemically-clean, smut-free surfaces so essential in securing durable, uniform bright zinc coatings. Also contains helpful hints on scale, oxide and rust removal.

Send for Your FREE Copies of These Helpful Reports TODAY!

These factual, informative guides to increased production efficiency are yours merely for the asking. Just fill in the coupon below and your FREE copies will be sent promptly. Every works manager, production superintendent or other executive responsible for stainless steel fabrication or bright zinc plating should have these reports for ready reference!

Remember, too, that your nearby Oakite Technical Service Representative is readily available to give you the benefit of his specialized knowledge and experience on any metal surface preparation problem you may have. Write today!

Among the Week's Trade Notes

Pittsburgh Equitable Meter Co.-Merco Nordstrom Valve Co. have opened new offices at 411 Bona Allen Building, Spring and Luckie Streets, Atlanta. The Memphis office will be closed at the end of December and all Southern operations will be handled through the Atlanta office.

American Brake Shoe Co.'s Kellogg Division has acquired the Crown Spray Gun Mfg. Co., Los Angeles.

Black Industries, Cleveland, announce the formation of the Mec-Rad Division which will manufacture the mechanical components of all types of radionic devices. The division will be under the supervision of John Altmayer, chief engineer.

Claud S. Gordon Co.'s Cleveland office will move to larger quarters at the beginning of the year at 7016 Euclid Avenue.

Peninsular Steel Co., Cleveland, will expand their activity in Ohio for the distribution of Graphitic Tool Steels to include Dayton and Cincinnati.

Rolled Thread Die Co., Worcester, announce the appointment of L. C. Bigelow & Co., Inc., 250 West 54th Street, New York, as its sales and service representatives in the New York area.

General Electric Realty Co., Schenectady, has expanded its holdings in Milwaukee to include the eight-story building constructed in 1930 by the Milwaukee Electric Railway & Light Co. in that city and which occupies several floors and will continue as a tenant. Most of the structure is used as headquarters for the General Electric firm.

Ray-O-Vac Co., Madison, Wis., manufacturer of dry cells, batteries and flashlights, is reported planning to take over the huge ordnance plant on Milwaukee's northern outskirts which was abandoned recently by the Army ordnance department early in December as part of the government's plan to cut down on small arms ammunition. Tentative plans call for the employment of about 3000 workers.

Brillion Iron Works, Brillion, Wis., has an expansion program under way including an extension to its cleaning room and machine shop, new engineering department quarters, general office and garage.

F. L. Jacobs Co. has purchased the Continental Die Casting Co., Detroit, for an undisclosed consideration. The transaction will place Jacobs among the first three producers of automotive hardware for the post-war period.

Blaw-Knox Co. has appointed H. Russell Loxterman engineer in charge of sales of furnace equipment throughout the Middle West, with an office in Peoples Gas Building, Chicago. He has been in charge of similar work in the Pittsburgh district.

Modern Collett Co., Ecorse, Mich., burned almost to the ground in a Christmas week-end fire. Damage was estimated at $1,000,000. An explosion in the boiler room appeared to have caused the flame, which spread rapidly, fed by coolant oils.

Graham Transmissions, Inc., Milwaukee, manufacturer of variable speed drives, has appointed five sales engineering organizations as representatives. They are: Frank Campbell Coe, 15th and Market Streets, Philadelphia 2; John B. Foley Jr. Co., 249 Erie Boulevard, West, Syracuse; Paul M. Kline, 2030 East 22 Street, Cleveland; Bruce W. Rogers, Box 172, Akron; D. W. Smith, 149 Broadway, New York 6.

National Battery Co., St. Paul, has acquired its tenth plant which is located in Zanesville, Ohio. The plant will manufacture batteries for Army and Navy use.

Corrosion Control Corp., Norwalk, Conn., has changed its name to Cordo Chemical Corp.

James Russell Boiler Works Co. will now be known as the James Russell Engineering Works, Inc.

Monarch Machine Tool Co., Sidney, Ohio, has opened a sales and engineering office at 209 Upper Carnegie Building, Cleveland 6. H. W. Robinson is in charge.

Spencer Lens Co., Buffalo, has announced the sale of its Doat Street four-story optical plant to the Royal Bedding Co., Pittsburgh. Spencer will retain possession under lease until after the war when it will consolidate all departments in its new plant near Buffalo.

Gerrard Co., Inc., a United States Steel Corp. subsidiary, has changed its name to Gerrard Steel Strapping Co., to link it more closely with its field of business.

Hydro-Arc Furnace Corp., LaGrange, Ill., has been acquired by the Whiting Corp., Harvey, Ill.

Vibration Engineering Co., New York, has taken over the business formerly conducted by B. T. Butterworth, Jr.

Gehnrich Corp., Long Island City, N. Y., has been purchased by W. S. Rockwell Co., New York, and will be operated as Gehnrich Oven Division of the Rockwell company.

Woburn Degreasing Co., Harrison, N. J., has changed its name to Woburn Chemical Corp.

Forging & Casting Corp., Ferndale, Mich., a subsidiary of Allegheny Ludlum Steel Corp., now will function as Forging and Casting Division of the corporation.

Industrial Machining Co., Racine, Wis., has been organized by John Gellert, Ray J. Eckenrode and Walter H. Hammond to manufacture jigs, dies, tool fixtures and metal parts.

Delaware & Hudson Co. directors approved Dec. 29 the sale of the Chateaugay Ore and Iron Co., Lyon, N. Y., to the Republic Steel Corp. for an undisclosed price. The Chateaugay company has low-phosphorous iron ore bodies leased to Republic in 1939.

Bethlehem Steel Co. is reported to have leased space in the Lincoln Building on E. 42d Street, New York.

Gabriel Co., Cleveland, has purchased International Metal Hose Co., Cleveland. Gabriel has been a large supplier of automotive parts such as snubbers, shock absorbers, and hydraulic systems. The purchase of International Metal Hose Co. will permit expansion of the company into the field of flexible tubing and gasoline hose couplings, as well as tubing for encasing flexible drive shafts in control mechanisms.

Julian E. Jackson has been appointed New England representative of the federal Division of Patent Administration, and at his Boston headquarters, 17 Court Street, he will maintain a complete file of the 40,000 enemy patents seized by the Alien Property Custodian and now made available to American manufacturers.

Cincinnati Planer Co. has appointed the following exclusive sales representatives in the North East: Harrington-Wilson-Brown Co., Chrysler Building, New York City, for Northern New Jersey, Eastern New York and Connecticut; Lynd-Farquhar Co., Park Square Building, Boston, for Massachusetts, Rhode Island, New Hampshire, Vermont and Maine; C. H. Briggs Machine Tool Co., Inc., Onondaga Hotel, Syracuse, N. Y., for the Syracuse area, and George Keller Machinery Co., 1807 Elmwood Avenue, Buffalo, for Western New York State.

North Bergen Brass & Aluminum Foundry, Secaucus, N. J., will hereafter be known as the Koons Foundry.

Detrola Corp., New York, has completed its merger into the International Machine Tool Corp. and is now known as the International Detrola Corp.

SUN ROLL OILS

Knock "soft spots" out of cold sheets

stop staining . . . cut six passes to four . . . speed output

Rolling cold sheets to perfection is a job in any mill. But rolling manganese steel sheets in fewer passes and eliminating spots is an achievement that makes Sun Oil Engineers proud of Sun Roll Oils.

Tough sheets for helmets were being cold rolled from rough sheets to the desired finished thickness. With a competitive vegetable oil, this operation required six passes. At the same time, temperatures generated caused the oil to stick to the strip. This subsequently caused carbon spots that often resisted final heat treatment with the danger of developing soft spots in this vitally needed steel.

Spots stopped when a Sun Oil Engineer recommended a change to Sun Roll Oil. The strip now passes through the rolls clean and free from any trace of carbon—danger of soft spots in finished sheets has been "knocked out."

Two passes were eliminated at the same time with Sun Roll Oil. Now, these cold sheets are reduced in just four passes. Production has been stepped-up . . . a better finish obtained . . . and costs lowered.

In your plant—whether it is cold or hot rolling, lubrication or processing—let a Sun Oil Engineer show you the possibilities of speeding up your output and lowering costs with Sun Industrial Products. Write . . .

THE MASTER ELECTRIC COMPANY
INDUSTRIAL EQUIPMENT DIV. — DAYTON, O.

Preparation for Termination Suggested

New York

• • • **Evidence that the** seriousness and imminence of contract termination for both the contractor and subcontractor is a matter for immediate action was presented recently in a letter mailed to all subcontractors and suppliers of Allis-Chalmers Mfg. Co. Emphasizing that ways and means of getting quick money settlements and orderly and economical disposition of materials and facilities depended upon preparations now, the letter offered suggestions which could be carried out in the interim.

The letter suggests in part:

"Claims of government contractors and subcontractors including any claims that you may have on a prime contractor's purchase order covering products for the government, are subject to government audit. It is vital, therefore, that you keep accounting and other records in such manner and in such detail, and maintain such adequate cost accounting system as will enable you to produce the cost and other information necessary to prove your claims. Some claims have already been disallowed because of the inability to support them with proper records.

"**An inventory** of the items involved showing extent of completion will also be required. Careful study of such documents as Army Procurement Regulation No. 15 and Army Termination Accounting Manual for Fixed-Price Supply Contracts will greatly assist in obtaining an idea of the accounting data and other information that will be required.

"It is becoming clearer every day that the government, upon contract termination, will not pay for facilities, materials, work in process, or items beyond the reasonable requirements of the contract at the time of termination. Of at least equal importance to adequate records, therefore, is careful procurement, inventory, and production control, which will insure that commitments, inventories, and work in process are not ahead of the requirements of a sound production program. In general, this requirement will be met by observance of the WPB priorities and CMP regulations and general preference and scheduling orders."

o o o

Koppers Completes 18 Coke Batteries

Pittsburgh

• • • **Eighteen Batteries** of Koppers-Becker coke ovens, totaling 1,142 ovens with an annual coal carbonizing capacity of 9,196,000 tons, were completed or under construction by Koppers Co., engineering and construction division, in the United States, Canada and Brazil during 1943, according to Joseph Becker, vice-president of Koppers and general manager of the division.

Largest of the coke oven projects is that for the new Geneva Steel Co. plant at Geneva, Utah. One battery of 63 ovens is in operation, and three batteries of 189 ovens are ready for operation. The four batteries will have a total carbonizing capacity of 1,766,000 tons. Coke capacity is roughly 70 per cent of coal carbonizing capacity.

One of three batteries, totaling 171 ovens, for the Bethlehem Steel Co. at Lackawanna, N. Y., is operating, with two still under construction. They will have a total capacity of 1,363,000 tons. A battery of 70 ovens, with 703,000 tons capacity, was completed for the Bethlehem Steel Co. at Steelton, Pa.

Another project of more than a million tons capacity was completed for Inland Steel Co., at Indiana Harbor, Ind. Two batteries totaling 146 ovens have a capacity of 1,185,000 tons.

At Sault Ste. Marie, Canada, a battery of 86 ovens with a capacity of 766,000 tons, was built for the Algoma Steel Corp., Ltd.

Other projects completed were: Republic Steel Corp., Cleveland, one battery, 75 ovens, 665,000 tons capacity; Tennessee Coal, Iron & Railroad Co., Fairfield, Ala., one battery, 73 ovens, 550,000 tons; Donner-Hanna Coke Corp., Buffalo, one battery, 15 ovens, 114,000 tons.

Near completion is a battery of 55 ovens for the new plant of the Brazilian Steel Co., Volta Redonda, Rio de Janeiro, Brazil. The ovens have a rated capacity of 570,000 tons.

Ever look at a hot mass of steel and imagine it as the hull of a battleship, or the front of a fighting tank, or maybe only the barrel of a buck private's gun? For over 117 years it has been our business to help turn these imaginings into facts . . . It has been our business to produce the best steels possible to meet America's rigid requirements. If you are engaged in war production and have a carbon or alloy steel problem, "A.W." Quality Steels are ready to serve you.

STAR for EFFICIENCY

Quality . . . in the steel that goes into the making of STAR Hack Saw Blades is closely guarded by Clemson. Continuous tests assure uniformity in the metallurgical structure of each type of STAR blade.

In the race to keep up with increasing production schedules for critical war machines and materials, there can be no slowing down because of inferior tools. That's why STAR high-speed steel "MOLY" Type* Hack Saw Blades are chosen by so many shops for fast-cutting metal-sawing jobs where accuracy counts. The same holds true for the Unbreakable Special Flexible Blade for cutting tough metal in awkward positions.

In the Maintenance Department the emergency repair man knows the value of STAR Blades when he's called on for a rush job. STAR products have proved their dependability under all sorts of circumstances.

*T.M. Reg. — Blades bearing the name "MOLY" are made only by Clemson Bros., Inc., and affiliated companies.

Vinson Outlines WPB-OPA Plan To Insure Essential Civilian Production

• • • **OES director Fred M. Vinson** last week announced details of a program for insuring adequate production of essential civilian goods to be effectuated jointly by the WPB and OPA.

A broad policy statement addressed to WPB Chairman Donald M. Nelson and OPA administrator Chester Bowles lays down procedural responsibilities of the two agencies in carrying through the program. It also establishes the framework for changes and modifications in existing price control techniques when such action will result in stepping up production of specific items.

Primarily, these changes will result in a greater equalization of profit margins for all products and price lines of individual consumers' goods industries when such action is needed to improve production of essential items. There is also provision for special handling of price control affecting marginal producers, and affecting producers whose current profits are at excessively high levels.

The policy statement incorporates two major principles on which will be based any future joint operations of the two agencies in formulating programs for production of essential civilian goods. These are:

1. The WPB is responsible for formulating plans and programs to assure needed volume production of essential civilian goods. When WPB finds that existing price regulations "constitute a serious impediment" to fulfillment of the programs, certification to this effect will be made to the OPA.

2. OPA is empowered, under certain conditions, to revise existing price schedules as a production stimulant, but in every case pricing formulas spelled out in the policy statement must be adhered to as a preventive against inflationary or uncontrolled price increases.

Particular emphasis is placed by the program on the need for improving output of essential low-cost goods where serious shortages have developed in recent months.

The WPB is directed to utilize its full authority in getting production of essential consumer goods particularly in controlling distribution of facilities, raw materials, and processed commodities.

In certifying to OPA that the supply of a particular essential consumer product is or threatens to become inadequate for basic civilian needs, WPB must indicate that it has prepared and is ready to carry through a production program with "its full legal authority." The certification, a copy of which must be transmitted to the director of Economic Stabilization, is required to include a description of all steps WPB has taken or is prepared to take.

Pittsburgh Workers to Go on Priorities

Pittsburgh

• • • **With local manpower** officials insisting that the essential worker shortage here will be much less serious after March 1, and with the chance that the district may struggle through until that time, workers may soon be rationed on a priority basis in order to forestall being placed in the so-called Group 1 "Critical Class."

If the district becomes classified as critical, it would compel all employers, essential as well as non-essential, to place their workers on a 48-hr. week. It might also cut off future production contracts, curtail expansion programs, and even necessitate war contract cutbacks.

The only possibility of correcting the situation according to WMC officials in case the rationing system does not work would be a mass migration of non-essential workers to essential jobs, coupled with an increase in the hiring of women.

Spot checks here indicate that the response to help wanted ads for essential war industries is far below expectations, while available non-essential jobs are said to find plenty of applicants.

Aside from official pronouncements, it is understood that within the manpower labor-industry committees here there is considerable difference of opinion as to the reality of an actual labor shortage. Nevertheless, WMC Director Paul V. McNutt is reported to have been trying to clamp down the critical label on the Pittsburgh district for some time.

The Pennsylvania State WMC has declared that the Pittsburgh region will be made a critical labor shortage area unless the labor picture is substantially changed, for the better, by Jan. 23.

CONTROLLED QUALITY STEEL FOR WAR

MESABI

Quiet blue lakes, endless miles of rolling, dark green forests of spruce, pine and balsam, accented by bold slashes in silver and white of slender birch and aspen; shelter for deer and moose; lair of bears, lynx, bobcats, wolverines and foxes; with trout, bass and pike hiding in crystal waters; ducks and geese feeding on lakes; partridges and prairie chickens nesting in cut-over timber lands—this is the Mesabi country.

Mesabi meant giant in the red man's tongue when Chippewas were driving Sioux out of the north woods and shoving Sacs and Foxes eastward. White men, long after, applied the name to the vast iron ore range stretching 100 miles in a narrow belt across Northern Minnesota—a giant among ranges.

Other Lake Superior ranges are the Cuyuna, and Vermillion in Minn., the Marquette in Mich., and the Menominee and Gogebic in Mich. and Wisc.

Open iron ore pits, 30 stories deep, wide enough to hold several football stadiums, yawn in the sylvan setting of the Mesabi. Far down deep in these man-made canyons, long ore trains and huge heavy-duty trucks, toy-like in the distance, crawl along winding ledges and switchbacks in continuous procession, bringing topside millions of tons of rich red, black, blue, purplish iron ores dug out of the depths by giant electric shovels and shipped by rail and water to blast furnaces to be converted into iron; then on to become steel, backbone of war and peace.

Winter stops production at open-pit mines on the Lake Superior iron ranges. But, on the job now, in snow, ice, sub-zero temperatures, are geologists, metallurgists, mining engineers and their crews. These hardy men are busy laying out the work in preparation for the next season's production, that the tonnage of iron ore mined and shipped this year may be greater than the 84½ million tons in 1943.

"Big Swede," the giant of the electric shovels at the J&L Hill Annex iron ore mine, is as big as a house, has a boom of structural steel beams towering 10 stories high and weighing as much as a freight locomotive, a structural steel dipper "stick" nearly as big, with huge steel bucket on its end that "crowds" into the hard ore body and comes up with sixteen tons in every "bite".

Four of "Big Swede's" bites load a freight car. One 8-hour turn with "Big Swede" produces enough iron ore—12,000 tons—to fully load a Great Lakes ore boat.

Steel for a ship a day to put the Axis away is a record established in steel plate production at the Jones & Laughlin Pittsburgh Works, during a recent month, the War Production Board announced. It was "enough steel to build 33 merchant ships . . ." the official announcement said. The Maritime "M" was recently awarded to the J&L Pittsburgh Works which, with the J&L Aliquippa Works, also holds coveted Army-Navy "E."

U. S. Steel Issues Isothermal Transformation Diagrams

• • • **Fifty-six diagrams,** so-called "S-Curves," have been brought together in the new "Atlas of Isothermal Transformation Diagrams" published by United States Steel Corp. Each "S-Curve" represents the time of response of a particular steel to specified conditions of temperature and therefore serves as a map to guide the practical man to the proper heat treatment of each of these steels.

These diagrams represent the results of a systematic experimental investigation which has been carried out over 15 years at the Kearny Research Laboratory. The booklet, which will be distributed to war material producers who are users of steel, to metallurgists and technologists in industrial and educational laboratories, and to others interested, has been termed a significant contribution by U. S. Steel to the science and practice of ferrous metallurgy.

In the practical heat treatment of steel, as ordinarily conducted, the steel is first heated to a temperature higher than its so-called transformation temperature at which the carbon goes into solution, and then it is cooled in some specified way, as by quenching in water or oil, or allowing it to cool slowly in the furnace. In this process the step which most significantly influences the properties developed in the steel is the initial rate of cooling, which is a matter of both temperature and time; because of this the results are difficult to interpret usefully in general terms. This difficulty can be obviated by separating the effects of temperature from those of time at temperature; and this separation is the fundamental idea on which these diagrams are based.

Two Civilian Items Returned to Production

Washington

• • • **Manufacture of** 2,000,000 electric irons and 50,000 bathtubs in 1944 was authorized Dec. 30 by the War Production Board, this being the first important resumption of civilian manufacture since the war started.

The 1944 output of bathtubs will be reserved for installation in war housing projects. The irons will be distributed through normal trade channels, not rationed, and should be generally available by summer.

Aluminum Founders Warned About Orders

Washington

• • • **Aluminum foundries** and fabricators are cautioned not to accept orders for any month in excess of 105 per cent of their capacity. Even though the foundry may be able to deliver in the succeeding month, the order must be classified as a "carry-over" order. Albert Butler, chief of the accounting and statistics branch of the Aluminum Division, has written all foundries and fabricators that they may not consider they have any period of grace in which to pile up their orders. The letter reads:

Your attention is called to paragraph (t) (2) (iii) of CMP Regulation No. 1. This paragraph requires that you reject orders when your expected production for particular products has been booked to 105 per cent. An analysis of Form WPB-2685 for the third quarter shows that aluminum fabricators have accepted more orders than allowed by the regulation. It would appear that a number of mills accepted orders on the assumption that they were permitted to do so if they could deliver them during the 30-day period following the month of delivery called for on the order. The regulation specifically provides that you must not accept orders beyond the 105 per cent limit. There is no longer provision in the regulation allowing a 30-day grace period, and even the provision in the earlier issues of the regulation never permitted the acceptance of orders with the intent of making delivery in the grace period.

Where a foundry or fabricator has accepted an order within the 105 per cent limit which it cannot deliver in the month of delivery called for by the order, it is a "carry-over order." In determining whether the mill's total orders are within the 105 per cent limit for any one month, "carry-over" orders, for previous months of the same and preceding quarters must be considered.

Two Blades Instead of One Yielded by Taper Rolling

• • • **The story** of the taper rolling process, whereby airplane propeller blades are rolled from alloy steel close to the finished shape and contour of the blade, has been detailed in part by the American Iron and Steel Institute.

Rehabilitation of an old hand mill and the use of an old crew, "grown gray in service," played a large part in the development. Taper rolling works three ways to speed up propeller production:

Two blades now can be made with the same amount of special propeller-blade alloy steel formerly used for one; the 30 machine tools ordinarily required to machine and shape the blades have been reduced to three or four, man-hours have been cut drastically.

After a distinctive process of rolling, the blades are about the same length and width as those made under conventional methods. They are six-tenths of an inch thick at one end point, tapering to 13 hundredths.

Early Purchase Orders Required on Critical Materials

• • • **WPB has revoked** Dir. No. 1 of Priorities Reg. 18, which required the early placement of purchase orders for specified items of a critical nature on which delivery is required during 1944.

It was pointed out that the direction had been substantially effective in stimulating the early placement of orders for certain components, and since demand of others could not be predicted because of their nature, the direction would result in confusion and delayed production.

WMC Amends Method of Determining Essential Firms

Washington

• • • **The WMC has** announced the amendment of instructions for the determination of the essentiality of an establishment by providing that the end-use of a product be considered as an additional test.

The essentiality of an establishment, it was explained, depends not only upon its being engaged in an activity included in the List of Essential Activities, but also upon the extent to which the product or service is used to meet war needs or minimum civilian requirements under wartime conditions.

WMC's ruling in earlier instructions, which are still in effect, provided that whenever the essential and unclassified activities are not separate, as in the case when the same workers are engaged in both departments, the establishment will be classified as essential only if 75 per cent of its activities are devoted to production of items on the essential list.

Memo for Post-War Production

HEAT-TREATED STEEL SHOT

We manufacture shot and grit for endurance

A shot or grit that will blast fast with a clean finish.

This is the only reason why so many operators are daily changing to our shot and grit, from Maine to California.

The unprecedented demand for our—

Heat-Treated Steel Shot and Heat-Treated Steel Grit

has enabled us to expand our production and maintain a quality that is more than satisfactory to our hundreds of customers all over the country.

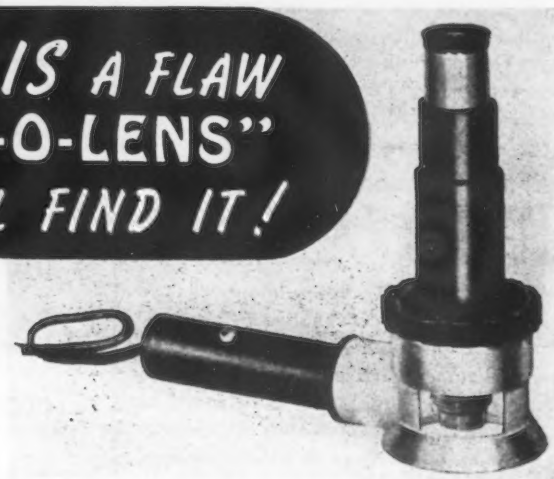
HEAT-TREATED STEEL GRIT

IF THERE IS A FLAW "FLASH-O-LENS" WILL FIND IT!



The new FLASH-O-LENS offers foundry-men, machinists, and many others engaged in producing metal parts for war contracts an efficient, economical means of examining the most minute defects during routine inspections.

FLASH-O-LENS consists of a portable 40x microscope combined with a perfect source of illumination in one convenient, compact unit . . . They are available in several models—powered by either standard flash light dry cells or by current from any AC or DC outlet—and with a selection of various combinations of lenses, all interchangeable in the one lens housing.

Send today for illustrated catalog describing the new FLASH-O-LENS

E. W. PIKE & COMPANY

PIKE

Manufacturers ELIZABETH, N. J.

New Book

• • • "Steel in Action," by Charles M. Parker, secretary of the technical committees, American Iron and Steel Institute, covers the steel situation both at home and abroad, and will help overcome public lack of understanding in the steel industry.

Many previously unpublished statistics are included.

According to Mr. Parker, the steel industry accounts for 45 per cent of the income of the United States and 40 per cent of the jobs. (Jacques Cattell Press, $2.50.)

Fabricated Structural Steel Bookings Show Sharp Decline

• • • **The November, 1943 bookings** of fabricated structural steel for bridge and building construction reported to the American Iron & Steel Institute by companies representing 75.6 per cent of the total average bookings of the industry during the years 1923-25, totaled 29,205 tons as compared with 61,721 tons reported for the preceding month and 49,637 tons estimated for the entire industry for the corresponding month of last year. Reported shipments totaled 35,152 tons as compared with 130,425 tons estimated for the entire industry the same month last year. The reported tonnage available for future fabrication at November 30 was 134,610 tons.

District WPB Manager Quits

Pittsburgh

• • • **Known for his understanding** of industry and its problems, and credited with as prompt service as red tape would allow, (and sometimes beyond this), Albert H. Burchfield, Jr., has resigned as the Pittsburgh district manager of the WPB. He returned to his former post as vice president and director of the Joseph Horne Co. Jan. 1. C. C. Morrison, former district manager of priorities, succeeds Burchfield as WPB director.

Can Makers Elect Governors

New York

• • • **F. J. O'Brien,** president of the Can Manufacturers Institute revealed that four new members were elected to the board of governors: W. H. Funderburg, Continental Can Co.; Victor LeComte, LeComte & Co., Inc.; J. E. Macry, Empire Can Corp.; R. S. Solinsky, Cans, Inc.

SURFACE FACTS ABOUT METALS

First of a series of articles on the preparation of metal surfaces for protective finishes

PICKLE BATH TONERS

IMPROVED PICKLE SOLUTIONS PRODUCE BRIGHTER AND CLEANER WORK

Research Chemists in the American Chemical Paint Company laboratories, some years ago, made a valuable contribution to metal finishing which revolutionized the acid pickling of iron and iron alloys. The inhibitor—Rodine—which was developed at that time controls the pickling action to the removal of scale and prevents needless attack on clean metal. In addition to making it possible to greatly increase the speed of production, the savings in acid, metal, and the reduction of hydrogen embrittlement makes the use of Rodine standard in most pickling operations today.

In the continuing research on the pickling of metals, the ACP Laboratories have developed a further aid for pickling baths—"ACP Pickle Bath Toner" for use with or without Rodine. It fills a definite place in improving the finish of pickled metals and greatly reduces waste due to excessive dragout.

ACP Pickle Bath Toners are supplied in either a powder or liquid form for use in either sulphuric or muriatic acid solutions, producing brighter and cleaner surfaces. The emulsifying action of Pickle Bath Toners reduces the contamination of the pickle solution by oil, admirably adapting them to the pickling of work slightly oily and in conjunction with Rodine for the pickling of alloy steels that are difficult to pickle.

These Pickle Bath Toners, in both the powder and liquid grades, are furnished with and without inhibitor action. The uninhibited types are recommended where the advantages of the Pickle Bath Toner can be combined with the many advantages of the inhibitor, Rodine. In such cases the Toner *and* the Rodine are added to the new pickle bath and as future additions of acid are made only the Rodine is added.

In a few operations where strong inhibitor action is not required, for example in cold pickling solutions, or where actual attack or "etching" of the metal is wanted for subsequent operations, the use of the mildly inhibited form of Toner is recommended to obtain the improved cleaning action and still retain sufficient inhibition to prevent excessive etching.

Any sulphuric or muriatic pickle solution will be improved by the addition of ACP Pickle Bath Toner. Generally the powdered forms are recommended for use in sulphuric acid and the liquid forms for use in muriatic acid solutions. ACP Pickle Bath Toners are now supplied as follows:

Pickle Bath Toner No. 101—Powdered form without inhibitor for use with or without Rodine.

Pickle Bath Toner No. 102—Mildly inhibited powdered form for use without Rodine where but little inhibitor action is wanted.

Pickle Bath Toner No. 1—Non-inhibited liquid form for use with or without Rodine.

Pickle Bath Toner No. 2—Inhibited liquid form for use without Rodine where but little inhibitor action is wanted.

While ACP Pickle Bath Toners will be generally beneficial there are several operations where little inhibitor action is deemed necessary, including electroplating, galvanizing, pickling in cold solutions or in some electrolytic pickling units, etc. In addition, Pickle Bath Toners also improve the penetration, the wetting and the spreading action of zinc or ammonium chloride fluxes in preparation for galvanizing, tinning, etc.

Steel requires pickling to remove scale whether the fabrication is for steel plates for battleships, airplane parts, motor vehicle or ordnance parts.

Rodine in the pickling bath confines the acid action to removing the scale and inhibits acid action on the clean metal. This controlling action of Rodine in preventing the acid from dissolving clean steel, saves acid by eliminating a needless waste. The life of the pickle bath is increased and better pickling is accomplished.

Our technicians are available to adapt Rodine or other ACP Products to your individual production problems. Time will be saved if you will give us as complete details as possible concerning your methods and requirements.

Welding Organization and Training

(CONTINUED FROM PAGE 61)

ward a uniform and educationally sound welding training program through the establishment of certain procedures as being basic instructional practices.

Supervision Unsatisfactory

At the time we were establishing an on-the-job training program we had not lost sight of the other two conditions disclosed by the survey. Apparently these two conditions, namely conflicting and insufficient supervision, are peculiar to any new enterprise of major proportions where there is no prior organization or nucleus of established supervision to use as a foundation for an organization.

As has been indicated, the arrangement of shift supervision as shown in Fig. 1 was entirely unsatisfactory because of two reasons:

1. The conflicting supervision resulting from the three shipway welding arrangement.
2. The insufficient supervision resulting from one foreman attempting to direct the work assignment of an entire shipway alone.

These problems were easily solved by making the organizational changes as shown in Fig. 3. This confined the welding supervisors' activity to two shipways and left him in complete charge of the daily welding activity on those shipways. At the same time the shift welding foreman was given three subforemen—one each for the forward, midship and aft sections of the hull. (It is to be understood that this arrangement is the product of emergency conditions.)

As soon as this supervisory arrangement was functioning smoothly J. K. Doolan, general manager, inaugurated a series of supervisory training conferences under the direction of David F. Jackey from the Division of Education, maintained by the State Department of Education in cooperation with the University of California.

This has led to problem solution conferences being held regularly with the supervisors and foremen and has contributed to a feeling of mutual effort and the solution of many production problems. From a problem solution conference, for instance, came the work assignment by shifts as shown in Fig. 4.

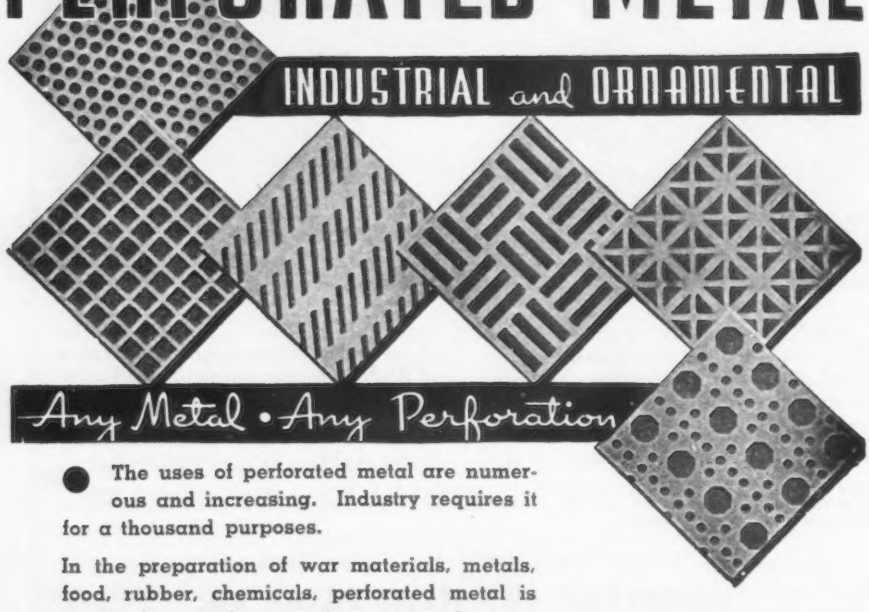
We had been troubled by both a duplication of pickup work and a reluctance on the part of some of the welding foremen to fully pickup behind the completion of production welding. A conference was held and the result was a breakdown of shift responsibility for the completion of all pickup in designated areas.

At the present time we are engaged in a job relations training program. Moreover it is with the knowledge that future welding activity is limited to the number of men who are qualified and willing to assume responsibility for the direction of welding operations that we plan further supervisory training on such subjects as:

The art and science of welding
Metallurgy of welding
Stress analysis
Welding sequence
Job organization
Supervision and management

And any other knowledge or skill necessary to good welding supervision.

PERFORATED METAL



● The uses of perforated metal are numerous and increasing. Industry requires it for a thousand purposes.

In the preparation of war materials, metals, food, rubber, chemicals, perforated metal is required to perform an important role.

The Harrington & King PERFORATING Co.

5657 FILLMORE STREET—CHICAGO 44, ILL.

Mass Production of Bombs

(CONTINUED FROM PAGE 66)

a Wheelabrator cabinet, which removes any sand adhering around the ingates, after which they are placed on the floor for the ingates to be parted. The now separated bombs are distributed by means of an electrically operated transfer bogie to the various gantries along which they roll to the various cutting-off machines, where the casting head is parted from the bombs. From here the bombs are transferred on gantries to a battery of swing grinders, where the external portion of the bomb, particularly the ingate, is trimmed off.

From this point, the castings are passed along gantries to the testing machines and are then loaded into trucks. Any slight surface defects are remedied by electric welding before despatch.

The mechanization is completed by a very useful overhead chair conveyor, which has a circuit of more than 850 ft. Among its duties, is the return of the corebars from the stripping station to the wood wool wrapping machines, and collecting of cut-off heads for transfer to wagons outside the buildings.

PERSONALS

• **L. D. Granger** has been elected vice-president, **George H. Creveling** elected treasurer and **Franklin Berwin** elected secretary of American Wire Fabrics Corp., New York, a subsidiary of Wickwire Spencer Steel Co.

• **D. W. Figgis**, executive vice-president of American Can Co., New York, has become president. **C. H. Black**, vice-president in charge of sales, was chosen to succeed Mr. Figgis and **S. Sloan Colt**, president of the Bankers Trust Co., New York, was elected a director.

• **Benjam' H. Gilpin** and **Milton E. Chandler**, both of Chandler-Evans Corp., South Meridan, Conn., and **John B. Byrne** of Hartford-Connecticut Trust Co., were elected directors of Niles-Bement-Pond Co.

• **Ralph L. Wilson**, former chief of the constructional steels section of the metallurgical and conservation branch, steel division, of the WPB in Washington, D. C., became chief metallurgical engineer of the Timken Roller Bearing Co., Canton, Ohio, January 1. Mr. Wilson's experience includes 6 years with the metallurgical departments of the United Alloy Steel Corp. and Central Alloy Steel Corp., after which he was for ten years employed by the steel and tube division of the Timken Roller Bearing Co. as metallurgical engineer, specializing in alloy steel tubing applications in the various process industries.

• **E. L. Berry**, vice-president and general manager of Link-Belt Ordnance Co., Chicago, has been elected vice-president of Link-Belt Co., the parent organization. Mr. Berry, who began his Link-Belt career in 1914, has for many years devoted his time particularly to matters of production and personnel. **Richard F. Bergmann**, company chief engineer, has also been elected a vice-president of the company. Mr. Bergmann came to Link-Belt in 1924, through the purchase of Howe Chain Co., Muskegon, Mich. **John E. Martin** has been appointed manager of Link-Belt Ordnance Co., with headquarters at the plant. Mr. Martin started with the company in 1927, and since Pearl Harbor has been assistant to Brigadier General G. M. Wells, War Dept., Washington, D. C.

• **Pinkney W. Love** has been appointed manager of the Washington, D. C. office of Lukens Steel Co. and subsidiaries, By-Products Steel Corp. and Lukenweld, Inc. Mr. Love succeeds **Charles A. Carlson** who is resigning to establish his own business for the manufacture of the Carlson Internal Combustion Engine.

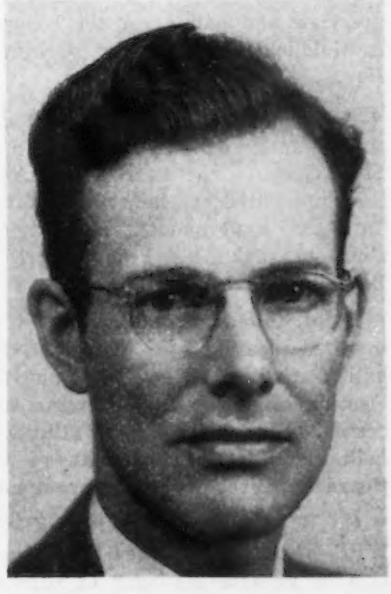
• **Mr. Gordon Groth** has been appointed assistant to the president of the Pennsylvania Rubber Co., Jeannette, Pa. Previously he was affiliated with Carnegie-Illinois Steel Corp., Pittsburgh, and Simmons Mfg. Co. of Cleveland.

• **Edmund J. McSweeney**, former superintendent of motive power for the Baltimore & Ohio Railroad, was named president of the Vulcan Iron Works, Wilkes-Barre, Pa. He will succeed **Perry Holder**, who resigned to become president of the Wickwire Spencer Steel Co.

• **Harold C. Cox** has been appointed superintendent of the steam and combustion department of the local plant of Bethlehem Steel Corp., Johnstown, Pa. **George W. Kerr** has been named assistant superintendent.

• **Marvin G. Sedam** has been appointed director of research for the Alloy Rods Co., York, Pa. He will have complete supervision of new technical developments and materials control. Mr. Sedam was formerly associated with the Harnischfeger Corp., Milwaukee, Wis., as chief metallurgist in charge of welding rod research and development.

MARVIN G. SEDAM, director of research, Alloy Rods Co., York, Pa.



• **V. N. Crasnoff**, has been named assistant general superintendent of Western Cartridge Co., East Alton, Ill. Mr. Crasnoff will supervise product engineering and manufacturing phases of the company's operations. **R. W. Merkle**, assistant to Mr. Crasnoff when he was superintendent of the company's ammunition division, has been named to succeed him. **D. R. Jones** was named assistant superintendent of the ammunition division, and **S. R. Irish** will continue as assistant general superintendent handling administrative matters.

• **James H. Jewell** has been made an assistant manager of industry departments of Westinghouse Electric & Manufacturing Co. Mr. Jewell, manager of the company's agency and specialties department since 1940, will continue to head that division. In his new position Mr. Jewell will supervise all activities of the industry departments except application data and training and general contract.

• **W. L. McGrath**, executive vice-president of the Williamson Heater Co., Cincinnati, for the past 10 years, was elected to the presidency of the firm. He will take the position which became vacant upon the recent death of **W. C. Williamson**. Mr. McGrath was head of the National Warm Air Heating & Air Conditioning Assn. for two years, and was also chief of the code authority of N.R.A. for the furnace industry.

• **Joseph W. McDougal** has been elected president of the Miller Tool & Mfg. Co., Detroit. Previously secretary-treasurer, Mr. McDougal succeeds **Alvin L. Miller**, founder of the company, who remains as a director. Mr. McDougal continues as treasurer, but has been replaced as secretary by **George H. Wilson**.

• **S. D. Mahan** has been appointed director of advertising and public relations of the manufacturing division of Crosley Corp. Cincinnati. In his new connection with the Crosley Corp. Mr. Mahan returns to the electrical appliance field where he spent over eight years, first as merchandise advertising and promotion manager and later as general advertising manager of the Westinghouse Electric & Manufacturing Co.

• **Leon R. Ludwig**, formerly head of Westinghouse Electric & Mfg. Co.'s circuit breaker and protective devices division, has been named manager of the motor division. He succeeds **R. W. Owens**, resigned.

ERNEST J. MEUTEN, assistant secretary of Niles-Bement-Pond Co.

• **H. I. Lewis** an official of American Hardware Co., Pettersburg, Va., will fill the newly created position of executive vice-president at the Weatherhead Co., Cleveland. **Henry F. Bailey**, a Cleveland banker, will take over the company's position of vice-president in charge of finance.

• **John U. Anderson,** secretary-treasurer of Pittsburgh Steel Co., Pittsburgh, has been elected a vice-president.

• **V. C. Mekell,** superintendent of foundries of Ampco Metal, Inc., of Milwaukee, Wis., has resigned to accept the management of product engineering and sales development for Syncro Machine Co., Rahway, N. J.

• **Willis Rabbe,** formerly with Upjohn & Co., Kalamazoo, Mich., has been elected vice-president and a director of the LeRoi Co., Milwaukee, to succeed **J. R. Frantz,** who is retiring.

• **James S. Duncan,** president and general manager of Massey-Harris, Ltd., Toronto, Canada, has been named to head the agricultural and food machinery commission of the United States, Canada and the United Kingdom.

• **Jasper Long,** formerly factory manager, has been promoted to the position of chief engineer and will be directly under the supervision of the general manager of Wade Electric Products Co., Sturgis, Mich. **Roger Ort,** formerly superintendent, has been made assistant production manager and **Daniel L. Wertz,** formerly of Hudson Motor Car Co., has been appointed sales manager.

• **Richard W. Banfield** was elected secretary and **Ernest J. Meuten** was elected assistant secretary of Niles-Bement-Pond Co., Hartford, Conn. Mr. Banfield first entered the company in 1935. He became assistant secretary in 1936 and office manager in 1939, which position he will retain along with his new promotion. Mr. Meuten has served as chief cost accountant of the company since 1935 and will continue those duties along with his election as assistant secretary.

• **Grover E. Leveque** has been made vice-president of Inter-State Iron Co. and Jones & Laughlin Ore Co., subsidiaries of Jones & Laughlin Steel Corp. Mr. Leveque's headquarters will be in Pittsburgh.

• **Dr. Harvey N. Davis,** president of Stevens Institute of Technology and director of the office of production research and development, WPB, has been elected an honorary member of the Institution of Mechanical Engineers in England.

• **Edward A. Kreller,** formerly with Detroit Alloy Steel Co., has been appointed manager of the Jessop Steel Company's cast-to-shape department in Detroit.

• **Milton Kutz** has been made acting assistant general manager of the electrochemicals department of E. I. du Pont de Nemours & Company, Wilmington, Del. The appointment marks the return of Mr. Kutz to the post which ill-health forced him to relinquish 18 months ago.

• **Col. T. H. Kruttschnitt** of San Mateo, Cal., has been appointed vice-president and manager of the Tonopah & Goldfield Railroad Co., Goldfield, Nev.

• **A. L. Grinnell,** for many years district manager for Rustless Iron & Steel Corp. in the Detroit office, has been appointed special representative on special assignments. He will continue to make his headquarters in Detroit.

• **E. M. Allen** announces his retirement as president of Mathieson Alkali Works, Inc., New York, and the election of **G. W. Dolan** as his successor. Mr. Allen will continue to hold his office as chairman of the Board of Directors of the company.

• **C. W. Garvey,** formerly of the WPB, has been appointed to the position of general manager of Gilmore Steel & Supply Co.'s Oakland plant.

RICHARD W. BANFIELD, secretary of Niles-Bement-Pond Co., Hartford, Conn.

• **Walter N. Westland** of Marion Steam Shovel Co., Marion, Ohio, has been appointed the company's sales manager. Mr. Westland joined the Marion organization in 1925. He previously held the position of district manager of the New England sales branch.

Also **L. C. Mosley** has been appointed manager of the mining division, a position left vacant by the recent death of **Homer Littlefield.** In addition to coal mining, Mr. Mosley will have charge of metallic and nonmetallic mining activities. Mr. Mosley has been with the company since 1925.

• **Paul D. Mallay** has joined the staff of Lukens Steel Co., Coatesville, Pa., and subsidiaries, By-Products Steel Corp. and Lukenweld, Inc., as manager of the companies' railroad division.

• **Charles Lindmueller,** manager of Metal & Thermit Corp. plant at East Chicago, Ind., since it was founded in 1911, is retiring. He will be succeeded by **W. G. Midnight,** heretofore assistant manager.

• **R. H. Grant** is retiring as vice-president of General Motors Corp., New York. He supervised the merchandising activities of all General Motors divisions and was recognized as one of the leading sales executives of the country.

• **Bruce A. Fleming** has been elected vice-president in charge of sales at Edwin L. Wiegand Co., Pittsburgh. He succeeds **Ernest N. Calhoun,** who recently became president of the company.

M. D. HOWELL, assistant to the president, U. S. Steel Corp., Del.

• **M. D. Howell** has been appointed to the position of assistant to the president, Benjamin F. Fairless, U. S. Steel Corp., Del., a newly created post. Mr. Howell will also continue as vice-president, secretary and treasurer of the Delaware Corp. in addito his new duties. Mr. Howell was formerly vice-president of Carnegie-Illinois Steel Corp. prior to which he was a vice-president of Chemical Bank and Trust Co., New York City.

• **Fay Keyler,** former vice-president and account manager, has been appointed first vice-president of the O. S. Tyson & Co., Inc., New York. **Elizabeth M. O'Neill,** former secretary, has been made secretary and treasurer. **George Balsam** has been made account manager. Previously he was assistant account manager. **Ernest S. Green,** who was an assistant on copy preparation, has been appointed manager of the copy department. **Herbert V. Mercready** joins the staff as a vice-president and **Kenneth W. Bailey** as an account manager.

• **C. Howard Paul,** treasurer and assistant to the president of Macintosh-Hemphill Co., Pittsburgh, and **Edmund L. Stewart,** treasurer of the Sandusky Foundry & Machine Co., Sandusky, Ohio, have been elected to membership in the Controllers Institute of America.

• **Jack Manildi** has been appointed manager of sales of Pacific Tube Co., Los Angeles. Mr. Manildi was for 10 years with the Oil Well Supply Co. and General Petroleum Corp. The past two years he assisted Mr. Harmon in forming and developing Pacific Tube.

• **L. V. Tuttle** has been appointed foundry manager at Gisholt Machine Co., Madison, Wis. Mr. Tuttle has been associated with the Koehring Co., Milwaukee, in a similar capacity for the past 12 years.

• **David Gross** has been appointed sales director of the materials test division of Allen B. Du Mont Laboratories, Inc., Passaic, N. J. Mr. Gross has been identified with Du Mont for several years past, specializing in television equipment sales until the outbreak of the war.

• **Hobart W. Seyler,** formerly assistant general superintendent, has been appointed general superintendent of Carnegie-Illinois Steel Corp. Clairton, Pa., Works. He succeeds **Frank F. Marquard,** who is retiring after more than 45 years of service.

• **Daniel C. Mills** has been made manager of industrial relations of Bethlehem Steel Co. Mr. Mills, who succeeds the late **G. W. Vary,** has been with Bethlehem Steel for 20 years.

• **F. N. Keithley** has been appointed district engineer of the thermit department by the Metal & Thermit Corp., New York. His headquarters will be at the corporation's South San Francisco branch.

• **Kenneth K. Stokes** has been appointed superintendent of transportation, Rock Island Lines, with headquarters in Chicago. Mr. Stokes has been acting superintendent of transportation since the death of **J. R. Pickering. T. O. Jennings,** general coal agent of Rock Island Lines, has retired recently.

• **Roland Whitehurst,** assistant sales manager of Electric Storage Battery Co. since 1940, has been assigned the title of sales manager. Mr. Whitehurst has been in the employ of the company since 1908, and was manager of its Washington branch for 20 years.

• **George M. Carvlin** has been elected a vice-president of Koppers Co., engineering and construction division. Mr. Carvlin had been an assistant to **Joseph Becker,** vice-president of the company and general manager of the division since 1940.

• **H. C. F. Mockridge,** of Toronto, member of the law firm of Osler, Hoskin & Harcourt, was elected a director of The International Nickel Co. of Canada, Ltd.

• **Leighton M. Long,** formerly chief metallurgist and foundry superintendent of the Bunting Brass & Bronze Co., Toledo, Ohio, has been named as an assistant research supervisor at Battelle Memorial Institute, Columbus, Ohio. Mr. Long has had over 20 years' research and supervisory experience in the metallurgical industries.

• **George L. Craig** has recently been appointed director of research of Calumet & Hecla Consolidated Copper Co., Detroit. Mr. Craig, metallurgist and research engineer, joined the Calumet & Hecla organization in 1934.

• **Frederic C. Weyburne** has been named general manager of the Marshall-Eclipse division of Bendix Aviation Corp., Troy, N. Y. Mr. Weyburne has been with Bendix since 1926, succeeding **Furber Marshall,** who resigned to become president of the Pharis Tire & Rubber Co.

• **John Maypole,** former sales engineer for the Kiekhaefer Corp., Cedarburg, Wis., has been appointed Chicago district sales manager for the firm.

• **B. F. Stauffer,** identified with the B. F. Goodrich Co. for the past 50 years, was elected president and general manager of American Anode, Inc., Akron, Ohio. Mr. Stauffer succeeds **Raymond W. Albright,** general manager of American Anode since 1926 who has been named vice-president and general manager of Distillation Products Inc., of Rochester, N. Y.

B. F. STAUFFER, president and general manager, American Anode, Inc., Akron, Ohio.

OBITUARY...

• **Carl A. Heins,** president and founder of National Electrotype Co., Inc., died on Dec. 27. He founded the company in 1907.

• **Harry T. Odenkirk**, sales manager of Keen Foundry Co., Chicago, Ill., died on Dec. 14.

• **Curtis H. Veeder,** inventor, manufacturer and director of the Veeder-Root Co., Hartford, Conn., died recently at the age of 81.

• **Frederick W. Wood,** who built the plant of the old Maryland Steel Co. at Sparrow's Point, which is the predecessor of Bethlehem Steel Co., died on Dec. 23 after an illness of little more than 24 hours. Mr. Wood was born March 16, 1875, and was 86 years old.

• **Walter L. Hague** died on Dec. 17, 1943, at his home in Pittsburgh, Pa. He was 71 years of age. Mr. Hague was one of the pioneers in the contract and jobbing electroplating industry, having operated Walter E. Hague & Son, Inc.

• **Robert F. Hamilton,** superintendent of Vance Iron & Steel Co., Chattanooga, Tenn., died suddenly of heart attack on December 30. Mr. Hamilton joined the company in 1919.

• **Hugh J. Homewood,** treasurer of Gisholt Machine Co., Madison, Wis., and affiliated with the company organization for nearly 20 years, died at his home on November 7 at the age of 49. Prior to his election as treasurer of the firm in 1940 he had served in various capacities culminating in his appointment as chief accountant and office manager, which positions he held for 10 years.

• **Byron V. Covert,** pioneer auto manufacturer, was found dead December 18 at his home in Lockport, N. Y. With **Alfred P. Sloan** he was one of the backers of the late **Herbert C. Harrison** in founding the Harrison Radiator Corporation, now a division of General Motors, in Lockport. He was 80 years of age.

• **Charles L. Nutter,** treasurer since 1902 and manager of the Old Colony Foundry, East Bridgewater, Mass., died December 28 in his 71st year. Prior to 1914, Mr. Nutter was an official of the Carver Cotton Gin Co.

• **Edgar H. Reed,** prominently identified with the Worcester, Mass., machine tool industry for years, died December 26 at Boothbay Harbor, Me., where he had lived since his retirement several years ago.

• **Erle F. Whitney,** assistant district manager of the General Electric Co.'s East Central district, for the past 14 years, died in Cleveland on Dec. 12.

• **George W. Vary,** manager of industrial relations, Bethlehem Steel Co., died Dec. 25, after a short illness of heart trouble and other complications. Mr. Vary had spent most of his business life with Bethlehem Steel Co. having started in 1903.

• **Nicholas L. Moon,** president of the Upper Merion & Plymouth Railroad Co. at Conshohocken, Pa., died on December 27 at Norristown, Pa., His age was 77. Mr. Moon was connected with the Delaware and Hudson Railroad from 1887 to 1907, and as division superintendent of the Lehigh Valley Railroad at Wilkes-Barre, Pa., from 1907 to 1910. After his term of service with the Lehigh Valley Railroad, he joined the Alan Wood Steel Co. as traffic manager. Later he became vice-president in charge of operations of the Upper Merion & Plymouth Railroad Co., and his final capacity was as president of the railroad, which position he held at the time of his death.

• **John S. Richards,** director of research of American Steel & Wire Co., died suddenly at his home in Cleveland on Dec. 23. He was 49 years old.

• **Roland J. Houck,** 51, plant manager and director of Motch & Merryweather Machinery Co., Cleveland, died Dec. 25 at Tuscon, Ariz., after a short illness.

• **Walter J. Allison,** tool expediter for General Motors Corp., passed away recently. He was 47 years of age.

• **Oscar T. Roder,** assistant to the general manager of Globe-Union, Inc., Milwaukee, died Dec. 26.

• **Chester H. Pape,** president of the Independent Foundry Co. and Peerless Pattern Works at Portland, Ore., died recently. He was 58 years old, a member of Portland's Metal Trades Assn. and past president of the Pacific Metal Trades & Gray Iron Foundry Assn.

• **Harold K. Ferguson,** founder and president of H. K. Ferguson Co., Cleveland, died of a heart attack, Dec. 9 at the age of 60. As an industrial engineer and builder Mr. Ferguson made at least two contributions to his profession that brought him recognition in his field. The first was the "standard factory" principle which provided for building plants from stock plans with structural steel already fabricated. The second was the assembling of an organization which could actually "manufacture" industrial plants.

Mr. Ferguson was born in Albion, Mich. He was graduated from Ohio Wesleyan University in 1905 and began his career as a timekeeper with the Austin Co. In 1909 he went to General Electric and rejoined Austin in 1912 as secretary of the company. In 1918 he founded the H. K. Ferguson Co.

• **Alexander G. Howard,** senior engineer, production department, Remington Arms Co., Lowell, Mass., died suddenly Dec. 12 while playing tennis at a country club. Mr. Howard was born in Ireland 58 years ago.

• **Paul C. DeWolf,** vice-president of Brown & Sharpe Mfg. Co., Providence, R. I., for the past 19 years, died Dec. 19. He was 61 years old.

• **Frank P. Weisbeck,** general superintendent of J. H. Williams & Co., Buffalo, died while at work Dec. 23. He was 59 and had been with the firm 30 years.

• **Louis Birkenstein** prominently identified with the metal industries for many years, died Dec. 28 in his 77th year. His son, **George Birkenstein,** president of the George Birkenstein & Co. and the Anker-Holth Mfg. Co., Chicago, died Jan. 2. He was 44 years old.

• **Edwin D. Coddington,** president of the E. D. Coddington Co., Milwaukee, and former vice-president and production manager of the Wisconsin Bridge & Iron Co., died in Douglaston, N. Y., recently, at the age of 78 years.

• **Carl Wheeler,** production control manager of Vickers, Inc., Detroit, died recently. Before joining Vickers in 1936, Mr. Wheeler was with Graham-Paige Co. for 19 years. Also **Charles G. Lloyd,** a sales engineer for Vickers recently passed away. He was born in Ebensburg, Pa., 50 years ago.

Renegotiation Figures Accepted

Cincinnati

• • • **Renegotiation of machine tool** contracts so far as the government's end of the job is concerned has been completed in the Cincinnati area. Most manufacturers have already had their final conferences with renegotiators and are now in possession of figures. While there has been no definite announcement, it is fairly well known that several of the manufacturers have closed books and have agreed to the figures and several have sent checks to Washington. In some instances some companies are writing letters of protest so that they may be in reasonable position to gain advantage of any subsequent relief that may be forthcoming. Most manufacturers are dissatisfied with the situation since the margin of profit permitted is reported to be very low.

On the new business side of the picture, manufacturers indicate a fair volume of lend-lease business during the month of December, with continuing fair business during the current month. Most plants are still going along with present forces in a few cases some men have been laid off.

A.S.A. Revises Standards On Machine Tool Elements

• • • **The American Standards Association** has announced the revision of two in the series of 20 machine tool standards, B5.7-1943, circular and dovetailed forming tool blanks, and B5.10-1943, machine tapers (self-holding and steep taper series).

The revised standard covering circular and dovetail tool blanks and their holders, first approved in 1936, includes besides the sizes and types of circular and dovetailed forming tool blanks, the associated mounting portions of their respective holders for use on automatic screw machines. To reduce the number of blanks now in use, the machines have been classified into six different groups of comparable stock capacities.

The American Standard for Machine Tapers (B5.10-1943), which was first approved in 1937, now sets a uniform practice for the slope of self-holding and steep machine tapers, the detailed dimensions for this type of taper tool shank and the corresponding dimensions for the taper socket in the spindle of the machine, including the dimensions of the keyways.

Both of these standards have been formulated by the A.S.A. committee B5 on small tools and machine tool elements, organized under the A.S.A. procedure and under the joint sponsorship of the American Society of Mechanical Engineers, the Society of Automotive Engineers, and the National Machine Tool Builders' Association.

The American Standard for Machine Tapers is available at 60c. a copy and the American Standard for Circular and Dovetail Forming Tool Blanks, at 50c. a copy, from the American Standards Association, 29 West 39th Street, New York 18, New York.

o o o

Tool Steel Identification System

[CONTINUED FROM PAGE 67]

substantial advantages in experience tabulations and in salvage work. Relative performance of various analyses may be checked, worn out tools can be easily sorted by analyses for maximum efficiency and value in the handling as scrap, and tools being salvaged by annealing and re-hardening can be given proper heat treatment.

Only commonly encountered domestic brands are included in the first standards lists being put out by the automotive companies. Others may be added later. The system follows one laid out several years ago and improved upon since by Gorham Tool Co., Detroit. The tool markings are for identification only and should not be confused, in any way, whatsoever, with specifications.

Identification first breaks down all high speed steels by the major alloy element in the composition, tungsten or molybdenum. Where tungsten predominates, the letter "T" starts off the code definition, and for molybdenum tools the letter "M" is used. The next phase of the symbol is a numeral indicating the chemical composition. The third part of the symbol is a letter which denotes the company producing the raw steel.

The symbols are keyed in this manner as regards formulas:

Tungsten High Speed Steels—"T"
Chemical Composition in Percentage

Tungsten	Chromium	Vanadium	Cobalt	Analysis Symbol
18.00	4.00	1.00		T-1
18.00	4.00	2.00		T-2
18.00	4.00	3.25		T-3
18.00	4.00	1.00	4.00	T-4
18.00	4.00	2.00	8.00	T-5
22.00	5.00	1.50	12.00	T-6
14.00	4.00	2.00		T-7
14.00	4.00	2.00	5.00	T-8

Symbol	Company
A	Vanadium-Alloys Steel Co.
B	Firth-Sterling Steel Co.
C	Henry Disston & Sons, Inc.
D	Universal-Cyclops Steel Co.
E	Bethlehem Steel Co.
F	Latrobe Electric Steel Co.
G	Allegheny Ludlum Steel Corp.
H	Columbia Tool Steel Co.
I	Braeburn Alloy Steel Corp.
J	Halcomb Works, Crucible Steel Co.
K	Carpenter Steel Co.
L	Midvale Co.
N	Simonds Saw & Steel
P	Vulcan Crucible Steel Co.
W	Jessop Steel Co.
X	Crucible Steel Co.

Thus if it was desired to specify a steel containing 18 per cent tungsten, 4 chromium, and 2 vanadium, made by the Allegeny Ludlum Steel Corp., the key would be "T" (for tungsten), "2" (denoting the formula), and "G" (denoting the maker), or T-2-G.

Assume a molybdenum steel containing 5 per cent molybdenum, 4 chromium, 1½ vanadium and 6 tungsten was desired. The analysis symbol would be M-2. Purchase orders from companies might read simply M-2, indicating no preference in the choice of maker. Later, the delivery of this order might be marked M-2-X, indicating that the particular specification involved came from Crucible Steel Co. of America. Typical trade names correlated within the framework of this coding system are shown in the accompanying illustration.

Molybdenum High Speed Steels—"M"
Chemical Composition in Percentage

Molybdenum	Chromium	Vanadium	Tungsten	Cobalt	Boron	Analysis Symbol
8.00	4.00	1.00	1.50			M-1
5.00	4.00	1.50	6.00			M-2
8.00	4.00	2.00				M-10
8.00	4.00	1.00		2.50	added	M-20
8.00	4.00	1.00	1.50	4.00		M-30
8.00	4.00	1.50		8.00	added	M-40

MACHINE TOOLS

. . . News and Market Activities

Onsrud Prices Approved, Yet OPA Sues

• • • **Sales of** wood and metal working machinery at prices later substantially approved by the OPA have resulted in an OPA suit for $60,000 against Onsrud Machine Works, Inc., Chicago. The sum asked represents three times the difference between prices assertedly charged for the machinery and established ceiling prices during the period when damage rights under the price control act commenced and the dates on which the company filed applications for upward revision of its prices.

The OPA's suit fails to take into consideration that the claimed above-ceiling prices later substantially were approved for subsequent sales.

Maximum Price Regulation No. 67, covering metal working tools, and No. 136, covering other machinery, set up Oct. 1, 1941, list prices as ceiling. Onsrud had increased its list prices between that date and Jan. 30, 1942, effective date of the price control act, because of rising production costs. The company manufactures high speed routing and milling equipment for non-ferrous metals used principally in the aircraft industry, and wood-working machinery for such special purpose work as fashioning the stock of the Garand rifle. During the period immediately before the price control act, Onsrud found that new special purpose machinery for the aircraft industry had been priced too low, and that this machinery rapidly was becoming the major part of its production. About 88 per cent of the company's sales go to the aircraft industry, representing metal working machinery; the balance, wood working machinery, is sold to government arsenals. The company's business mushroomed because of the war, net sales rising from $230,000 in 1938 to $2,050,000 in 1942 and about $3,000,000 in 1943. Profits after taxes amounted to about $30,000 in 1942 and approximately the same in 1943, so that judgment against the firm in the OPA suit would wipe out profits of two years.

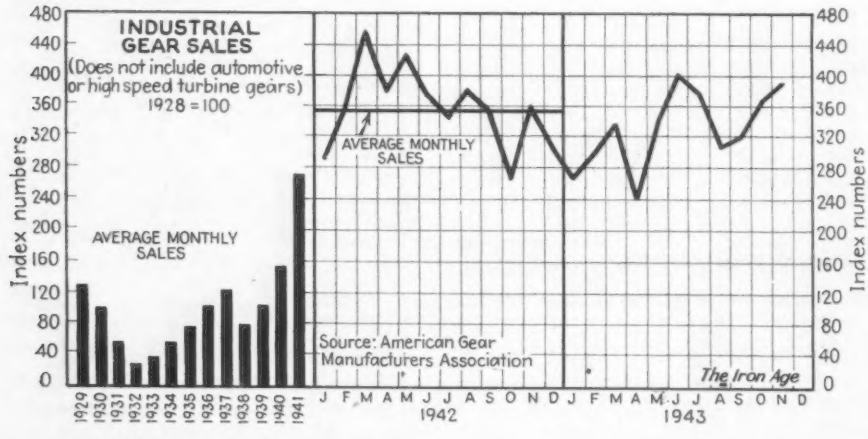
The company maintains that because of the kaleidoscopic change in the character of its business it did not have readily available the necessary information to file for validation of its prices prior to the six month deadline on damages after the effective date of the price control act. Lack of accurate cost records, and devotion of the entire energies of its small executive staff to production, delayed the filing, it is claimed. Application was filed under Maximum Price Regulation No. 67 for revision of prices on the metal-working machinery, on Sept. 7, 1942, and on the wood-working machinery, under Maximum Price Regulation No. 136, on Dec. 3, 1942. Thus most of the damages claimed by the OPA reflect over-ceiling sales of wood working machinery because of the longer time period involved between July 31, 1942, when damage suits became permissible, and the date of eventual filing.

The price increases granted were substantially those requested in each case, and were retroactive to the date of filing the petition. They also were substantially those in effect at the time the price control act was passed, the company states, so that increases made between the Oct. 1, 1941, ceiling price base date, and the cutback caused by the price control act were, in effect, validated.

The OPA contends that the company filed for price increases after an investigation had been started of the alleged overcharges, and that prior to Aug. 1, 1942, it called the defendant's attention to asserted violations of Maximum Price Regulation No. 67.

November Gear Sales Up 5 Per Cent

. . . The gearing industry as represented by the members of the American Gear Manufacturers Association shows an increase of 5 per cent in the business booked in November, as compared with October. The November index figure was 387 as compared with 368 for October.



WPB Relaxes Restrictions On Rotary Files and Vises

Washington

• • • **WPB by two** amendments to L-216 has eased restrictions upon the manufacture of two tool items—vises and rotary files and burrs. Since last summer manufacturers of rotary files and burrs were permitted to make only up to 10 per cent of their previous month's total production in the form of special sizes and shapes; under the revision the quantity is increased to 25 per cent of the previous month's total production. Chip-breakers, previously prohibited, are now permitted.

Another amendment issued simultaneously removes restrictions upon the manufacture of bench vises, except in the case of the four machinists' bench types which remain on the schedule. The limitation on types of metal that may be used continues in effect.

FOR YOUR HOIST MANPOWER PROBLEMS

Make the most of your manpower. Move materials faster and easier with fewer men . . . with men who need not be "born" hoist operators—just average workers who have a job and try to do it well. To keep things moving right along whether Tom, Dick or Harry is on the job is what you want. And you get what you want with Robbins & Myers Push-Button Two-Speed Control.

Skilled or otherwise, the hoist operator has two speeds under precise push-button control. For slow speeds (4 to 6 feet per minute) he presses one button; for high-speed handling, another. He presses the button . . . no "fishing" around.

Learn, at first hand, how Robbins & Myers Hoists can give you precise, productive speed control . . . control that is geared to today's need for the simpler operating methods that spread available manpower as widely as possible. Clip, sign, and mail the coupon today for your free copy of "Electrical Details of Robbins & Myers Hoists."

NON-FERROUS METALS

. . . News and Market Activities

Primary Aluminum Output Up 75%

• • • **Production of primary aluminum** increased more than 75 per cent from 521,106 net tons in 1942 to about 920,000 tons in 1943, according to the year end report on domestic mineral production submitted by the Bureau of Mines to Secretary Harold L. Ickes.

Construction difficulties and manpower shortages delayed the completion of the aluminum expansion program but by the last quarter of the year metal was being produced at an annual rate of 1,128,000 tons.

Because of the existing over-supply, operations of three newly completed potlines was delayed and indications were that six to 10 additional potlines would be closed.

Domestic production of bauxite increased from 2,768,343 net tons in 1942 to 7,166,000 net tons in 1943. One and a half million tons of bauxite were imported from South America. The bauxite stockpile totals more than four million tons.

Magnesium: Production in 1943 amounted to 185,000 tons valued at $76,000,000 compared with 47,420 tons worth $21,216,414 the year before.

Copper, Lead and Zinc: Despite the incentive of bonus prices, mine production of lead and zinc decreased in 1943 and copper production was only slightly increased. Smelter production of copper from domestic ores increased slight from 1,087,991 tons valued at $256,766,000 in 1942 to about 1,090,000 tons valued at $257,000,000 in 1943. Refined lead production declined from 467,367 tons in 1942 to about 425,000 tons. Slab zinc similarly declined from 629,957 tons to about 585 tons in 1943.

•

Copper Contract Cancelled

Toronto

• • • **Metals Reserve Co.** has cancelled its contract with the Granby Consolidated Mining, Smelting & Power Co., Ltd., Granby, B. C., for supply of copper, as of Dec. 31. The original contract, which became effective on all shipments of copper by the company after Nov. 1, 1942, expired at the end of 1943 and will not be renewed. It is stated, however, that Metals Reserve Co., has given Granby an order for a small additional tonnage of copper which will provide an outlet for its production for several weeks.

While no further cancellations have been announced between Metals Reserve Co., and Canadian base metals producers, contracts are being reviewed and some are likely to end this year.

Production costs at Granby have advanced sharply in recent months, largely because of the failure of the government authorities to provide the company with an adequate supply of labor. This had the two-fold effect of restricting production, while at the same time development had to be reduced and the grade of ore treated had to be lowered. The contract under which Granby operated called for payment by Metals Reserve Co., of all expenses plus a royalty to compensate for loss of ore reserves. This royalty was on a sliding scale, declining as costs increased above the base figure of 11c. a lb. operating costs.

•

CMP Changes

• • • **Aluminum slugs** have been designated as controlled materials to permit allotment of this form of aluminum for the manufacture of collapsible tubes, which may be made under the terms of Aluminum Order M-1-i, as amended Dec. 4, 1943.

Powders made from copper or copper-base alloys are no longer controlled materials as a result of Direction No. 42 to CMP Regulation No. 1. During the first quarter of 1944, producers of copper or copper-base alloy powders may make deliveries either on authorized controlled materials orders or on orders placed by customers who have been authorized on Form WPB-2959 to receive such powders. However, beginning with the second quarter of 1944, producers of such powders may make deliveries on orders placed pursuant to this authorization form only.

•

Beryllium Order Amended

• • • **WPB on Jan. 4** added the name of Beryllium Corp. of Pennsylvania to the list of approved smelters, thereby permitting it to buy beryllium-copper scrap without approval by WPB, in an amendment to Supplementary Order M-160-a. Beryllium is a copper alloying material and this order controls the purchase of this scrap by producers and smelters.

Copper production in terms of recoverable metal based on smelter receipts, except the Central and Eastern States which are mill outputs, in net tons

Scrap Price Controls Eliminated On Sales by Government Agencies

Washington

• • • **Sales and** deliveries of scrap metals by the War Department, Navy Department and the Procurement Division of the Treasury Department to dealers purchasing for resale will be exempt from the specific price control when the dealer certifies that he is purchasing for resale and that in reselling he will not exceed the applicable maximum prices, the Office of Price Administration announced. At the same time, when the dealer executes another certificate, these agencies and their employees will be exempt from the civil or criminal liabilities set forth in price regulations covering these items.

All sales by these agencies of used, waste, and scrap materials subject to price regulation have been exempt from price control for some time. These exemptions represent a further step by OPA to relieve the procurement agencies of burdens placed upon them in disposing of salvage materials and commodities. Where no certificates are executed by the dealer, the exemptions do not apply.

Auto Wreckers Meet in Cleveland

Cleveland

• • • **Wartime problems** and post war planning were the topics of discussion at the first annual meeting of the National Auto Wreckers Association in Cleveland on Jan. 10 and 11. The program was devoted to the problems of the auto wrecking industry and the relationship that industry plays to the war.

Members of the various governmental control agencies, the armed services and the industry took part in the meeting. OPA and WPB representatives discussed the "Used Parts Problem and Its Relationship to Wartime Transportation," while a representative of the Rubber Director of the WPB discussed the nation's rubber supply and how it affects the auto wrecking industry.

"Auto Salvage" and "Post-War Planning" were discussed by the group, and the representatives from the Army, Selective Service and the War Manpower Commission told members of the association what to look out for in the immediate future as far as manpower supplies were concerned.

On a national radio hook-up, a roundtable group composed of members of various scrap consuming industries, the auto wreckers association, and several government agencies discussed "Automotive Parts Replacement for War."

Scrap Yards Charge WMC With Aiding Labor Turnover

Boston

• • • **Relations between** the War Manpower Commission and scrap yards are not amicable. The latter claim that WMC makes no effort to aid yards hold what little labor they have. Instead, WMC makes it easy for the yard laborer to switch to another job, it is claimed. Appeals from yards are to sustain refusals to release men are usually answered by giving men a higher rating. A man capable of pushing a wheelbarrow around a foundry has a higher rating than he would working in a scrap yard.

Labor is so tight in some yards that it is frequently necessary to use truck drivers to help load cars and for other yard work. Extra compensation must often be made in such cases. Were it not for the fact that a sizable tonnage of scrap handled by yards is prepared, such as turnings and borings, yard labor problems would be even more acute than at present.

CINCINNATI — While shipments are being accepted on previous commitments, activity for additional amounts of material is all but absent in this area. Most melters are reported to have fair inventories running from perhaps 60 to 90 days. The tendency on the part of consumers is indicated to be one of careful retrenchment so as not to be caught in the event of cancellations with too large an inventory on hand.

•

PITTSBURGH — Supply and demand well balanced here. There appears to be no chance of a severe scrap shortage materializing this winter. With pig iron supplies easier, some tension has been taken off scrap. Alloy scrap is still a drug on the market.

•

BUFFALO—Scrap dealers reported this week that consumers were buying again after last month's near-embargo. All items with the exception of the troublesome alloys were moving in fair volume.

•

BOSTON—Metal working plant prepared scrap production is decreasing, little automobile scrap comes into the market, the supply of breakable, machinery, and textile cast is negligible, and heavy steel scrap supplies are off. Labor, the average yard's bottleneck, is further hindered by cold weather and snows. Government agencies are corraling some scrap but there is much less than a year ago. These agencies see to it that yards get little shipyard scrap.

•

BIRMINGHAM—Mills in this area are currently limiting scrap purchases to material available in the immediate district to avoid payment of higher freight rates. Foundries are out of the market for all grades.

•

ST. LOUIS — Scrap shipments here have fallen off since the turn of the year because of the scarcity of material, labor shortages, and cold weather. Industrial and railroad scrap provide virtually all receipts, and mills have been working into their reserves.

•

CHICAGO — Supply and demand for carbon grades appears to be pretty well balanced with no noticeable trend in either direction. Three local mills that were out of the market at WPB request are buying again. Cast iron is still not available in any measurable quantities, but alloy scrap continues far in excess of demand.

•

NEW YORK — Scrap demands have picked up in this area during the past week, with several mills calling for additional receipts and none are restricting quantity. The Army Salvage Center in Brooklyn is using war prisoners from Governor's Island for sorting and other operations, but yards continue to face a bad manpower shortage.

* Baled turnings are $5 per gross ton higher.

BUNDLES: Tin can bundles are $4 below dealers' No. 2 bundles; No. 3 bundles are $2 less than No. 1 heavy melting.

AT NEW YORK CITY or Brooklyn, the maximum shipping point price is $15.33 for No. 1 heavy melting, f.o.b. cars, f.a.s. vessel or loaded on truck. Minimum set at $14 per gross ton at any shipping point in U. S. Other grades carry differentials similar to those in table. New Jersey prices must be computed on basis of all-rail. At Boston the maximum is $15.05 for No. 1 f.o.b. cars, f.a.s. vessel or loaded on trucks. Shipments from a New England shipping point to a consumer outside New England carry maximum transportation charge of $6.66 per ton.

SWITCHING CHARGES: Deductions for shipping points within basing points (cents per gross ton) are: Pittsburgh, Brackenridge, 55c.; Midland, Johnstown, Sharon, Youngstown, Warren, Weirton, Cleveland, Toledo, Los Angeles, San Francisco, 42c.; Butler, Monessen, Canton, Steubenville, Cincinnati*, Portsmouth, Ashland, Coatesville, Harrisburg, Phoenixville, Bethlehem, Kokomo, Duluth, St. Louis, 28c.; Buffalo, Claymont, 36c.; Conshohocken, 11c.; Atlanta, Birmingham, 32c.; Pittsburg, Cal., 42c.; Middletown, 14c.; Sparrow's Point, 11c.; Chicago, 84c.; Detroit, 53c.; Alabama City, 26c.; Minnequa, 22c.; Seattle, 38c. At Cincinnati, for basic open hearth grades, foundry steel and auto springs and crankshafts, deduct 80c. per ton.

PITTSBURGH basing point includes switching districts of Bessemer, Homestead, Duquesne, Munhall and McKeesport. Cincinnati basing point includes Newport, Ky., switching district. St. Louis includes switching districts of Granite City, East St. Louis, Madison, Ill. San Francisco includes switching districts of S. San Francisco, Niles and Oakmont, Cal. Claymont, Del., includes the switching point of Chester, Pa. Chicago includes Gary, Ind., switching district.

MAXIMUM SHIPPING POINT PRICE—Where shipment is by rail or vessel, or by combination of rail and vessel, the scrap is at its shipping point when placed f.o.b. railroad or f.a.s. vessel. In such cases, the maximum shipping point prices shall be: (a) For shipping points located within a basing point, the price listed in the table above for the scrap at the basing point in which the shipping point is located, minus the lowest established switching charge for scrap within the basing point and (b) for shipping points located outside the basing point, the price in table above at the most favorable basing point minus the lowest transportation charge by rail or water or combination thereof. In lieu of dock charge add 75c. a ton, but 50c. if moved by deck scow or railroad lighter. Shipping by motor vehicle: The scrap is at its shipping point when loaded. For shipping points located within basing points take price listed in table minus applicable switching charge. If located outside a basing point, the price at the most favorable basing point minus lowest established charge for transporting by common carrier. If no established transportation rate exists, the customary costs are deducted. Published dock charges prevail. If unpublished include 75c.; at Memphis, 50c.; Great Lakes ports, $1; New England, $1.25. For exceptions see official order.

UNPREPARED SCRAP: For unprepared scrap, maximum prices shall be $3.50 (and in the case of the material from which No. 1, No. 2, and No. 3 bundles are made $4) less maximum prices for the corresponding grade or grades of prepared scrap. In no case, however, shall electric furnace and foundry grades be used as the "corresponding grade or grades of prepared scrap." Converter may charge $2.50 per ton on consumer-owned unprepared remote scrap (see order). A preparation-in-transit charge for allocated unprepared scrap is provided.

NEW LISTED GRADES: Priced in dollars per gross ton less than No. 1 heavy melting steel. Pit scrap, ladle skulls, slag reclaim, etc., of 85% or more Fe priced—$2; 75 to 85% Fe—$4; under 75% Fe—$3 per ton. Mill scale of 65% or more Fe—$8 per ton. Mill cinder and grindings, shipping point maximum price of $4 per gross ton at all U. S. shipping points.

CHEMICAL BORINGS: No. 1 (new, clean, containing not more than 1 per cent oil), $1 less than No. 1 heavy melting; No. 2 (new, clean, containing not more than 1.5 per cent oil), $2 less than No. 1 heavy melting. If loaded in box cars add 75c.

Heavy melt'g steel, Phila.	18.75	18.75	18.75	18.75
Heavy melt'g steel, Ch'go	18.75	18.75	18.75	18.75
No. 1 hy. comp. sheet, Det.	17.85	17.85	17.85	17.85
Low phos. plate, Youngs'n	22.50	22.50	22.50	22.50
No. 1 cast, Pittsburgh	20.00	20.00	20.00	20.00
No. 1 cast, Philadelphia	20.00	20.00	20.00	20.00
No. 1 cast, Ch'go	20.00	20.00	20.00	20.00
Coke, Connellsville: (Per Net Ton at Oven)				
Furnace coke, prompt	$7.00	$7.00	$6.50	$6.00
Foundry coke, prompt	8.25	7.50	6.875	6.875
Non-Ferrous Metals: (Cents per Lb. to Large Buyers)				
Copper, electro., Conn.	12.00	12.00	12.00	12.00
Copper, Lake, New York	12.00	12.00	12.00	12.00
Tin (Straits), New York	52.00	52.00	52.00	52.00
Zinc, East St. Louis	8.25	8.25	8.25	8.25
Lead, St. Louis	6.35	6.35	6.35	6.35
Aluminum, Virgin, del'd.	15.00	15.00	15.00	15.00
Nickel, electrolytic	35.00	35.00	35.00	35.00
Magnesium, ingot	20.50	20.50	20.50	22.50
Antimony (Asiatic), N. Y.	16.50	16.50	16.50	16.50

The various basing points for finished and semi-finished steel are listed in the detailed price tables, pages 142-155.

Composite Prices . . .

Starting with the issue of April 22, 1943, the weighted finished steel price index was revised for the years 1941, 1942 and 1943. See explanation of the change on page 90 of the April 22, 1943, issue.

	FINISHED STEEL	PIG IRON	SCRAP STEEL
Jan. 11, 1944	2.25513c. a Lb.	$23.61 a Gross Ton	$19.17 a Gross Ton
One week ago	2.25513c. a Lb.	$23.61 a Gross Ton	$19.17 a Gross Ton
One month ago	2.25513c. a Lb.	$23.61 a Gross Ton	$19.17 a Gross Ton
One year ago	2.26190c. a Lb.	$23.61 a Gross Ton	$19.17 a Gross Ton

	HIGH	LOW	HIGH	LOW	HIGH	LOW
1943	2.25513c.,	2.25513c.,	$23.61	$23.61	$19.17	$19.17
1942	2.26190c.,	2.26190c.,	23.61	23.61	19.17	19.17

Weighted index based on steel bars, beams, tank plates, wire, rails, black pipe, hot and cold-rolled sheets and strip, representing 78 per cent of the United States output. Index recapitulated in Aug. 28, 1941, issue.

Based on averages for basic iron at Valley furnaces and foundry iron at Chicago, Philadelphia, Buffalo, Valley and Southern iron at Cincinnati.

Based on No. 1 heavy melting steel scrap quotations to consumers at Pittsburgh, Philadelphia and Chicago.

. . . Prices of Finished Iron and Steel

Steel prices shown here are f.o.b. basing points, in cents per lb., unless otherwise indicated. Extras apply. Delivered prices do not reflect 3% tax on freight. **(1) Mill run sheet, 10c. per 100 lb. under base; primes 25c. above base.** (2) Unassorted 8-lb. coating. (3) Widths up to 12-in. (4) 0.25 carbon and less. (5) Applies to certain width and length limitations. (6) For merchant trade. (7) For straight length material only from producer to consumer. Discount of 25c. per 100 lb. to fabricators. (8) Also shafting. For quantities of 20,000 to 29,999 lb. (9) Carload lot in manufacturing trade. (10) Prices do not apply if rail and water is used. (12) Boxed. (13) Portland and Seattle price, San Francisco 2.50c. (14) This base price to be used in figuring annealed, bright finish wires, commercial spring wire.

EXCEPTIONS TO PRICE SCHED. NO. 6

Slabs—Andrews Steel Co. $41 basing pts.; Wheeling Steel Corp. $34 Portsmouth, Ohio; Empire Sheet & Tin Plate Corp. $41; Phoenix Iron Co. (rerolling) $41, (forging) $47; Granite City Steel Co. $47.50.

Blooms—Phoenix Iron Co. (rerolling) $41, (forging) $47.

Sheet Bar—Empire Sheet & Tin Plate Co. $39 mill; Wheeling Steel Corp. $38 Portsmouth, Ohio.

Billets, Forging—Andrews Steel Co. $50 basing pts.; Follansbee Steel Corp. $49.50 Toronto, Ohio; Phoenix Iron Co. $47.00 mill.

Billets, Rerolling—Continental Steel Corp. may charge Acme Steel in Chicago switching area $34 plus freight from Kokomo, Ind.; Northwestern Steel & Wire Co. (Lend-Lease) $41 mill; Wheeling Steel Corp. (small) $36 Portsmouth, Ohio; (blooming mill sizes) applicable base, f.o.b. Portsmouth, Ohio; Stanley Works may sell Washburn Wire Co. under allocation at $39 Bridgeport, Conn.; Keystone Steel & Wire Co. may sell Acme Steel Co. at Chicago base, f.o.b. Peoria; Phoenix Iron Co. $41 mill; Continental Steel Corp. (1¾ x 1¾) $39.50, (2 x 2) $40.60 Kokomo, Ind. (these prices include $1 size extra); Keystone Steel & Wire Co. $36.40 Peoria; Connors Steel Co. $50.69 Birmingham; Ford Motor Co. $34 Dearborn, Mich.

Structural Shapes—Phoenix Iron Co. $2.35 basing pts., (export) $2.50 Phoenixville; Knoxville Iron Co. $2.30 basing pts.; Sheffield Steel Corp. $2.55 St. Louis.

Bar Size Shapes—(Angles) W. Ames & Co., 10 tons or over, $3.10 mill.

Rails—Sweet Steel Co. (rail steel) $50 mill; West Virginia Rail Co. (lightweight) on allocation based Huntington, W. Va.; Colorado Fuel & Iron Corp. $45 Pueblo, Colo.

Hot Rolled Plate—Granite City Steel Co. $2.65 mill; Knoxville Iron Co. $2.25 basing pts.; Kaiser Co. $3.20 Pacific Ports.

Merchant Bars—Sheffield Steel Corp. $2.75 St. Louis; W. Ames & Co., 10 tons and over, $2.85 mill; Eckels-Nye Steel Corp., $2.50 basing pts. (rail steel) $2.40; Phoenix Iron Co. $2.40 basing pts.; Sweet Steel Co. (rail steel) $2.35 mill; Joslyn Mfg. & Supply Co. $2.35 Chicago; Central Iron & Steel Co. $2.20 basing pts.; Granite City Steel Co. $2.35 Granite City; Calumet Steel Div., Borg Warner Corp. (8 in. mill bars) $2.35 Chicago; Knoxville Iron Co. $2.30 basing pts. Laclede Steel Co., sales to LaSalle Steel granted Chicago base, f.o.b. Madison, Ill.

Reinforcing Bars—W. Ames & Co., 10 tons and over, $2.85 mill; Sweet Steel Co. (rail steel) $2.35 mill; Columbia Steel Co. $2.50 Pacific Ports.

Cold Finished Bars—Keystone Drawn Steel Co. on allocation, Pittsburgh c.f. base plus c/l freight on hot rolled bars Pittsburgh to Spring City, Pa.; New England Drawn Steel Co. on allocation outside New England, Buffalo c.f. base plus c/l freight Buffalo to Massfield, Mass., f.o.b. Massfield.; Empire Finished Steel Corp. on allocation outside New England, Buffalo c.f. base plus c/l freight Buffalo to plants f.o.b. plant; Compressed Steel Shafting Co. on allocation outside New England, Buffalo base plus c/l freight Buffalo to Readville, Mass. f.o.b. Readville; Medart Co. in certain areas, Chicago c.f. base plus c/l freight Chicago to St. Louis, f.o.b. St. Louis.

Alloy Bars—Texas Steel Co. for delivery in U. S. except Texas and Oklahoma may use Chicago base, f.o.b. Fort Worth, Tex.; Connors Steel Co. when shipped outside Alabama, Mississippi, Louisiana, Georgia, Florida, Tennessee, Pittsburgh base, f.o.b. Birmingham.

Hot Rolled Strip—Joslyn Mfg. & Supply Co. $2.30 Chicago; Knoxville Iron Co. $2.25 basing pts.

Hot Rolled Sheets—Andrews Steel Co., Middletown base granted on shipments to Detroit or area; Parkersburg Iron & Steel Co., $2.25 Parkersburg.

Galvanized Sheets—Andrews Steel Co., $3.75 basing pts.; Parkersburg Iron & Steel Co. $3.85 Parkersburg; Apollo Steel Co. $3.75 basing pts.; Continental Steel Co., Middletown base granted on Kokomo, Ind., product; Superior Sheet Steel Co. granted Pittsburgh base except for Lend-Lease.

Pipe and Tubing—South Chester Tube Co. when priced at Pittsburgh, freight to Gulf Coast and Pacific Ports may be charged from Chester, Pa., also to points lying west of Harrisburg, Pa.

WAREHOUSE PRICES

Delivered metropolitan areas per 100 lb. These are zoned warehouse prices in conformance with latest zoning amendments to OPA Price Schedule 49.

*Recommended for large sections only. Note: The extras shown are in addition to a base price of 2.70c. per 100 lb., on finished products and $54 per gross ton on semi-finished steel major basing points and are in cents per 100 lb. and dollars per gross ton in semi-finished. When acid open-hearth is specified and acceptable add to basic open hearth alloy differential 0.25c. per lb. for bars and bar strip, $5.00 per gross ton for billets, blooms and slabs. The ranges shown above are restricted to sizes 100 sq. in. or less or equivalent cross sectional area 18 in. wide or under with a max. individual piece weight of 7000 lb.

BASE QUANTITIES

Standard unless otherwise keyed on prices.

HOT ROLLED: Sheets, strip, plates, shapes and bars, 400 to 1999 lb.

COLD ROLLED: Sheets, 400 to 1999 lb.; strip, extras on all quantities; bars, 1500 to 39,999 lb.; NE alloy bars, 1000 to 39,999 lb.

EXCEPTIONS: (1) 150 to 499 lb. (2) 150 to 1499 lb. (3) 400 to 1499 lb. (4) 450 to 1499 lb. (5) 500 to 1499 lb. (6) 0 to 1999 lb. (7) 400 to 1999 lb. (8) 1000 to 1999 lb. (9) 450 to 3749 lb. (10) 400 to 3999 lb. (11) 300 to 4999 lb. (12) 300 to 10,000 lb. (13) 400 to 14,999 lb. (14) 400 to 39,999 lb. (15) 1000 to 39,999 lb. (16) 1500 to 39,999 lb. (17) 2000 to 39,999 lb. (18) 3500 to 39,999 lb.

(*a*) Philadelphia: Galvanized sheets, 25 or more bundles.

Extra for size, quality, etc., apply on above quotations.

CAST IRON WATER PIPE

Per Net Ton

6-in. and larger, del'd Chicago.... $54.80
6-in. and larger, del'd New York... 52.20
6-in. and larger, Birmingham 46.00
6-in. and larger f.o.b. cars, San Francisco or Los Angeles 69.40
6-in. and larger f.o.b. cars, Seattle. 71.20

Class "A" and gas pipe, $3 extra; 4-in. pipe is $3 a ton above 6-in. Prices shown are for lots of less than 200 tons. For 200 tons or over, 6-in. and larger is $45 at Birmingham and $53.80 delivered Chicago, $59.40 at San Francisco and Los Angeles, and $70.20 at Seattle. Delivered prices do not reflect new 3 per cent tax on freight rates.

LAKE SUPERIOR ORES

(51.50% *Fe, Natural Content, Delivered Lower Lake Ports**)

Per Gross Ton

Old range, bessemer, 51.50 ..... $4.75
Old range, non-bessemer, 51.50..... 4.60
Mesaba, bessemer, 51.50 ..... 4.60
Mesaba, non-bessemer, 51.50 ..... 4.45
High phosphorus, 51.50 ..... 4.35

*Adjustments are made to indicate prices based on variance of Fe content of ores as analyzed on a dry basis by independent laboratories.

PRICES

SEMI-FINISHED STEEL

Billets, Blooms and Slabs

Pittsburgh, Chicago, Gary, Cleveland, Youngstown, Buffalo, Birmingham, Sparrows Point (rerolling only). Prices delivered Detroit are $2.00 higher; delivered E. Michigan, $3 higher; f.o.b. Duluth, billets only, $2.00 higher; billets f.o.b. Pacific ports are $12 higher. Delivered prices do not reflect three per cent tax on freight rates.

	Per Gross Ton
Rerolling	$34.00
Forging quality	40.00

For exceptions on semi-finished steel see the footnote on the page of finished steel prices.

Alloy Steel

Pittsburgh, Chicago, Canton, Massillon, Buffalo, or Bethlehem, per gross ton	54.00

Shell Steel

	Per Gross Ton
3 in. to 12 in.	$52.00
12 in. to 18 in.	54.00
18 in. and over	56.00

Basic open hearth shell steel, f.o.b. Pittsburgh, Chicago, Buffalo, Gary, Cleveland, Youngstown and Birmingham.

Prices delivered Detroit are $2.00 higher; E. Michigan, $3 higher.

Note: The above base prices apply on lots of 1000 tons of a size and section to which are to be added extras for chemical requirements, cutting, or quantity.

Sheet Bars

Pittsburgh, Chicago, Cleveland, Youngstown, Buffalo, Canton, Sparrows Point, Md.

	Per Gross Ton
Open hearth or bessemer	$34.00

Skelp

Pittsburgh, Chicago, Youngstown, Coatesville, Pa., Sparrows Point, Md.

	Per Lb.
Grooved, universal and sheared	1.90c.

Wire Rods

(No. 5 to 9/32 in.)

	Per Lb.
Pittsburgh, Chicago, Cleveland	2.00c.
Worcester, Mass.	2.10c.
Birmingham	2.00c.
San Francisco	2.50c.
Galveston	2.25c.

9/32 in. to 47/64 in., 0.15c. a lb. higher. Quantity extras apply.

TOOL STEEL

(F.o.b. Pittsburgh, Bethlehem, Syracuse)

	Base per lb.
High speed	67c.
Straight molybdenum	54c.
Tungsten-molybdenum	57½c.
High-carbon-chromium	43c.
Oil hardening	24c.
Special carbon	22c.
Extra carbon	18c.
Regular carbon	14c.

Warehouse prices east of Mississippi are 2c. a lb. higher; west of Mississippi 3c. higher.

CORROSION AND HEAT-RESISTING STEEL

	No. 304
Plates	18.00c.*
Sheets	19.00c.

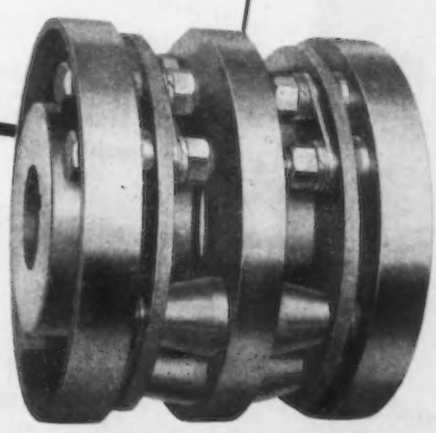
*Includes annealing and pickling.

THOMAS FLEXIBLE COUPLINGS

Since 1914 "THOMAS" has produced the most dependable couplings made. They are specified by engineers and designers because no other type or make of coupling has these features:

NO BACKLASH
NO WEAR
NO LUBRICATION
NO THRUST
FREE END FLOAT

Backlash shocks and vibrations are the destructive forces that take annually in maintenance, millions of dollars from the industries. This terrific drain, however, is greatly lessened by the adoption of Thomas Flexible Couplings.



For specifications on couplings for all standard purposes write for the new Thomas Catalog with complete engineering data.

"BUILT TO LAST A LIFETIME"

THOMAS FLEXIBLE COUPLING CO.

WARREN, PENNSYLVANIA

T-4

HOW TO STREAMLINE HEAT-TREATING PRODUCTION

Constructed for the heat-treatment of steel castings, this battery of gas-fired furnaces illustrates the degree of engineering perfection to be expected when R-S Engineers are called into consultation.

Three of the R-S Car Hearth Furnaces are direct fired for high temperatures while the fourth (second from the left) is convection heated for low temperature heat treating. Furnace doors, cars and transfer car are electrically operated from central stations.

All those who have seen this installation say that it is a fine example of modern streamlined heat-treating production as well as an efficient method of obtaining the most from available manpower.

Inquiries are invited.

2 in.	33½	15½
2½ to 4 in.	39	22½
4½ to 6 in.	37½	21

On butt weld and lap weld steel pipe jobbers are granted a discount of 5%. On less-than-carload shipments prices are determined by adding 25 and 30% and the carload freight rate to the base card.

F.o.b. Gary prices are two points lower discount or $4 a ton higher than Pittsburgh or Lorain on lap weld and one point lower discount, or $2 a ton higher on all butt weld.

PACKS AUTHORITY

The removal of drawing and fabricating compounds, machining oils, carbon smut — is often a *stubborn* operation. It bows only to *cleaning with authority.*

Wyandotte Metal Cleaners go at a job that way — with authority! However mean the job of metal cleaning or degreasing that's put up to Wyandotte—the job gets *done,* and in jig-time! For Wyandotte Cleaners are *specialized* to fit the demands of any job.

War production can't lag for a second because of metal cleaning difficulties. And wherever used, Wyandotte has seen to it that such "hitch-hikers" *never even get a start.*

Your best friend in helping you meet any cleaning problem that may arise is the Wyandotte Service Engineer. Thousands have learned that he, and the Wyandotte compound he specifies, have what it takes. Find out for yourself—today.

GRAY FORGE IRON: Valley or Pittsburgh furnace $23.50

(1) Pittsburgh Coke & Iron Co. (Sharpsville, Pa., furnace only) and the Struthers Iron and Steel Co., Struthers, Ohio, may charge 50c. a ton in excess of basing point prices for No. 2 foundry, basic, bessemer and malleable.

(2) Price shown is for low-phosphorous iron; high-phosphorous sells for $28.50 at the furnace.

(3) Eastern Gas & Fuel Associates, Boston, is permitted to sell pig iron produced by its selling company, Mystic Iron Works, Everett, Mass., at $2 per gross ton above maximum prices.

(4) E. & G. Brooke Co. permitted to charge $1.00 per ton extra.

(5) Pittsburgh Ferromanganese Co. (Chester furnace only) may charge $2.25 a ton over maximum basing point prices.

Basing point prices are subject to switching charges; silicon differentials (not to exceed 50c. a ton for each 0.25 per cent silicon content in excess of base grade which is 1.75 per cent to 2.25 per cent); phosphorous differentials, a reduction of 38c. per ton for phosphorous content of 0.70 per cent and over; manganese differentials, a charge not to exceed 50c. per ton for each 0.50 per cent manganese content in excess of 1.00 per cent. Effective March 3, 1943, $2 per ton extra may be charged for 0.5 to 0.75 per cent nickel content and $1 per ton extra for each additional 0.25 per cent nickel.

5800 LB. CARBON BASKET ASSEMBLY (34' x 7' 1¼" x 5' 1") built of ⅛" cold rolled copper, reinforced with ⅝" copper angles . . . completely fabricated by Brandt for a chemical plant.

Forming, Welding, Fabricating—

Call BRANDT of Baltimore

for Precision in Heavy Plate and Sheet Steel Work

Here, at your command, is an 8½ acre plant . . . with the most modern equipment for shearing, rolling, forming, welding and completely fabricating ferrous, non-ferrous and alloy metals to your specifications . . . from the lightest gauge up to and including 1¼" mild steel or ¾" armor plate. Address: Charles T. Brandt, Inc., Baltimore-30, Maryland.

BRANDT of Baltimore—*Craftsmen in Metal Since 1890*

METAL POWDERS

Prices are based on current market prices of ingots plus a fixed figure. For ton lots f.o.b. shipping point, in cents per lb.

Copper, electrolytic, 150 and 200 mesh	21½ to 23½c.
Copper, reduced, 150 and 200 mesh	20½ to 25½c.

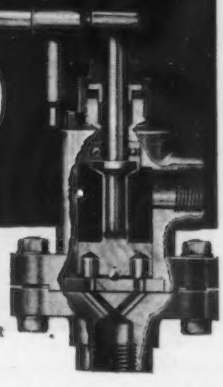
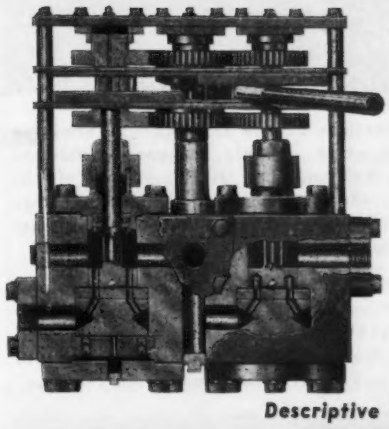
Easy to Operate

HYDRA
VENTURI-VACUUM
VALVES





3- and 4-way straight operating or neutral point operating valve

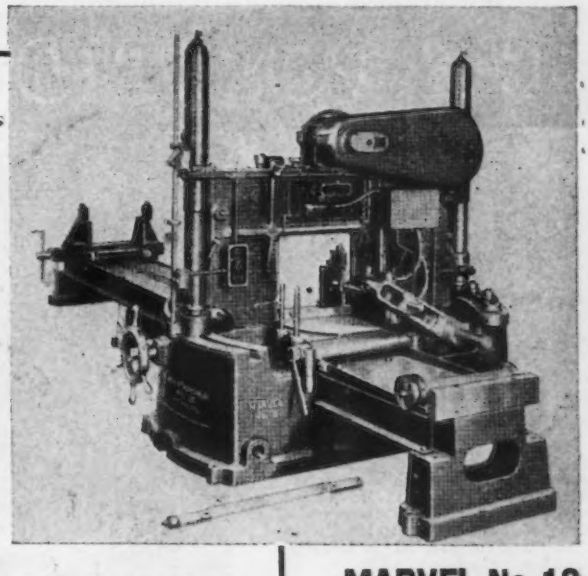
2-way angle and straight through shut-off valve

Hydra Venturi-Vacuum Valves are *unlike* any other valves you have ever used. They operate quickly and easily, have no springs or cups to bother with, cause no shock on the line when closing and require only a fraction of the usual maintenance cost. Many installations in steel mills, rubber packing, car building plants and foundries substantiate these claims.

Descriptive folder upon request.

ALBRIGHT EQUIPMENT CO.
FERNDALE, JOHNSTOWN, PA.

CUTS the Toughest Steels and Largest Sizes *easily.*



This giant hydraulic metal - cutting saw is more than just a larger hack saw. It is a new development in metal-cutting methods that introduces a new principle of metal sawing — the Roll-stroke blade action makes it possible to cut the toughest steels in the largest sizes easily and rapidly. It also permits a simple and efficient, very low pressure Hydraulic Feed System.

Built for heavy work, completely enclosed in heavy housing, this machine will stand up under the rough usage of the average steel mill warehouse and forge shop, where it will speed cutting-off, and reduce material loss.

MARVEL No. 18
Giant Hydraulic Hack Saw
Capacity 18"x18"

Cuts angles up to 45° by simply swiveling upper machine housing.

C-F POSITIONERS

Safety, Economy, Speed, *PLUS* Better Welding!

A weldment can be no stronger than its weakest weld—and "down-hand" welding is your best assurance of stronger flawless welds. That's why "positioned welded" is so frequently specified today!

C-F Positioners eliminate crews with slings and chains, clear your floor space, reduce accidents and ***make every weld a faster, better weld!*** The 135° ***beyond horizontal*** tilting feature of C-F Positioners combined with 360° table turn ***assures*** the proper welding position in even the most inaccessible corners!

Adaptable too! Heat treating, cutting, large pipe and boiler-handling problems and jobs where a continuous turn is necessary, are easily answered with a C-F Positioner. ***You'll*** find new uses! Many sizes and true-rated capacities. Hand or power operated. Write for catalog showing sizes, installations and many uses.

2.00% carbon	19.50c.	19.90c.	20.50c.

Spot prices are ¼c. higher per lb. contained Cr. For extras and premiums see MPR 407.

Other Ferroalloys

Ferrotungsten, Standard grade, lump or ¼X down, packed, f.o.b. producer's plant at Niagara Falls, New York, Washington, Pa., York, Pa., per lb. contained tungsten. 10,000 lb. or more $1.90

Ferrovanadium, 30-35%, contract basis, f.o.b. producer's plant, usual freight allowances, any quantity, per lb. contained vanadium.
- Open Hearth $2.70
- Crucible $2.80
- Primos $2.90

Cobalt, 97% min., keg packed, contract basis, f.o.b. producer's plant, usual freight allowances, per lb. of cobalt metal $1.50

Vanadium pentoxide, 88%-92% V_2O_5 technical grade, contract basis, any quantity, per lb. contained V_2O_5 ..... $1.10

Ferroboron, contract basis, 17.50% boron minimum, f.o.b. Niagara Falls, carlots, per lb. alloy..... $1.20
Ton lots $1.25

Silcaz No. 3, contract basis, f.o.b. Niagara Falls, all quantities, per lb. of alloy ..... 23c.

Silvaz No. 3, contract basis, f.o.b. Niagara Falls, all quantities, per lb. of alloy ..... 40c.

Grainal, f.o.b. Bridgeville, Pa., freight allowed 100 lb. and over, maximum based on rate to St. Louis, per lb..... 45c.

Bortam, f.o.b. Niagara Falls
Ton lots, per lb. ..... 45c.
Less ton lots, per lb..... 50c.

Borosil, 3% to 4% boron, 40 to 45% silicon, f.o.b. Philo, Ohio, per lb. contained boron..... $6.25

Ferrocolumbium, 50% to 60%, f.o.b. Niagara Falls, ton lots, per lb. contained columbium ... $2.25
Less ton lots $2.30

Ferrotitanium, 40%-45%, f.o.b. Niagara Falls, N. Y., ton lots, per lb. contained titanium $1.23
Less ton lots $1.25

Ferrotitanium, 20%-25%, 0.10 C max., ton lots, per lb. contained titanium $1.35
Less ton lots $1.40

High-carbon ferrotitanium, 15%-20%, 6%-8% carbon, contract basis, f.o.b. Niagara Falls, N. Y., freight allowed East of Mississippi River, North of Baltimore and St. Louis, per gross ton....$142.50
3%-5% carbon $157.50

Ferrophosphorus, 18% electric or blast furnace, f.o.b. Anniston, Ala., carlots, with $3 unitage freight equaled with Rockdale, Tenn., per gross ton $58.50

Ferrophosphorus, electrolytic 23-26% carlots, f.o.b. Monsanto (Siglo), Tenn., $3 unitage freight equalized with Nashville, per gross ton $75.00

Ferromolybdenum, 55-75 per cent, f.o.b. Langeloth and Washington, Pa., any quantity, per lb. contained molybdenum ..... 95c.

Calcium molybdate, 40%-45%, contract basis, f.o.b. Langeloth and Washington, Pa., any quantity, per lb. contained molybdenum.. 80c.

Molybdenum oxide briquettes, 48%-52% Mo, f.o.b. Langeloth, Pa., per lb. contained Mo..... 80c.

Molybdenum oxide, in cans, f.o.b. Langeloth and Washington, Pa., per lb contained Mo..... 80c.

Zirconium, 35-40%, contract basis, carloads in bulk or package, per lb. of alloy ..... 15c.
Less ton lots ..... 16c.

Zirconium, 12-15%, contract basis, carlots, bulk, per gross ton.....$102.50
Packed $107.50
Less ton lots $112.50

Alsifer (approx. 20% Al, 40% Si and 40% Fe), contract basis, f.o.b. Niagara Falls, per lb. ... 7.50c.
Ton lots ..... 8c.

Simanal (approx. 20% Si, 20% Mn, 20% Al), contract basis, f.o.b. Philo, Ohio, with freight not to exceed St. Louis rate allowed, per lb.
- Car lots ..... 8.75c.
- Ton lots ..... 9.25c.
- Less ton lots ..... 9.75c.

AIR CONTROL VALVES FOR LONG SERVICE

Hannifin "Packless" Air Control Valves give you the positive, accurate control of air operated equipment that is essential in modern machine applications, plus a simple, effective design that assures long service with minimum attention. Hannifin disc-type design has no packing, and no leakage or packing maintenance troubles. The bronze disc controlling air flow is ground and lapped to form a perfect seal with the seat. Wear is negligible, yet, if necessary after long service, a simple re-lapping restores the original efficient seal.

Hannifin Valves give you a complete range of choice, in hand or foot operated models, duplex valve, spring return, manifold, and electric types, and pressure regulating valves. Write for Bulletin 57-A.

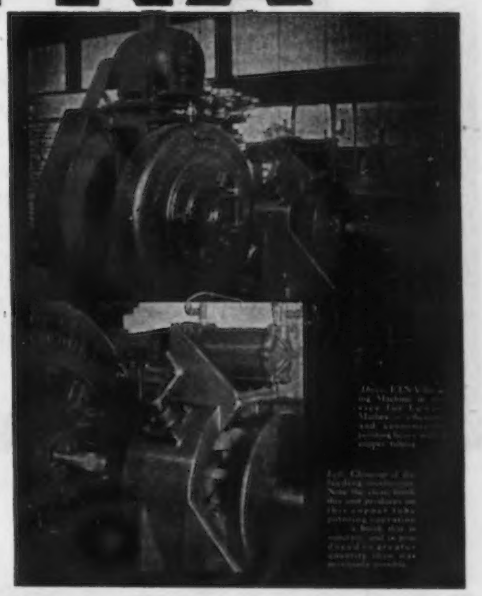
HANNIFIN Air Control VALVES

LEWIN-MATHES Got the right answer at

ETNA

They had a job of pointing heavy-walled copper tubing, and wanted to speed up the operation. Just how to do it didn't appear on the horizon, and so Lewin-Mathes did the safe and logical thing—they put their swaging job up to Etna.



The answer to that problem is illustrated on this page. It's a modern Etna Swaging Machine that points *more* copper tubes per hour in less time at less cost. If you have a problem involving tapering or reducing tubing and solid rounds—ask Etna about it.

Etna has the swaging machines from ⅜" to 4" and the experience to help you get the most out of this type of machine.

IF IT'S A QUESTION OF TAPERING, SIZING OR REDUCING OF ROUND SOLIDS OR TUBING... "Ask ETNA About Swaging"

ETNA MACHINE COMPANY
TOLEDO OHIO

We're offering *Better Lubricant*

YOU'LL GET INCREASED PRODUCTION, SMOOTHER FINISH, LONGER TOOL LIFE FROM SAFCO ENGINEERED CUTTING FLUIDS...OR YOUR MONEY BACK

We've helped others increase their production without increasing manpower or adding to their equipment—*simply by selection of the right lubricant for a given job*. In some cases the results have been truly remarkable. Here are four typical examples:

Chrome-Moly Steel Machined 30% Faster

In a tapping operation on heat treated chrome-moly steel forgings for aircraft parts, SAFCO No. 560 Cutting Oil was tried at the recommendation of the Swan-Finch technical man.

Results:

A 30% increase in production
Tap life increased 6 times
Threads brighter and smoother
Rejects eliminated

In addition, machine operators like SAFCO No. 560 because it is clean to use and keeps machines cleaner.

There may be an operation in *your* plant where SAFCO No. 560 Cutting Oil or another of our "engineered" lubricants for the metal working field can increase your production efficiency. Why not find out by calling in a Swan-Finch technical man?

Eliminates Staining; Speeds Cleaning in Drawing Nickel Silver

In drawing nickel silver to form shells for milking machines, the use of SAFCO Drawing Compound No. 32 was prescribed by a Swan-Finch technical representative. In comparative tests, the SAFCO Drawing Compound consistently produced better results:

Black stains that appeared on pieces drawn with the oils formerly used were eliminated.
Easier cleaning of drawn pieces was obtained.

The SAFCO line of Cutting and Drawing Oils and Compounds includes a product developed to meet virtually every operating condition. The Swan-Finch technical man may have the right solution to your problem.

You Can't Do That to Me!

POLITICS make strange bedfellows, war is hell and truth is stranger than fiction. If you don't believe this, read the following hypothetical correspondence dated a few months hence, between the largest machinery buyer in America and a machinery manufacturer.

March 1, 1944

Mr. O. U. Sapp, President,
Centerpeed Machine Co.,
Kattsburg, Ioho.

Dear Sir:

Your quotations to me on orders 15,675 to 15,700, for various items of equipment have been received and referred to my fourth assistant for consideration. He reports that in his estimation your prices are 25 per cent too high on each of these orders.

I have implicit confidence in my fourth assistant's capability in pricing machinery since he is a graduate of the Yarvard School of Business Administration and before joining my staff was a junior legal assistant for the Sunrise Peanut Butter Co.

Therefore, these orders have been repriced and are herewith enclosed with mandatory instructions to you to accept them at the reduced prices specified. If you don't like this you can sue us, but separate suit must be brought on each individual order.

Failure to comply will subject you to fine and imprisonment and the seizure of your plant in accordance with Section 9 of the Selective Service Act of 1940.

Yours very truly,

Iam Itt,
2nd Lt., Office of Secretary of War,
Washington, D. C.

Telegram, via Western Union.

2nd Lt. Iam Itt, March 2, 1944
Office, Secretary of War,
Washington, D. C.

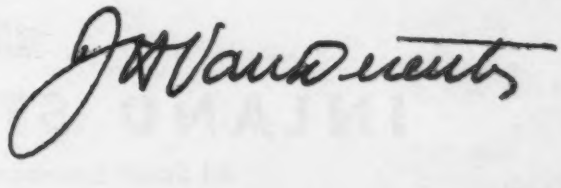
Reference your letter March 1, you can't do this to me.
O. U. Sapp, Kattsburg, Ioho.

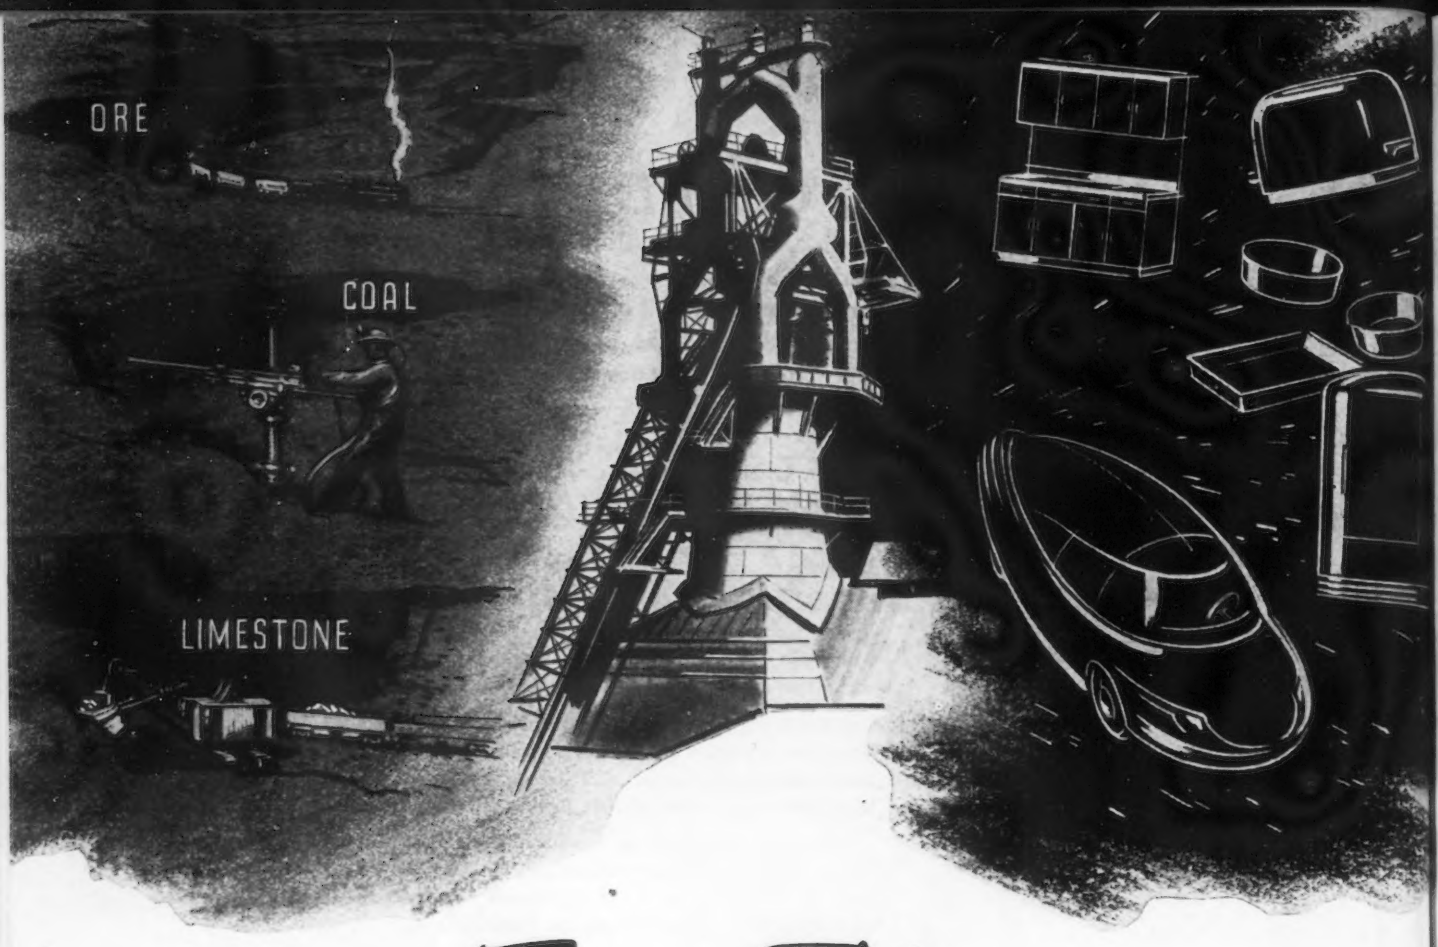
Telegram, via Western Union. March 3, 1944.
O. U. Sapp, President,
Centerpeed Machine Co.,
Kattsburg, Ioho.

Retel yours March 2, Oh, can't I? Read joker in Revenue Act of 1943, Section 801, entitled "Repricing of War Contracts."*
Iam Itt, 2nd Lt., Office, Secretary of War.

Yes, dear reader, it's not fiction but fact. And this is exactly what not only may but will happen to our machinery manufacturers if this act passes in present form. Fortunately it hasn't yet. So if you are interested, and you should be, I advise you to send for a copy of it (H.R. 3687), and then write to your congressmen about it.

* See page 99, this issue.





Finer Things
Are Coming Out of the Ground

From the ore ranges, the coal fields, and the limestone beds are coming vast quantities of blended iron ore, coking coal, and purest limestone—the principal ingredients for making steel, the "master metal" in both peace and war.

Today this steel must all go into the production of the materiel of war, but tomorrow, when Victory is ours, finer things will come to us from out of the ground because of improvements now being made in steel.

Inland metallurgists are constantly testing and re-testing, melting and re-melting, adding one element and taking away another—always seeking for something better. Already they have contributed many new methods and new steels to production for war.

These, and the newer methods and Inland steels that are sure to come from continued intensive research, will help you meet the needs of America at peace.

The IRON AGE

JAN. 20, 1944

NEWS FRONT

▶ Machine tool builders with depressing immediate prospects say they have been approached by Ford Motor Co. representatives armed with automobile parts blueprints. Pick out what you want to do, prepare to get started right away, and we'll get the material and permission from WPB, is said to be Ford's offer.

▶ Independent West Coast rolling mills, operating at reduced pace in limited capacity, are hoping for the lifting of production restrictions of reinforcing bars and shapes.

West Coast steel men are pressing for a representative on the Industry Advisory Committee on Steel to the WPB. Although the Kaiser management is in sympathy with this recommendation, others think that the Kaiser organization is sufficiently represented in high councils in Washington.

▶ While little has been heard of leaded steels since the start of the war, interest has not declined. English mills particularly are enthusiastic about the technique, and in the U. S. the steels will undoubtedly be prominent in the post-war period.

Highly machinable steels will likely contain sulphur topped off with some 0.01 (not 0.25, as has often been the case) per cent lead.

Boron alloyed steels, currently employed almost exclusively in armor plate, will be used in the post-war period primarily in steels having about 1 per cent Mn for use in sections $\frac{3}{4}$-in. or more in size.

▶ Apparently there is some propaganda motive in the elaborate publicity regarding the rocket plane developed by the Americans and British. Certainly the development will require many years yet to mature.

Rocket assisted take-offs for bombers has long been employed by Germans and Russians, and will shortly be used by Allies. Aircraft so far developed to operate exclusively by rocket power or jet propulsion have a short range and little weight-carrying capacity, as most of the space is taken up by propulsion equipment.

Operation of planes so far developed leaves much to be desired as regards flexibility. Speeds are high for short periods, operation in the air is comparatively quiet, and acceleration and deceleration are smooth.

There's not much fireworks out the back end while in operation in the air, but on take-off there is a blaze of sparks streaming out behind for hundreds of feet. This would seem to rule against carrier take-offs, despite Navy statements to that effect, until operation is greatly improved.

▶ Some important manufacturers of aircraft components in the East are already beginning to streamline their organizations in the face of leaner post-war years. Drastic changes in top manufacturing personnel recently have been made, much like a field general weeding out the less efficient as a result of battle experience.

▶ Upwards of 30,000 boys and girls 16 to 18 years of age have been putting more than a million hours a week in Pacific Coast aircraft plants. Some groups alternate four-week periods of school with work; others work 4 hr. a day. While the rate of turnover and absenteeism is high the kids do a good job because of their interest in airplanes.

▶ Price Adjustment Boards have allowed profits before taxes of 1.5 to 22 per cent. Greatest bulk falls between 7 and 13 per cent. Where contractors made outstanding contributions having a revolutionary effect on the war, highest profits were allowed.

Of the $5,300,000,000 savings through renegotiation, $2.5 billion was returned to the Treasury and $2.8 billion came from price reductions. Of this over $1 billion would not have been captured through the excess profits tax.

▶ Tin and black plate production is expected to reach 627,000 tons in the first quarter of 1944 and climb to 750,000 tons in the second quarter.

▶ Post-war machine tool surpluses are estimated at $2,500,000,000, hearings of the House Small Business Committee brought out. The new bill being considered there provides for the setting up by RFC of advisory committees for each class of available surplus.

Electrolytic Polishing

SINCE Jacquet and Rocquet first described a practical method for the electrolytic polishing of metallographic specimens of iron and steel in 1939,[6] the method has been tried rather extensively in this country.[7-18] Previous to Jacquet's and Rocquet's work, electrolytic polishing had been confined to the non-ferrous metals.[1-5] The use of this principle of anodic attack in a fluid electrolyte has proved to be an extremely useful tool to the metallographer. The process yields a specimen with a smooth surface, free from scratches and devoid of the disturbed and flowed metal which may be produced in the conventional polishing methods. It is rapid and economical, and may be used successfully by operators lacking the technique and skill required for good results with mechanical methods.

However, many laboratories have been deprived of the use of the polishing method because of a lack of detailed information on the apparatus required and the procedures to be followed. A general impression has been created that electrolytic polishing is rather difficult to apply, and is much less practical than is actually the case. Some laboratories have been deterred from adopting this polishing method through fear of explosion of perchloric reagents.

It is the purpose of this article to present detailed information relative to apparatus and procedures which have been used successfully by laboratories of the Crucible Steel Co. of America for nearly two years, and to explain the precautions taken to prevent explosion of the perchloric reagents involved. It is hoped that this information will permit any laboratory to make a rapid adaptation of proved apparatus and procedures without the necessity of considerable experimental work.

Apparatus

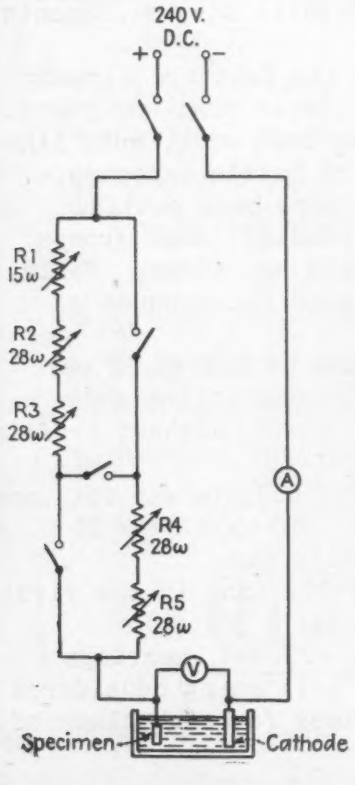
Electrolytic polishing is achieved by causing the specimen to be the anode in a suitable electrolyte and applying the proper factors of voltage and current. A schematic circuit diagram for an electrolytic polishing unit is shown in Fig. 1.

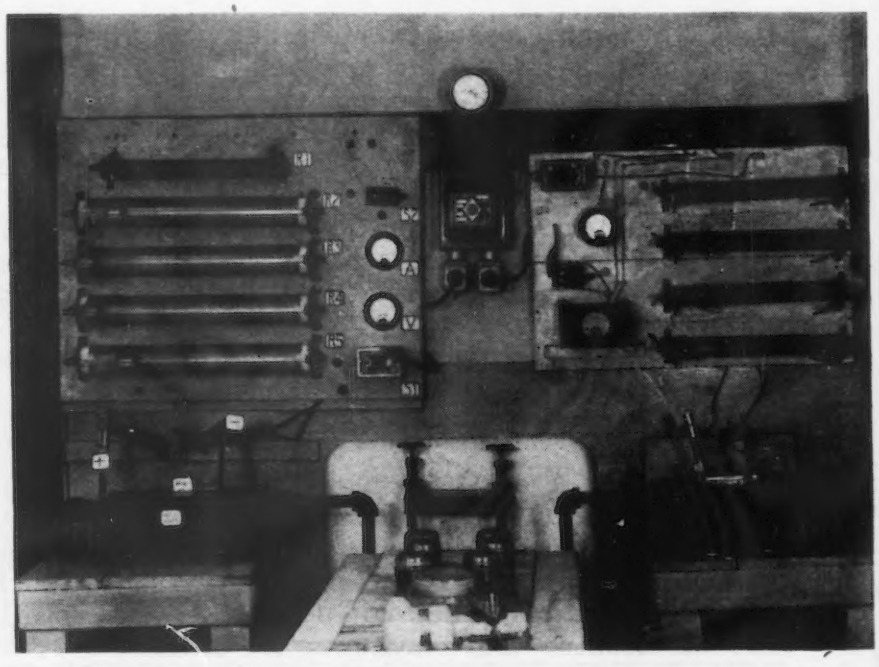
Two separate units, as set up in the Eastern Research Laboratory at Harrison, N. J., are illustrated in Fig. 2. As both units are essentially the same, the unit shown on the left will be described in detail.

The resistors, voltmeter, ammeter and switches are mounted on ½-in. transite board, 25 x 32 in. A photograph, the wiring diagram and the pertinent data concerning the electrical apparatus are shown in Fig. 3. With this arrangement, the resistors may be connected either in series for low currents, or in parallel when currents greater than 6.5 amp. are required.

The electrolyte is contained in a glass dish approximately 5½ x 3½ x 2 in. (an inexpensive butter dish serves admirably), which should be kept covered when not in use. As shown in Fig. 4, the vessel is supported in a wood-lined, welded steel water jacket.

During the polishing operation the specimen clamp itself is attacked, and unless made of a corrosion resistant steel, such as Type 302, has a very short life. The construction of a satisfactory clamp is shown in the photograph and drawings of Fig. 5. The jaws, which are the only part of the clamp which dip into the electrolyte, are easily replaced after they have corroded too thin for further use.





Above: Fig 2—Shown here is the double installation of electrolytic polishing units at the Eastern Research Laboratory of the Crucible Steel Co. of America.

Left: Fig. 1—Circuit diagram for an electrolytic polishing unit.

# of Metallographic Specimens

By L. A. HAUSER
Crucible Steel Co. of America, New York

. . . As a supplement to mechanical polishing, electrolytic polishing of metallographic specimens offers many advantages. With this method, smooth, scratch-free surfaces are produced with no disturbed metal. To encourage use of this rapid and economical polishing method, detailed data on the apparatus used and the procedures to be followed are presented herein by the Crucible Steel Co. of America, successful users of electrolytic polishing for two years.

The clamp is fixed vertically to one end of a horizontal wooden arm, which is pivoted through an oversize hole about a vertical pin at the other end.

The cathode is a 2 x 6 x ⅛-in. strip of corrosion resistant steel (Type 302) and is attached to a similar pivoted wooden arm. These arms are pivoted to facilitate adjustment of the distance between cathode and anode and can be lifted from the electrolyte when not in use.

Electrolytes

Three different electrolytes have been used successfully. Their compositions are as follows:

No. 1. Perchloric acid—acetic anhydride	
*Perchloric acid, 68 to 72 per cent	185 cc.
Acetic anhydride	765 cc.
Water	50 cc.
No. 2. Perchloric acid—ethyl alcohol	
Perchloric acid, 68 to 72 per cent	1 volume
*Ethyl alcohol denatured with 3 per cent ether	4 volumes
No. 3. Perchloric acid — acetic acid	
Perchloric acid, 68 to 72 per cent	1 volume
Acetic acid, glacial	10 volumes

** It has been found that satisfactory polishing can be done if 60 per cent perchloric acid is used, and with No. 2, if ethyl alcohol without ether is used.*

Extreme care must be taken in the preparation of Solution No. 1. The acetic anhydride is placed in a beaker immersed in a cold water jacket, and the perchloric acid added slowly, drop by drop, from a burette. The water is added last in the same manner as the perchloric acid. A rise in temperature due to the reaction occurs near the surface and the temperature there should be closely watched and not permitted to rise above 90 deg. F. In cool weather, about 5 or 6 hr. are required for the preparation of one liter of this solution. In the summer, one or two days may be required for its preparation. Evidently the temperature of the perchloric acid in the burette influences the heat of reaction. After the solution has been prepared, it must then be permitted to stand for 24 hr. before using. Once aged, however, it is not necessary to keep the solution cool. This electrolyte has been used at a temperature as high as 120 deg. F. without any danger whatsoever. Samples mounted in bakelite, lucite or other organic materials cannot be polished in any of these solutions because of the danger of an explosive reaction.

Solution No. 2 is not explosive during its preparation. However, it should be carefully prepared in the same manner as Solution No. 1, but at a more rapid rate. Approximately ½ hr. is consumed in preparing this electrolyte, which may be used immediately.

Solution No. 3 may be quickly prepared by slowly pouring the perchloric acid into a beaker containing the acetic acid without danger of explosion. A liter of solution may be prepared in 4 or 5 min. and may be used at once.

Solution No. 2 is recommended for

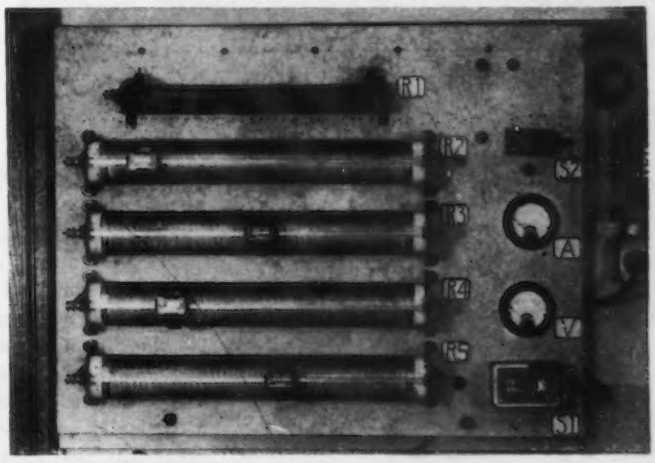


FIG. 3—On a half inch transite board are mounted resistors, voltmeter, ammeter and switches. Below is the wiring diagram of the control board.

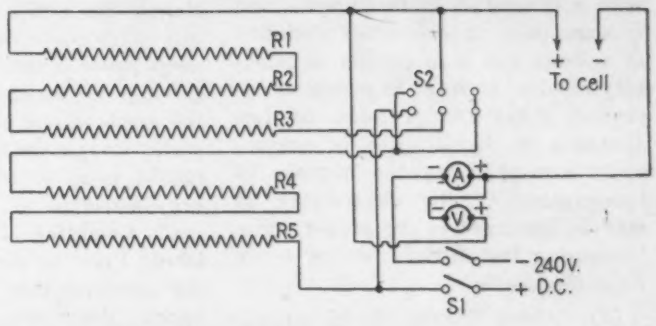

R1 = 14.7 ohms, 6.5 amperes
R2 = R3 = R4 = R5 = 28 ohms, 6.5 amperes resistors
S1 = 2-pole, 5 ampere-250 volt toggle switch
S2 = Double pole, double throw switch
V = 0-150 volt d.c. voltmeter
A = 0-150 ampere d.c. ammeter

only those steels containing complex high alloy carbides. Solution Nos. 1 and 3 have proved to be equally effective on a variety of steels: Plain carbon, low alloy, high speed and the corrosion resistant grades. These solutions are probably the best all-purpose electrolytes, and Solution No. 3 is particularly recommended because of its ease in preparation.

Variables in Operation

There are seven variables in the electrolytic polishing operation. They will be discussed individually, and may be listed as follows:

(1) E.m.f. across cell
(2) Current density
(3) Distance between anode and cathode
(4) Dimensions and shape of specimen
(5) Condition of surface to be polished
(6) Time of polishing
(7) Condition of electrolyte

(1) E.m.f. across cell: This variable is quite important. With a constant source of direct current, it is affected by the external resistance; the distance between the anode and cathode; the size of the anode and cathode, and the composition, temperature and volume of electrolyte. Usually a given steel may be polished with a leeway of 10 to 20 volts, and in some cases, a still wider variation of voltage will give equally satisfactory results. During the polishing operation, if the e.m.f. becomes too low (because of the increase in conductivity accompanying the increase in temperature of the electrolyte), it may be increased to the proper value by moving the cathode farther away from the anode.

(2) Current density: It is impracticable to determine quantitatively the current density with this unit, for two reasons: (1) The clamp itself contributes an undeterminable amount of area normal to the current. (2) Portions of the surface of the specimen other than the face being polished, contribute an undeterminable amount of area normal to the current.

However, the current density is an important factor. If it is low, the polished surface will contain highlights, and some complex carbides will be pitted, whereas, if it is too high, general pitting occurs. In many cases, a wide latitude of current density is permissible, but in others, it is not. Actually, however, total current is measured rather than current density, and pieces of widely different sizes can be polished without difficulty.

(3) Distance between anode and cathode: The distance between the anode and cathode is varied to provide the proper combination of e.m.f. and total current. As far as was determinable, the distance between anode and cathode, by itself, has no effect on the polishing.

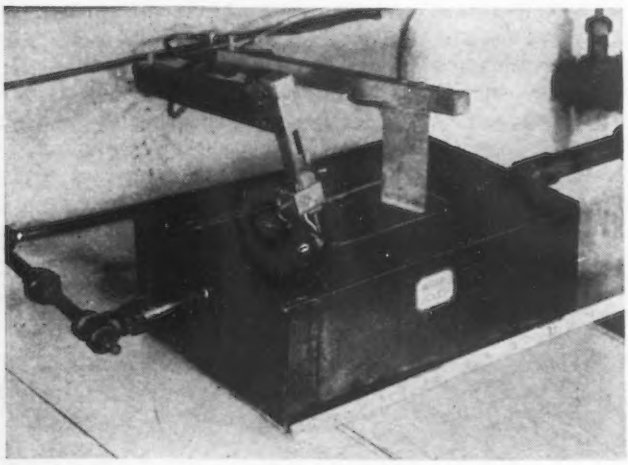

FIG. 4 — Cell and welded steel cooling jacket used for electrolytic polishing.

(4) Dimensions and shape of specimen: Specimens of any shape may be polished, so long as they can be held in the anode clamp. As mentioned previously, samples mounted in bakelite or lucite cannot be polished electrolytically. However, when specimens are held in a metallic polishing clamp, the entire assembly may be put in the anode clamp, and the specimens polished satisfactorily. The surfaces of the specimen in contact with the anode clamp should be free from scale. Copper or brass spacers should not be used, as copper contaminates the electrolyte.

(5) Condition of surface to be polished: Prior to electrolytic polishing, the specimen may be finished on 000 paper, American Optical Abrasive Nos. 303 or 303½ lead lap grit, 600 mesh Carborundum, levigated alumina or may have been previously polished and etched. In general, it may be stated that the finer the prior polish, the shorter will be the time required for the electrolytic polishing operation.

(6) Time of polishing: Suggested times for various conditions are given later in this paper.

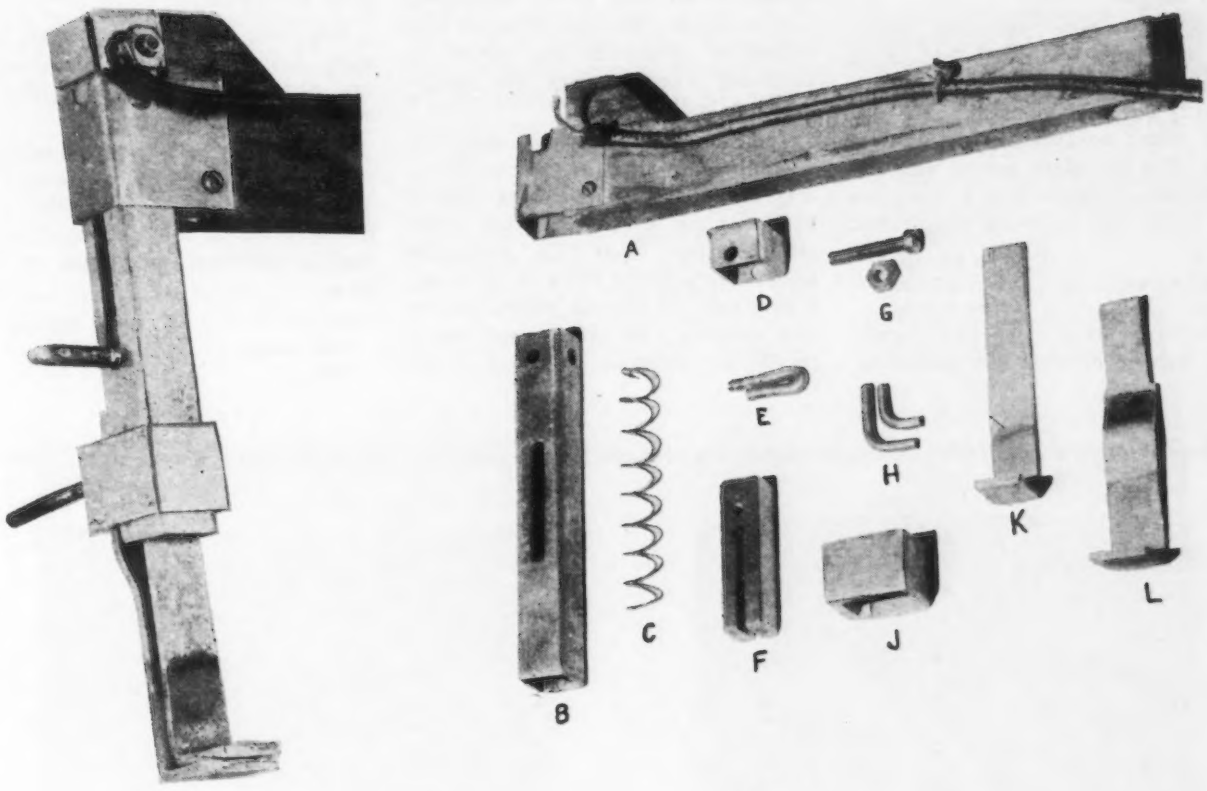
(7) Condition of electrolyte: As stated previously, Solution No. 1 has been used satisfactorily at temperatures as high as 120 deg. F. However, the increase in temperature causes an increase in conductivity of the solution, and in some cases, this limits the maximum allowable temperature. For this reason it is advisable to use the electrolytic cell in a water jacket, insuring more constant operating temperatures and more consistent results.

About 300 cc. of electrolyte are usually used, although considerable deviation from this amount does not seem to affect the polishing. The conductivity of the solution increases with an increase in amount of electrolyte.

The electrolytic polishing solutions are used over and over again. A small amount of electrolyte is lost in "drag-out," and fresh solution is added to make up the loss. The life of the electrolyte is dependent upon the number of samples polished, the average operating temperature (solutions must be replaced more often in summer) and the change in composition due to evaporation losses. The addition of water contaminates the solution and results in poor polishing. Care should be taken that both specimen and electrodes are dry before placing in the cell.

Recommended Practices

After this specimen has been given the desired prior finish, it should be dried (washed in alcohol if greasy) and placed in the specimen clamp with the face to be polished parallel to the cathode. Immediately after the clamp has been placed in the electrolyte, the e.m.f. should be applied. Slight adjustments of the variable resistors and the positions of the anode and cathode may be necessary during the polishing operation to attain the proper values of e.m.f. and current. The solution need not be stirred during the polishing. After the proper time, the switch is opened, and the specimen clamp immediately removed from the electrolyte. The specimen should be picked from the clamp with a pair of tongs and quickly washed under running tap water to remove the electrolyte and sludge which may stain the sample. During the polishing operation, a certain amount of etching occurs (except with the corrosion-resistant grades). Frequently no further etching is required, but if nec-



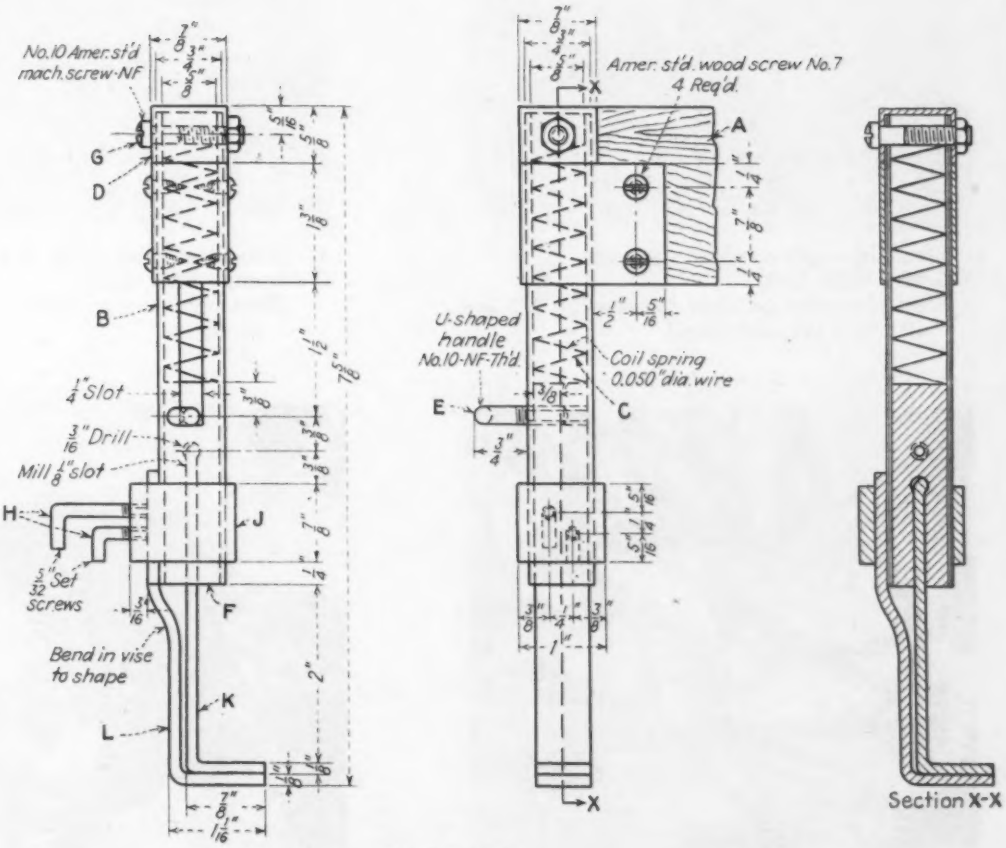


FIG. 5—Illustrated above is the steel specimen clamp. For long life the clamp should be made of corrosion resistant steel. Clamp assembly is shown (above right) and clamp details indicated (right).

NOTES

All metal pieces, except spring C and bearing post G made of KA_2S

A - Wooden arm and sleeve
B - Square barrel
C - Coil spring
D - Cap
E - U-shaped handle
F - Slotted piston for holding upper clamp jaw K
G - Binding post
H - Set screws which fit into collar J
J - Collar for holding lower clamp jaw L in place
K - Replaceable upper clamp jaw (movable)
L - Replaceable lower clamp jaw (stationary)

essary, the specimen is etched in the usual fashion.

For electrolytic polishing, steels may be roughly divided into three groups: (1) Plain carbon and low alloy; (2) corrosion-resisting; and (3) those which contain high alloy carbides. For the plain carbon and low alloy steels, Solution Nos. 1 and 3 are used under the following conditions:

E.m.f.	50 to 60 volts
Total current	1.5 to 2.5 amp.
Time	0.5 to 2 min.

Micro-examination may show insufficient etching or improper polishing. If re-polishing is necessary, the sample is returned to the electrolyte and re-polished directly. It is not necessary to return to the papers or polishing wheels unless the sample becomes badly pitted.

The corrosion-resisting grades—austenitic, ferritic or martensitic—may be polished in the same fashion as the plain carbon and low alloy steels, except that the austenitic grades are polished for a longer time, 3 to 6 min., to remove effects due to cold working. In some cases better results are obtained by finishing the polishing at 70 to 90 volts and 2 to 6 amp. for 10 sec.

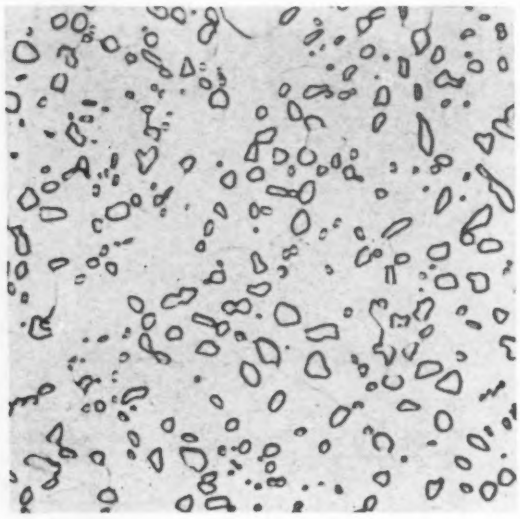
For those steels which contain high alloy carbides, Solutions Nos. 1 and 3 may also be used, under the following conditions:

E.m.f.	120 to 150 volts
Total current	3 to 6 amp.
Time	3 to 5 sec.

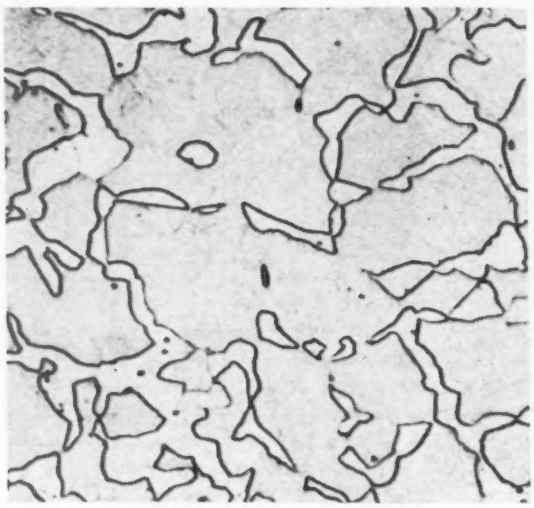
Solution No. 2 may be used under slightly different conditions, as follows:

E.m.f.	80 to 100 volts
Total current	7 to 10 amp.
Time	3 to 5 sec.

Fig. 6—Photomicrographs showing results obtainable with electrolytic polishing. All magnifications are 1200 diameters.

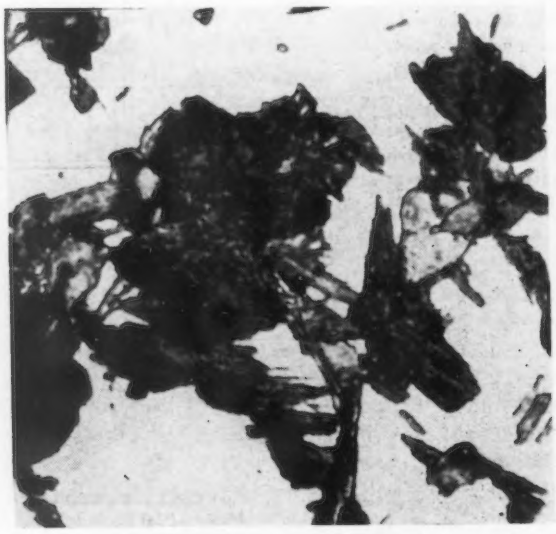


A **Structure**—spheroidized cementite
Grade—SAE 9260
Electrolytically polished followed by a 5 sec. etch in 4 per cent picral



B **Structure**—martensite and ferrite
Grade—SAE 4640
Electrolytically polished as etched in polishing

C **Structure**—martensite and bainite
Grade—SAE 9260
Electrolytically polished as etched in polishing



D **Structure**—intermediate transformation product and martensite
Grade—SAE 9260
Electrolytically polished as etched in polishing

The specimen is then etched, if necessary, and examined. It is sometimes necessary to re-polish several times to remove all the scratches. In this event, the specimen should be washed and dried between each polishing period. A longer polishing time will over-etch the specimen and over-heat the solution.

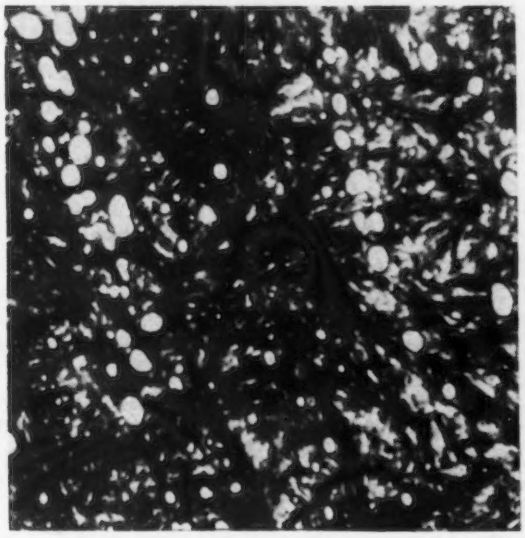
Solution Nos. 1 and 3 may be used to identify Cb-rich carbides. These carbides etch a dark pink color when polished under the following condition—80 to 100 volts, 3 to 4 amp. and 3 sec.

The procedures recommended in the ASTM standard method are quite similar to those outlined in this paper. However, in discussing the use of the acetic anhydride-perchloric acid electrolyte (Solution No. 1) the ASTM suggests the best current density to be used. As previously pointed out, the exact current density is difficult to evaluate; thus values of total current have been recommended here.

In the preparation of this electrolyte, the ASTM method states that the acetic anhydride should be added to the perchloric acid. This paper has recommended the addition of the much smaller volume of perchloric acid to the acetic anhydride. Considerable heat is evolved regardless, but it is felt that the latter method requires the lesser time.

The ASTM discussion on the use of the acetic acid-perchloric acid electrolyte (Solution No. 3) suggests values of voltage and current which are in close agreement with those shown in this paper.

The proper use of the electrolytic polishing method depends upon a full understanding of its advantages and



E **Structure**—tempered martensite and carbides

Grade—0.80 per cent C tool steel
Electrolytically polished as etched in polishing

limitations. It is not advocated as a substitute for mechanical polishing, but rather as an important auxiliary to it.

Advantages

The chief advantage of electrolytic polishing is that it produces a smooth, scratch-free surface, with no disturbed metal. The metallographer may thus be sure that the structure observed under the microscope is the true structure, not one which may have been smeared or flowed, which is possible by even the most careful mechanical polishing.

The photomicrographs presented in this paper are examples of the results that can be obtained with electrolytic polishing. The grade, magnification, etchant, etc., are listed with each photomicrograph.

Electrolytic polishing is not foolproof, and the operator must develop a technique for consistent results. However, operators lacking the skill required for good mechanical polishing can achieve excellent results with this method.

Considerable time may be saved over the conventional method of polishing, particularly if large samples are to be polished, or if many samples of the same grade are to be polished.

Disadvantages

There are limitations to the electrolytic polishing process. On some specimens, the surface appears wavy at low magnifications, and in general, structures are best revealed at magnifications of 500 diameters or higher.

In the electrolytic polishing process, some inclusions are held intact and appear in their true shape. They are not ground flat. However, many inclusions fall out, or cause localized attack and pitting. This condition is accentuated in light etching martensitic structures, but usually at a relatively high magnification areas free from pitting may be found for study or photography. This pitted condition may give the steel an extremely "dirty" appearance at low magnifications. In its present stage, electrolytic polishing is not recommended for the study of non-metallic inclusions.

Electrolytic polishing has been used successfully on a wide variety of steels, but one grade, a fast finishing steel containing 1.25 per cent C and 3.50 per cent W has thus far proved impossible to polish electrolytically.

It has also been found that more difficulty is encountered in distinguishing small amounts of untempered martensite from free ferrite in samples that have been polished electrolytically than in those which had been conventionally polished and etched.

Acknowledgments

The author wishes to acknowledge his indebtedness to W. C. Coons, formerly with the Crucible Steel Co. of America, for the preparation of the photomicrographs and his efforts in the original investigation; to J. L. Klein, formerly with the Crucible Steel Co. of America, for his aid in the development; to C. K. Baer for his revised wiring diagram, and to the officials of the Crucible Steel Co. of America for their permission to publish this paper.

Swedish Sponge Iron

By EINER AMEEN
General Manager, Söderfors Works
Stora Kopparbergs Bergslags Ab., Sweden*

. . . For years there has been a great deal of interest shown by steel men in this country in the Wiberg process of low temperature reduction of iron ore by CO gas regenerated from carbonaceous material in an electric furnace. After many struggles the Söderfors Works has perfected a furnace of 11,000 net tons annual capacity which has been in continuous operation since 1941. Behind the scenes much controversy has raged here as to whether this process had application in this country, considering the quality of local ore resources, labor and power costs. This comprehensive article "lays it on the line" and enables a complete analysis of all factors to be made. Detailed cost data are supplied in the concluding part.

PRODUCING pig iron from iron ore in order to use this pig iron for the purpose of steel making can rightly be considered as a roundabout process. It is therefore evident that the problem of producing steel direct from the ore has been subjected to a great deal of interest. As a matter of fact innumerable schemes have been advanced for the solving of this problem and much energy as well as large sums of money have been spent in order to try out in practice different methods, but the results so far have been rather indifferent.

In 1918 Martin Wiberg, professor of metallurgy, Royal Technical University, Stockholm, proposed a new and theoretically clever method for the production of sponge iron by means of gaseous reduction. The essentials of the process are the following:

The Wiberg Process

Sintered or lumpy ore, high in iron, is charged into a shaft furnace (Fig. 1) or other type of furnace operating on the counterflow principle. In the lower part of the shaft carbon monoxide is introduced at a temperature of 1650 to 1830 deg. F. While passing up through the shaft the gas reduces the ore to iron and in the process the carbon dioxide in the gas rises to 25-30 per cent corresponding approximately to the equilibrium existing at 1650-1830 deg. F. C between FeO, CO_2 and CO. About 75 per cent of the gas thus formed is evacuated from the shaft by means of a fan and is forced through a carburetor where the carbon dioxide in passing through an incandescent layer of carbonaceous material is converted into carbon monoxide which is again introduced into the lower part of the shaft. Since the reaction $CO_2 + C = 2\ CO$ is endothermic, heat must be supplied to the carburetor. This is done electricallly.

That portion of the gas (about 25 per cent) not circulating through the carburetor continues through the shaft, causing a pre-reduction of the ore, whereby the CO_2 contents of the gas is further increased. The carbon monoxide still remaining in the gas is finally burnt in the upper part of the shaft where air is introduced, thereby preheating the ore to 900-1000 deg. C (1650 to 1830 deg. F.). As an excess of air is used in the preheating zone the ore is partly oxidized. Simultaneously a partial elimination of sulphur takes place.

The lower part of the shaft is designed to form a cooling chamber in which the sponge iron is cooled and finally discharged.

A schematical diagram used to explain the Wiberg process is given in Fig. 2. This diagram is not quite accurate in as much as no consideration has been given to the fact that part of the gas must be burnt in order to preheat the ore.

A more detailed diagram in which the matter of preheating has been taken into account is given in Fig. 3. In working out this diagram the following is further assumed:

1. The sintered ore charged consists of pure Fe_2O_3.

2. As the ore received from the sintering plant normally is somewhat warm the temperature thereof is assumed to be 100 deg. C. (212 deg F.)

3. The carbonaceous material charged into the carburetor consists of pure carbon.

4. There are no heat losses due to radiation from the shaft or the carburetor taken into account.

5. The gas entering the shaft as well as the gas entering the carburetor has a temperature of 1000 deg. C. (1830 deg. F.).

6. The gas escaping from the furnace has a temperature of 100 deg. C.

With the assumptions as stated the theoretical consumption of power and fuel will be as follows:

	Per Metric Ton of Metallic Iron	Per Net Ton
Consumption of power...	675 kw-hr.	612 kw-hr.
Consumption of coal....	165 kg.	330 lb.

The low power and fuel consumption thus theoretically attainable in the Wiberg process evidently evoked great interest therein, although many were doubtful as to the practical application thereof, since the coordination of the different steps in the process were considered particularly difficult.

Early Experiments

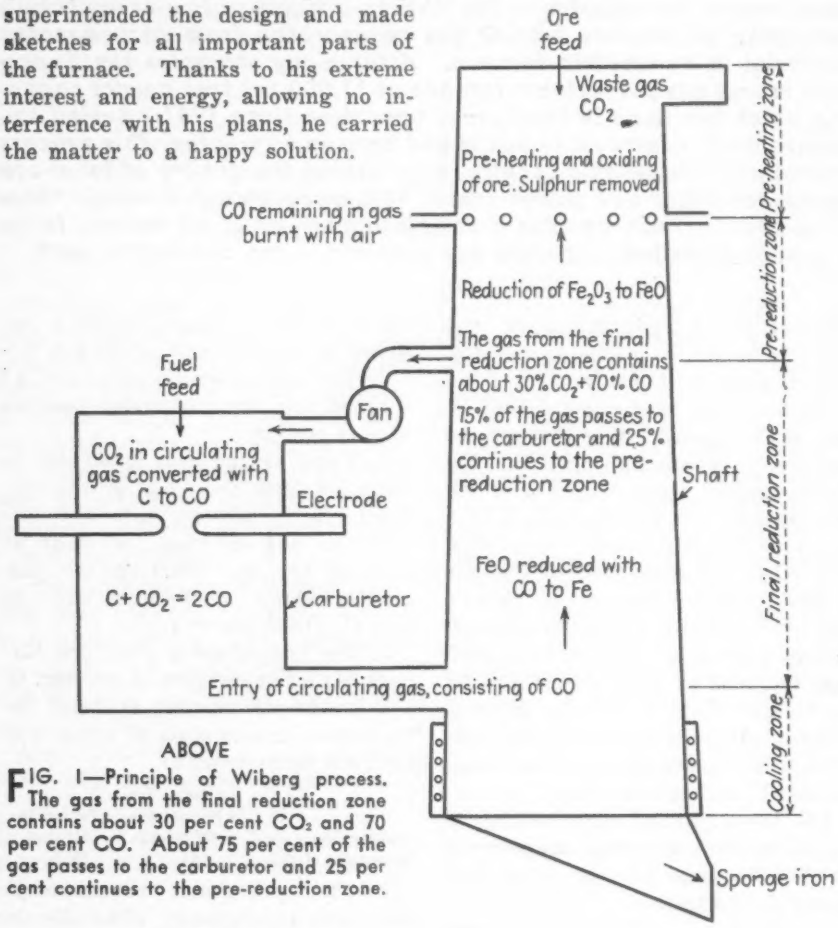
In 1920 a small experimental furnace, producing about 500 kg. of sponge iron in 24 hr., was built at Woxna, Sweden. Under the auspices of the Swedish Iron Masters' Association (Jernkontoret) a slightly larger furnace, having a daily production of

*Represented in the United States by Stora Kopparbergs Corp., 230 Park Avenue, New York.

about 2 metric tons, was later erected at Sandviken, Sweden. Finally in 1930 the Stora Kopparbergs Bergslags Ab. erected at its Domnarvet works a furnace with a daily capacity of about 2 tons.

Due to the encouraging results obtained at Domnarvet, Emil Lundqvist, managing director of the Stora Kopparbergs Bergslags Ab., decided in 1932 to have erected at the company's Söderfors plant a furnace of commercial size. This furnace was to have a yearly capacity of about 10,000 metric tons (11,000 net tons).

The late Mr. Lundqvist (deceased 1942) took an active part not only in the designing of the furnace but also in the work connected with all the alterations and experiments subsequently carried out. He personally superintended the design and made sketches for all important parts of the furnace. Thanks to his extreme interest and energy, allowing no interference with his plans, he carried the matter to a happy solution.



ABOVE

FIG. 1—Principle of Wiberg process. The gas from the final reduction zone contains about 30 per cent CO_2 and 70 per cent CO. About 75 per cent of the gas passes to the carburetor and 25 per cent continues to the pre-reduction zone.

o o o

As the nearest assistant to Mr. Lundqvist in the sponge iron experiments, Helge Kihlander, works manager of the Söderfors plant, put in a lot of hard work in solving all the various problems that appeared from time to time and zealously superintended the operation of the furnace.

Due to local conditions at Söderfors it was decided to erect the sponge iron furnace on the site of an old blast-furnace. The existing equipment, such as ore and charcoal hoists were to be retained as far as practically possible and for this reason the height of the shaft and certain other matters were therefor predetermined.

The carburetor was designed on the direct-flow principle; in other words the fuel and the gas were to move in the same direction. The carburetor was equipped with six top electrodes, connected in 3-phase. Fig. 4 shows a cross-sectional view of the plant. The furnace was started in the end of 1933 and was kept in operation until June 1934. The results obtained during this period demonstrated among other things the impossibility of a continuous operation, the reason being that the lower part of the carburetor became clogged by an accumulation of charcoal breeze. It was therefore necessary to empty the carburetor from time to time.

During this trial period, comprising 100 days of operation, the following results were obtained:

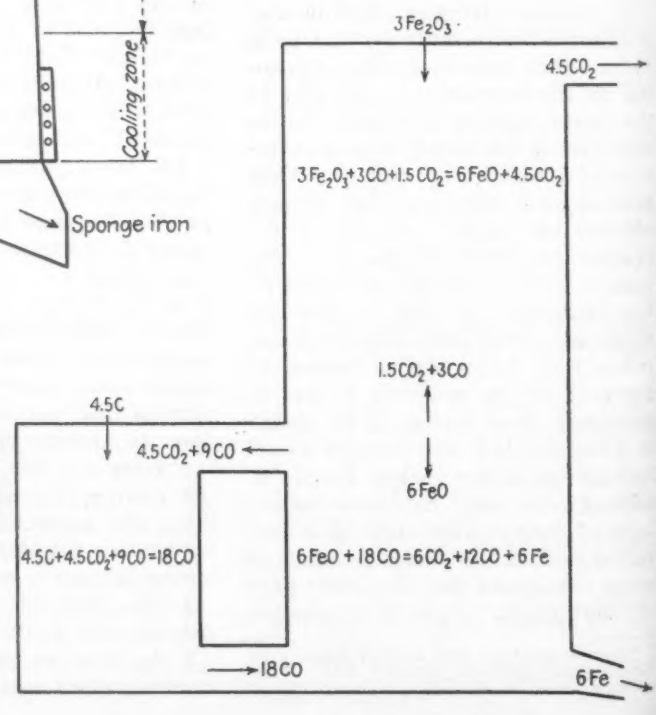
Production about 6 metric tons (6.6 net tons) of sponge iron in 24 hrs. with a degree of reduction of 75-95 per cent.

	Per Metric Ton	Per Net Ton
Power consumption about...	1550 kw-hr.	1400 kw-hr.
Charcoal consumption about.	14.5 hl.	37 bu.
Electrode consumption about	6 kg.	12 lb.

From June to December 1934 the furnace was at a standstill almost the whole time. A new fan was installed to replace the temporary fan previously used. Several other changes, such as providing the carburetor with an arrangement for discharging the charcoal breeze, were also made. In January 1935 the furnace was restarted and kept in operation a couple of months when it was again shut down, the reason therefor being a breakdown of the fan. On inspection it was found that, due to carbide precipitation, cracks had developed near the center of the runner. The vanes of the runner were cast from a heat resisting steel, analyzing about 0.08 per cent C, 18 per cent Cr and 20 per cent Ni. A new runner was manufactured from the same type of steel but with an addition of titanium to prevent carbide precipitation. The new runner was forged instead of cast.

Single-Phase Carburetor Tried

As the results with the six-electrode carburetor had proven far from satisfactory, the carburetor problem was given renewed and careful study. A number of different types were de-



RIGHT

FIG. 2 — Simplified schematical diagram of the Wiberg process. Preheating is not considered in the chemistry of the process.

o o o

o o o

signed and models made. Finally it was decided to employ a system of three parallelly connected, single-phase carburetors, working on the counterflow principle. For the time being only one single phase carburetor was to be erected. The old 3-phase carburetor was therefore torn down and a new single-phase carburetor, Fig. 5, was erected in its place. The carburetor was provided with a 600 mm. (23.6 in.) top electrode and with a rammed-in bottom contact, composed of Söderberg mixture. The alterations completed, the furnace was again put in operation in the beginning of 1937 but after having been in use a short time only difficulties were again experienced with the carburetor, necessitating some changes. By the end of 1937, however, the furnace could be put in regular use and was kept in continuous operation from November 1937 until December 1940.

Certain interruptions occurred, however, caused in particular by the top electrode in the carburetor. It developed that this electrode was gradually eaten away underneath the roof arches, causing pieces of the electrode to drop down into the carburetor. In order to remove these pieces the carburetor had to be shut down, with rather lengthy interruptions as a consequence. These interruptions took place at intervals of about two months and the risk of electrode breakages could not be eliminated in spite of numerous attempts to protect the electrode. Trouble was also experienced by hangings in the shaft, resulting further in lowered production.

During the periods of undisturbed operation the following results were obtained:

Production about 10 metric tons (11 net tons) of sponge iron in 24 hr. with a degree of reduction of about 90 per cent.

	Per Metric Ton	Per Net Ton
Power consumption about...	1200 kw-hr.	1090 kw-hr.
Charcoal consumption about.	13.5 hl.	34.8 bu.
Electrode consumption about	1 kg.	2 lb.

Due to the difficulties with the carburetor, mentioned above, it was decided to repeat the test with a 3-phase carburetor, constructed on the direct-flow principle and accordingly a new carburetor of an improved type was designed. The furnace was shut down in December 1940 and was out of commission until August 1941. In the meantime the new carburetor was installed, the shaft was repaired and partly relined and certain other adjustments and improvements were made. The furnace was started in August 1941 and after various adjustments was in full operation in November 1941. From that time on one is justified in stating that the furnace had left the experimental stage. The following report will therefore cover the results obtained from November 1941 and onwards.

Operating Data Summarized

The data in this article was originally presented in the form of a paper read at the spring meeting of the Swedish Iron Masters' Association (Jernkontoret), May 29, 1943. For convenience, all metric units have been converted into English measure on the following basis:

1 kg. = 1 metric ton = 2205 lb.
= 1.103 net tons
1 cu. meter = 35.3 cu. ft.
1 hectoliter = 2.84 bu.
25.4 mm. = 1 in.

The krona has been figured at 25c.

Results obtained in the first six months of 1943 in producing electrically a sponge iron with about 65 per cent metallic iron, 77 per cent total iron and with a degree of reduction of 85 per cent have been as follows:

Production, 24 hr.	21.5	net tons
Power consumed, kw-hr.	730	per net ton
Charcoal consumed, bu.	28	per net ton
lb.	375	per net ton
Electrode consumption, lb.	5.4	per net ton

Annual output is around 7700 net tons and by extending the data it is expected that the power consumption can be brought down to 640 kw-hr. per net ton by increasing output of the furnace to 11,000 net tons annually, or approximately 30 tons a day. With a projected furnace double this size, it should be possible, the author states, to lower the power consumption to 550 kw-hr. per net ton for the same degree of reduction.

Electric furnace smelting of both pig iron and sponge iron has been brought to a high state of perfection in Sweden where three factors have contributed to its success: high grade ore, cheap power from hydroelectric stations and abundant timber from which charcoal can be obtained. Actually, however, the production of pulp and paper is such a prime industry there that it has first call on the wood supply so that there is a real advantage in favoring processes where electric power replaces solid fuels to a large extent. —Ed.

Present Installation Described

Due to the patent situation the present furnace installation cannot be described in detail. Roughly it corresponds, however, to the original installation, as shown in Fig. 4, which illustration therefore will serve as a basis for the following general description.

The sintered ore is charged into the furnace from an ore bin placed above the shaft (1). The shell of the shaft is made of welded steel plate, lined with fire brick, 900 mm. (35.5 in.) in thickness. For heat insulating purposes the space between the shell and the fire brick is filled with Sil-O-Cel powder. The principal dimensions of the shaft are as follows:

Inner diameter at top	800 mm.	31.8 in.
Inner diameter at bottom	2,000 mm.	78.8 in.
Outer diameter at top	3,700 mm.	146 0 in.
Outer diameter at bottom	5,500 mm.	217.0 in.
Height of furnace from working floor to top of ore bin	24,000 mm.	948.0 in.
Cubic contents of ore bin	7.8 cu. m.	279 cu. ft.
Cubic contents of shaft, including ore bin	42.0 cu. m.	1480 cu. ft.

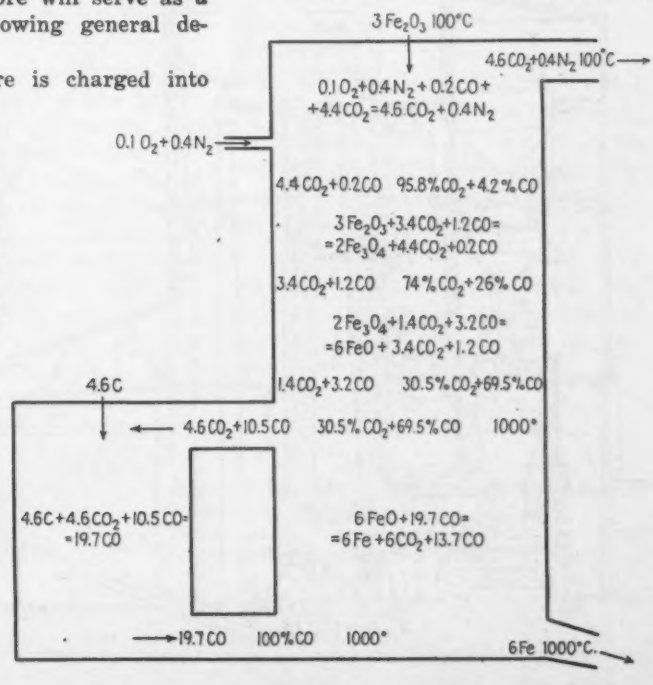


FIG. 3—Schematical diagram of the Wiberg process, with consideration given to the preheating of the ore.

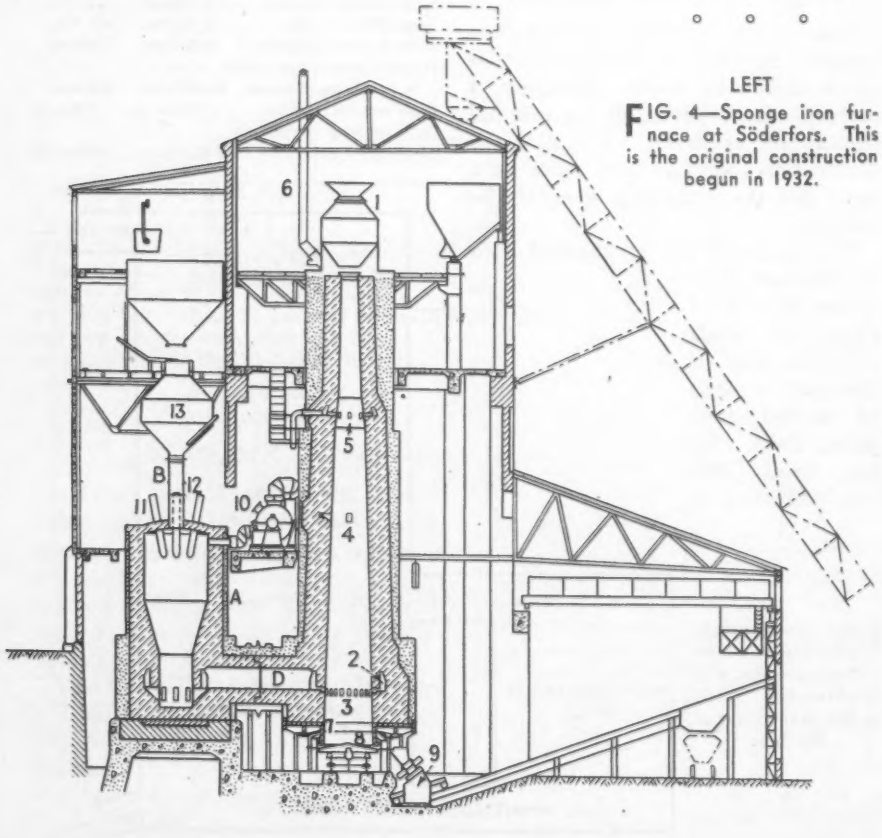
The gas enters the lower part of the shaft through a circular flue (2) from which it is distributed by means of a number of openings (3). The circulating gas is drawn from the furnace through four openings (4). The air for combustion is admitted through 12 openings (5) evenly spaced round the shaft. The waste gas leaves the shaft through a chimney (6) which is provided with an automatic regulator whereby a certain pressure can be maintained in the shaft. The lower part of the shaft is designed to form a cooling chamber (7), cooled by water. The machinery for discharging the sponge iron is placed underneath the cooling chamber and consists of a rotating table (8) that discharges the material into a container (9). The speed of rotation of this table can be adjusted from 0.15 to 0.90 r.p.m.

In level with the discharging table the shell is provided with inspection windows to enable the furnace operators to inspect the appearance and condition of the sponge iron, while being discharged. The discharging chute is equipped with a device by means of which samples of the sponge iron can be withdrawn.

The circulating gas passes to the fan (10) through heat resistant steel piping, provided with dust collectors. The fan is of the single runner type, designed for a maximum capacity of 110 cu. m. (3900 cu. ft.) per min. and a pressure of 360 mm. (14.2 in.) at 800 deg. C. (1470 deg. F.) and 2950 r.p.m. The runner is self-cleaning and is made of forged heat resistant steel. The whole fan is carefully insulated with Sil-O-Cel powder. On the exhaust side the fan is provided with a regulating valve. By means of this valve and by regulating the speed of the fan the volume of gas in circulation can be adjusted.

The carburetor consists of a shaft lined with fire brick. The shell is made of non-magnetic (austenitic) steel of the 18/8 type. For insulating purposes there is a layer of Sil-O-Cel powder between the fire brick and the shell. The carburetor has three pairs of electrodes (11) entering through the roof. Each pair of electrodes is connected to a single phase transformer. The electrodes are of the Söderberg self-baking type, 300 mm. (11.8 in.) in diam.

The transformers each have a capacity of 400 kw. The secondary voltage can be adjusted in five steps to give 55-90 volts. The fuel is fed into the carburetor by means of a centrally located charging pipe (12). Above the carburetor there is a fuel bin (13) from which it is possible to charge the carburetor without permitting any entrance of air. The fuel bin has a capacity of 14 cu. m. (500 cu. ft.). The ashes and breeze formed in the carburetor are removed from the lower part thereof by means of discharging rakes.



LEFT

FIG. 4—Sponge iron furnace at Söderfors. This is the original construction begun in 1932.

The Practical Operation of Furnace

When the sponge iron furnace is to be put into operation a fire is started in the carburetor and in the flue leading to the shaft and kept up for about two weeks, thereby carefully and slowly drying out and preheating the brick work. When the drying is completed, the shaft is cautiously filled with first class, porous sintered

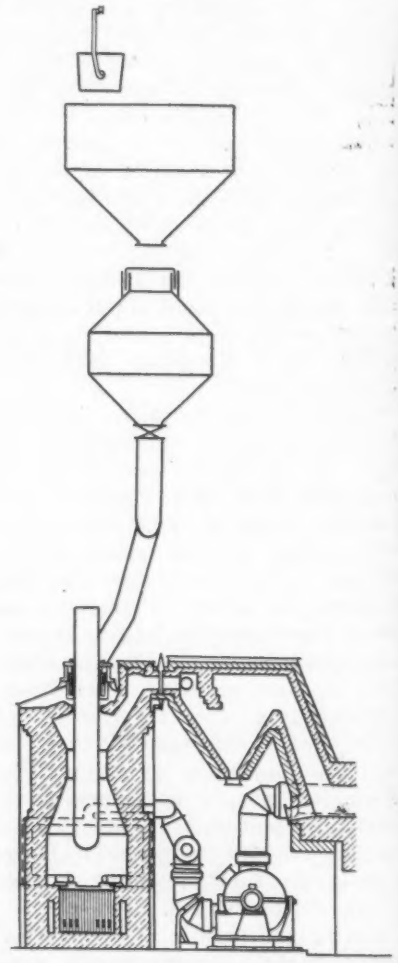


FIG. 5—Single phase carburetor which was in continuous operation from November, 1939 until December, 1940.

ore. Crushing of the sinters is avoided.

The carburetor is filled with charcoal, on the top of which and in between the electrodes is put a layer of coke and some scrap iron so as to provide satisfactory contact. To heat the carburetor the power is put on and after operating for a few hours with a load of 200-300 kw. the fan is started. By circulating the warm gas generated in the carburetor the shaft is gradually heated until the temperature reaches that required for the reduction. When reduction begins excess gas is generated and passes up through the shaft. When the percentage of carbon monoxide in the excess gas is sufficiently high, air is in-

troduced in the preheating zone and the gas is ignited. During the whole period of preheating, in order to prevent hangings in the shaft, the furnace is operated at a rate that will discharge about 400 kg. (880 lb.) of product per hr. Following the practice just described, the furnace will be in full operation about eight days after the completion of the preheating period.

In normal operation of the furnace the following matters have to be attended to: The bin above the shaft has to be filled with sintered ore. This has to be attended to every 10 hr. as the bin holds sufficient material for this period. The fuel bin above the carburetor is filled every 11 hrs. At certain intervals, about twice in 24 hrs., sufficient charcoal breeze is discharged from the carburetor so as to keep constant the loss of pressure therein. The charcoal breeze bucket, having a capacity of about 1.5 cu. m. (53 cu. ft.) is emptied four times weekly. On an average about 0.4 hl. (1 bu.) of ashes and breeze have to be discharged for each ton of sponge iron produced.

By regulating the voltage on the transformers and thereby the power input, the temperature of the gas entering the shaft is also regulated. The temperature of the inner surfaces of the carburetor is controlled by means of suitably located thermocouples. Individual regulation of the three pairs of electrodes guards against superheating of the carburetor walls and prevents unbalanced operation. The temperature of the gas leaving the carburetor is kept at 950-1000 deg. C. (1740-1830 deg. F.). It is very important that the temperature does not greatly exceed 1000 deg. C. as this would cause hangings in the shaft. On the other hand the temperature should not be kept below 950 deg. C. as this would considerably lower the rate of production.

In operating the furnace it is desirable to keep constant the degree of reduction, i.e. the ratio between metallic iron and total iron in the sponge, as this will have a great bearing on the subsequent remelting of the sponge iron in the electric steel furnaces. For reasons discussed later, the furnace at Söderfors is operated so as to give a degree of reduction of about 85 per cent.

When the sponge iron discharge bucket is filled, a double valve is closed and the bucket is removed and emptied. The sponge iron, being pyroforic, ignites in contact with air if the temperature exceeds about 200 deg. C. (390 deg. F.). For this reason the sponge iron must be cooled down before being emptied. The bucket, holding 1.5 metric tons, is normally emptied every 1 hr. and 40 min.

In producing normally 20 metric tons of sponge iron in 24 hr. the time spent by the material in passing through the different zones of the shaft is as follows:

Ore bin	16 hr.
Preheating zone	6 hr.
Prereduction zone	13 hr.
Final reduction zone	30 hr.
Cooling zone	11 hr.
Total	76 hr.

During the operation all matters of interest are recorded. Temperatures and gas pressures in the different parts of the furnace are measured and registered hourly and the gas is analyzed at regular intervals. The load on the electrodes is registered and the volume of the circulating gas is measured. All temperatures are measured by means of thermocouples except in the combustion zone where it is ocularly estimated. This is done simply by running an iron bar through the shaft and leaving it there for a few minutes. After having rapidly withdrawn the bar the temperature thereof can be estimated. By this means it is possible to check in a simple manner the temperature conditions in the combustion zone, this being of special importance as otherwise local superheating and hangings might take place. All instruments used in the supervision and regulation of the furnace operation are installed in a central control room.

As noted all conditions in operating the Söderfors furnace are very carefully checked, this being of particular interest with this novel type of furnace. Normally, however, it should be possible to limit considerably the number of observations.

In shutting down the furnace the procedure is as follows: The power to the carburetor is disconnected, the circulating fan is stopped, the air supply to the preheating zone is shut off and the sponge iron remaining in the shaft is discharged as quickly as practicable. The fuel in the carburetor is also discharged and the whole system is left to cool.

The furnace crew and the distribution of the work on the furnace is as follows:

Designation	Number of men needed in 24 hr.	Character of the work
Furnace operators	3	Emptying of sponge iron and charcoal breeze buckets; charging the carburetor and taking of samples.
Instrument observators	3	Read and attend to the instruments; lower the electrodes and attend to the carburetor in general; assist in charging the carburetor.
Fuel loaders	2	
Oilers, etc.	1	
Total	9 men = 3 men per shift	

The personnel requires no particular skill. As evidenced, workers with no experience whatsoever in steel plant work can be trained in about two weeks to carry out their duties satisfactorily.

Reliability of the Process

In putting the process to practical use the question of reliability is naturally of the greatest importance and will therefore be discussed in detail on bases of the results obtained at Söderfors. In the development of the process the biggest troubles have been hangings in the shaft, difficulties with the circulating fan and carburetting problems.

As to the hangings in the shaft it needs to be pointed out that these are of two types, viz., hangings in the combustion zone and hangings in the gas intake level. In the early stages the hangings in the combustion zone sometimes became so serious that the sintered ore fused together, forming solid big lumps. By increasing the number of air intakes in this zone and by careful control of air pressure and temperature, these difficulties have been eliminated.

The hangings in the gas intake level are caused by the welding together of the reduced sintered ore, the dominating factor being the temperature. For this reason the temperature of the gas entering the shaft must be kept below 1000 deg. C. (1830 deg. F.). The trouble therefore can be said to be due to the difficulties experienced in keeping the temperature of the gas at a constant level, not easy to attain with the early carburetor designs. The present type of carburetor causes no difficulties in this respect and troubles with hangings in the gas intake level have been eliminated.

In the beginning the difficulties with the circulating fan were caused by breakdowns of the runner. With the changes in the design, already mentioned, the runner has performed satisfactorily. The fan has now been in operation over four years at a temperature of 1200 deg. F. and is still at work. At a careful inspection recently made, no defects were discovered and only a slight wear was no-

(CONTINUED ON PAGE 150)

Application of Stress-Strain Theory in

Fabrication of Aircraft Parts

. . . The problem of springback in formed parts, such as those with flanges, is related to basic stress-strain theory and the plastic behavior of metal. Tests show that per cent elongation values for a given material vary widely, depending upon the distance between gage points in the tensile specimen. Application of this basic theory to bar forming of extrusions is exemplified and a problem in stretch forming of a wing cap channel is solved graphically.

o o o

By F. C. Hoffman

Production Design Development Engineer, Lockheed Aircraft Corp., Burbank, Cal.

o o o

THE first and foremost problem in aircraft fuselage production is one of proper design and rapid production of sheet metal forming tools. A full understanding of forming properties of various aircraft materials, the limits of each method of forming, and die design and construction are of vital importance to every tool designer and tool planner. In view of the great variety of parts to be produced, the expense and time consuming trial-and-error method of die development should be reduced to a minimum. If the limits to which parts can be formed by the common methods are known and applied, a large percentage of parts can be designed so that they may be formed readily and economically using as few operations as possible. If parts are designed so that they take advantage of new simplified methods, it is important that tools be made with close cooperation between the preplanners, tool planners and tool designers.

Forming metal is accomplished by forcing all or most of the fibers into their plastic range. In simple forming this stress is one of compression and tension. More complex forming, such as drawn parts, makes use of compression, tension or a combination of each.

Fig. 1 diagrammatically shows fundamental stress condition. Simple tension is shown at *a* with its well known maximum shear component along the 45 deg. diagonal plane. Triple tension is shown in the next figure, *b*. This type is of special interest because it represents practically a complete absence of formability. Permanent deformation under conditions would require a permanent increase in volume. If sufficient force were applied, failure would result without any appreciable change in shape. At *c* is shown combined tension and compression in two dimensions. The figure could be modified to show compression on all four vertical planes, thus producing pure shear in any plane inclined 45 deg. to the direction loading. This would represent the most formable condition.

The properties of a material are commonly judged by the yield strength, ultimate strength and elongation in 2 in. While these properties are usually sufficient to judge the structural value of a material, they do not necessarily give enough information to judge the forming characteristics nor to analyze typical forming operations. Of much more value is the stress-strain curve. Such a curve for 24ST alclad aluminum alloy is shown in Fig. 2. Since a detailed discussion forming operations has been published recently,* only a brief discussion will be given here.

In Fig. 2, the vertical axis shows the stress applied to the specimen being tested while the horizontal axis shows the amount of stretching which takes place when these different loads are applied. In the upper right hand corner is plotted the tension curve and in the lower left hand corner is plotted the compression curve. It will be noted that the compression curve is very similar to the tension curve. However, slight variations can be observed, but for all practical purposes the compression characteristics can be considered similar to the tension characteristics. For the present only the tension curve will be discussed.

The most important points of this curve are shown in Figs. 3, 4, 5 and 6. Fig. 3 shows the unit yields at the critical points of the curve. Fig. 4 shows the elastic limit. On the 24ST stress-strain diagram it is located at the intersection of 37,000 lb. per sq. in. stress and 4 per cent strain. Within this area the material being tested stretches in direct proportion to the force applied, but returns to its original length when the force is released. This curve is a straight line and is

* *Elastic Theory in Sheet Metal Forming Problems, by F. R. Shanley, published in the July, 1942, issue of the Journal of Aeronautical Sciences.*

called the proportional elastic limit or modulus of elasticity slope.

The next point is the yield stress, Fig. 5, and is the force required to produce a permanent set or strain of 0.2 per cent. In 24ST this stress is approximately 42,000 lb. per sq. in. and will cause the material to stretch approximately 0.6 per cent. When the force is released the material elastically contracts 0.4 per cent as before and leaves a permanent deformation of 0.2 per cent. The next point is the ultimate strength, Fig. 6, and is the maximum unit force which the material can withstand without failure. This stress, which is approximately 65,000 lb. for 24ST, will produce 18 per cent permanent deformation. It is to be noted that the same elastic recovery is still present and is of somewhat larger magnitude than that which occurs at lower strains. At maximum strain the recovery appears to be approximately 0.006 in. per in., and at the yield point the elastic recovery is 0.004 in. per in. The effect that this difference may have on analyzing springback problems is now being investigated.

The range in between the yield point and the ultimate is termed "plastic range" and it is, therefore, obvious that forming must be done within these limits. It is necessary, though, to bear in mind that elastic recovery does exist throughout this range and causes serious difficulties in springback, even though it is only of a magnitude of 0.4 per cent or 0.004 in. per in.

Fig. 7 shows a comparison from which the following general conclusions may be drawn. At *a* is a stress-strain curve for a low yield stress material such as 24SO, and at *b* is one of a material of high yield stress, such as 24ST. The elastic recovery per unit strain is much less in *a* than in *b* and accounts for the lack of springback in the annealed stock. Curve *c* is for a different type material—one of high modulus of elasticity, the slope being approximately three times that of 24S and typical of a low carbon steel, one having approximately the same yield and total strain as aluminum. The elastic recovery is much less than that for 24ST, and the piece, therefore, would not have as much springback.

The application of this data to a practical problem is evident when the following is considered. Consider two materials, 24SO and 24ST of 0.051 in. gage, to be formed over a ⅛ in. bend radius. The springback angle in 24SO will be much less than that for 24ST due to the fact that although the outer fiber length is the same in both cases, the elastic recovery, inch per inch, or total elastic recovery is one-fifth as much for SO as for ST. This will shorten the outer fiber much less for ST. In the compression side of the radius, the same phenomena are observed. The change in length takes place on both sides of a neutral plane, and causes the springback angle to greatly increase in this latter case.

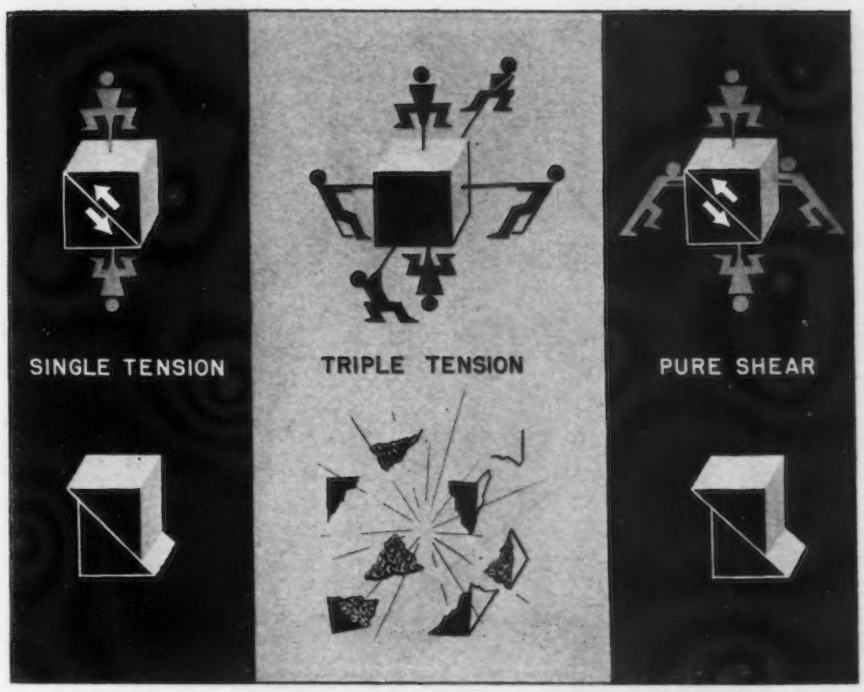

FIG. 1—Animated diagram showing nature of stresses applied to metal. Application of triple tension represents complete absence of formability since permanent deformation under such conditions would require a permanent increase in volume—an obvious impossibility.

This same analysis can be applied to another practical example when the same material is being bent over two different radii, one being large and one small. In the small bend radius, the outer fiber length subject to recovery is less than the outer fibers on the larger radius and although the elastic recovery, inch per inch, is approximately the same, more

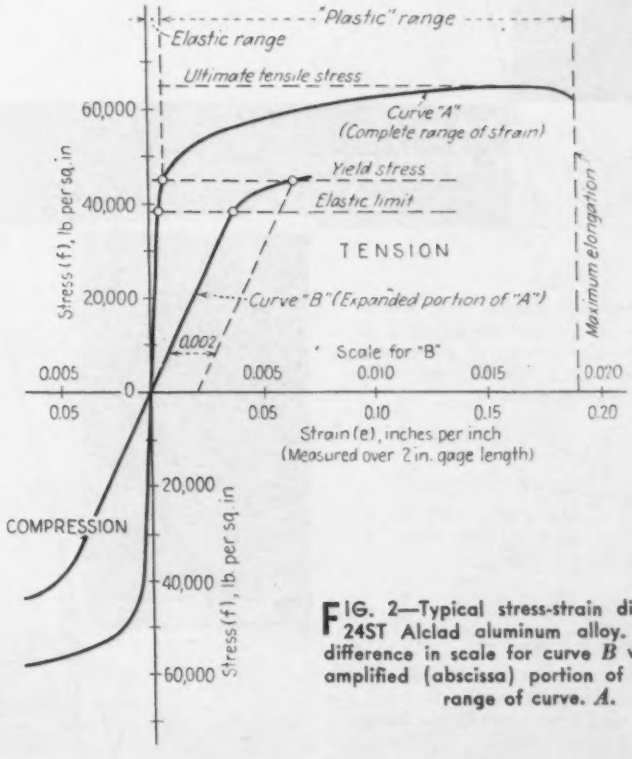

FIG. 2—Typical stress-strain diagram for 24ST Alclad aluminum alloy. Note the difference in scale for curve *B* which is an amplified (abscissa) portion of the elastic range of curve. *A*.

o o o

ABOVE

FIG. 4—Up to the elastic limit, there is full elastic recovery after stress is relieved (24ST).

o o o

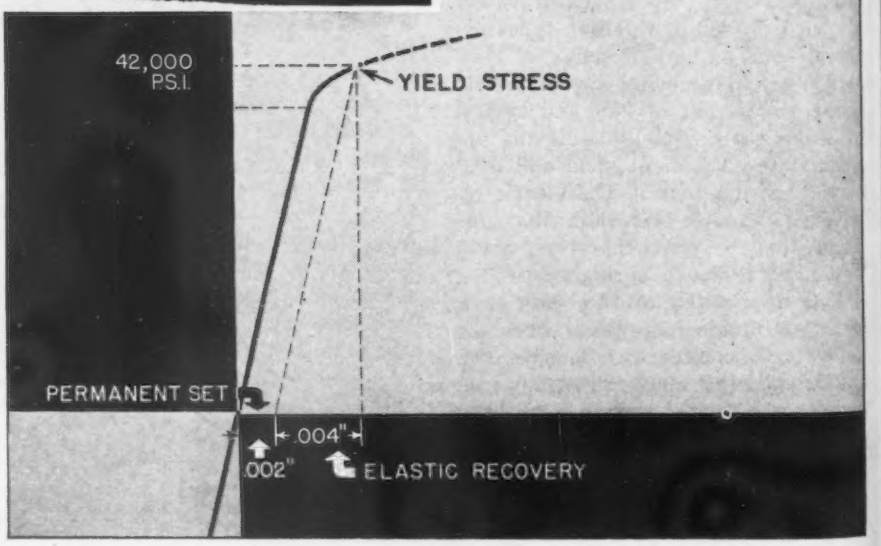
RIGHT

FIG. 5—Once the elastic limit is passed, permanent set takes place but there is always some elastic recovery present (24ST).

inches are acted upon in the larger bend radius, thereby causing a greater springback angle.

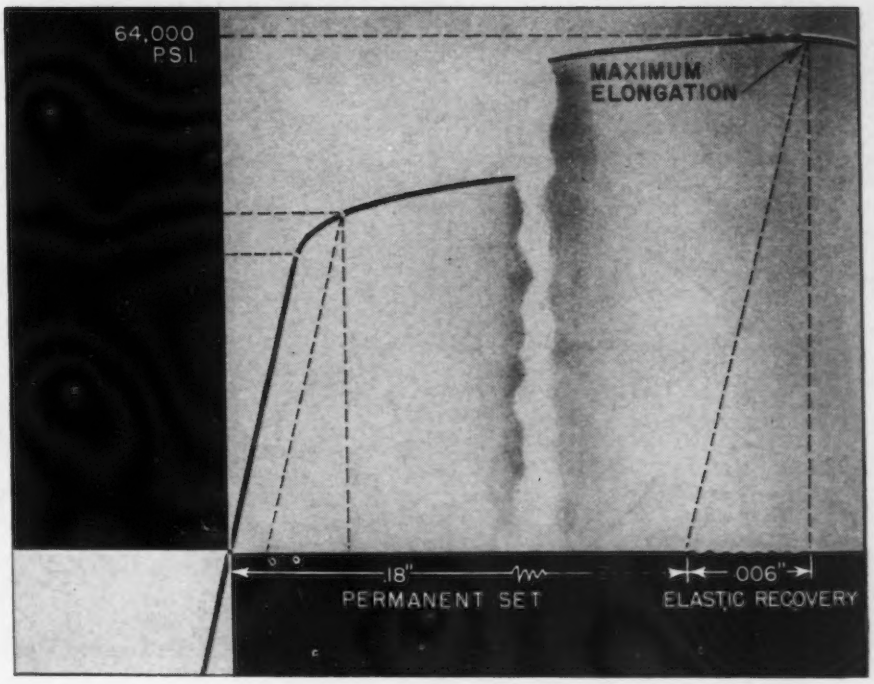
When material is bent over a radius, as in the examples of flanges on bulkheads or wing ribs, Fig. 8, the outer fibers of the material are stretched and the inner ones compressed. Fig. 9 shows the geometry of such a simple bend. Let us consider the material as being 24ST, 0.051 gage, bent over a ⅛ in. radius and the forming done by the rubber hydropress or power brake. As shown, the outer fibers *EC* are stretched distance *ED* and the inner fibers are compressed a corresponding amount. The neutral axis remains the original length and is located approximately in the center of the sheet. When the force bending this material is released, the fibers which are stretched recover elastically, thereby becoming somewhat shorter, and the inner fibers, which are in compression, expand in the same proportion. Although this amount of elastic recovery in the outer and inner fibers is approximately only 0.004 in. per in. as previously explained, it does cause considerable springback trouble.

A test coupon similar to the one shown in Fig. 10 has been used to determine maximum elongation and its distribution in 2 in. It is held between grips which are about 5 in. apart. The specimen is machined down to ½ in. in width by 2 in. in length in the center portion. On this area is photoprinted a fine grid of lines 0.01 in. apart. Elongation studies were made from these specimens after failure occurred and the results plotted as shown in the graph. The



location of the measurements taken along the length of the specimen are shown on the horizontal axis, and the amount of elongation or unit elongation in per cent is shown on the vertical axis.

In the area directly adjacent to the fracture the material stretched approximately 40 per cent, but over the 2 in. length the average is only 18 per cent. This average value is the one usually referred to in handbooks. The high local elongation which occurs near the fracture explains why it is possible to bend 24ST material to a much smaller radius than could ordinarily be expected. The progressive bending around such a small



ABOVE

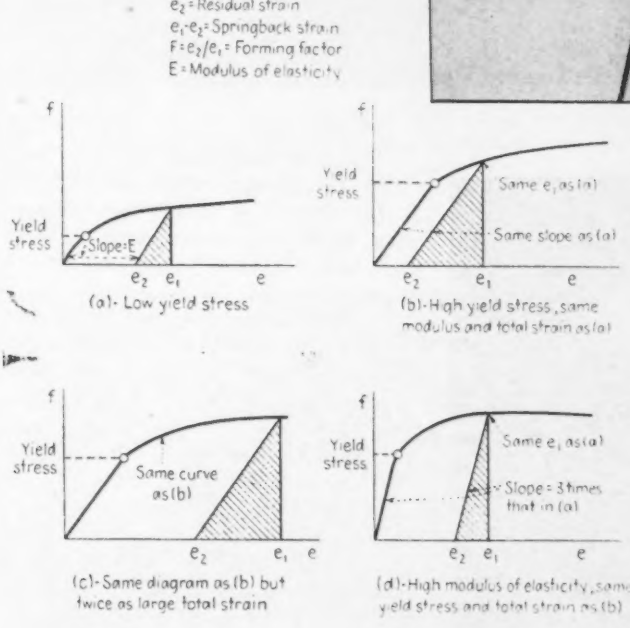
allowable elongation over larger gage lengths; for example, 12, 36 and 48 in., which would be applicable to forming large sheets on the stretch press. It was found that for these larger gage lengths the average elongation dropped down considerably, in some cases to approximately 50 per cent that of the 2 in. gage length value.

For 24ST material, the practical interpretation of these data leads to the conclusions that there can be expected:

(1) Upwards of 40 per cent elongation if only a very small area of the sheet is deformed.



ABOVE

FIG. 7—Effect of shape of stress-strain diagram on springback—At "B" the elastic recovery is much greater than that shown in "A" for a low yield material, the elastic recovery being e_2e_1. If these charts were true stress-strain diagrams of 24SO and 24ST, then in "A," e_2e_1 would be approximately one-fifth that of "B" or elastic recovery for 24SO is approximately 0.001 in. per in., whereas the elastic recovery for 24ST is approximately 0.005 in. per in.

o o o

radius takes advantage of these high local characteristics.

A number of elongation charts on various material have recently been compiled and give the elongation in ¼ in. gage lengths and 2 in. gage lengths, as shown in Table I. Further studies were made to determine the

53SW	0.032	29	19	16	10
24ST	0.032	23	17	9	4
52S½H	0.032	20	11		3

(2) Approximately 18 per cent when the forming occurs over 2 in.

(3) Only 9 or 10 per cent elongation when large sheets such as fuselage skins or cowl panels are stretch formed.

A few years ago an effort was made to form parts directly from ST material which had previously been formed in the annealed temper (SO) and then heat treated. By so doing, troublesome heat treat distortion could be eliminated. In order to proceed with this program it was desirable to determine the minimum bend radius which could be used for 24ST, thereby not necessitating design changes of SO parts which already had a suitable bend radius. Many bent specimens were made and cross-sections of some are shown in Fig. 11.

In this particular instance, the material was 24ST, 0.064 in. gage. The top specimen was bent on a ⅛, the second on a 5/32, the third on a 3/16 and the bottom on 7/32-in. radius. Before bending these parts, scribe lines 0.01 in. apart were scratched into the alclad surface on both sides of the specimen and may be seen by close observation in these cross-sectional views. At the time of this investigation the photo-grid process had not been developed or at least was not in use at this plant. After forming, these lines were measured and found to agree with the theoretical geometry of bending previously shown in Fig. 9. The outer fibers stretched to limits approaching those shown for ¼ in. gage lengths and the inner fibers compressed a corresponding amount, thereby locating a neutral point approximately midway in the

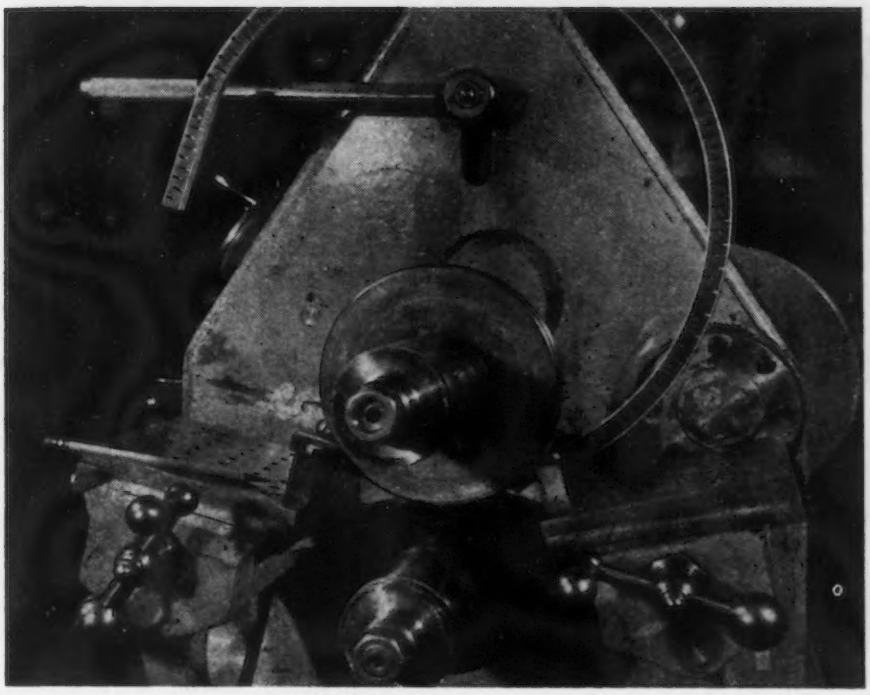

FIG. 13—A 24ST C-channel being formed in a two-roll contour machine. The flanges are prevented from collapsing by use of a notched micarta filler strip.

bend and how it affected the fatigue life of the part.

Many specimens of various gages were formed on their minimum bend radii and subjected to vibration tests. A machine was constructed to hold these bent-up specimens with one leg held stationary while the other oscillated as shown in Fig. 12 until failure occurred. When the results were

sheet. After determining the minimum bend radius upon which 24ST could be formed without fracture, there was still doubt as to what effect the work hardening had made in the

compared with specimens formed in the SO condition and heat treated, it was found that those formed from the ST stock had the longer fatigue life.

In most hydropress flanging operations, the form blocks must be undercut to allow for springback. To form a 90 deg. flange angle in a 24ST part, for example, a 10 deg. undercut is used.

A two-roll contour machine such as the one shown in Fig. 13 forms by compressing the inner fibers and stretching the outer ones in the same manner that a small bend radius is produced. This view shows a C-channel, 24ST extrusion being contoured in the plane of its web.

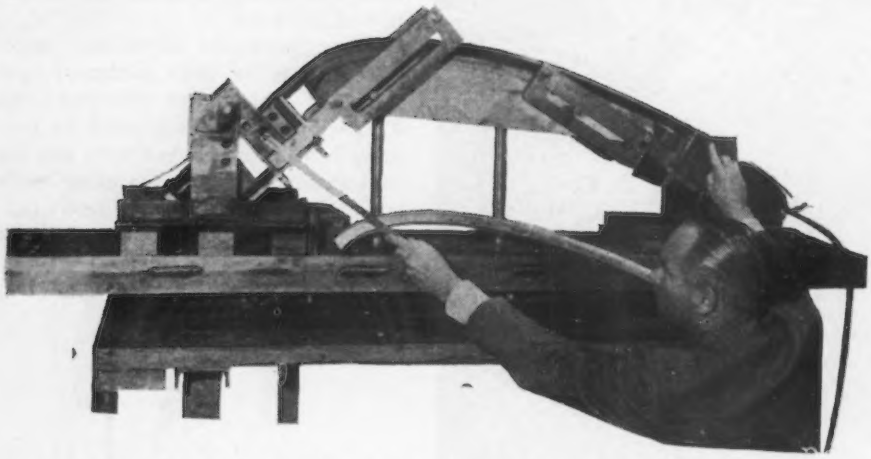

Fig. 16—Table type stretch press used to form the cap strip shown in Fig. 17.

Bar forming is one of the newer techniques used in forming aircraft extrusions and preformed sections. A bar contoured to allow for springback is developed and a straight bar or pressure bar is used to force the preformed section or extrusion against this developed contour as the two pass between the large driven rolls. Fig. 14 shows a T-extrusion being shaped in one pass through the machine to an irregular contour. The amount of springback added to this bar can be judged from the fact that the part opens up to approximately 180 deg. The flange angle is also changed during this forming process.

Fig. 15 illustrates a check fixture needed to check each part individually as it comes through the machine, since springback characteristics vary. These variations may be caused by one or a combination of the following: Hardness of material, cross-sectional tolerances, pressure of rubbing block or amount of lubricant used and in some cases the general technique of the operator.

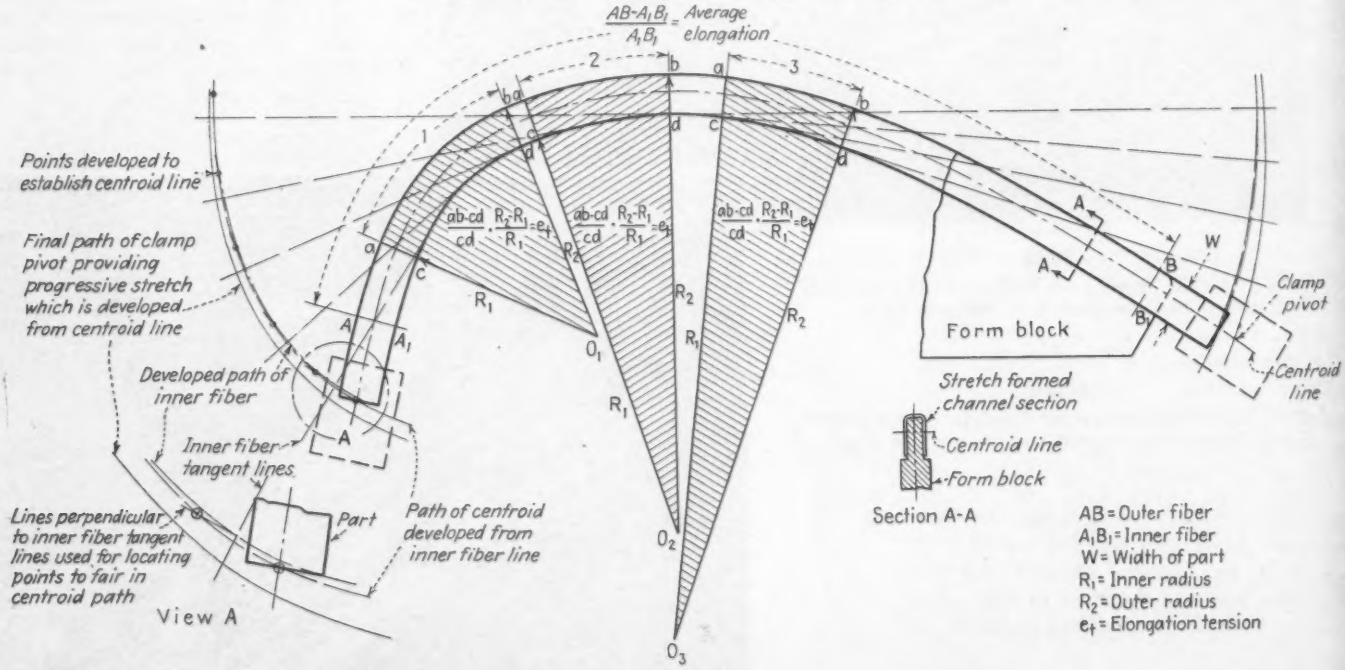
Stretch Forming

Stretch forming is one of the most interesting techniques developed during the past few years to form aircraft parts. The preliminary action is the elongation of elements in the neutral plane, bending and shear stresses being secondary. Fig. 16 shows a table type stretch press forming a cap strip to be used as the leading edge for a wing tip. The limiting factor in a part of this type is the region that has the sharpest radius of curvature, Segment 1 in Fig. 17. Actually, the areas of the triangles shown do not enter into the calculation. The triangles are shaded merely to bring out the fact that the curve consists of radii of different lengths. It is necessary to put a "permanent bend" in this part because it is already assumed that both the inner and outer fibers of the part in this area will be forced into its plastic range by the geometric lay-out of the clamp or jaw path.

This area, Segment 1, requires the outer fibers to elongate near their maximum limits, as the inner fiber *CD* must be held in tension during the forming cycle in order to prevent excessive springback or buckling upon release of the tension of the forming force. The geometry of this area is the projected part width W divided by the inner radius R_1, which gives a difference of 12 per cent from the inner fiber to the outer. The radius in this area is of importance when the part width W is of such magnitude that the outer fibers in this area will be stretched beyond their ultimate limits. Of course, it is assumed that the inner fiber is deformed at least 0.5 per cent. If this were maintained, the outer fiber would be forced to stretch 12½ per cent.

A part with an irregular contour such as this, with some areas sharp and others relatively flat, requires sensitive adjustments in the forming fixtures. During the forming cycle the clamp jaws must follow the developed path established by the geometrical lay-out shown in Fig. 17. In order for the clamp to follow this predetermined path it is necessary to pivot the clamps off-center, as shown in Fig. 16. The movement of the clamp inward is governed by the slot-

FIG. 17—Layout procedure chart for stretch forming a cap strip for a leading edge. The geometry of the clamp path is laid out so as to maintain all fibers in tension during the forming process. The pivot point in this case is operated by the die and pivoted from another point which is attached to the bed of the press. (See Fig. 16.)



ted lever actuated by the form block as it rises.

An effort has been made to present these springback phenomena in a simple manner. Past experience has shown that if the theory of elasticity which occurs during forming were better known by those who design and plan aircraft parts, much time and material could be saved. It is hoped that this presentation will assist in some small way in showing the relationship of theory to practical everyday application.

o o o

FIG. 18—To determine the distribution of elongation, the cap strip was scribed with circles before being formed by first giving the material a coat of template ink. The elongation was then measured with dividers as shown. This is the same setup as shown in Fig. 16 and plotted in Fig. 17.

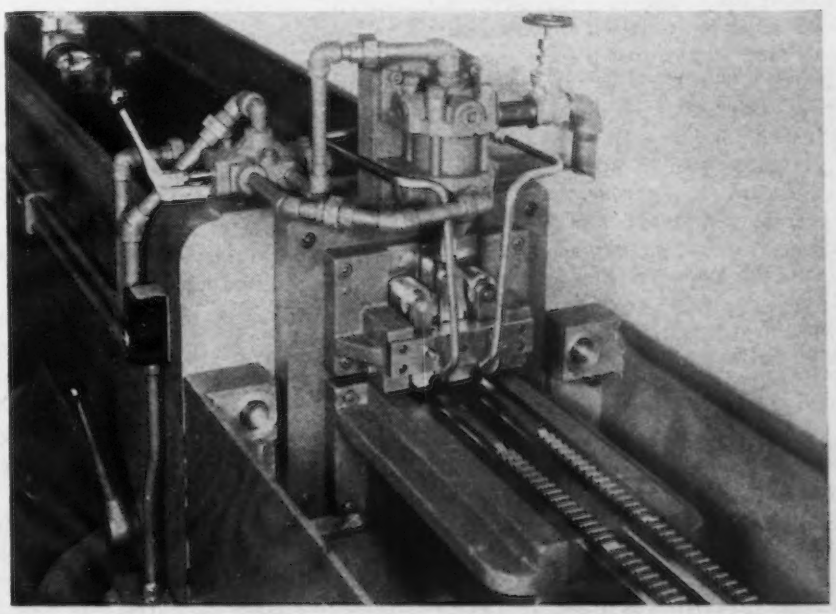
Hydraulic Fixture Aids Broaching Operation

DEEP slots are being successfully broached to close tolerances on small parts with the aid of a special hydraulically actuated clamping fixture, illustrated, designed by the Colonial Broach Co., Detroit. The parts are alloy steel drive spline inserts for hydraulic disk brakes for airplanes, made by the aeronautical division of the National Acme Co., Cleveland.

In a length of a little over 3 in., more than half the 13/16 in. diameter round stock is removed in two passes by a single machine equipped with two broaches. In making the spline inserts, it is necessary to maintain the depth and width of the slot within close limits and locate it directly opposite a narrow slot on the periphery of the piece.

To achieve this positioning, the center portion of the fixture clamp is stationary and is fitted with fingers or lips which engage and position the narrow slots directly above the broach center lines. The other halves of the semi-cylindrical clamps are mounted on movable arms which are actuated by a wedge cam and rollers. Vertical movement of the cam is obtained by a hydraulic ram operating off the hydraulic system of the hydraulic broaching machine. The parts fit freely into the contours of the clamp when the pressure is released. This fixture is mounted against the faceplate of the machine and below it guideways are bolted for holding sectional type broaches.

In production, the pieces are placed on the grooved pilot ends of the broaches so that when the broaches move inward, the parts are drawn into the fixture. The clamp is then closed and broaching proceeds. Return of the broaches pushes the parts out of the clamps. The operator then moves one part into the second station, inserting an unfinished part in the first. In the latter, a flat is produced on the length of the piece, removing approximately ¼ in. of the diameter, at the same time leaving about 1/32 in. of metal to start forming the sides of the slot. In the second pass, the slot is deepened an additional ¼ in. and the sides brought to size within close limits and highly finished. The top edges of the slot are also rounded. One piece is completed at each stroke and production rate is approximately 100 pieces per hr.



Some Malleable Iron

. . . In this discussion, the gating of castings, preservation of chills, and use of synthetic sands are commented upon.

o o o

AT the London annual conference of the Institute of British Foundrymen, held in September, some interesting aspects of the production of malleable iron castings were discussed. With regard to the use of the spherical-shaped feeder, it was remarked that there is a tendency among many patternmakers to avoid its use. They agree that the job could be done with the spherical-shaped feeder; but often when the pattern reaches the foundry, the shape of the feeder is anything but that which was designed to enable the founder to overcome the troubles that are likely to arise. Troubles arise without a feeding head which gives maximum feeding facilities and the minimum of difficulty from local crystallization.

It was remarked by one speaker that while he had no criticism to make of the practice of coating chills with a core oil or similar type of oil, it is a good plan, for some jobs in malleable form, to shellac the chills and to dust them with very fine sand; but care must be exercised to insure that the sand is not dusted onto the chill thickly. The burnt or dead material from annealing pot bating, suitably crushed, may be used.

If chills which have become badly scaled are used, it was said that considerable thickening of the chills and also—a more dangerous occurrence from the point of view of the malleable castings producer—the presence of primary graphite, would probably be found. This might be due to the effect of oxide coating on the chill, on the molten metal; that effect is a type of inoculation which results in the precipitation of primary graphite. When this occurred, the trouble had been cured by replacing the old chills with new ones.

With regard to the use of synthetic sands, attention was drawn to a statement that due to the lower moisture content, there is delayed freezing of the casting and a consequent increase in pulls and tears. It was suggested that a factor which governed to an even greater extent the occurrence of pulls and tears was the density of ramming. This supposition, the speaker said, was confirmed by the observation that, presumably owing to the greater permeability of the synthetic sand, "it was found that synthetic sand could be rammed at least three to four times harder than with natural bonded sands."

Discussing photographs of castings and the runners and risers used, it was remarked that it was an outstanding achievement to have done so much with so little feeder metal. In the case of a tank hub casting it was surprising that such a very heavy flange around the center of the casting could be made completely sound with simple joint feeders, where the heavy section was at a higher level than the feeder. Where there was a light section above the feeder it was satisfactory. Of course, the casting temperature was an important factor in dealing with that casting, and presumably the casting temperature was as low as possible in order to insure that the metal at the top of the mold would freeze rapidly.

It was suggested that atmospheric pressure feeding would not be very applicable to malleable foundries, in view of the long freezing range; while that did not affect gravitational feeding, it might be found very difficult to force the metal up-hill under atmospheric pressure while it was passing through that very pasty condition within the freezing range.

It was also suggested that by using jet type runners on top of the spherical feeding head it might still be possible to cut down the size of the spherical feeder by running through the feeder itself, particularly through the top of the feeder.

Discussing the change from natural to synthetic sands, one speaker mentioned his experience with a 30 per cent chromium cast iron. It had to be cast at a temperature of about 2600 deg. F., as estimated by the Schofield pyrometer. The trouble had been experienced, that although the synthetic sand could be rammed harder than the naturally-bonded sand and the gases would still get away, the result was some cracked and pulled castings. It was not necessary, for making the small castings, to have green strength of 5 to 7 lb. per sq. in.; they could be made with green strengths of about 2½ lb. per sq. in. and the bentonite saved.

Referring to a series of tests carried out with a single vent to within ¼-in. of the face of the test piece, it was said that in a mixture of the Mansfield variety, which had a permeability of 18 to 22, with one vent in the 2 in. circle it went up to 25; in the case of a synthetic sand having an A.F.A. number of about 100 to 120, it went up to 150 with a single vent. The fact that the molds were rammed very much harder in the one case than in the other had had an effect on the strength, but not very much influence on the permeability as shown by the A.F.A. test. It was rather an important point that the effect of the permeability over an area was the same in the synthetic sand unvented and even rammed hard as in a natural sand which had to be vented and rammed fairly soft; there was the same ease of evacuation of gases, or indeed, the evacuation was easier, in the case of the synthetic sand.

Referring to the problem of accuracy of dimensions, it was said by one speaker that he was afraid it was not sufficiently realized generally outside the malleable industry how great were its difficulties as compared with those of other branches of the founding industry. Casting temperature is one factor; founders in general do not seem to appreciate the differences which the initial casting temperature makes when working to extreme accuracy of dimensions. Chills have a definite effect; and, even more important, there is the problem of the location of the feeding heads.

With reference to the remarks on

Castings Problems . . .

formation of primary graphite due to scale or oxide on the chill, it was said that such a chill might be cleaned by sand-blasting. Failing that, it would be better to replace a chill rather than take risks by its extended use.

It was agreed that the density of ramming had as much effect on the occurrence of "pulls" in castings as had the lower moisture content of the synthetic sand, and that a great deal of attention had had to be paid to this aspect. With regard to the increase of permeability shown by the backing sand, after continued use, it was suggested that the strength of the sand had been reduced by the diminution of bond, and also the percentage of coal dust had become less and that these two factors were contributory to this end. With regard to the tank hub casting, previously mentioned, it was remarked that although it was perhaps surprising to find that the top of the flange was sound when joint feeders alone were used, there was merely a run-off on the top of the flange, and, as a matter of fact, thousands of castings had been made in this manner, and they were quite sound. It was necessary to cast at as low a temperature as possible.

Replying to a question concerning the running of metal direct into the top spherical feeders, it was remarked that this was the speaker's practice with joint feeders but not with top feeders because he was concerned only with green-sand molding, and would be afraid that the dropping metal would damage the mold and also affect the actual running of the casting. Nevertheless, it was said to be good practice to fill the top feeder partially, and then make an addition of hot metal to increase the effectiveness of the feeding metal.

It was remarked that it is not an economical proposition to patch a mold produced from a molding machine, and that it is cheaper to knock the mold out and make another. With hand molding, it was remarked that patching-up does present difficulties and is usually effected by wetting the damaged part of the mold and by subsequent sprigging. In order to avoid or reduce the drying out of synthetic sand, it is customary to add a small percentage of oil.

In the main, it was said no dressing was used on any of the cores discussed except in some special cases where it had been found necessary to black them with a mixture of wet blacking and plumbago. For example, the cores used in manufacture of 3-in. bombs were treated in this manner. There was, however, no dressing used on the molds, as they were cast green, the sand incorporating coal dust.

Calibrated Handwheel for Turret Lathes

A CALIBRATED handwheel for turret lathe cross-slide longitudinal travel, used with or without the regular machine stops, has been devised at the Pittsfield works of the General Electric Co. to enable even inexperienced operators to obtain closer and more uniform dimensions than can be obtained with stops alone. The wheel periphery is graduated to represent 0.005 in. travel for each mark and has adjustable pointer clips which slide in a T-slot in the outer edge of the wheel. The outside diameter is turned flat before being graduated and when the handle is removed from the wheel, the slot is machined for the pointer clip bolts to slide in easily.

An opening through which the T-head bolts may enter the groove is provided at the point where the handle bolts to the wheel. When the handle is in place, the bolts are prevented from leaving the slot. Thumb nuts for the T-bolts hold the pointer clips in place. A reference pointer is formed by a bracket which extends from the wheel hub housing.

When the handwheel is used with a stop, the stop is permitted to kick off the feed before the full travel and the cut is completed by turning the proper pointed clips up to the reference pointer. Uniform dimensions to within 0.001—0.0015 in. are permitted by the use of this method.

Mass Production of

By W. W. BROUGHTON
National Lead Co., New York

o o o

LINE production of the usual articles of commerce is commonplace today. In many industries the flow of parts and subassemblies to a main assembly line helps to streamline fabrication, cut handling costs and increase efficiency through specialized labor. Parts are produced at a rate of speed geared to the output of the plant; they flow down the tributary conveyor belts to the main assembly artery and thence out into the reservoir of industry much as drops of rain ultimately find they way to the sea.

The extension of the mass production idea to the making of tools to be used to produce parts for an assembly line is, however, a new concept, one that has most interesting possibilities. The staggering number of planes demanded by our armed forces at the earliest possible moment has presented problems to the aircraft industry even more difficult of solution than those of an aerodynamic nature.

If the tools necessary to produce the thousands of odd shaped blanks of aluminum alloy sheet stock used on today's warplane were to be made by orthodox methods, the time required in both man and machine hours would be enormous.

One solution to the problem of obtaining blanking dies quickly and cheaply was developed by the Consolidated Aircraft Corp. through the use of a new form of a material which had already proven satisfactory for forming dies.

This material, a zinc-base alloy called Kirksite "A" by its producer, the National Lead Co., has been in almost universal use throughout the aircraft industry in ingot form for sandcast dies for several years. At the suggestion of Consolidated, a technique for rolling the alloy was developed and it can now be obtained in a wide range of sizes and gages.

The procedure developed by Consolidated has been modified and mass-production methods added by the Douglas Aircraft Co. for use at both the Santa Monica and Long Beach plants. At the first-named plant alone, more than 10,000 blanking dies have been produced at the rate of nearly 1000 per month. They are called PBT (pierce-blank-template) dies.

A complete description of the various steps in the sequences developed by Douglas follows:

Step 1: Two thin steel templates are received from the mold loft (where the various details of the airplane are developed from the original blueprints

o o o

BELOW

FIG. 1—Master template clamped to the 1/8 in. plow steel sheet ready to have outline of punch and rivet and piercing holes scribed on its surface.

ABOVE

FIG. 2—Checking plow steel punch for trueness of shearing (or broaching) edge.

o o o

Kirksite Blanking Dies

. . . At Douglas Aircraft Co., more than 10,000 blanking dies for aluminum alloy sheet metal parts have been made on a production basis at the rate of nearly 1000 per month. Flat plow steel punches are used in conjunction with rolled Kirksite "A" zinc alloy dies, which are broached to final size by the punch itself. The soft dies are self-sharpening. The practice in making such dies in a number of aircraft plants is reviewed.

and laid out on steel for the shop to use in checking parts for size and shape). One of these templates is cut out to the exact shape of the desired aluminum alloy blank, with all holes drilled and cutouts made. The other is really a blueprint on steel, that is, a layout scratched on steel to serve as an imperishable master gage.

Step 2: The first of these templates is laid upon a piece of ⅛ in. plow steel (an inexpensive, low carbon steel) and its outline scribed on the steel, complete with centerpunch marks for all holes, Fig. 1. This layout also can be done by chemical transfer from films taken off lofting templates.

Step 3: A band saw is used to cut the steel close to the outside of the scribed outline (as well as inside the outline of any large interior holes) and the flat punch completed by hand filing to the scribed line. All straight edges are smoothed on a horizontal spindle disk grinder.

Step 4: The punch is checked against the template, Fig. 2, and then is placed on a piece of rolled Kirksite "A" 5/32 in. thick and of suitable size. This in turn is placed upon two sheets of ¼ in. hot rolled steel that have been previously jig drilled with two positioning holes and with two or more holes to provide means of holding the die backing plate to the upper platen of the press, as well as a means of holding the die set together for storage. This pile of four sheets of material is clamped to the

RIGHT

FIG. 3 — Steel punch, Kirksite sheet and punch and die backing plates stack-clamped for drilling in order to assure correct registration of blanking punch and die, as well as individual piercing punches.

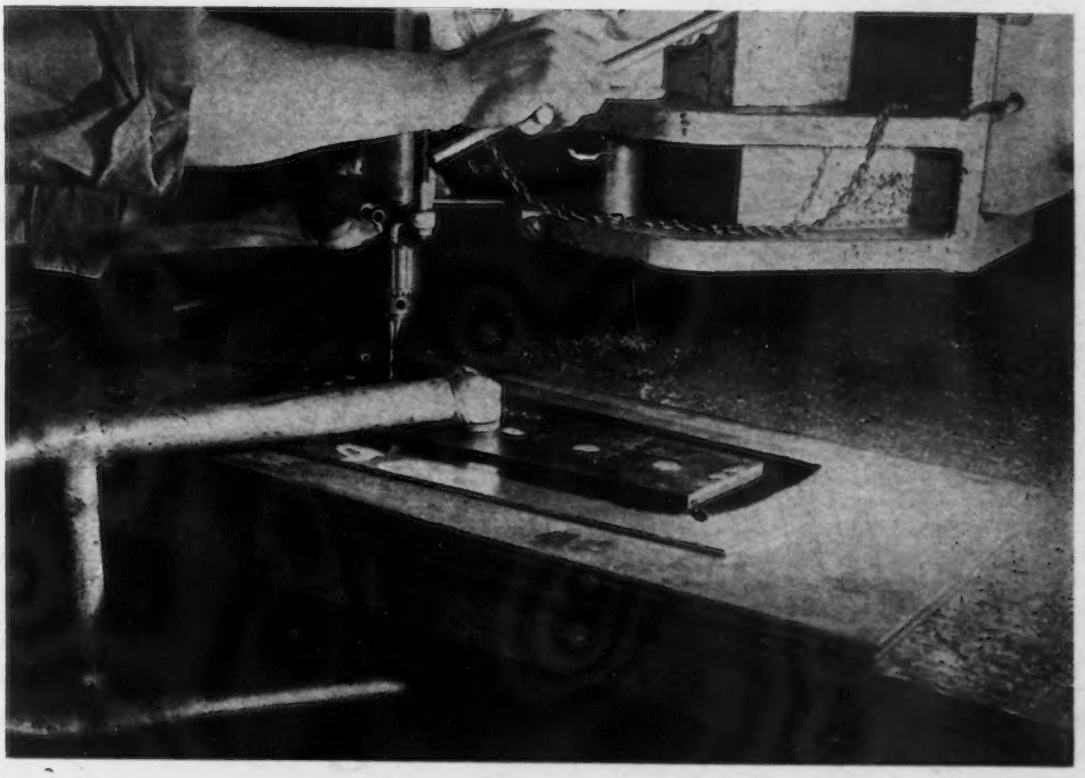

FIG. 5—Cementing strips of rubber inside die (and outside punch) to act as ejectors for blank and scrap. Rubber grommets are used around piercing punches. Cork is sometimes used in place of rubber for "stripping".

bed of a drill table, Fig. 3. A sufficient number of holes are drilled through these sheets to allow for the riveting of punch and die to their respective backing plates, and countersunk. Backing plate sizes run from 5 x 6 in. up to 48 x 90 in. In the larger sizes plate thickness is 5/16 in.

Since the steel punch must also act as the die for any small holes to be pierced in the blank and because it is essential that these holes be accurately coordinated with the positioning dowels, they are drilled through all four plates before disturbing the clamped position. These holes are, of course, the exact size of the holes desired in the blank.

The punch outline is also scribed on the Kirksite sheet before the clamps are removed.

Step 5: The steel backing plates are turned over and countersunk for rivets. The holes in the punch backing plate corresponding to the holes to be pierced in the blank are redrilled to a standard size (5/16 in.) to allow clearance for piercings. In the die backing plate, these same holes (registering with the holes to be pierced in the blank) are redrilled to provide a press fit hole (3/16 in.) for the standard knurled end of stock piercing punches (hardened and ground).

Step 6: By means of a pair of dividers, a second line is now scribed on the Kirksite sheet 1/16 in. outside the outline of any large holes to be cut in the blank. A hole is drilled through the Kirksite inside this newly scribed line to allow for the entry of a jig-saw blade.

Step 7: The Kirksite die then goes to the jig-saw operator who quickly saws around the inner scribed line of the die as well as the outer scribed line of any "islands" of Kirksite which are to act as punches for large holes in the blank.

Step 8: The die and the islands, if any, now go to a special routing machine, Fig. 4, which has a 30 deg. single fluted bit equipped with a plain cylindrical tip. This cylindrical portion acts to limit the depth of the cut and must be positioned at such a height above the router table as to allow about 1/32 in. of the sawn edge

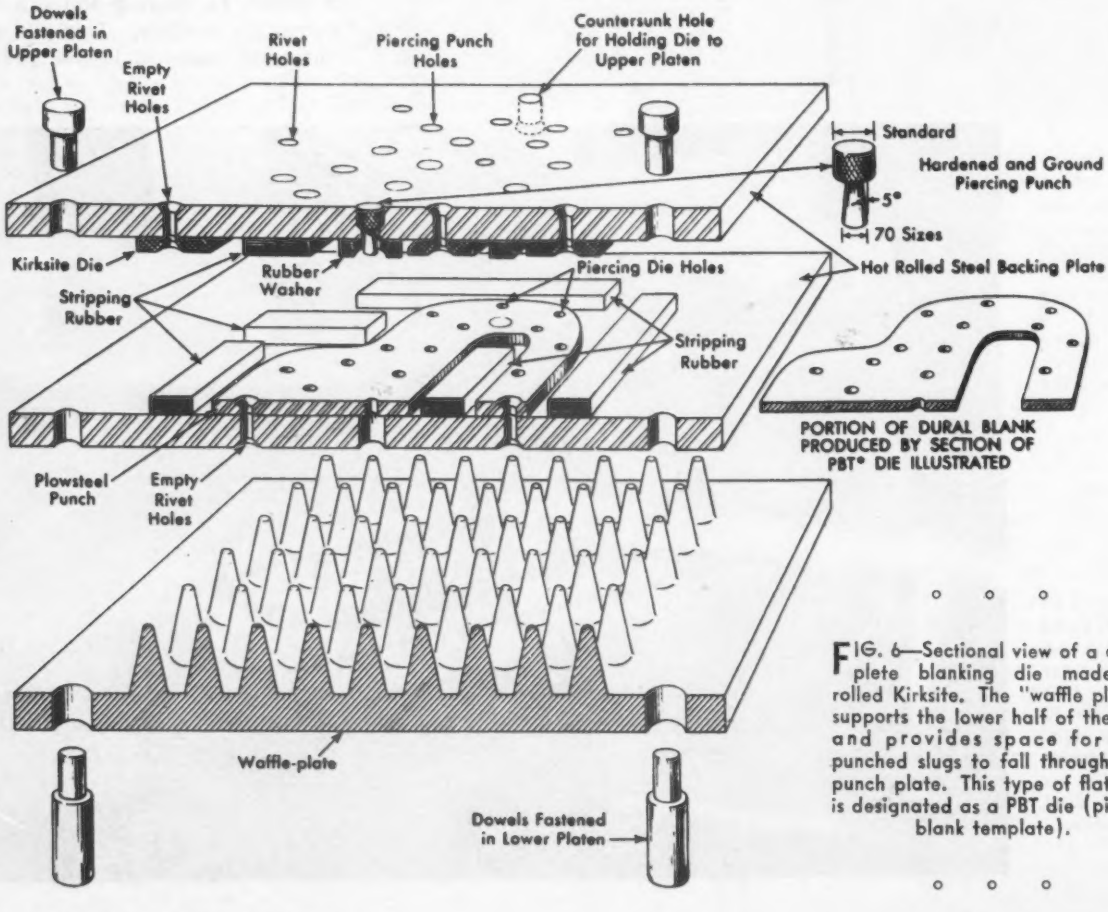

FIG. 6—Sectional view of a complete blanking die made of rolled Kirksite. The "waffle plate" supports the lower half of the die and provides space for the punched slugs to fall through the punch plate. This type of flat die is designated as a PBT die (pierce blank template).

of Kirksite die to remain untouched by the router bit. The operator places the die over the router bit and feeds the sheet against the cylindrical guide tip until it will go no further. He then follows the sawn edge all the way around the inside of the die as well as the outside of any islands, if present. This results in a 30-deg. bevel under the desired cutting edge of the die.

Step 9: The hardened steel piercing punch (of which a stock of 70 different sizes is kept on hand) are provided with a knurled shank of a diameter to provide a press fit in a 3/16 in. hole. Punches of the correct sizes for this particular blank are then pressed into their respective holes in the die backing plate and staked in place. These punches are made on automatic screw machines and are heat treated to a hardness of 55 Rockwell C.

Step 10: The Kirksite punch and die, with any islands, are now flush riveted to their respective backing plates in a pneumatic squeeze riveter. Heads are ground flush with plates by means of portable disk sanders.

Step 11: Strips of rubber about ½ in. wide and ⅛ in. thick are cemented (Goodrich E70 cement) to the backing plates, Fig. 5, inside the die to eject the blank and outside the punch to strip the scrap. Small rubber washers (also ⅛ in. thick) are cemented to the die backing plate around each of the steel piercing punches to aid in ejecting the blank.

Step 12: The die set is now ready to be broached. This is done with the plow steel punch itself in a press in which the test blank is to be made. The die set is provided with a "waffle plate," Fig. 6, and with positioning dowels to fit the backing plates. The die is secured to the upper platen of the press by means of three or more flat head screws. The punch, also positioned by dowels, is simply laid on the waffle plate. The press is operated, causing the punch to shear through the bevelled undercut of the Kirksite die, the scrap falling free in the die, from which it can be easily removed. A few blanks made from scrap material are not run through. It will be found that whatever small burrs occur on the edges of the first blank soon disappear.

Step 13: The test blank is now checked against the master template, Fig. 7, and if found to be accurate, the die set is removed from the press, the two parts fastened together by means of screws and wing nuts and sent to the tool room to await call for production.

The arrangement of the equipment in the Douglas die room is in the form of a U and line production methods are employed. By using the principle of the division of labor into simplified steps it is possible to have each man perform just one step or machining operation, at which even a relatively green worker soon becomes proficient. One worker does drilling, another band or jig sawing, a third, disk grinding, etc. Although a fairly large number of workers are employed, the manhours of labor per die is much lower than if the job were performed by a few toolmakers and the monthly output is correspondingly large, around 1000 die sets a month. To produce the same number of conventional steel blanking dies would truly be an enormous and costly undertaking.

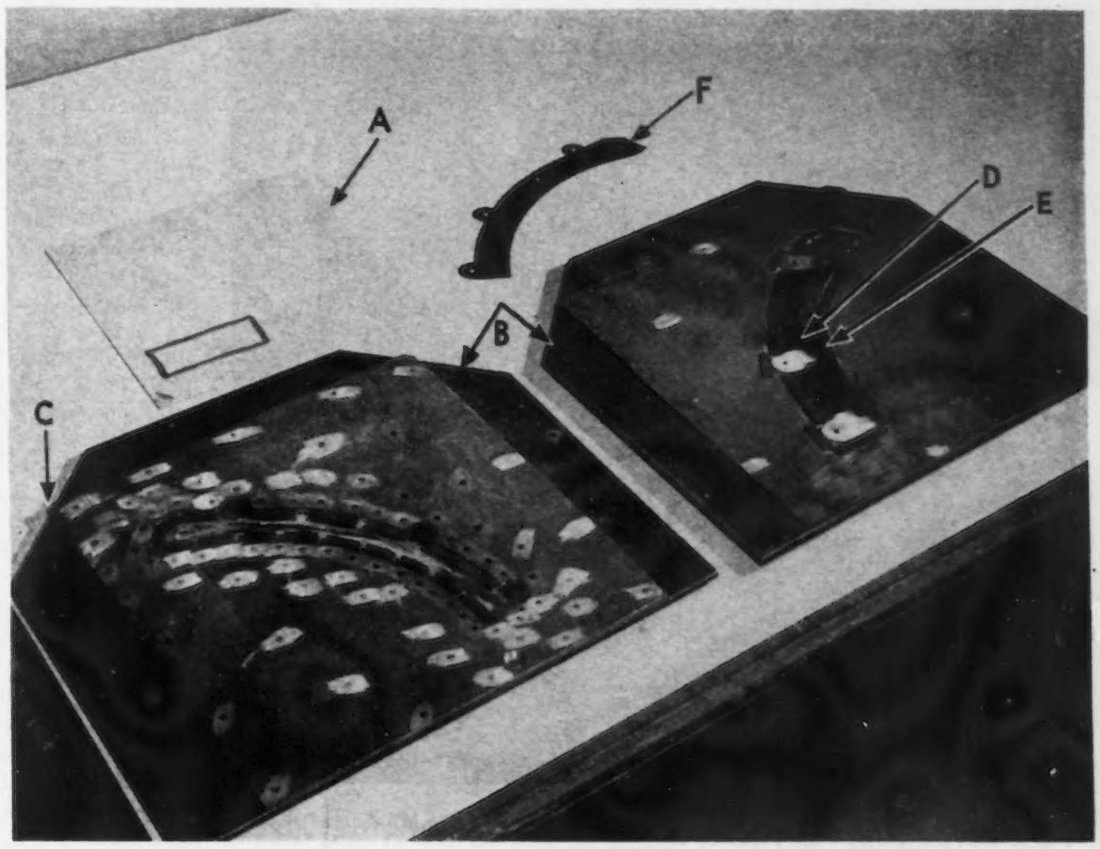

FIG. 7 — Finished PBT die showing A—master template; B—backing plates; C—Kirksite die; D—steel punch; E—rubber ejector strips and F — finished blank. The white blotches are the result of grinding rivet heads flush on the Kirksite die.

Variations in Method

The foregoing is a description of the methods and equipment used by Douglas. Since few of the potential users of this type of die have a sufficient volume of die work to warrant an assembly line setup, it may be well to point out variations of the methods just described as applied in other plants.

Steps 1 and 2 will vary, but have no real bearing on the final result. Whatever the method used, layout and alinement must be accurate.

In Step 3, an engraving machine or any other two dimensional pantograph can be used in place of the bandsaw and file. The original template can then be used as a guide or pattern to produce the punch.

In Steps 7 and 8, a number of variations are in everyday use with success. Consolidated Aircraft uses a special routing machine which utilizes the punch as a guide template in routing the Kirksite. This requires a rapid and readily accessible adjustment for the vertical position of the router. Vega also uses a template shaped like the die rather than the punch and scribes the line for the saw cut with a special scriber which marks the saw guide line 1/32 in. inside the template. Murray Corp. of America has developed a free-hand method of routing in which the operator stays within the proper distance of the outline of the punch by eye. Curtiss-Wright saws close to the line with a band saw, broaches the punch through without beveling the edge to provide scrap clearance and simply breaks the resultant bead of crushed Kirksite away from the bottom edge of the die. This must, of course, be done **before** the die is mounted on its backing plate.

Northrop Aircraft has a router which has its bit above the table, cutting downwards. A pin in the table top, slightly back from the cutter, provides a guide against which the punch bolted to the Kirksite sheet is pressed. The cutter is lowered to an established position, cutting its way down into the Kirksite and the correct position of the cut relative to the punch is maintained by holding the punch in contact with the guide pin as the outline is being cut.

In Step 9, Boeing Aircraft Co. and others use flathead steel rivets hardened and ground to size for the piercing punch and press them into the die backing plate but do not stake them fast. This necessitates an additional backing plate to retain the piercing punches in place, but provides a quick way of replacing broken punches. The two plates are spaced by washers having the same thickness as the punch heads and are fastened together by countersunk flat head screws. At Willow Run the Ford Motor Co. uses punches which are cold headed with a countersunk head and swaged to size in an upsetting machine, thus eliminating the necessity for spacers between the two backing plates.

In Step 11, some plants have had trouble with the stripping rubber flowing between the Kirksite and its backing plate. Curtiss Wright now leaves the first blank in the die and cements the rubber to it instead of to the backing plate. Consolidated sometimes uses a steel stripper plate on top of the rubber strips.

FIG. 8—A larger size PBT die ready for the press. Some of these dies are longer than the longest press platen and to complete the operation must be shifted after half the blank is formed.

Waffle Plate Modifications

It will be noticed that the waffle plate shown in Fig. 6 is a solid casting. If interference occurs with the piercing punches, the interfering tit must be broken off. More recent practice is to make these tits removable. By numbering them in one coordinate direction and lettering them in the other, it is possible to designate on the worksheet for each die the tits that must be removed. A waffle plate made in this manner is a permanent fixture.

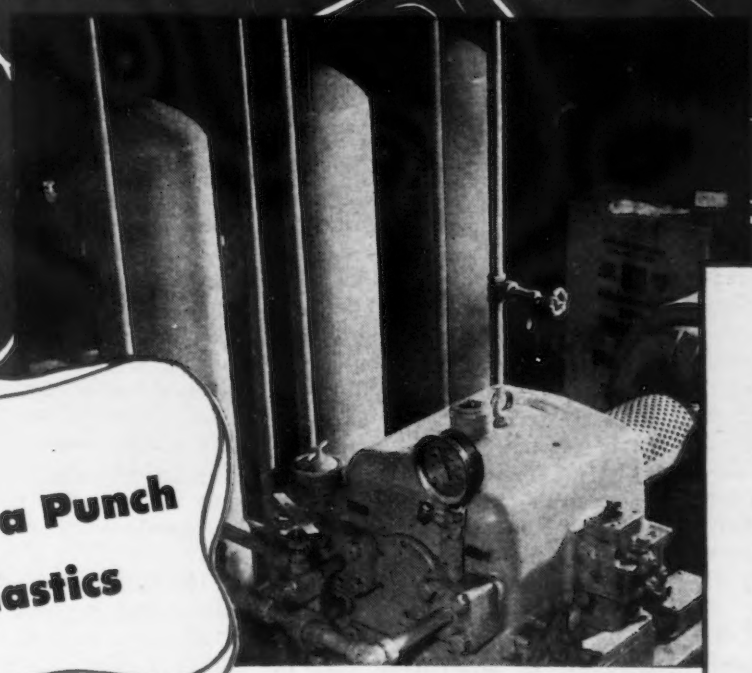
Consolidated Aircraft uses a simple ribbed construction which provides troughs about ¾ in. deep and ½ in. wide across the press under the die set. When there are no piercing holes that interfere with these ribs a standard ribbed plate is used, but if holes are in such a position that the ribs interfere with the removal of piercings, the rib is milled away at that point and hence becomes a part of that particular die set. Boeing uses adjustable ribs held in place by countersunk screws and rectangular nuts sliding in T-slots in a bed plate at right angles to the ribs. These ribs can be altered in spacing or set at an angle to obtain clearance for all pierced holes. In both designs the piercings are removed by a blast of air through between the ribs under the punch backing plate.

While most plants do the actual blanking in a mechanical press or a hydropress, Douglas has used the pneumatic hammer (Cecostamp) for the purpose with success. A very short stroke is used (about ¾ in.) and rapid production obtained.

Dies Self-Sharpening

Kirksite dies of this kind have proved to be self-sharpening, that is, material flows toward the punch sufficiently to keep the cutting edge honed. Tests have proved that 30,000 dural blanks of a thickness of 0.037 in. can be produced without destroying the smoothness of the edges of the blank. Ford is successfully blanking ¼ in. dural. Some firms are blanking stainless steel up to 0.025 in. thick when only a couple of hundred parts are needed.

In any case, the use of Kirksite "A" requires zero clearance between punch and die and this obviously calls for extreme care in securing perfect alinement.



Oilgear generator or pump powering three accelerators that actuate molding presses. Many processes have used this successful Oilgear technique for years and with entire satisfaction.

Putting a Punch in Plastics

Oilgear Made Idle Seconds Do the Work of Dollars

If the new machine or process you are developing has idle moments in its recurrent work cycle, take a tip from Phoenix. The Phoenix Metal Cap Company of Chicago operates a battery of plastic molding presses. These presses require no power at all during the charging periods, so Oilgear engineers saw a way to reduce costs. Instead of the big drive that would normally be required, they installed one small, highly efficient Oilgear Fluid Power generator . . . and for each press, a single air-accelerator. The Oilgear system works while the presses rest . . . *building up in the accelerators the tremendous power required for the molding operation.* The saving in initial drive investment was immense, power consumption was reduced.

This is just another highlight in the story of Oilgear versatility which with Oilgear engineering experience is solving problems up and down the land—machine design puzzles solved by means of the tremendous force in small space . . . the force without motion . . . the steplessly variable speeds . . . the combination of linear and rotary motion . . . or any of the other functions Oilgear provides. Oilgear may be a "natural" for you. Why don't you find out? Now is the time. . . . THE OILGEAR COMPANY, 1303 West Bruce Street, Milwaukee 4, Wisconsin.

ARE YOU TRYING TO:

1. Apply large forces through long . . . or short . . . strokes at variable speeds?
2. Obtain automatic work cycles, variable speeds in either direction . . . with or without pre-set time dwell?
3. Apply large forces through continuous or intermittent reciprocating cycles at constant or variable velocities?
4. Obtain extremely accurate control of either position or speed of a reciprocating member?
5. Apply accurately variable pressure either static or in motion?
6. Closely synchronize various motions, operations or functions?
7. Apply light . . . or heavy . . . forces at extremely high velocities through either long or short distances of travel?
8. Obtain continuous automatic reversing drives at constant R. P. M. or over a wide range of speed variation?
9. Obtain accurate remote control of speed and direction of rotation, rates of acceleration and/or deceleration?
10. Obtain constant horsepower output through all or part of a speed range?
11. Obtain automatic torque control?
12. Obtain accurately matched speed of various rotating elements?
13. Obtain constant speed output from a variable speed input?
14. Obtain full pre-set automatic control, elimination of problems of shock, vibration, etc.?

You Need Oilgear!

STANLEY H. BRAMS

• Automotive Engineers annual meeting promises future cooperative work . . . Light metals again subjects of controversy . . . Postwar aircraft market is analyzed.

DETROIT—The war program of the Society of Automotive Engineers was distinctively recognized last week at the annual meeting, with award from the Army Ordnance Department of a distinguished service citation, first of its kind ever granted. Beyond that, the annual meeting was keynoted by reports of advance on subjects of wartime development and incisive projections for the future. There was quite definitely a post-war tinge to the many papers presented and to the discussions in the corridors.

However, the new president, W. S. James of Studebaker, made it clear that war work continues to be the number one job of the engineers. In a press conference he predicted that the exchanges of information which have been brought to a high level through the activities of the SAE War Engineering Board would likely continue, although probably in modified form, after the war.

"The competitive spirit has never been so strong among the engineers as it has been between other automotive executives," he said. "I cannot help but believe that the close bonds of relationship and friendship developed among engineers of many companies during the war will be bound to have effect in continued close relationships afterward."

L. W. Kempf, of Aluminum Co. of America, predicted wide use of aluminum parts for post-war automobiles, anticipating that secondary aluminum, usable for engine parts, would be available in large supply at about 5c. per lb., making costs of aluminum and iron castings about equal. The discussions in the corridor later produced a diametrically opposite viewpoint—that automobile engine weight reductions would come by reason of more precise ferrous castings and by smaller engines, rather than by widespread use of aluminum.

E. C. DeSmet, executive engineer of Willys-Overland Motors, Inc., declared that regardless of costs or weight saving advantages, aluminum requires high welding skills to fabricate, and poses intensified servicing problems due to inelasticity under shock, causing cracking or tearing rather than denting, as in steel, thus discouraging the use of aluminum for body parts. Going further into his subject, Mr. DeSmet discussed proposed plywood bodies and declared that skill and time factors in manufacture would increase costs tremendously. His basic thesis was that costs are likely to be the final determinant in postwar automobiles; and inasmuch as this was a prime factor in pre-war cars as well, no revolutionary changes should be anticipated.

E. J. Willis of Alcoa bespoke support of continued use of the L-head engine in automobiles, despite anticipated gradual increases in compression ratios. L-head engines, he said, protect a piston dome from the flame better than overhead valve motors, because of the proximity of the head. The chamber design will improve roughness, he anticipated. He declared that aluminum pistons and heads allow greater spark advance with less detonation, resulting in greater fuel economy and more torque. Future engines, he predicted, will provide approximately 8 to 1 compression ratio, with aluminum pistons and heads contributing toward better economy.

A TRUCK session produced some rather stimulating viewpoints presented by G. W. Laurie of Atlantic Refining Co. on the post-war truck desires of fleet operators. As regards cooling systems, greater accessibility was urged, along with consideration of surge and expansion control, better water pumps, better thermostats, more easily cleaned systems, and underhood temperature controls for quicker warm-up. Medium and heavy duty truck operators, particularly want power plants which are removable as a unit from the chassis, to aid problems of maintenance. Light truck operators did not deem this necessary.

Fleet operators urged better vision, standardization of hand brake type and location, more comfort for drivers, sturdier hardware, and other improvements. More rust-proofing on bodies, even at higher cost, was declared justified, but rust-proofing of chassis parts did not seem warranted.

A STIMULATING session on postwar private flying served to debunk many commonly held ideas on the size of the market. J. H. Geisse of the Civil Aeronautics Administration offered a table of rather convincing statistics indicating that demand for private planes in 1945, even counting the wants of demobilized Air Force pilots, would be around only 39,000 units, and that because of carryover the 1946 demand would diminish to 16,000. He admitted that the heightened interest of the public in aviation because of the war might upset these anticipations, but his inference was that past experience promised comparatively little variation from the statistics. Broader ownership of private planes is not contingent on income, however—he cited the fact that the average annual earnings of approximately 100 airplane owners in one section of the country recently disclosed average income of $2200 per year.

Limited market or no, William D. Hall, chief engineer of Aeronca Aircraft Corp., painted a glowing picture of the quality of aircraft that would be available after the war. He anticipates a mass market two-place "strip model" plane which will sell at approximately $1000. The medium-priced model of this type aircraft would be about $1500 in two-place version, and about $3000 in four or five-place models. High performance planes selling at $2000 would have non-spinning characteristics, controls coordinating rudder and aileron for easy operation, and cruising speeds of 100 to 120 miles in lower priced models, perhaps as much as 140 miles an hour in higher priced models.

W. P. Eddy, Jr., who lately left GMC Truck Coach Div. to join Pratt & Whitney, discussed the effects of wartime developments on future steel. He anticipated such developments as improved fatigue resistance developable by improved surface finish, design which would reduce stress concentrators in highly stressed parts, reduced alloy content in steels for heat treated parts in which deep hardening is unnecessary, and a

Portrait of ONE GOOD TOOL *Making Another*

ONE good tool carving another from solid steel . . . that's a familiar sight, any hour of the day or night . . . on hundreds of machines throughout the many acres of Pratt & Whitney's Small Tool Division. Here at Pratt & Whitney we make thousands upon thousands of cutters, reamers, dies, taps, and other metal working tools for industry. Each one embodies the skill and craftsmanship gained in our 84 years in this line. And each one is made to the well known standard of Pratt & Whitney accuracy which has built a name for these fine tools in every civilized country in the world.

In war shops all over the nation, 24 hours a day, thousands of Pratt & Whitney Small Tools are biting into castings, forgings, all sorts of tough metals . . . as Pratt & Whitney cutting tools have done for more than three-quarters of a century. After the dawn of peace, these same fine tools will resume their job of helping their users meet the competition of civilian production.

DO YOU know what these top quality tools can do . . . in cutting costs and increasing production? Get in touch with the nearest Pratt & Whitney branch office. There are seasoned engineers there who will gladly cooperate in the economical solution of your metal working problems.

Frozen Action — P&W PHOTO 1/100,000 SEC.

A familiar scene in the Pratt & Whitney Small Tool Division — one P&W small tool milling another one. Here a P&W Milling Cutter is making the secondary fluting cut on a P&W Spiral Fluted Taper Reamer. This provides necessary chip clearance yet leaves ample support behind the cutting edge.

great increase in shot blasting and other applications which impart compressive stress to surfaces. He looked ahead to a period of lowered manufacturing costs, better and more uniform products, and ability to use cheaper steels in the future by means of more precise and more highly developed heat treatment cycles. Steel casting improvements, he anticipated, would make possible more diversified applications; X-ray and gamma-ray will be more highly utilized. Welding, he said, has progressed from an art to a technique during the war and there will be more of it, replacing more extensive assembly methods; welded road and rail transportation equipment, as well as machinery and structures of countless types, were envisioned, but he cautioned that bringing this about would require more attention to welding design.

On the subject of alloys, Mr. Eddy forecast use of less alloys, more intelligent specification of materials by engineers, better selection of steels by metallurgists. He anticipated that there would develop a wider use of needle steels because of "actually startling" savings made in alloying elements in experimental needle steel heats. As for NE steels, he declared their reception after the war would depend on such factors as technical superiority (which his paper implied was not a factor, inasmuch as low alloy structural steels are interchangeable for most applications); sales efforts; length of the war with consequent greater familiarity with NE steels; regimentation after the war which would tend to continue use of the NE's; national preparedness and its effect on stockpiling; and price structures.

S.A.E. CONVENTION FIGURES: *Maj.-Gen. G. M. Barnes, technical chief of Ordnance, talks with the new president of the Society of Automotive Engineers, W. S. James of Studebaker Corp. At the annual dinner Gen. Barnes presented the S.A.E. with a citation of distinguished service.*

Straws in the industry wind: Curtailment of operations at the Vigo Ordnance Plant, Terre Haute, Ind., has made possible the lease of four buildings to Delco Radio Div. of General Motors, Kokomo, Ind. Production of radio and electronic equipment for the Signal Corps and Navy will require about 500 people in the Terre Haute operations.

Two months from the time officials announced production of more than 1000 Flyaway B-17's, Ford Motor Co. revealed last week-end that a second thousand has been produced. With production at the rate of several hundred a month, Flyaways are ahead of planning and close to projected peak. Considerable additional numbers have been shipped in knock-down form for final assembly elsewhere.

Inland's Growth and Achievements Termed Typical of the American Way

Chicago

• • • Commemorating its recently celebrated 50th anniversary, Inland Steel Co., Chicago, has published an elaborate historical book entitled "The Story of Inland Steel."

The story of how 40 carloads of antiquated machinery were parlayed into the largest "independent" steel company in the United States is told against a backdrop of contemporary history covering the past 50 years. The text elaborates, step by step, how each of the factors contributing to the company's rise affected the firm as it stands today. Numerous photographs and drawings complement the text.

Excellent photographs cover many operations in steelmaking and show views of the Inland plants. Heavy machinery — blooming mills, cranes, bar mills, continuous rolling mills, all in operation—has been included in the photographs. Captions give capacities, speeds and other data concerning their vast potentialities.

Inland's management-employee relationship is stressed, with pictures showing employees undergoing various health tests in the Inland clinic. Safety first is "sold" to employees with posters, signs, moving pictures and meetings. Inland's excellent safety record is brought out in this new book.

The book's latter section is devoted to Inland's contribution to the war effort and tells the story of its preparation for war, and its record breaking production. A short resume gives Inland's plans for the future peacetime world.

The book is concluded with the following statement:

"The strength to which Inland has grown in 50 years has been made possible because of the system which exists uniquely here in America. Some people call it the free enterprise system. Others call it the American way. Whatever it is termed, it is the system that offers everybody freedom of choice, freedom of opportunity. It is the system that rewards initiative and courage and enterprise and hard work. It is the system that encourages business, rather than stifles it. And therefore it is the system that results in more employment for more millions, under better conditions. It is the system that creates and produces and distributes more—that has brought better living to more people—than any other system on earth.

"Inland is a product, and a part, of that system. It's a good system—one that has proved by the past that it possesses the strength needed for the future."

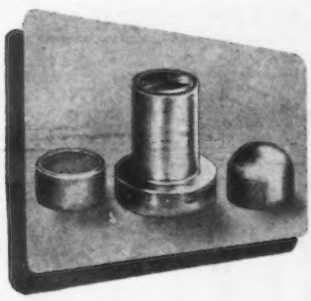
how to Fit the Tool Steel to the Job...

Longer tool life — more output per week from every tool — depends a lot upon selecting the proper tool steel for each job.

And that is where Carpenter can help you—by offering a tried-and-proved method of finding the *one* tool steel that will do each job best.

In thousands of plants, the Carpenter Matched Set Method of selecting tool steel is providing longer tool life. It is saving many hours that might otherwise be spent for re-grinding, repairing or replacing tools that fail prematurely. It is giving tool steel users an *easier* method of selecting the proper tool steel *at the start of each job.* For help in using the Matched Set Method to solve *your* tool steel problems, ask for the Manual shown below.

And for on-the-spot service, take advantage of the experience of your nearby Carpenter representative. He can show you how to put this useful method to work, improve heat treating procedure and boost output per tool. Put his experience to work on your problems today.



How One Tool Steel User Solved A Tool Failure Problem...

THE TOOL: A coining punch for forming bearing races from 1015 steel. Production speed—16,000 pieces per day.

THE PROBLEM: Again and again, tools would fail after running only a half-day.

THE SOLUTION: Needing *greater toughness,* they selected Solar tool steel and got these results:

1. Tool life increased from 8,000 to 200,000 pieces, and the tool room had 48 fewer tools to make each month.
2. Output was stepped up 11,160 pieces per month.

MATCHED TOOL STEEL MANUAL

. . to work in your plant!

Ask for this handy Manual. It contains an alphabetical *Tool Index* and *Steel Selector* and *simplified* heat treating instructions. You can quickly spot the proper tool steel for any one of more than 200 types of tools. This Manual is offered free to tool steel users in the U.S.A. who request it on their company letterheads.

Carpenter MATCHED TOOL STEELS

Washington . . .

L. W. MOFFETT

• Why should industry pay exorbitant taxes and forego even reasonable profits for extensive Government regulation calculated to completely socialize it? . . . Renegotiation has not been fair.

WASHINGTON — "It is a fact that during the past eight years attempts have been made to limit excessive profits on the manufacture of war materials, and that neither the Congress, the Treasury Department, the War Department, the Navy Department, the Maritime Commission, nor any other department of the Government has as yet been able to formulate a satisfactory plan of eliminating excessive profits or recapturing excess profits on the production."

With this somewhat doleful admission, Senator David I. Walsh concludes a report dissenting from the new tax bill favorably reported by the Senate Finance Committee, of which he is a member. The segment of industry which has been under the ministrations of the Price Adjustment Boards may possibly disagree with the Senator's concept of the Government's profit limiting ability.

Senator Walsh's report is a scholarly, sincere-appearing and fair-sounding document. It says that the Senate amendments to the House tax bill will emasculate the renegotiation law, create a new crop of war millionaires and social repercussions. It points out that some of the new provisions such as the one exempting standard commercial articles is sure to permit unrestrained profiteering to the damage of other taxpayers.

With seemly restraint it knocks cold the arguments for renegotiation after taxes. The report soberly reminds its readers that war kills men —that there should be equality of sacrifice, but that there isn't a chance of such an ideal state of affairs being achieved. Business is invited by Senator Walsh to avoid the repetition of World War I "scandals," by creating 23,000 millionaires.

The 1942 after-tax profits of an anonymous list of 200 war contractors is published. The profit calculations are based on net worth and it is before renegotiation.

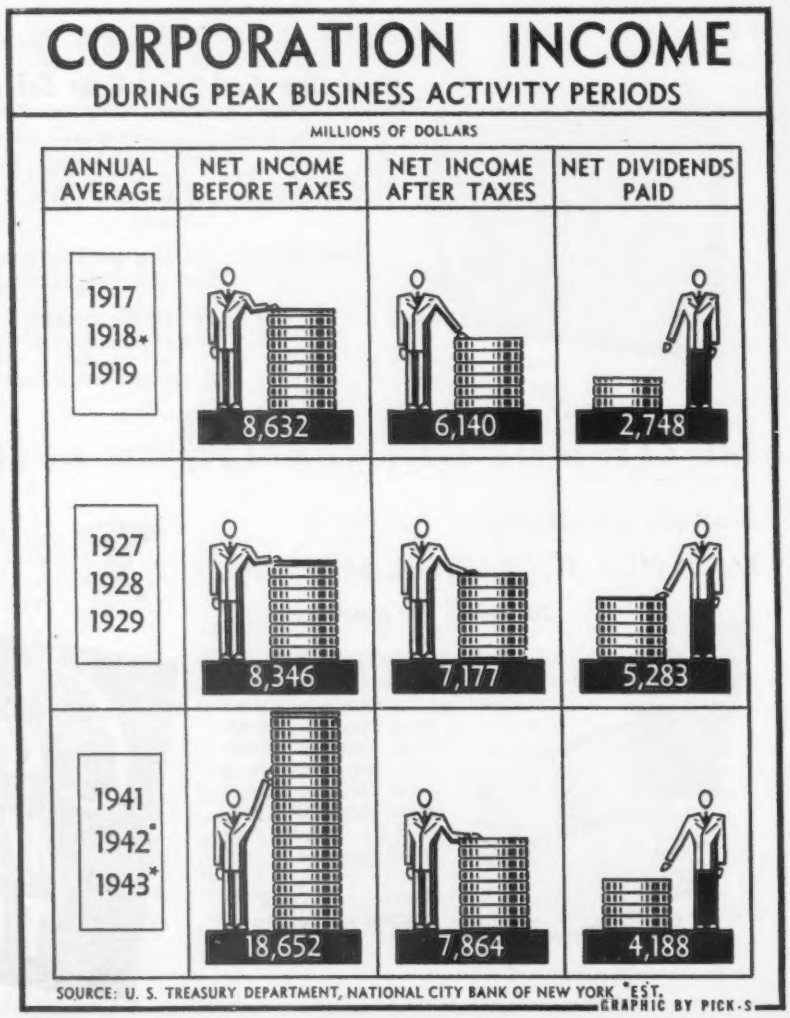
APPROXIMATELY one-half of the contractors made less than 50 per cent profit on investments, but only one-tenth of them made between 40 and 50 per cent profit. About one-sixth made between 30 and 40 per cent; another sixth made between 20 and 30 per cent, while one-fiftieth of the group made less than 20 per cent.

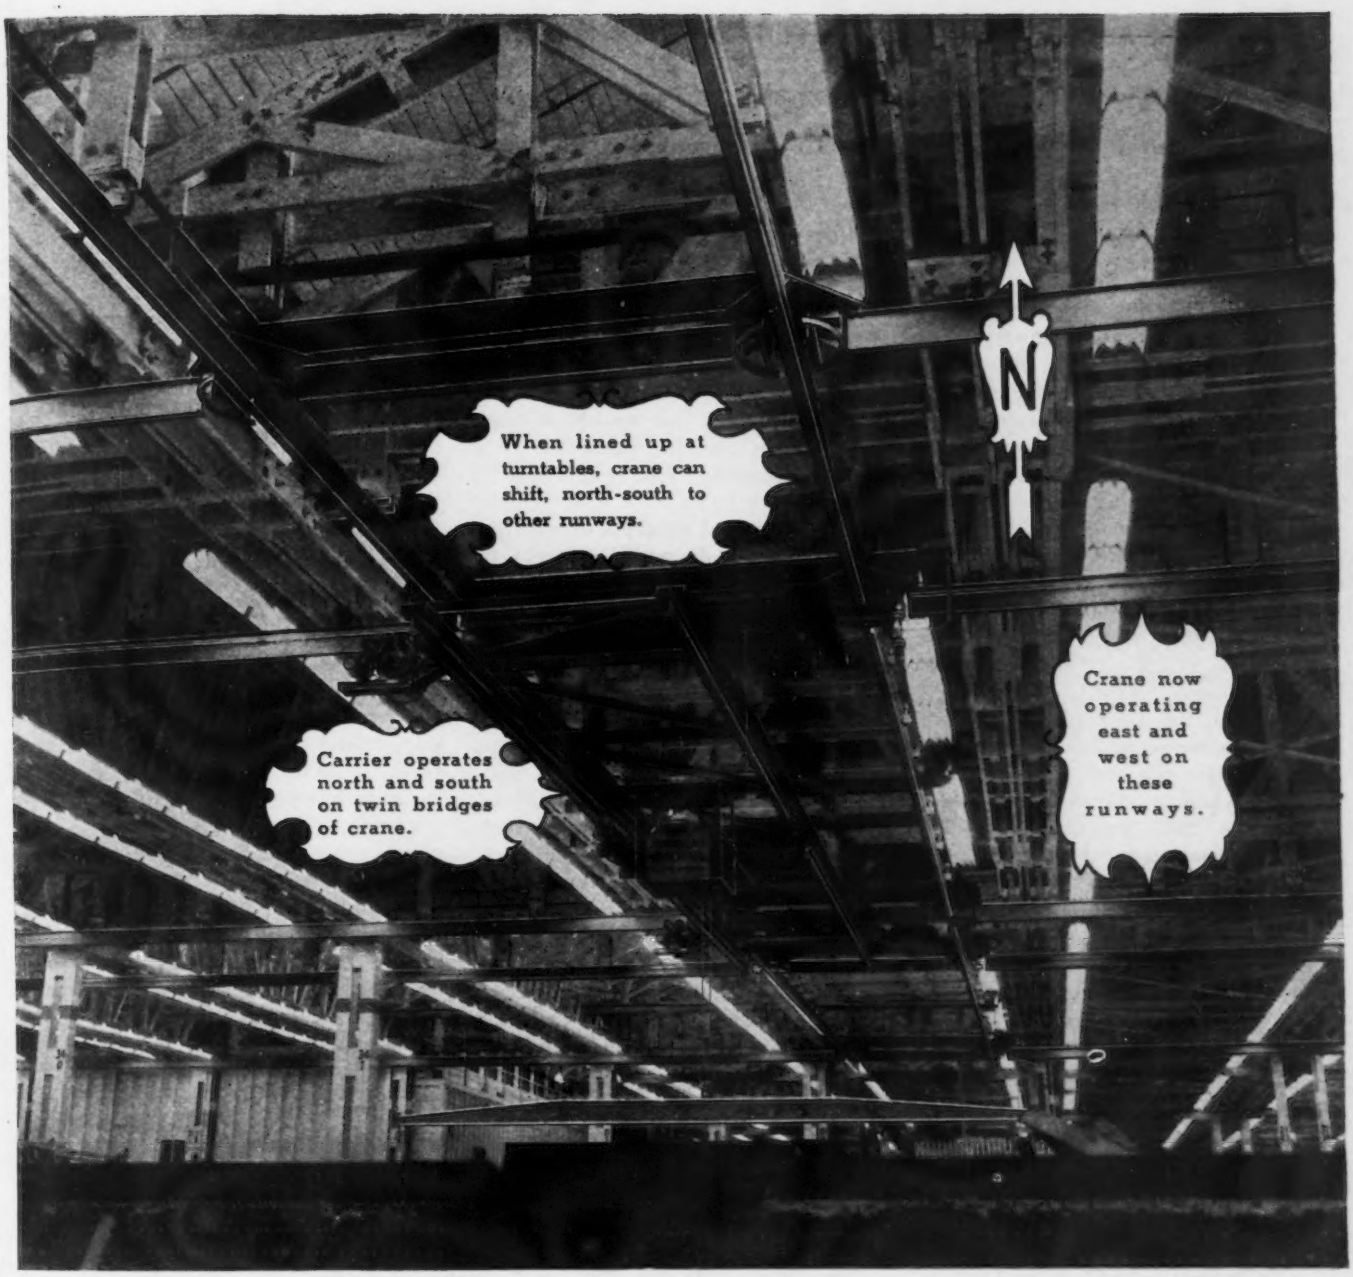
The profiteer list included 39 contractors whose profits were above 100 per cent. In this group of manufacturers some very high profits are set forth with one as high as 630 per cent.

The report says:

"To wage this war, the Nation must expend its substance and lives of its young men on an appalling scale. Despite much talk of equalizing the sacrifices that can never be done in sober fact. To achieve the defeat of Hitler and Japan, thousands must contribute their lives or broken bodies. Measured by their sacrifice, any lesser contribution of time or effort, or money seems but a paltry mite. Equality of sacrifice there can never be. To those who die or are maimed, we are eternally in debt.

"But if we cannot match their supreme sacrifices we must do our best to spread the burdens of the war as fairly as we can. Every class and group must do its share to carry the Nation's war load. Above all else, we must make certain that no group or class shall exploit the war for its selfish benefit. This is but simple fairness to our soldiers and sailors and





No One-Way Streets

Cranes no longer need lead a one-track life. American MonoRail engineering now makes it possible for crane bridges to operate north, east, south or west to furnish hoist hook service throughout the largest plants ever built.

The photo shows how this was accomplished in the largest timber structure ever built. And while it is one of the first installations of its kind in the country, plant engineers claim that it is proving a big production help.

Regardless of size, American MonoRail engineering service is available on any project. This service is offered cheerfully and without obligation.

SEND FOR BULLETIN C-1. A 56 PAGE BOOK SHOWING SUCCESSFUL APPLICATIONS OF AMERICAN MONORAIL SYSTEMS.

THE AMERICAN MONORAIL CO.

13103 Athens Avenue ★ Cleveland 7, Ohio

also to our people—who are enduring unwonted restraints for the common good."

WHO can disagree with Senator Walsh? No patriotic American could.

And yet there are those in Government who think that it is fair to hammer the profits of industry down to irreducible minimums while labor and the farm group have been permitted to let their incomes rise practically unchecked. There is no law to renegotiate these profits.

Furthermore, there are those in Government who would have everyone lose sight of the fact that the President has endorsed the National Resources Planning Board's formula for converting the United States to state socialism.

The Congress-killed NRPB advocated that the Government controls now in existence be continued for an indefinite period, and that the Government should dictate production, guarantee "full employment" to all, with artificial distribution of all goods for an indeterminate period, called transition.

If the Government succeeds in putting this program into effect after the war what difference does it make what war contractors make in the way of profits? The NRPB plan means confiscation by the Government of all means of production—the confiscation would merely take a little more from industry if profits are allowed to go unchecked.

In speaking of equality of sacrifice, what equality can there be in making industry pay exorbitant taxes and forego reasonable profits for extensive Government regulation which is calculated to completely socialize it? Isn't this political profiteering? Business pays the bulk of the tax bill through direct taxes and the taxes the Government imposes on its employees.

THE original concepts of taxation have been discarded. Once Government taxation aimed at providing revenues for running the departments of government. Now Government taxes for social purposes, to provide the wherewithal for social experiments.

Business pays the piper when the Government sets up competitive businesses, when it engages in relief activities, when it establishes new Government agencies with swollen payrolls.

And when profits are slashed beyond reason, what common-sense or equity is there in establishing wasteful, inefficient and politically-minded lending agencies to provide a WPA for industry after the war, to effect industrial recovery under the auspices of an administration which has indicated a revengeful attitude toward all business? Such a program as this is guaranteed to put more Government in business and to eventually snap the control of private management.

The war has so increased productive means that no normal peacetime economy can effectively use those means.

These facts are being used as an excuse for those who want to collectivize America as a result of this war—which is now designated as "the people's revolution" by such of our leaders as Vice-president Henry Wallace.

WHO can say what profit on net worth is enough to take industry safely through the next few years to come? Bankruptcies are good guarantees for businesses getting further under Government control through having to seek Government financing.

Unemployment and business failure is a certainty sometime after the war which is bound to be distressing and yet it is to be preferred to political profiteering of social-minded leaders who refuse to see the end of America's industrial might in a generation or two of state socialism.

The argument that the Government could not possibly arrive at proper prices when manufacturers had no ideas of cost is valid and the usual legal assumption that men must be bound by their contracts when they enter into them does not hold under the extraordinary buying problems of war.

BUT renegotiation itself has not been fair. The Price Adjustment Boards have been accused time and time again of coercive methods. There is no formula. Competing contractors receive varied treatment.

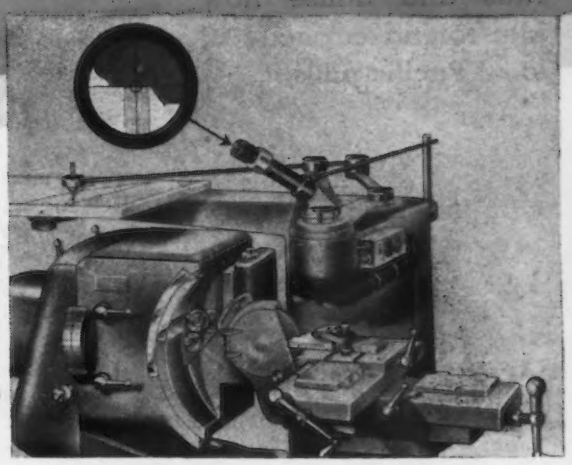
Government negotiators have invaded the privacy of war contractor's records and renegotiation "agreements" have resulted from the judgments of the minds of these men who have no real guiding standards in making decisions.

Obviously, it would save time and be more fair if the standard procedures and the personnel of the Bureau of Internal Revenue were employed and if need be legislation passed to lift the excess profits tax to 100 per cent. The argument that there would be no incentive to hold prices down if the excess profits tax alone were relied upon has no standing.

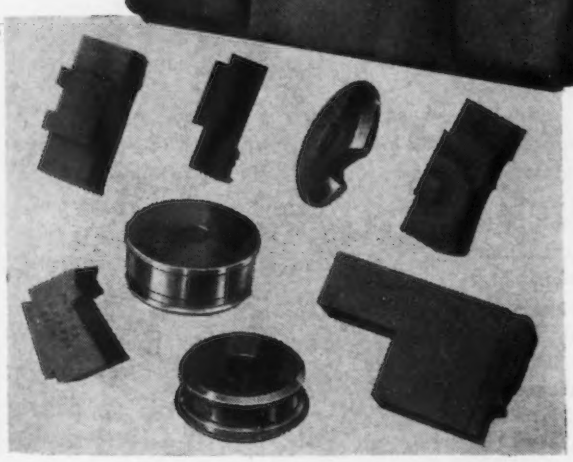
THE BULL OF THE WOODS — BY J. R. WILLIAMS

The SHEFFIELD MICRO-FORM GRINDER

With Pantograph and Microscope



Operator feeds grinding wheel toward point marked by cross hairs.



Typical flat and circular form tools possible to produce on Micro-Form Grinder.

Manufactured under Patent No. 1,811,940

FINISH GRINDS PROFILES DIRECT FROM DRAWING

No Templates Nor Masters

- Grinds both circular and flat form tools, templates, profile gages, cams, dies, etc. to accuracy of .0003".
- Especially suited for grinding cemented carbides and hardened steel.
- Grinding time, especially on intricate profiles, reduced as much as 50-75% compared to other methods.
- Not limited by regularity nor irregularity of work, nor by straight lines, angles or curves.
- Can be used reversely for making layouts from parts having unknown profiles, and for checking parts against layout drawings.

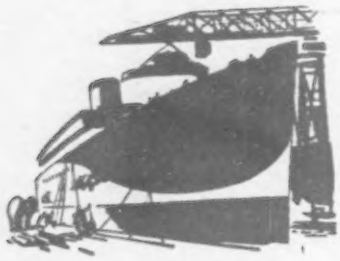
MACHINE TOOLS—GAGES—MEASURING INSTRUMENTS—CONTRACT SERVICES

WEST COAST . . . OSGOOD MURDOCK

• Relaxation or removal of restriction on use of reinforcing bars and light shapes would save manpower and materials and utilize now idle rolling capacity of local Pacific mills.



SAN FRANCISCO—Relaxation of restrictions on production of reinforcing bars and light shapes, perhaps complete removal of restraint, at least in the Pacific market area, seems practical and logical to steel production executives and to the construction industry, starting now and henceforth, at least until the current situation changes again.

Most of the independent and local rolling mills on the West Coast are confined to the production of bars and light shapes and are entirely caught up and operating at reduced pace in limited capacity. Meanwhile the substitution of wood timber structural members on major military and war industry establishments continues, and bridges, war highways, runways and other authorized structures absorb additional manpower, wood and other materials because of limitation on reinforcing bars and light structurals that are readily available from Pacific Coast mills.

At Seattle, Northwest Steel Rolling Mills is reported now operating a single day shift. On San Francisco Bay, Judson is operating one of three open hearths and Pacific States one of three electric furnaces. At both San Francisco and Los Angeles, Bethlehem is partially shut down with idle open hearths and rolls.

Scrap is plentiful throughout the Coast area, most mills having three months supply and some accumulating a surplus. In recent weeks scrap has been selling below ceiling price for the first time since ceilings were imposed.

It is pointed out that the saving of manpower and substitute materials, especially wood, should be the prime consideration, but that the situation in this far Western critical area deserves separate consideration in this respect, to maintain maximum production and secure best results most efficiently and with least expenditure of manpower.

Although plate rolling capacity of the Kaiser Fontana plant is rated at approximately 800 tons daily, output has risen to as high as 1300 tons of prime plate in a single day, and it is probable that January production will average 1000 tons per day. Practically all plate is used by California Shipbuilding Corp. at Wilmington, about 50 miles from the mill, and the entire output of the mill has not been sufficient to supply Cal-Ship's demand for plate.

SPORADIC, irreverant, defiant and even picturesque strikes continue to speckle the record of constantly swelling far Western production. Compared to total manhours exerted, the losses through these strikes are infinitesimal. Their occasional occurrence is in spite of generally improved relations in the far West between labor and management and the intelligent, judicious, level-headed leadership on both sides of the bargaining table.

At South San Francisco, 500 CIO mill workers, half the entire plant force, were out at the Bethlehem plant because of a debate whether chargers' helpers in the billet mill should receive the same pay as chargers. Molders in the Pacific Northwest, 6000 strong, were in a state of armed truce awaiting a WLB wage decision over a request for 8c. an hr. more, straight across the board. Shiprights at the Moore yard in Oakland refused to launch several hulls because of a Maritime Commission order banning the traditional practice of paying a full day's wages to the launching crew no matter what hour of the day it occurred. This beef now has to be avoided by arranging launchings at the end of a shift or, when they occur early in a shift, by holding over the launching crew from the previous shift and paying overtime.

One of the most senseless and disturbing disputes occurred also at the Moore yard when a new naval auxiliary vessel, built at another yard, was brought into Moore's repair yard for the final installation of special Navy equipment. Since shipyard machinists receive higher pay for repair work than for work on new vessels, the union demanded repair men's pay because the ship was at a repair dock, and built at another yard. There was only a difference of 14c. an hr., and a few hours work of a few machinists. The Navy stood pat on instructions and the union refused to yield. Thereupon the Navy ordered its enlisted men and rated machinists to perform the work and the vessel was completed and made ready for sea.

At Marinship, Boilermakers Local No. 6 AFL, the local Committee Against Segregation and Discrimination, and the yard management continue in a three way toss the bean bag game over whether Negroes shall be full members of the union or members of an auxiliary specified by the national boilermakers. It is understood that the union local wants to drop the matter and the management of the yard is only anxious to fulfill its union agreement, but that the national officers of the union still insist on carrying out a traditional policy.

WHILE Congressman Warren G. Magnuson was in Seattle with Senator M. C. Wallgren holding hearings in the home town and attracting considerable local attention over an investigation of structural defects and splits in Liberty ships, Mr. Magnuson pointed with just pride to the fact that the Puget Sound area has produced more auxiliary naval vessels per manhour paid for than any other section of the country. He further predicts that naval facilities in the Puget Sound area will be greatly expanded in the near future, requiring the expenditure of millions of dollars. Since the Navy has expanded its previous one inaccessible yard on San Francisco Bay into two major establishments, there may be a possibility of a second Puget Sound Navy Yard, constructed on an already existing nucleus, as at Tacoma.

Shipping and embarkation activities both in the Puget Sound and San Francisco Bay areas are steadily ac-

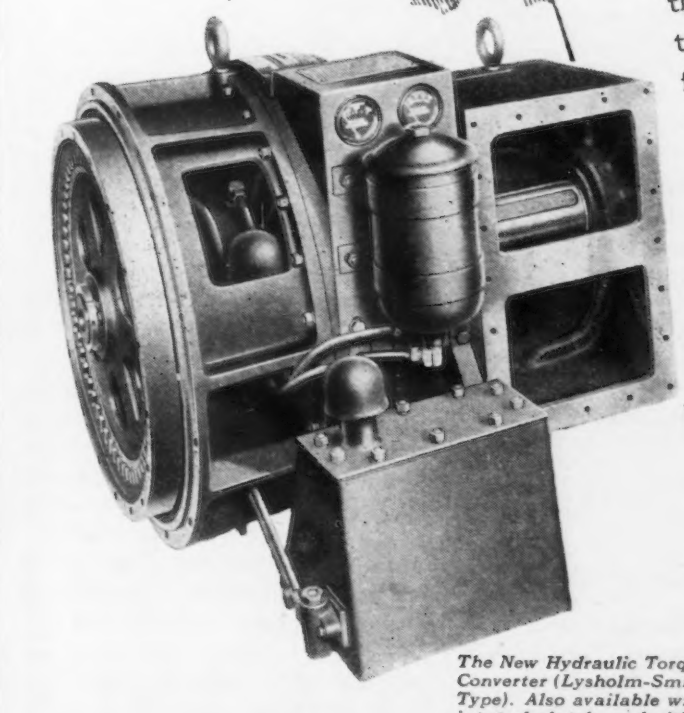
LIFTING WAR CLOUDS WILL REVEAL A NEW TWIN DISC HYDRAULIC TORQUE CONVERTER

As soon as war conditions permit, Twin Disc is ready to produce and deliver a new model Hydraulic Torque Converter, incorporating a series of important improvements. Years of field experience with a limited number of hard-working "pre-war" models, plus the developments coming out of our intensive effort to provide the armed services with ever-better equipment, have brought about changes that will mean added wear-life and fewer service interruptions.

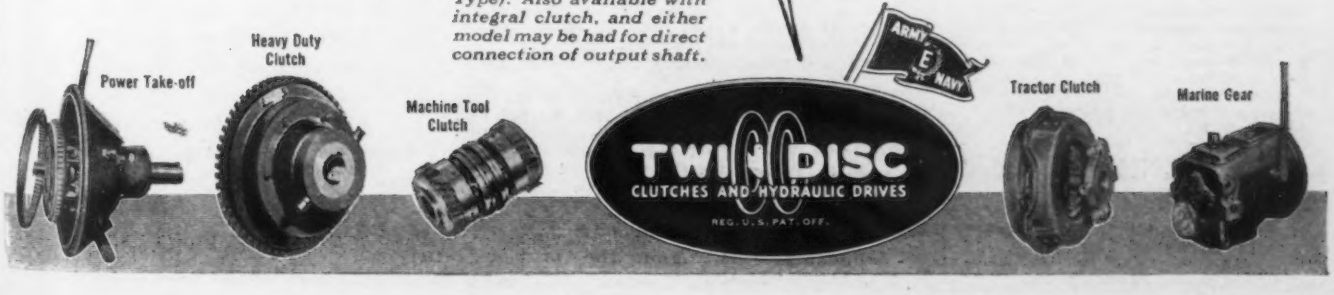
An entirely new sealing arrangement is employed. These new seals have been proved by thousands of hours of service under the most trying conditions. Bearings have been isolated from the fluid and are independently lubricated. A positive-action external pump now supplies the basic pressure within the housing.

Space does not permit full details here.

We'll be glad to send you a copy of Bulletin No. 135, which tells all about the new models. Even though you cannot now get immediate delivery, you will want the facts on which to base your own post-war planning. Send for Bulletin No. 135 today. TWIN DISC CLUTCH COMPANY, Racine, Wisconsin (Hydraulic Division, Rockford, Illinois).



The New Hydraulic Torque Converter (Lysholm-Smith Type). Also available with integral clutch, and either model may be had for direct connection of output shaft.



celerating, and every preparation continues to be made for increasing repair, supply and reinforcement activities for major Pacific engagements.

ALTHOUGH the new P-61 night fighter has been in production by Northrup Aircraft Co. at Hawthorne for three or four months, and although the planes have been steadily flying over southern California in trial runs, official mention only occurred last week after an Army-Navy show in the Coliseum. They call the ship a Black Widow and it is of divided tail construction like the Lockheed P-38. It is said to have a fairly long range and great speed and flying characteristics. It is powered with two Pratt & Whitney motors and heavily armored and armed.

LEADING suggestion, amounting to considerable pressure has been advanced to secure the appointment of one far Western man on the Industry Advisory Committee on Steel to the WPB at Washington. Because of the rapid industrial development of the far Western area and the location here of major additions to steel producing facilities, it is held in the far West that one member of a 15 man advisory committee should come from the Pacific slope and represent the growing interests of this region. It is understood that the Kaiser management has been especially in sympathy with this recommendation, although others in the trade on the West Coast suggest that Mr. Kaiser and his organization are well and ably represented in high councils at Washington and have secured uncanny results and seemingly universally sympathetic consideration of requests and suggestions.

The one millionth steel cartridge case made by the Norris Stamping & Mfg. Co. of Los Angeles was recently personally presented by Lt. Gen. William P. Knudsen on behalf of the United States Army to President K. T. Norris, one of the most brilliant and rapidly moving stars in the heavens of Army Ordnance. On his last previous visit, Gen. Knudsen had presented the one millionth brass cartridge case as a lasting souvenir to the Norris organization. A fourth star has been added to the company's Army-Navy "E" flag, the first won by any firm in the entire West.

Republic Starts Two New Electrolytic Plate Lines

Niles, Ohio

• • • **The nation's** tin plate capacity was increased by approximately 3,600,000 base boxes per year when Republic Steel Corp. formally opened its new electrolytic lines here Jan. 15. The placing of these two lines in operation not only marks the inception of two of the largest capacity lines in the industry but also nearly the last included within the tin plate expansion program. While termed an expansion program it should be noted that the building of electrolytic lines has not been so important from the standpoint of adding capacity as the potential tin saving involved in their operation. These two new lines alone are expected to save approximately 1500 tons of tin compared with the same capacity in hot dipped plate. A large assembly of Congressmen, Army and state officials as well as industry figures toured the new installation.

P. S. Killian Named Purchasing Agent of Bethlehem Steel Co.

• • • **Paul S. Killian,** senior assistant purchasing agent of the Bethlehem Steel Co. since 1941, has been elected purchasing agent, it was announced by Charles R. Holton, vice president in charge of the company's purchasing.

Mr. Killian joined Bethlehem Steel Co. on May 21, 1917, when he started working in the purchasing department at Bethlehem, Pa., as a stenographer. After working in various capacities in that department he was advanced to a division head in 1923. On Jan. 1, 1934, he was made assistant to the purchasing agent; on Jan. 1, 1936, he was named an assistant purchasing agent, and on Jan. 1, 1941, he was appointed senior assistant purchasing agent.

Tower Sets Post-War Steel Production At 70 Million Tons

Cleveland

• • • **Before** the annual convention of the Institute of Scrap Iron and Steel, at Cleveland, on Jan. 12, Walter S. Tower, president of the American Iron and Steel Institute made several observations on the future production rate of steel in the United States. Annual capacity for production of steel ingots is now pressing 95 million net tons, a figure that will be exceeded if and when the entire government-sponsored expansion program is finished. After the close of the war, an estimated 10 per cent of this capacity will be discarded because it is old and inefficient. Therefore, steel ingot capacity will be close to 90 million tons.

Mr. Tower stated that some semi-official calculations figure that demand will be as high as 120 million ingot tons or about 85 million tons in terms of finished steel in the early years of return to peace. On this basis he states that neither the scrap nor the ore would be available to support such a demand for any length of time.

While peace time demand for ingots has never reached 65 million tons or 45 million tons of rolled products, Mr. Tower appraises post-war needs to be between 45 and 50 million tons of finished products or 67 to 70 million tons of ingots per year. This would be satisfactory if costs were reasonably related to market prices, but this is problematical. It is obvious now, said Mr. Tower that there must be closer scrutiny of costs.

. . . Cited for Awards . . .

• • • **The following** companies have been awarded the Army-Navy E award for excellence in war production:

Anchor Duck Mills, Rome, Ga.
Arrowhead Rubber Co., Vernon, Cal.
L. F. Grammes & Sons, Inc., Allentown, Pa.
Hanlon-Waters, Inc., Tulsa, Okla.
Heyden Chemical Corp., Cherokee Ordnance Works, Danville, Pa.

Typical Struthers Wells Forged Marine Propeller Shafts

2000 Ton Hydraulic Forging Press

TITUSVILLE a name to remember now, and for your postwar planning. Out of our experience in serving America and her Allies since the opening of World War II — incredible advances in speed, precision, and economy of manufacturing have been made. These, plus our 50 years' training in forging and welding practice, assure the quality, operating characteristics and uniformity you must have in your postwar products.

Modern facilities include a complete forge plant with forge presses up to 2000 tons; two large welding shops with 172 welding machines; complete heat treating facilities; and three large modern machine shops—Producing heavy carbon and alloy steel forgings rough turned or finish machined complete; Line shafts, Propeller shafts, Steel pipe moulds, Straightening and leveling rolls, Finished crankshafts, Pressure vessels, High pressure seamless pipe.

Let TITUSVILLE Forge technicians and craftsmen cooperate with you!

Fatigue Cracks . . . BY A. H. DIX

Nails

• • • We boast at every opportunity that most of the questions addressed to your favorite family journal are answered. But occasionally we strike a deceptively simple one that throws us for a loss. Such a one is, *"When and where were the first machine cut nails made?"*

The encyclopedia isn't much help, nor were the various authorities we consulted. If you have any inside information on this, will you send it along to fatten our batting average?

Nor Balm in Gilead

• • • *Apropos of nothing, we would like to pass along something we read in Cecil Brown's "Suez to Singapore." A British censor refused to O.K. the line, "General Berganzoli took asylum in Bengazi," on the grounds that there is no asylum in Bengazi.*

Stalled Reindeer

We did not receive the Dec. 9th and 16th issues. We do not know whether or not Santa Claus had anything to do with this interruption, but whoever or whatever is the cause somebody evidently knows a good thing when seen.

Will you send them and bill us.

—Edward E. Woelfle,
Woelfle Bros., Ltd., Kitchener, Ont.

St. Nick can take the rap. This year the post office staggered under the heaviest burden of Christmas mail in history, resulting in many delays. Undelivered copies will be replaced without charge.

Hemoglobin Normal

In a recent issue you referred to librarians as being bloodless. We would like to know on what you base such an observation.

We have been called many things but this is the unkindest cut of all. Might we suggest that we are not always as we seem? We are anxious to have this corrected in case the Red Cross should come across your statement.

—Paula M. Strain
Edith A. Hill
Helen L. Hurd

Admittedly, our generality was based on limited evidence, for our contacts with librarians outside of their working hours have been nil, and for all we know, their unfrolicsome air is but a professional mask. We are, therefore, glad to certify that we know of no reason why a librarian should be inferior as a blood donor to say a chanteuse or a riveteuse.

Memory-Clingers

Speaking of names, there is the Syracusan who is on the advisory board of the Committee for Constitutional Government—Cloud Wampler.

—Larry

Then there's Rockaway, New Jersey's chief of police, Dewey Pott.

Fable

A Kaiser shipyard worker who was much impressed with the fabulous doings of his boss was showing his Eastern brother through the yard. Kaiser was such a great man, he said, that all he had to do was to sit at a great desk and push a button for whatever he wanted done.

Pointing to a partially completed ship he said it would be launched before dark. The brother looked doubtful.

Ten minutes later an eclipse darkened the sky and gave the impression of evening. The brother said, "Look! It is dark and the ship is not finished." The shipyard worker said, "Don't worry. He'll do something about it."

Hardly were the words out of his mouth when the eclipse ended. "By God," the brother said, awestricken, "he found the right button."

—Mac

Stop Order on L.C. "K"

• • • Our knuckles were cracked recently for writing Magnaflux with a small "m." In acknowledging the crack we remarked that the same thing happened whenever we lower-cased Monel, Bakelite, or any other trade name, for the capital is warning that the name is private property.

C. H. (Eastman Kodak) Steele took exception to insistence on that capital. "Why worry," he said, "whether a trade name is generic or specific?" But now he takes it all back:

I now discover what everyone else in the Company seems to know, that our Legal and Advertising people raise Merry Hell every time they find Kodak spelled with a small initial letter or used generically. The old slogan, "It it isn't an Eastman, it isn't a Kodak," still means precisely what it says, and woe betide transgressors.

A correcting note in "Fatigue Cracks" might let me get my very red face part way out of the dog house.

—C. H. Steele,
Eastman Kodak Co., Rochester, N. Y.

P.S. If "Merry Hell" is a bit on the strong side for the other seventeen readers, tone it down.

All eighteen readers are hardy souls and can take "Merry Hell" unwatered. "Merry Hell" is what the Eastman people better start raising with Funk & Wagnalls, for our edition of the desk standard dictionary not only spells Kodak with a small "k," but has as the chief definition, *"To take an instantaneous picture of,"* which gives the impression that you can kodak with a Graflex, a Minicam, or even a Brownie.

Casualty

Your item on cable-ese reminds me to remind you that the cable companies have ruined the art by their recent notice that any word not in the dictionary shall be charged for at the rate of five letters equal one word.

This takes the fun out of things like "smorning" (this morning), "Clevelandwards" (to Cleveland), "Sevenish" (about seven). And your list of "uns" should have included the useful "unknow," as in "unknow story."

Cleaned up for publication in your family journal, there is the famous message a disgruntled foreign correspondent sent to his chief, "Lakewards injump."

—Deac

Puzzles

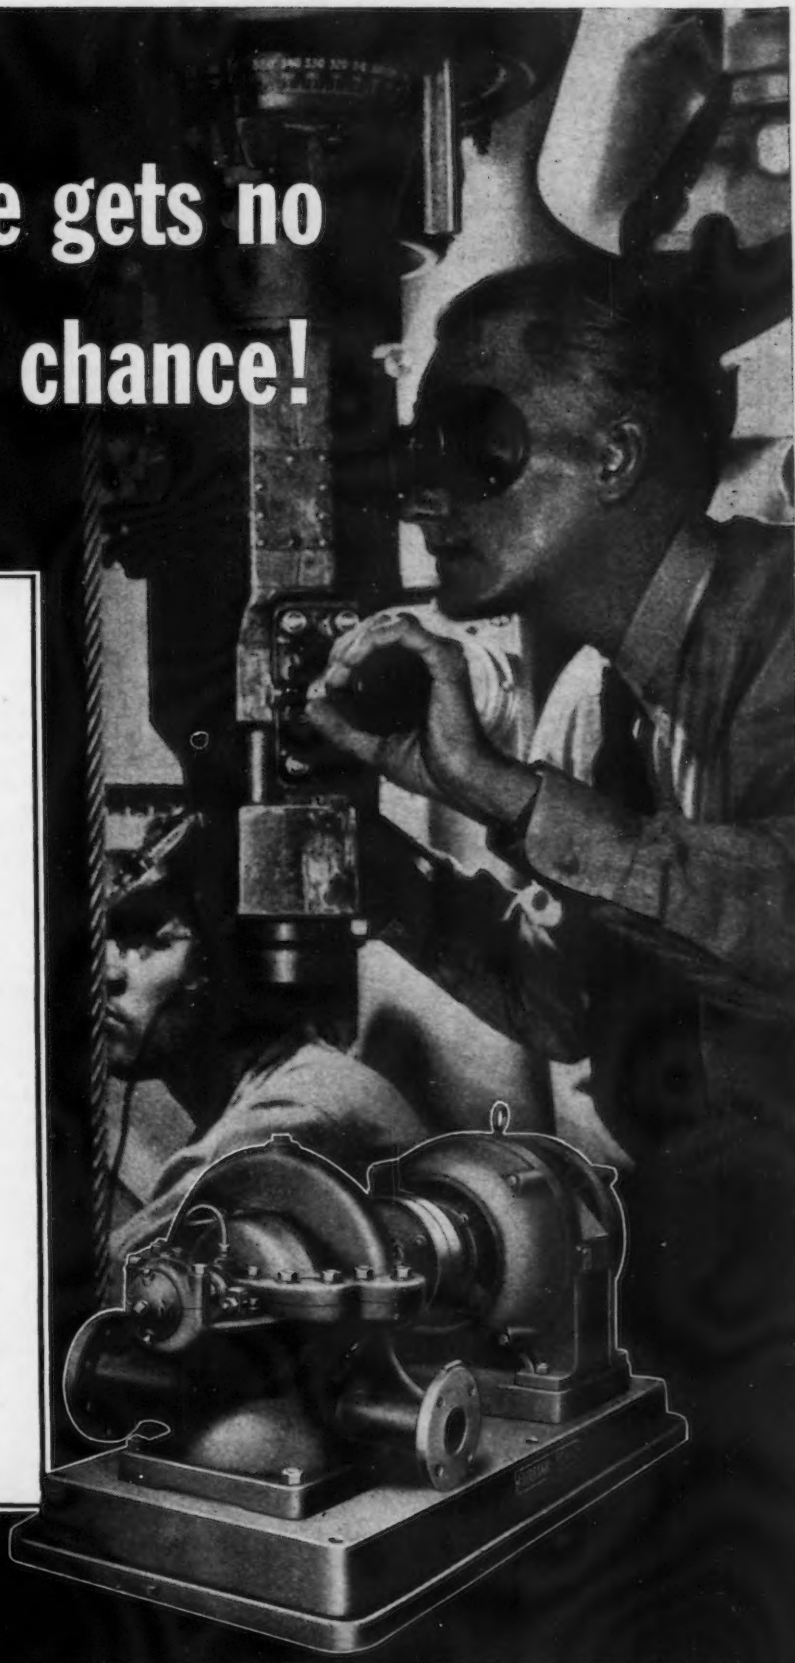
Last week's problem comes out this way: 354 from 486 leaves 132.

In his excellent series on tubes and tube making (issues of Dec. 16, 23 and 30) Dr. B. P. Planner explains that the Pilger (German for "pilgrim") process, in which the tube is carried forward and backward, gets its name from the Jumping Procession of Echtermach (Luxemburg) whose ritual required the atoning pilgrims to take three steps forward and two steps backward.

Which reminds us of this one—to be done in your head within 15 seconds:

A frog in a 21-ft. well climbs 3 ft. each day and slips back 2 ft. each night. In how many days will it be out of the well?

...and failure gets no second chance!



"Surface!" With that command life itself hangs in the balance . . . depends upon pumps . . . reliable and efficient pumps that dare not fail *once!* It's a critical moment at any time . . . on any submarine, that demands the highest standards of perfection in pumping equipment.

That's why Fairbanks-Morse Pumps are used in United States submarine service. You can rely on Fairbanks-Morse Pumps . . . can know in advance that their mechanical superiority assures you dependable, economical operation now and for years to come.

For consultation without obligation, write Fairbanks, Morse & Co., 209 Fairbanks-Morse Building, Chicago 5, Illinois.

Fairbanks-Morse Centrifugal Pumps

Dear Editor:

SMOOTH TALKER

Sir:

A gentleman who gave the name of B. E. Plumner recently called to renew our subscription for THE IRON AGE. He said he represented the Consolidated Trade Journals of Chicago, Kansas City, Atlanta and New Orleans.

He is in his middle thirties, reddish blonde, sharp features, rather prominent nose, about 5 ft. 8 in., 160 lb. He was a smooth talker. We gave him a check for $6 made out to THE IRON AGE.

C. W. ROTHE
Fi-Ro Machine & Welding Works,
203 N. Pearl Street,
Natchez, Miss.

● We have no representative in Mississippi. Consolidated Trade Journals is unknown to us, and is not listed in the Chicago telephone directory. Our subscription rate is $8 a year. Inasmuch as the check was made out to The Iron Age the loss will be sustained by whoever cashed it without proper endorsement.—Ed.

TOOL DISPLAY BOARD

Sir:

Your Oct. 14, 1943, issue illustrates on page 73 a tool display board which Westinghouse places near tool cribs and cutter grinders, to show the proper point angles for drilling various metals and non-metals.

Is it possible to get a more legible copy? We would like to set up similar displays in some of the Yard's shops.

BEN REZNEK,
Associate Metallurgist
Norfolk Navy Yard,
Portsmouth, Va.

● A copy of the captions used on the board, specifying the proper point angles for drilling various materials, has been mailed to you.—Ed.

PASSIVATION

Sir:

What can your technical staff tell us about "passivation" (we believe that to be the word) of stainless steel? The process, as we understand it, is a dipping of the finished stainless steel product in a solution of nitric acid. The purpose, as understood, is to clean the bright surface of dirt, and especially from particles of steel resulting from grinding, or burring of stampings.

G. H. PARKER
R. I. Warp Stop Equipment Co.,
248 Pine Street,
Pawtucket, R. I.

● Passivation is accomplished by immersing the material in 10-20 per cent solution nitric acid at 140 deg F. for about 20 min. or in a 40-50 per cent solution at room temperature for one hour. The latter procedure is better as no heating or exhaust hoods are needed. Earthenware crocks may be used to hold the acid and the material can be handled with wooden trays.—Ed.

PROJECTION WELDING

Sir:

Is it possible to convert projection welders originally made for steel to the welding of aluminum?

SHEET METAL FABRICATOR
Ohio

● Projection welding of aluminum has been done to a very limited extent. If the object is merely to make good commercial welds, projection welders for steel can be converted to aluminum rather easily, but owing to the fact that aluminum welding demands a much higher amperage the capacity of the machine in gage size of aluminum will be considerably less than in the case of steel. For aluminum spot welding data, see "Recommended Practices for Spot Welding of Aluminum Alloys," issued by the American Welding Society, 33 W. 39th St., New York, price $1.—Ed.

DROSS REMOVAL

Sir:

Can you refer us to any one who can acquaint us with any improved method of taking the dross out of a galvanizing kettle, different from the process of using a deep dipper or shovel made up of bars with spaces between them to allow the good metal to filter through?

W. H. ROSS
Fittings Limited,
Oshawa, Canada

● Get in touch with Wallace G. Imhoff, Vineland, N. J., galvanizing consultant.—Ed.

THREAD GAGES

Sir:

We are interested in obtaining more detailed information on the special internal thread gages, illustrated on page 72 of the Dec. 9 issue.

E. M. CONNERS
Fisher Body Detroit Division,
General Motors Corporation,
Central Development and
Experimental Unit,
6051 Hastings Street,
Detroit 11

● Write to C. H. Borneman, Supervisor, Tool & Gage Service, General Electric Co., Schenectady, N. Y.—Ed.

SEIZED PATENTS

Sir:

I have read Reader Tolley's letter about seized patents, Jan. 6 issue. My experience, so far, has been similar.

Is he correct in assuming that exclusive license is given by APC? Cannot others obtain license to patents that have already been licensed?

E. W. EKSTRAND,
President
Ekstrand Machines, Inc.,
65 Springdale Avenue,
Newark 7, N. J.

● Licenses to manufacture under seized patents are not exclusive. Any number of firms may be granted manufacturing licenses under the same patent. What Reader Tolley refers to is the fact that lists of seized patents include those for which exclusive manufacturing rights were obtained before the war began. These prewar arrangements continue in force.—Ed.

INFRA-RED RAYS

Sir:

Your Dec. 9 issue describes the drying of impregnated castings with infra-red rays.

It has occurred to me that this source of heat could be employed for drying molds in a steel foundry.

P. CHAPMAN,
Metallurgist
Canadian Car & Foundry Co., Ltd.,
621 West Craig Street,
Montreal, Que., Canada

● This is already being done. See July 15, 1943 issue, page 61. For additional information write to Infra-Red Engineers, Inc., 812 Huron Rd., Cleveland.—Ed.

COPPER-CLAD BOTTOMS

Sir:

We have been told that an article was published some time ago describing the process used in manufacturing stainless steel utensils with a copper-clad bottom.

Did this article appear in IRON AGE?

KITCHEN UTENSIL MANUFACTURER

● Not in Iron Age, nor, so far as we know, in any other publication. The process is not especially difficult. Standard copper-plating solutions are used and the utensils are immersed part way or stopped off in any one of several accepted ways. The only thing out of the ordinary is that the utensils are rotated constantly during the plating operation.—Ed.

MODERN KITCHENS

Sir:

There is a growing consciousness of the inadequacy of the kitchen layout and fittings in the average British home and I feel there is bound to be a considerable demand for these things after our two countries have together settled their accounts with the enemies of freedom and progress, and we can once again turn our attention to the homes we both value so highly.

May I therefore request that you obtain for me one or two pamphlets giving information on these?

WILLIAM HOPE
42 Ullswater Road,
Flixton, Manchester,
England

● Your inquiry is being turned over to the Modern Kitchen Bureau, Division of Edison Electric Institute, 420 Lexington Ave., New York.—Ed.

X-RAY COUNTING TUBES

Sir:

In your June 10, 1943 issue you presented an article entitled, "Testing With X-Ray Counting Tubes." The idea was that steel cylinders and tanks could be tested for flaws and irregularities through the use of an X-Ray element and a Geiger counter-system.

Is such apparatus being manufactured in the United States?

L. P. WENZELL,
Technical Assistant
Monsanto Chemical Co.,
Monsanto, Ill.

● So far as we know no complete set-ups of this type are available as yet, but individual pieces of equipment could be assembled from established sources as for instance, Fisher Scientific Co., Pittsburgh.—Ed.

THE Next JOB

WHEN the last gun has fired, the conversion from war work to peace-time stampings will be simple at Transue—change dies and obtain the right steel sheets. Production and engineering experience gained these last few years will be valuable in planning and making deep drawn steel stampings for much-needed civilian products.

Designers and Makers of Deep Drawn Stampings

ALLIANCE, OHIO

SALES OFFICES: NEW YORK, PHILADELPHIA, CHICAGO, DETROIT, INDIANAPOLIS, CLEVELAND

This Industrial Week . . .

- **Order M-126 Stays on; Use of Excess Steel Spurred**
- **Union Demands Before WLB Soon; Steel Firms Compile Cost Data**
- **Competition for Alloy Steel Orders Becomes More Intense**
- **National Steel Ingot Output Rises Slightly to 98.5 Per Cent**

MIXED trends which have perplexed many an industrialist during recent months are more apparent than ever. Headlines which on Jan. 7 proclaimed probable widespread relaxation of metal goods manufacture through the easing of order M-126 were disproved Jan. 13 when the Army, Navy and WPB decided not to revoke the order. On the other hand, at a meeting with industrialists Monday, Donald M. Nelson of WPB indicated that limited civilian output is being started in certain areas to use excess and idle stocks of available metals, although no general resumption of civilian output can be allowed at this time when new allied war action is imminent.

Excess steel stocks are estimated to be about 3,500,000 to 4,000,000 tons now and can be expected to increase, particularly after the invasion is successful. Surplus steel from Canada also is being sold in this country, without rigid restriction.

Meanwhile, as the time for the widely-heralded invasion approaches, equipment is being rushed to completion with production schedules telescoped and additional workers assigned to the manufacturing tasks. National steel ingot production increased slightly this week to 98.5 per cent of capacity from last week's rate of 98 per cent.

THE Presidential demand for a National Service Act has aroused consternation and indignation among labor unionists and the steel union's demands for higher wages are expected soon to be placed before the War Labor Board. At the same time, steel companies, large and small, are filling out complicated cost sheet forms on specific carbon steel products for the OPA which is studying the need for a price increase. It is expected that OPA will process one product at a time and render decisions product by product. If price adjustments come quickly enough, smaller marginal companies may be greatly assisted.

Much of the current news has centered around the machine tool industry. The need for orderly distribution of the estimated $2,500,000,000 worth of surplus machine tools in the postwar world has stressed before the House Small Business Committee last week by leaders of the industry, who advocated keeping the best machines in this country. Changes in the Lend-Lease setup as it affects machine tool shipments to Britain are reported being talked over in Washington. The industry vigorously is opposing section 801 of the proposed new tax bill which it is asserted would allow Government procurement officers to set arbitrary prices on machinery purchased by the Government or by any contractor or subcontractor, without consideration of existing prices or manufacturing costs.

OTHER highlights of the news include the placing before the Senate of a proposal that corporations be permitted to set aside as reserves up to 20 per cent of the normal net income tax; a WPB plan to lay before auto makers a suggestion that controls be maintained for three years after the end of the European war; the tapering of operations by a number of aircraft, shipbuilding and ordnance plants; the loss of 13,000 tons ship late in a strike at the Irvin Works of Carnegie-Illinois Steel Corp.

Competition for alloy steel orders is more intense due to the smaller volume of business available. Allotments for first quarter were below total alloy steel production capacity. Output of electric furnaces at 4,621,462 tons in 1943 represented an increase of over 300

Chicago Electric Furnaces May Close

Washington

• • • Indicative of the reduced demand for electric furnace alloy steel capacity, the government may announce soon that the Republic Steel Corp.'s nine 70-ton electric furnaces at Chicago will be closed for the duration.

The newly-built furnaces are nearly complete and six of them can now be operated. Three of them have been used and there are three which are complete except for cable installations. A 36-in. bar mill and three new open hearths, together with cooling and other equipment, may receive the same treatment at the hands of the government.

News Highlights in This Issue

Civilian Output Eased	95	National Service Act	101
Auto Output Control	95	Revised Pricing Method	102
Order Relaxation Studied	96	Electric Furnace Output	102

per cent above 1929 production. The new mark is expected to remain an all-time high for many years.

ALTHOUGH restrictions have been lifted from dealer purchases of idle and excess steel, enabling warehouses to buy the material more freely and permitting new dealers to handle such stocks, the action is not as beneficial to steel users as last week's announcements indicated. When the steel enters a warehouse it loses its identity as excess material and hence becomes more difficult to dispose of. The new dealers with lower overhead may be able to undersell regular jobbers.

The continuation of restrictions on construction is a blow to many producers and sellers of construction steel, whose production facilities are in low gear. Mills are idling on the west coast and concrete bar makers over the nation are averaging no more than 25,000 tons a month in orders against a normal 75,000 to 100,000 tons per month. Instances of price cutting have been reported in the concrete bar market. The 15,000 tons of concrete bars required at Savannah, Ga., and the 10,000 tons at Houston, Texas, which were supposed to have been used for concrete barges and for which the Maritime Commission took bids Jan. 5, will be up for new bids Jan. 23. All of the first bids were rejected because of low prices.

THE fall in demand for beehive furnace coke, the long distance between coke ovens and coal supplies, the high cost of operations at many plants despite OPA relief, and the increase in by-product coke supplies, are expected to drastically reduce the number of beehive coke ovens in blast this year. Some observers at Connellsville, Pa., believe that 1944 may see the practical extinction of that part of the beehive coke industry built up by the war with the exception of those plants which are maintained by steel companies or are leased by steel companies. Plants which still have coal available nearby, and which produce high grade foundry coke, will maintain output.

Pittsburgh district steel ingot operations have gained half a point to 98 per cent and in Chicago output was up one point to 103 per cent. The Cleveland operating rate gained three and a half points to 96.5 per cent and Buffalo has snapped back to 104.5 per cent for the first time since the week of Nov. 11. Eastern district operations increased 18 points to 103 per cent. Declines in operations occurred in Youngstown, down half a point to 97 per cent; Detroit, down four and a half points to 99 per cent; and St. Louis, down two and a half to 101.5. Unchanged from last week's operating rate are Wheeling at 95 and Birmingham at 99. At least 5 million tons of steel ingot capacity will be eliminated when the steel industry emerges from the war, according to Walter S. Tower, president, American Iron and Steel Institute, who addressed the Institute of Scrap Iron and Steel at Cleveland this past week.

Steel Wage Issue to WLB Soon

Pittsburgh

• • • A War Labor Board panel is expected to take over the steel wage demands in the steel industry soon, following a request made early this week by U. S. Steel Corp. steel producing subsidiaries to the Secretary of Labor, to certify to the WLB steel union wage issues.

John A. Stevens of U. S. Steel Corp. of Delaware, said: "Proposals now being referred to the board are of such a nature as not to permit solution in collective bargaining, since they either involve departure from a National Economic Stabilization Program or concern fundamental matters of principle on which the respective viewpoints cannot be reconciled." He stated that most of the proposals would involve increases in cost which the subsidiary companies are financially unable to absorb.

Other proposals of the USWA, not involving wage increases, will continue to be the subject of collective bargaining, according to Stevens. It is understood that a WLB panel, to hear the steel wage case, is now in the process of being formed. It is expected to hear all steel companies.

IDEAS GALORE

. . . to help you take full advantage of the New Arc Welding Technique in metal fabrication . . . as it applies to possibilities in your production.

"DESIGN for Arc Welding"

This "How-to-do-it service is already saving time and money for manufacturers.

You too will be surprised at the number of time and cost-saving ideas it will bring you—ideas that are readily adaptable to your use.

This Remarkable Service . . .

—will show you many ways in which you can use steel bars, sheets, angles, channels, beams, pipe, tubing, and flame cut sections to cut costs and get better results in designing a new product or to meet changing conditions.

Good-Bye "Theory"
Welcome "Practice"

In these design sheets, for the first time, is a service that is really practical and helpful to anyone working with metal. They contain no involved discussions, no guesswork, just practical ideas you can use.

Issued Serially In Plate Form

Each plate available for immediate filing and future reference. Most subjects covered by two, three or more suggestions as to how results may be accomplished through welding. Join the thousands who have acclaimed this service as the best they've ever received. Use the coupon below to get your name on the list for this service.

News OF Industry

Civilian Output Approved on Regional Basis

HEAVY GOING: *Down at the stern as she pitches in a heavy sea this escort carrier plows through the Atlantic, shepherding a convoy to an allied port. Planes are lashed to the flight deck, with their wings folded back.*

Washington

• • • **WPB Chairman** Donald M. Nelson on Monday told leading industrialists that limited civilian production will be started in three or four WPB regions to use excess and idle stocks of available metals. An order to this effect is being circulated in WPB.

The WMC designation of regions according to the freeness of labor supply will govern. Manufacturers in cities in the regions selected designated as group 3 and group 4 labor areas and who employ 50 or fewer employees will be permitted to resume civilian production. Smaller manufacturers in tighter labor areas also will be permitted to get into civilian production. If the plan proves successful it will be extended on a nationwide basis.

In a statement to the press, however, WPB said that Mr. Nelson and the 14 top-flight executives agreed that with America's major offensives still to come there can be no general resumption of civilian production at the present. July 1 is the accepted date for fairly large-scale reconversion involving large industries, such as the automobile, railroad and petroleum industries, which have first priority.

Business men who attended the first of a series of meetings with WPB on reconversion were: J. L. McCaffrey, International Harvester Co.; Eugene G. Grace, president, Bethlehem Steel Co.; Alvan Macauley, president, Packard Motor Co.; James H. Marks, vice-president, Packard; Henry M. Reed, president, American Radiator & Standard Sanitary Corp.; Henry J. Kaiser, president, The Kaiser Co., Inc.; A. W. Robertson, chairman, Westinghouse Electric & Mfg. Co.; E. Tappan Stannard, president, Kennecott Copper Co.; Fred Lazarus, F. & R. Lazarus Co.; Otto A. Seyferth, United States Chamber of Commerce, president, Muskegon Foundry Co.; A. H. Nicoll, Graybar Electric Co.; Henning W. Prentis, president, Armstrong Cork Co.; Fred W. Nichol, vice-president, International Business Machines Co.; Robert Gaylord, president, National Association of Manufacturers.

AFL president William Green and CIO president Philip Murray will meet with Mr. Nelson some time in the near future, a WPB spokesman said.

Small manufacturing concerns, those with less than 50 employees, in the regions indicated, will ask WPB for permission to begin production. The company must show that it has little or no war work, that the civilian product it wishes to make is of relatively high essentiality, and that the metals it needs in the forms required are held as idle or excess by the Redistribution Division.

Lists of excess materials are available in WPB regional offices and also in the WPB metals divisions.

The size of the new program can best be seen by the fact that there are more than 3,500,000 tons of idle and excess steel stocks available. Considerable amounts of aluminum and adequate supplies of idle and excess copper are said to be available.

WPB Plans 3 Year Auto Control

Washington

• • • **At a future** meeting with automobile manufacturers, WPB expects to propose that wartime controls be maintained for three years after the end of the European war to insure every producer equal competitive start in production.

Arthur D. Whiteside of WPB says that under the plan each auto company would be allowed to make as many cars in the three-year period as the company made in 1941. The full quota could be made at any time in the three-year period.

At least one spokesman for the auto industry said that in his opinion the Whiteside plan would be generally opposed by the industry. When the war ends the industry should be allowed to determine its own pattern through competition, he said.

Mr. Whiteside said, "General Motors is making engines and cannot get out of war production immediately. The company would prefer to make one-third of its 1941 production for three years than to make the bulk of its pre-war output the first year the war ends."

When asked whether the automobile industry would "go for the idea," Mr. Whiteside said that in his opinion the industry would and that passenger car manufacture must start as soon as manpower, materials and capacity are available—very likely as soon as the war in Europe is over. But, Mr. Whiteside said, automobile dealers may find it "hard going" during the three years.

"Besides," he declared, "WPB's legislation runs out in December this year. Any new legislation will provide for the agency's continuance at least a year to a year and a half into the post-war period."

WPB Orders Relaxation Examined To Prevent "War Is Over" Attitude

Washington

• • • **Although WPB will** take firm steps toward planning reconversions, it has refused to revoke Order M-126 which forbids the use of iron and steel in the manufacture of about 400 classifications of so-called "non-essential" goods. In an all-day session last Thursday, WPB and the Army and Navy representatives met to decide whether this order should be revoked or relaxed.

The decision not to do anything "at present" represents, observers believe, a determination on the part of the services to do nothing that would make it appear that the home front has decided the war is over. Consequently, no substantial production for civilian use will be permitted before the European invasion is successful, although M-126 does not represent a substantial beginning.

WPB did take an important preparatory step toward the reconversion date by permitting warehouses and dealers to buy idle and excess steel stocks without restriction. The action was taken in an amendment to Order M-21-b-1 (see page 106).

Other moves affecting reconversion prospects pertained to resumption of construction, relaxation of orders governing hard-facing materials, and alloy scrap.

The stocks, which will be subject to all WPB restrictions on the use of steel except in WMC groups 3 and 4 labor areas, are estimated to be about 3,500,000 to 4,000,000 tons now. These supplies are expected to grow possibly as large as 10,000,000 to 15,000,000 tons.

WPB released the restrictions on warehouse purchases so that when other limitations are lifted, such as permission granted to use idle and excess stocks without reference to any other WPB order (THE IRON AGE, Jan. 6, page 144), civilian type steel stocks will be available against this day.

Steel Division officials say that cold finished strip is rather plentiful in all sizes and gages, as are small alloy billets and rounds from idle stocks. Off dimension bars and rounds also can be bought.

Structurals, bars, channels and angles can be bought, but bar shapes and angles, which include small size angles and T's, are scarce.

Because Canada has discontinued ship construction and production exceeds consumption, surplus Canadian steel is being sold in this country practically without restriction. While only in limited quantities, these uncontrolled steel purchases form sort of a welcome "gray" market.

Significantly, the biggest movement in the American civilian type excess steels is to the starved export markets, mostly cold finished steel and hot rolled strip, that up to now United States warehouses have rejected. Alloy bars and billets are slow-moving.

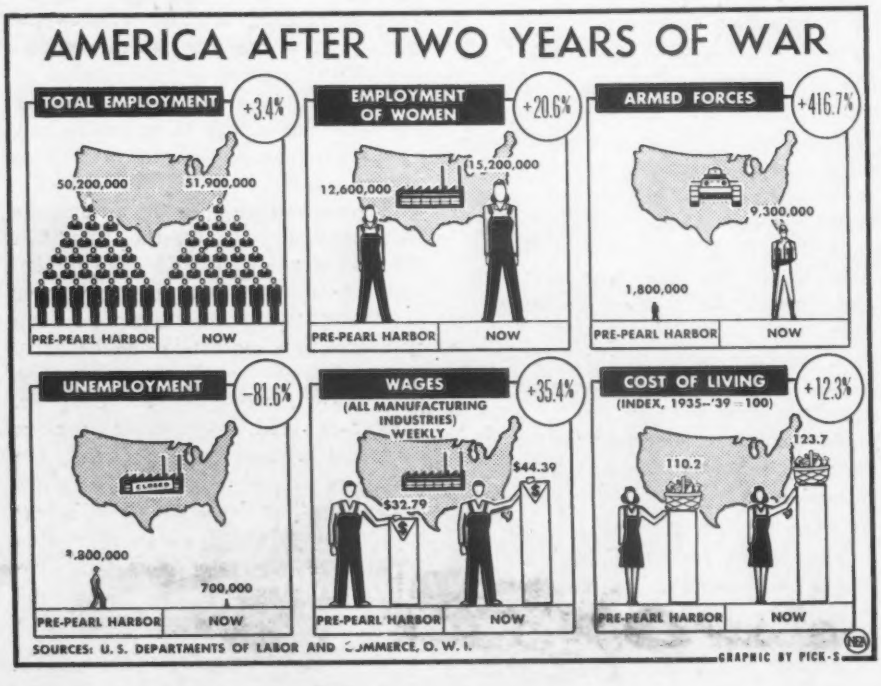
An announcement, made on Wednesday of last week by WPB, that restrictions would continue on construction and facilities without modification until the future course of the war becomes clearer.

WPB has predicted that the value of all construction both Governmental and private will be only $3,900,000,000 in 1944, about half the value of all construction in 1940 and 1943 when construction amounted to $6,830,000,000 and $7,595,000,000 respectively.

It is probable that construction will not for a long time reach the highs of 1941 and 1942 with the all-time highs of $11,129,000,000 and $13,389,000,000. But peacetime construction particularly private housing is expected to boom as soon as bans are lifted.

At the same time because of the current satisfactory supply-demand of the alloying materials involved, WPB has revoked Order L-223 restricting the use of ferroalloys in coating base metals by fusion welding of alloying metals. Quantities used for hard-facing are low.

WPB said last Thursday that restrictions on the use of low alloy steel scrap had been removed and that mills can use certain low alloy steel scrap in carbon steel at their discretion because of the plentiful supply of alloy scrap. (See scrap market, page 158.) This change was effected by amendment to Supplementary Order M-24-c.



Canada Eases Use Limits On Steel and Light Metals

Ottawa

• • • **While certain** material shortages still exist, Canadian construction control has also been eased to permit dwelling construction. The release of metals will not result in any perceptible increase in consumer goods because most of these still require scarce items and because their manufacture would not have any labor priority.

Eased restrictions on steel pipe, cast iron pipe, wire and wire rods will permit the production of more water pipe, drainage pipe, bailing wire, box strapping, and other such items. Lifting of these restrictions followed the removal of restrictions on the sale and use of aluminum scrap and secondary aluminum ingots derived from scrap. A new order cancels aluminum restrictions on the sale and use of rivets, cast welding rod, welding wire, metallizing wire, wire for anodizing, and tie wire for electrical conductors.

China Fights: Shoulders Are Hoists in Crude Shops in Caves

• • • Valiant Nation, Undaunted by Pitiful Lack of Equipment, Makes Tools of War in Small Caverns to Oppose Highly Mechanized Japs

Straining their backs, workmen move a large piece of machinery into place in the Chungking cave. As in most of the plants in Free China, there are no overhead hoists.

o o o

RIGHT

A corner of the machine shop at the Ming Sung shipyards in Chungking is shown at right. All workers are filing, evidence of the amount of hand labor which china must do.

At the Ming Sung shipyards in Chungking, workers haul a small ship up the ways by physical strength. Hand winches are shown at lower left and right. The yard is a far cry from the modern layouts at mighty shipbuilding plants in the U. S.

U.S. Should Retain the Best of Its Machine Tools, House Group Told

Washington

• • • **Views expressed** on Capitol Hill last week indicated that an estimated $2,500,000,000 worth of surplus machine tools would be distributed in an orderly manner in the postwar world, rather than to be dumped on the market haphazardly. It was also evident that the newest tools and those most suitable for maintaing high-level production in a peacetime economy would remain in the United States. This is significant in view of whispered plans, in high Government circles, for exporting untold numbers of machine tools to Europe, particularly Russia, to aid in rehabilitation work.

These facts were brought out in testimony given to the House Small Business Committee by representatives of the machine tool industry in the first open hearing on the Committee's bill, HR 3873, which sets up a system for distribution of Government surpluses.

The bill would amend the RFC act so as to include a surplus property section and would establish a Surplus Property Board. The chairman of the board would be the chairman of the board of directors of the Defense Supplies Corp. and its membership would include the Secretaries of War, Navy and Treasury, as well as three individuals to be appointed by the President, with the consent of the Senate. The three individuals so appointed shall be businessmen who have had at least five years' experience in the business of the retail sale and distribution of merchandise.

This board would be charged with determining and prescribing the methods to be used by the various government agencies in making and maintaining inventories of property and shall determine what property held by these agencies should be sold or leased and shall advise RFC of all such determinations.

Under the section headed "Duties of Governmental Agencies" the bill provides for the maintenance of uniform and accurate inventories of property by the agencies and requests cooperation of the agencies in the determination of surpluses as well as the sale of such property.

Property which is classed as surplus wil be sold or leased by the RFC. An important feature of the bill is the section which provides for the setting up, by RFC, of advisory committees for each class of available surplus property. The members of these committees are to be selected from persons who are familiar with the handling and marketing of such property. RFC when disposing of property is required, under the bill, to consult with the appropriate committee or committees on questions of price, time, method and manner of sale.

The bill, introduced by Chairman Patman on Dec. 18, charges RFC with the following responsibilities in the disposition of surpluses:

1. Distribution of such property shall be made through established trade channels.
2. The acquisition of large quantities of such property for speculative purposes should not be permitted.
3. Surplus property should be sold or leased at prices low enough to achieve their disposition, but high enough to enable the United States to secure a fair return.
4. The prices at which any particular property or class of property is sold or leased should be uniform.
5. The sale or lease of surplus property should be at a rate which will not unduly disrupt trade and commerce.
6. Disposition of property should take into consideration the establishment of small business enterprises and the strengthening of already existing small businesses.
7. All sales are to be made in accordance with regulations set up by the Surplus Property Board and property is to be advertised for competitive bidding, except in cases where the board determines that competitive bidding would be contrary to the public interest.

The bill also gives the board authority to dispose of property which is not salable, or for any other reason impracticable to sell or lease under the provisions of the act.

Representatives of the machine tool industry, including manufacturers and dealers, were in unanimous agreement on the bill and have agreed to actively support its passage. They also urged the Committee to push the bill through the House as soon as possible. Mr. Patman said he expected the Banking and Currency Committee to begin hearings on the measure very shortly and that he would urge action as soon as possible. This latter committee will report the bill to the House. The House Small Business Committee, being a special committee, has no authority to report bills.

George R. Shuman, vice-president, Prussian Machinery Corp., Detroit, and Burrell Wright, Esq., representing the machine tool group, presented testimony of a similar nature in outlining the problems confronting the machine tool makers.

Mr. Shuman told the Committee that $3,000,000,000 worth of machine tools had been built in the last three years, which is more than 15 times a normal year's production. In the light of these facts he said that HR 3875 was the "first constructive step toward their problem."

Mr. Shuman asked the Committee to allow the personnel of the machine tool industry to handle the disposition of surplus machinery. It was his view, through his experience in OPM, WPB, OPA and Army Ordnance, that the Government did not have the proper trained men to do the job. Testimony by later witnesses seemed to convince the committee of the validity of this argument.

Mr. Shuman also said that definite commissions should be paid to dealers who are able to dispose of machines for the Government, provided the dealer has a purchaser for the machine. He also urged reallocation of all usable machines, whether new or used, provided these machines would be put to use, and not stored. After prolonged discussion between industry representatives and the Committee it appeared that the committee was favorable to these suggestions and would probably incorporate them in a revised bill.

Additional suggestions by Mr. Shuman and reiterated by other industry members include: listing and cataloging of all machinery held by the Government; such a catalog should be distributed to all manufacturers and dealers; the newest and most usable machines not to be exported and those exported to be sold at manufacturers' standard prices; used machines to be sold by regularly constituted dealers within the industry; and prices should be established on a base of machinery of equal value.

THE IRON AGE asked members of the committee about their attitude respecting exportation of machine tools and found them in solid agreement that the best machine tools, as well as the latest models, should be retained in this country.

R. A. Vine, Vine Machinery Co., Detroit, presented the dealer's side of the problem. Mr. Vine objected to the present system which requires three competitive bids on the sale of government machinery that is to be resold. He contended that this would permit machinery to fall into the hands of speculators and seemed to favor sales on the basis of individual machinery for a specific use. Committee members were warm to this proposal.

Mr. Vine also asked the committee to strengthen the portion of the bill which requires accurate inventories to be maintained. He requested adequate technical descriptions so users will know exactly what is available

and can request such machinery as they can use, rather than have it bought up by "traders" who happen to be on the spot. He intimated that the recent Detroit fiasco evolving around Army sale of machine tools could have been avoided had adequate descriptions been available.

When told that it might take six to eight years to dispose of the surplus machine tools available at the war's end, the committee members seemed to favor a slow, orderly disposal.

In emphasizing the size of the problem, Mr. Shuman estimated that the automotive industry would only be able to utilize 10 to 20 per cent of government machine tools in their plants.

Citing specific examples, Mr. Shuman said that General Motors would be able to buy approximately 15 per cent of the 55,000 government tools now in its plant, while Chrysler would be able to use 20 per cent of 19,000 government tools.

Effect of Tool Exports Examined

Washington

• • • **While exports** of machine tools to United Nation's countries have undoubtedly been necessary to the successful prosecution of the war, one effect at least will be the shutting-off of normal peacetime markets, according to WPB officials.

While machine tool exports increased in 1941 over the 1939 figure — the shipments being $93,404,000 in 1939 and $200,190,000 in 1941—the downward trend in foreign demand is illustrated by the net decrease to $159,340,000 in 1942.

For the year ended December, 1943, exports will be up again to about the 1940 level of something over $200,000,000.

In 1939, the United Kingdom bought $25,570,000 worth of tools. In the first real production year of 1940 for the British dominions, more than $125,000,000 of tools were purchased from the United States which is five times the 1939 dollar value.

The United Kingdom imported approximately $124,000,000 in 1941 and $77,359,000 in 1942. Indications are that approximately the same amount of imports in 1943 were sent to the United Kingdom.

The declining demand in the last two years for which statistics are available illustrates that even under Lend-Lease, England and her dominions have an ever-decreasing need for machine tools.

On the other hand, Canada has been shipped about 29 times the 1939 value of machine tools in the past three years, about $114,000,000. While shipments to Russia are less than the imports of United Kingdom, Russia has received approximately $150,000,000 worth of machine tools and demand for this equipment seems to be increasing.

Complete Government Control of Machine Prices

• • • Section 801 of the proposed Revenue Act of 1943 (H.R. 3687) as reported to the Senate, if enacted, will allow any government procurement officer to set any price he pleases on machinery purchased for the government or by any contractor or subcontractor, without any consideration of existing prices or manufacturing costs. It is legalized confiscation.

Here are the facts:

Section 9 of the Selective Training and Service Act of 1940, already establishes the right of the Secretary to set what he considers a fair price on articles or services required by the government, and compels the acceptance of the contract.. But there is no explicit authority to delegate this power and it affects prime contracts only.

The pending Revenue Act of 1943, as passed by the House, in paragraph b-403-f-1 provided that "whenever, in the opinion of the Secretary of a Department the price under any contract with such Department or subcontract which affects such Department exceeds a fair price, the Secretary may require the contractor or subcontractor to negotiate to fix a fair price thereunder. If an agreement is not reached, the Secretary by order may fix the price which he determines to be a fair price for performance under such contract or subcontract after the date of the order."

This and all other references to "forward pricing" were eliminated by the Senate Finance Committee, who have, however, added the new "Section 801" to the bill.

This new section is not confined to the forward pricing of "contracts" and "subcontracts" as defined in the amendments to the renegotiation act, nor is it subject to any of the other restrictions embodied in that amendment. It empowers any procurement officer to whom the secretary may delegate this authority to set the price on any contract or subcontract for services or articles directly or indirectly required for the war, all the way back to the mine.

If the price is too low, suit may be brought in "any appropriate court" (the Court of Claims). This leaves to a supply contractor no practical remedy, since he can not bring suit on each of several hundred orders.

This bill when passed by the Senate, will go to conference, and the conference committee will be made up of members of the Senate Finance Committee and the House Ways and Means Committee. We attach a list of these men. We suggest that you write to each of them expressing your opinion of Section 801 of the Revenue Act of 1943, and that you consult or write to the Congressmen and Senators from your district if they are not on these two committees. In view of the existing provisions of the Selective Training and Service Act of 1940, this sweeping extension of authority is entirely unnecessary.

—The Editor.

Typical Strikes That Public Seldom Hears About Listed, Indicating "Battle of Home Front" Is No Idle Phrase

• • • **One aspect** of the war effort that never will be revealed fully is the damaging effect of minor strikes, slowdowns, absenteeism and kindred actions arising from controversies that fail to make the headlines. The "diary" reproduced in part below is an example of what many companies have been up against in their effort to help win the war. Timken's problems in this respect are by no means abnormal.

Washington

• • • **The following list** showing the war and pre-war record of labor, in part, in the plants of Timken Roller Bearing Co. was furnished the Smith House Committee to investigate the acts of executive agencies beyond the scope of their authority.

The evidence was introduced by the Timken Co. on Dec. 6 at hearings presided over by Representative Howard Smith, Democrat of Virginia, in which the legality of maintenance of membership clauses ordered incorporated in contracts by the War Labor Board was at issue. The exhibit listed strikes since 1937 only, 1943 strikes are listed below.

The number of strikes increased after December, 1941, the month in which the leaders of organized labor gave the government their "no strike" pledge.

14. **March 15 to 18, 1943**
25,790 man hours lost
Gambrinus Bearing Factory. Refusal of screw machine operators to work with and teach negroes who were upgraded to machine helpers.

15. **April 2 to 11, 1943**
36,875 man hours lost
Gambrinus Bearing Factory. Protest over union's withdrawal of the membership of an employee and his discharge by the company in accordance with the directive of the National War Labor Board.

16. **April 1, 1943**
54.6 man hours lost
Columbus Plant. Department 71. 14 men stopped work from 11.00 to 11.50 P.M. Department 72. 31 men stopped work from 11.00 P.M. to 12.24 A.M. Protest against swing shift.

17. **April 2, 1943**
46.8 man hours lost
Columbus Plant. Department 71. 12 men stopped work from 7.00 to 8.18 A.M. Department 72. 24 men stopped work from 7.00 to 8.18 A.M. Protest against swing shift.

18. **April 19 to 20, 1943**
49.4 man hours lost
Columbus Plant. Department 72. 26 men stopped work from 11.00 P.M. to 12.50 A.M. Protest against swing shift.

19. **May 1, 1943**
88 man hours lost
Columbus Plant. Department 72. 11 men did not work. Protest against swing shift.

20. **May 2, 1943**
1 man hour lost
Columbus Plant. Department 72. 5 men stopped work from 7.00 to 7.12 A.M. Protest against swing shift.

21. **May 12 to 15, 1943**
5,023 man hours lost
Columbus Plant. Departments 71 and 72. Protest against swing shift.

22. **May 18 to 19, 1943**
480 man hours lost
Canton Bearing Factory. Department 73. 64 men failed to report for work in protest against staggered layoff of 19 men due to shortage of stock caused by strikes at Gambrinus in March and April.

23. **May 24 to 26, 1943**
35,010 man hours lost
Canton Bearing Factory. Departments 73, 84, 76, 74, 78 and 59. Protest against the employment of females replacing males as machine operators.

24. **May 26, 1943**
55 man hours lost
Camden Avenue Plant. 22 women refused to work and were ordered to leave the plant. Protest against delay of War Labor Board in acting on union's demand for 5½ cents per hour wage increase.

25. **May 27 to 29, 1943**
1288.2 man hrs. lost—strike
1322.5 man hrs. lost—discipline
2610.7 man hrs. lost—total
Mt. Vernon Plant. 101 employees left the plant in sympathy with 54 employees who were disciplined for smoking by a three-day layoff.

26. **May 31 to June 1, 1943**
234 man hours lost
Columbus Plant. Department 86. Refusal to meet wage demands of chip-washer attendants.

27. **June 9, 1943**
7.5 man hours lost
Gambrinus Bearing Plant. Department 61. 15 Gridley Screw Machine operators stopped working for ½ hour in protest against overtime work of an employee who previously had assisted negro trainees. They also demanded an 8-hour day, 48-hour week instead of a 7½-hour day, 45-hour week.

28. **July 8, 1943**
156.8 man hours lost
Canton Bearing Factory. Departments 67-1 and 67-2. 33 men refused to work and were ordered to leave the plant. Protest against a 7½-hour day and a ½-hour lunch period in these predominately female departments.

29. **July 13 to 17, 1943**
17,176 man hours lost
Canton Steel Mill. Some of the recorders in Department 190 refused to work on a 3½ crew schedule which the Company installed to comply with an order of the War Manpower Commission to establish a 48-hour week. Nine departments struck in sympathy.

30. **July 19 to 20, 1943**
228.3 man hours lost
Gambrinus Steel Mill. Tool Steel Mill Department 736. 20 men struck because they refused to continue to work on other jobs at their regular rate of pay.

31. **July 21, 1943**
13.5 man hours lost
Canton Bearing Factory. Department 73. 27 operators of Landis and Norton O.D. cone grinders stopped work from 8.00 to 8.30 a. m. in protest against a new system of checking grinding time and capacity of the machines.

32. **Aug. 13, 1943**
12 man hours lost
Columbus Plant. Department 72. Refusal of negro female operators to harden Cone No. 5557 which they claimed was too heavy.

33. **Aug. 26 to 28, 1943**
1234 man hours lost
Canton Steel Mill. Machine Shop Department 181. Refusal to work with negro female machine operator trainees.

34. **Sept. 7, 1943**
270 man hours lost
Canton Steel Mill. Inspection Department 133. Refusal to work with office employees who were assigned to work part-time in the department. Demand for Sunday work and double-time.

35. **Oct. 12 to 16, 1943**
21,516 man hours lost
Canton Bearing Factory. Department 59. Demand of women for piece work rates on seven new Type H Landis grinders. Departments 33, 34, 73, 76, 79, 84 and 91 struck in sympathy.

36. **Oct. 14, 1943**
260 man hours lost
Canton Steel Mill. 10-in. Mill Department 136. 40 men on the 12 to 8 turn stopped work at 1.30 a. m. due to the absence of 4 men of the crew of 48 men.

37. **Oct. 25, 1943**
43.2 man hours lost

G. E. and Bell Cooperate on Design of Jet Propelled Airplane

ITALIAN CAMPINI PLANE: *This Campini jet propelled plane made a flight from Milan to Rome, Italy, at an average speed of 130 miles per hour, with one stop enroute in 1941. Previously, it had flown for 10 min. at Milan in August, 1940.*

DESIGNER: *Harland M. Poyer, chief engineer of Bell Aircraft's Niagara Frontier Division, was responsible for the design of America's first jet propulsion airplane. First flown on Oct. 1, 1942, the ship powered by two jet propulsion engines designed by General Electric Co., has since made hundreds of flights.*

New York

• • • **Behind Gen. H. H. Arnold's** recent announcement that American-built jet propulsion powered fighter planes had passed experimented tests is a background of many months of close cooperative effort between British and American air forces, the Bell Aircraft Co., and General Electric Co. Jet propulsion as such is by no means a new idea. Experiments were made down through the years using various fuels, but one of the best known developments was the Italian Caproni-Campini jet propelled airplane. (THE IRON AGE, April 16, 1942, page 64.) First test flights of this ship were made in August, 1940, at Taleido Airport Milan, Italy. An improved model, a two-passenger 11,000 lb. ship, was later developed. For propulsion, air enters a nose duct and passes into a two-stage centrifugal compressor. The air is then ejected through a smaller duct with a controlled outlet behind the tail.

Other countries have worked on jet propulsion, but in recent years, of course, the war shrouded any developments with secrecy. The latest investigation of jet propulsion made public by the National Advisory Committee for Aeronautics in the United States, prior to the war, reported that after full developmental work was completed the system could become 70 to 80 per cent efficient at speeds *above those of sound.*

The British Royal Air Force, in July, 1941, transmitted to the U. S. Army Air Forces information on a jet propulsion engine which had flown successfully two months before, and the engine used was sent to the United States and turned over to General Electric Co., in September, 1941.

In less than six months from the time General Electric Co., received the engine, the first of a number of jet propulsion engines of modified design was ready for test. Bell Aircraft Co., built a plane around this engine design, suitable to operate with two of these units. In October, 1942, the first successful flight in this country in this type of ship was made. Since that time, this jet propelled ship has made hundreds of flights, and, as Gen. Arnold pointed out, there is a great deal of hope being held for this type of aircraft for both military and commercial use.

Service Act Opposed; More Strikes Cut Into Output

• • • **On the** labor front this week, opposition to the President's demand for a national service act was becoming broader. Wilfred Sykes, president of Inland Steel Co., one of many executives attacking the proposal, stated "there is no substitute for the initiative and willing effort of free men and women."

The threat of unemployment in the present war economy, according to Dr. W. P. Edmunds, area director of the WMC in Cleveland, is just a rumor. Layoffs in that area have totaled only 1000 (Thompson Products Co.) and reemployment of these workers has been rapid. Requests for workers on file at present in the Cleveland USES office total about 18,000, some 12,000 of which are for men.

Meanwhile organized labor continues through its usual turmoil. The Weirton Independent Union, Inc., vs. Weirton Steel Co., fight over a 22c. per hr. raise will go to the WLB soon; 48 scarfers held up 13,000 tons of ship plate production at Carnegie-Illinois' Irwin Works by striking; the annealing department of Allegheny-Ludlum's Leechburg mill was forced down when 63 men struck; and 200 from the Youngwood, Pa., plant of Robertshaw Co., struck to protest the USWA's suspension of seven local union officers who were accused of leading an unauthorized strike at the company's Scottdale and Youngwood, Pa., plants.

Pressed Steel Car Co., McKees Rocks, Pa., was hit by a strike when 150 workers walked out protesting high work requirements, and Bethlehem Steel Co.'s plant near San Francisco just recently resumed work after a stoppage involving more than 500 USWA members.

Simplified Pricing Method Set On Steel Sales from Warehouses

Washington

• • • **A simplified** procedure of pricing steel products sold from warehouses in carload lots was announced last week by the OPA. Establishment of the new pricing method coincides with the WPB announcement that beginning Jan. 13 warehouses no longer need to obtain certification of shipments of any amount of steel products they wish to ship from warehouses. Heretofore, they had to obtain certificates for amounts of 40,000 lb. or more.

The new method permits warehouses to calculate ceilings on carload shipments, whereas they previously had to obtain certification from WPB on such shipments and then apply to OPA for the ceiling price that could be charged for it.

The level of prices under the new change remain substantially unchanged. The new procedures are as follows for pricing carload shipments.

Standard wire nails, annealed smooth merchant quality wire, and galvanized smooth merchant wire: On shipments within the city or free delivery area of warehoused products, the maximum delivered price shall be the l.c.l. ceiling price plus extras, less a deduction of 15c. per 100 lb. On shipments outside the free delivery area, the maximum delivered price shall be the carload price plus the carload rate of freight from shipping point to destination.

Galvanized roofing and siding, and merchant wire products including poultry netting, screen cloth, and hardware cloth: The maximum delivered price is established as the higher of the following two alternatives—(1) The mill straight carload price to a jobber at the customer's destination, based on the governing basing point plus a 15 per cent mark-up, or (2) the mill straight carload price to a jobber at the shipping point, based on the governing basing point, plus a 15 per cent mark-up less a deduction of 20c. per 100 lb., plus the carload freight rate from shipping point to destination.

Secondary or rejected iron or steel production and re-usable iron and steel products not specifically priced by OPA: The maximum delivered price for these products will be the mill price and if that is not satisfactory to the seller, a proposed price may be submitted to OPA for approval.

Secondary and rejected hot rolled sheets, cold rolled sheets, galvanized sheets, cold rolled strip, hot rolled strip, and tin mill black plate: The maximum delivered price is fixed as the established ceiling price for 39,999 lb., except where the carload freight rates shall be used as freight factors rather than l.c.l. rates.

Basic heavy line steels: The maximum delivered price is fixed as the established ceiling price for 39,999 lb., except that carload freight rates shall be used in computing freight rather than l.c.l. rates.

Pipe and tubular products: Destination prices are set for each product on a similar basis to that provided for l.c.l. shipments except that the distributor's percentage mark-ups are lowered about 5 per cent. For carload shipments, however, a maximum freight absorption is established.

All other products for which carload prices are not established by the foregoing methods: The maximum delivered price for these products, if they were sold on a quantity plan on April 16, 1941, is established as the maximum delivered price for 500 lb. quantity, less 35c. per 100 lb. It is provided, however, that if the applicable price for a product is lower than the 500 lb. quantity price less 35c. per 100 lb., the lower price shall be the ceiling for the item. For products not sold on established quantity plans on April 16, 1941, the maximum price is fixed as the l.c.l. price less 15c. per 100 lb.

Under the new set-up, each seller must record all purchases and sales for OPA inspection. Sellers are no longer required, however, to submit to OPA monthly reports of sales of 40,000 lb. or more to one customer in any semi-monthly period. Sellers must supply buyers with complete invoices of shipments. Sub-dividing order to give sellers higher prices permitted on smaller shipments is specifically outlawed.

The new ceiling prices for carload shipments are applicable to material put through "the operations commonly known as the warehousing of iron and steel products," and for all material whether sold or shipped in carload or in l.c.l. quantities which has not been warehoused, no higher than mill prices may be charged.

o o o

Electric Output in '43 Shows Huge Gain

Pittsburgh

• • • **Electric** steel production, in 1943, not only set a new record but the mark probably will remain an all-time high for a few years. The 1943 production of 4,621,462 tons of electric steel represents roughly an increase of about 333 per cent over 1929 output.

On the basis of percentage of capacity operations, electric steel output last December reached its lowest point since Pearl Harbor, with operations averaging 87.2 per cent of rated capacity. Tonnage output is expected to decline over the next three months. As explained in previous issues, many customers are free to revert to the open hearth product if they so desire.

In the first quarter of 1942, the percentage of alloy steel made in the open hearth was 67 per cent. By the first quarter of 1943, the open hearths were turning out 75 per cent of alloy steel production. The trend during the third quarter of 1943 was downward for the participation of the open hearths, when they produced about 69 per cent of the alloy steel. The heavy pressure during October and November for transferring alloy steel to the electric furnaces made itself felt, as far as the open hearths were concerned, since November data indicates that the open hearths produced only 63 per cent of the total alloy steel made in that month.

Most observers are aware that even before the war ends there will be drastic competition for available alloy steel business between open hearths and the electric furnaces. Reports have been current that at least one company has, in a technical manner, eliminated the $10.00 premium for electric steel.

AIRCRAFT MODIFICATION: *To meet the needs of services in various theaters of combat, military aircraft modification centers are maintained. Here, at the Daggett, Cal., "mod" center an astro-dome on a temporary mount is being put into position on the gunner's upper escape hatch. The hatch will be stowed in the bomb bay loading platform.*

Wide World Photo

Senate Gets Plan to Help Build Corporate Reserves for Post-War Era

Washington

• • • **Taking up** the renegotiation provisions of the tax bill, the Senate has before it an amendment which is designed to assist war contractors in financing conversion to peace production. It was offered by Senator Truman of Missouri at the request of Senator Hatch of New Mexico. It would permit the setting aside as reserves up to 20 per cent of the normal net income tax to be invested in a special issue of non-negotiable, non-interest-bearing Government bonds. These bonds would be redeemable 18 months after the war. Upon redemption the income from the bonds would be subject to the Federal tax in effect at that time.

While the proposal has been received with considerable favor by the Senate, it is reported that final action on it will come either in the nature of a compromise of some sort or that it may be made the subject for separate legislation. Whether the legislation may be enacted is clouded by the reported opposition of the Treasury Department. The Treasury is said to favor aid to postwar industry by extension to three years of the provisions for a two-year carry-back, as well as carry-forward of losses, with the requirement of a cash refund by the Government in the event of application of carry-back provision.

At the war's end, many contractors, individual and corporate, Senator Truman told the Senate, will doubtless suffer large inventory losses. He pointed out that they feel a strong moral obligation to make substantial severance payments to unneeded wartime employees after cancellation of war contracts.

Headed by Senator Truman, the Special Committee Investigating the National Defense Program through its staff has made a survey within the past six months of the postwar reserve requirements of 100 war contractors.

Senator Truman said that the most striking feature of the replies is not the amount of money which will be required, nor the variety, but the complete uncertainty of the contractors themselves as to how much will be required and the purposes for which it will be required. Of the 86 companies whose answers have been tabulated, the Senator said, 28 have literally thrown up their hands and said they have no idea of any kind upon which they can make even a remote estimate as to how much money they will need or what they will need it for.

Said Senator Truman: "At one extreme we find the Sun Oil Co. of Philadelphia, whose executives stated that they did not think the company would require any substantial amount of money for postwar reconversion. As illustrations of the other extremes we find that the General Motors Corp. expects to need $150,000,000, General Electric Co. expects to need $50,000,000, Ford Motor Co. expects to need $70,000,000, Douglas Aircraft Co. expects to need $63,000,000, the Glenn L. Martin Co. expects to need $105,000,000 and numerous other companies expect to need only slightly smaller sums.

"Two points are perfectly clear as a result of this study: First, any provision designed to solve the postwar reserve problem must be extremely flexible. Second, any provision to be effective must be reasonably self-administering and must avoid, insofar as possible, a requirement of determination by Government administrators of the amount of money needed."

Supreme Court Gets Mine Wage Case

Washington

• • • **Arguments** were heard last week by the Supreme Court in the so-called portal-to-portal pay case in which steel companies, appealing from a lower court decision, maintained that iron ore miners are not entitled to underground travel time under the Federal Wage Act. The Act provides for a standard 40-hr. work week with time-and-half pay for overtime.

Directly, the cases concern employees of the Tennessee Coal, Iron & Railroad Co., the Republic Steel Corp., and the Sloss-Sheffield Steel & Iron Co., who operate 13 underground iron ore mines in Jefferson County, Ala. More broadly, however, decision in the case is awaited, not only because of its effect on steel costs, but also by reason of the fact that it probably will be a determining factor in the portal-to-portal case now in the lower court in which the United Mine Workers are demanding travel time pay for mining coal. In the new contract UMW was granted time allowance by the Government.

The Fifth Circuit Court of Appeals has held that the time spent underground by ore miners, aside from the lunch period is working time under the Wage-Hour Act. The Government, through Solicitor General Fahy, supported the position of the miners, who were represented by Crampton Harris.

Appearing for the Tennessee Coal, Iron & Railroad Co., Attorney Nathan I. Miller, former New York governor, contended that the Wage-Hour law did not provide for portal-to-portal pay and said that no allowance for such pay is made in the contract producers have with iron ore miners. Taking the same position, Attorney Borden Burr, representing the Republic Steel Corp., said that Congress in enacting the law did not intend that the accepted method of computing wages should be changed or that portal-to-portal pay be required.

"The facts show that from time immemorial underground portal-to-portal time has never been paid for, and the contracts, without exception, are based on that proposition," Mr. Burr said. "Congress could not have intended that these contracts be wiped out."

Indicating that a more liberal construction of the act might be made, Justice Frankfurter declared that since Congress did not define the term "work-week," it apparently had left the definition to be determined by "adjudicatory" processes. The Justice pointed out that if the court defines "work-week" as including travel time then "no contract can set this aside." Mr. Harris maintained that America is the only country that does not have portal-to-portal pay.

The arguments brought about the question of the beneficiary from a workman's lunch, the employee who eats it or the operator. Justice Rutledge had inquired whether all the time men spent underground should be considered as time spent in behalf of the employer, including the eating period.

Mr. Harris said that he did not think a man, while eating lunch is doing anything for his employer. Justice Roberts suggested that the employees could not work in the afternoon if they did not have lunch.

Jahco Ordered to Pay $7,000,000

Washington

• • • **Jack & Heintz, Inc.,** Cleveland, aircraft accessory manufacturers whose 84-hr. work week with high take-home pays and bonuses was the subject of Congressional investigation in March, 1942, will reduce by $7,000,000 the cost of products sold to the Government during the year ending Oct. 31, 1942. After tax adjustments on this amount, the net reduction to the Government will be about $1,750,000. Since the company has refused to make this refund to effect this reduction voluntarily, the Hon. Robert P. Patterson, Undersecretary of War, directed the repayment by the company to the Government of these excessive profits, as authorized by the price adjustment statute.

Jack & Heintz which in the past has voluntarily made several quite drastic reductions in price of products purchased by the Government, protested the renegotiation of this latest amount. Judge Patterson stated that "among the factors considered in making this determination were the satisfactory production accomplishment of the company and the success of the management in meeting production schedules. However, the fact that a company operates satisfactorily cannot be allowed to serve as an excuse for war profiteering. It must be borne in mind that the company's business was financed principally by the Government, which purchased its entire output."

During the 1942 fiscal year, Jahco made a profit of $8,361,000 before taxes. This was the figure used in renegotiation and expense deductions allowed by the Treasury Department were similarly allowed in renegotiation, according to the War Department.

William S. Jack, president, charged that the administration was flirting with a revolution by such arbitrary practices because soldiers coming home after the war will find factories without money for postwar reconversion. The men will object when offered jobs in a glorified WPA.

Lake Shipments Near Record Despite Adverse Conditions

Cleveland

• • • **Despite a shipping** season that was far from ideal, Great Lakes carriers transported the second largest tonnage in their history during 1943, according to A. T. Wood, director of the ODT's Great Lakes division. The bulk freight traffic covering the four major commodities, iron ore, coal, grain, and limestone, totaled 175,690,915 net tons. This tonnage was surpassed only by shipments in 1942 which amounted to 182,731,421 net tons.

From navigational and dock operating points of view, the Lake season was the most unsatisfactory encountered in nearly 20 years. Ice conditions in the spring, prolonged dense fogs in early summer, and an early winter characterized by below-zero temperatures in November were deterrents that entailed a full month's shipping loss. Frozen ore that had to be thawed before it could be loaded into the vessels also slowed up loading operations.

Shipments are shown in table below.

COMMODITY	1943 Net Tons	1942 Net Tons
Iron Ore	94,533,434	108,125,990
Bituminous Coal		
From Lake Erie	46,059,334	47,814,592
From Lake Ontario	4,069,396	3,624,256
From Lake Michigan	1,062,371	185,000
Anthracite Coal		
From Lake Erie	680,929	909,949
From Lake Ontario	155,730	334,773
Grain*		
From Lake Michigan	154,240	428,295
From Lake Superior	11,655,876	8,073,291
Limestone	17,339,675	18,570,048
TOTAL	175,690,915	182,731,421

* Equal to 421,961,725 bu. in 1943 and 299,237,926 bu. in 1942.

WPB Tightens Controls On All Contract Letting

Washington

• • • **While WPB** is lifting its restrictions on materials and facilities, as enumerated in its L and M orders, it plans to draw in the reins smartly on the actual letting of contracts. This will apply not only to war contracts but also to the letting of contracts for production of civilian type goods. These controls are to be exercised through the policies laid down on controls affecting manpower. The new program is outlined in the recently issued General Operations Circular No. 193. Controls over production, materials and facilities are tightened. Coincidentally, War Manpower Commission has released an appeal to the Smaller War Plants Corporation to assist in the actual shifting of contracts from certain areas and placing such contracts or subcontracts with plants where the labor supply is not restricted. The WMC will certify the short labor areas and the availability of labor; the SWPC will certify the plant facilities that are available for taking on subcontracts and will certify the subcontracts that might be shifted.

WPB Relaxes Limitations On Use of Alloy Bearing Scrap

Washington

• • • **Low alloy steel** scrap may be used in the manufacture of carbon steel at the discretion of the mill, according to the WPB, because of shortages of carbon steel scrap and the plentiful supplies of alloy scrap. In an announcement last week, WPB stated that copper scrap may be used in melting carbon steel, and further lifting of limitations on melting alloy scrap were announced this week. The newly amended order (M-24-c) provides that alloy scrap shall be melted only in production of alloy iron or alloy steel except:

1—Chromium or chromium-vanadium steel scrap with 1.65 per cent chromium maximum.

2—Chromium-molybdenum steel scrap with 0.27 per cent molybdenum maximum.

3—Nickel-chromium-molybdenum steel scrap, with maximums of 0.70 per cent nickel; 0.60 per cent chromium; and 0.25 per cent molybdenum.

Dealers and producers of alloy scrap are still required to segregate it, except producers turning out less than 10 tons of scrap a month which has low alloy content.

DESCALED IN 5 MINUTES

WITH NO DIMENSIONAL CHANGE

HAS YOUR DESCALING PROCESS ALL THESE FEATURES?

- Rapid and economical
- No dimensional changes
- No etching
- Produces chemically clean surfaces
- Easy to operate
- Can be fully conveyorized
- Long solution life

2496 teeth to each of these pieces!

And a whole tank load of them can be cleaned in the same 5 minutes. What plant manager does not value such a saving of time these days? That's a reason why so many companies are using the Bullard-Dunn Process for descaling heat-treated work. It not only saves time—it cleans parts with tiny crevices, such as those pictured here, as rapidly and thoroughly as flat pieces. And it leaves surfaces chemically clean, ready for any subsequent operation. See the list above for other important advantages.

Write today for booklet; send us your samples, too, if possible—and you'll be on your way to "a better job, in shorter time".

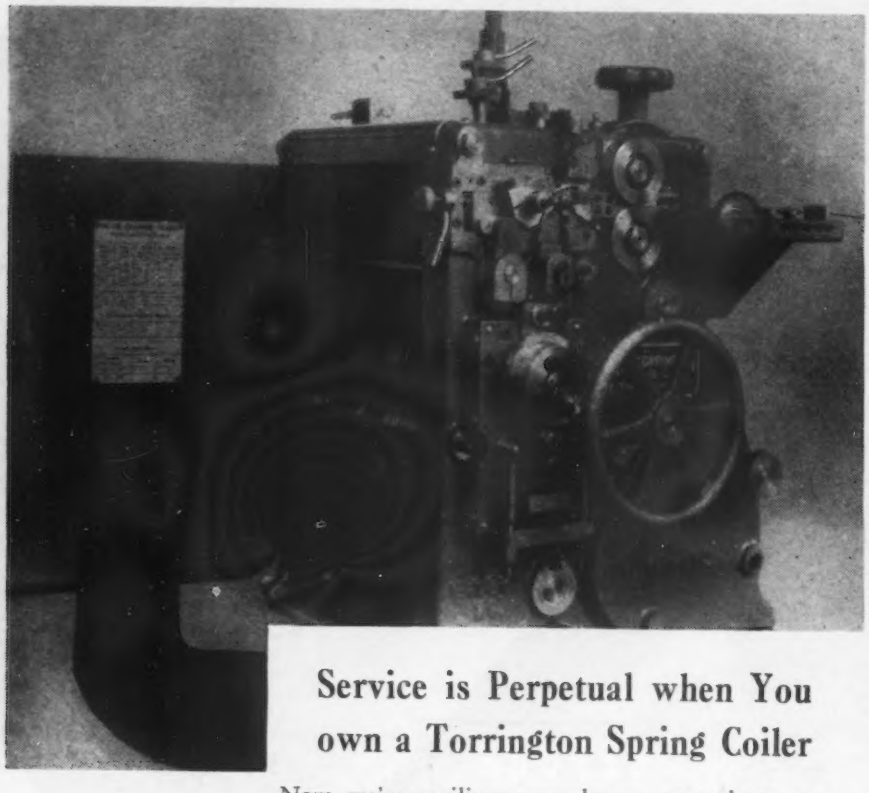
TORRINGTON
Force Feed Mechanical
LUBRICATOR

Positive, never-failing force-feed bearing lubrication. Design flexibility also enables power takeoff from machine to front, rear, side or bottom by ratchet or rotary means. For complete information write, stating number of feeds and drive desired.

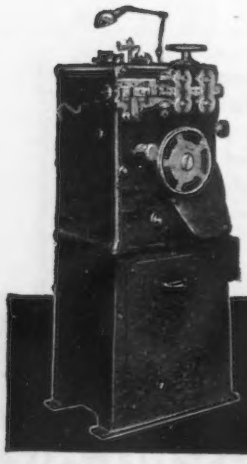
THE TORRINGTON
MANUFACTURING CO., TORRINGTON, CONN.



Service is Perpetual when You own a Torrington Spring Coiler

Now we're mailing new change gear charts to every owner of a Torrington Coiler. Made of white plastic, clearly, cleanly printed, there's one for every model we make. Carefully kept sales records will be referred to, and every owner will soon receive a new chart for each machine he owns.

Besides the little things, which come to Torrington Coiler users without their asking for them, there's always engineering help available upon request. You have only to ask, and we'll gladly help you to increase the utility of your coiler and maintain its accuracy.



THE TORRINGTON
MANUFACTURING COMPANY
TORRINGTON, CONNECTICUT

Restrictions Removed on Warehouse Idle Stock Sales

Washington

• • • **All restrictions** on the purchase of idle and excess general steel products by warehouses or dealers were removed by WPB this week in an amendment to order M-21-b-1. The amendment also permits any person to qualify as a dealer, even though he was not in business on Aug. 9, 1941 as required in the original order. Dealers may not buy from producers except for direct shipment to consumers; they may purchase idle and excess stocks; and they may purchase from other distributors. No authorization is required from WPB to begin operations as a dealer, but such operations must be in conformity with Priorities Regulation No. 13, which outlines procedures under which materials may be sold by persons not in the regular business of selling such materials.

Warehouses may purchase idle and excess inventories of any type without limitation, but in re-ordering material from producers they are still confined to the products in which they dealt during the base period. Under the amended order, dealers as well as warehouses may order steel from producers or suppliers for direct shipment to customers on the basis of the customers' allotment numbers. Warehouse reports on form WPB-2888 will henceforth be required quarterly instead of monthly. No reports are required of dealers, but records are subject to WPB inspection.

Price Briefs

• Amdt. 3 to RMPR 125 makes a readjustment in the maximum prices for copper and copper base alloy castings that will restore part or all of the reductions made last February in ceilings for some types of castings. Order effective Feb. 1. (Release No. OPA-T-1618)

•

• Amdt. 20 to RPS 49 simplifies procedure for pricing steel products sold out of warehouses in carload quantities. (Release No. OPA-T-1640)

•

• Amdt. 1 to MPR 43 places used steel drums under price control in Puerto Rico.

•

• Amdt. 26 to Order A-1 of MPR 188 provides manufacturers on 1000 different kinds of manually-operated valves a uniform method of establishing maximum prices for sales to producers of various types of appliances. (Release No. OPA-3808)

•

• Amdt. 10 to RPS 41 makes an upward adjustment of 17 per cent in the ceiling prices for miscellaneous freight car castings to compensate for increased production costs, principally labor. (Release No. OPA-3812)

•

• Order No. 28 under Section 1499.3(c) of the GMPR sets prices for transfer of brass and bronze valve inventories. (Release No. OPA-T-1649)

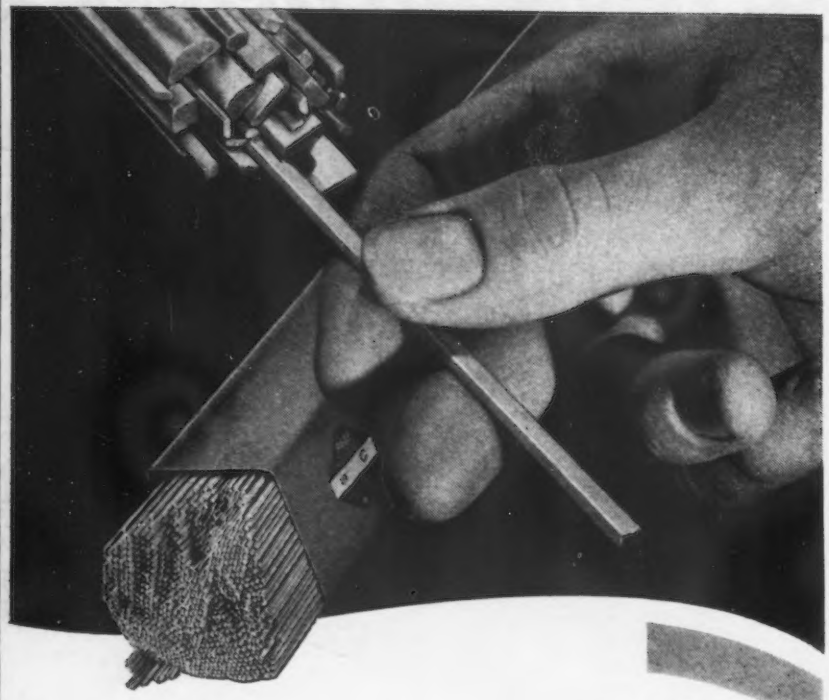
PAGE for WIRE



With mills practically at capacity producing wire for war and for essential industry, users of wire find that there are many things that they can do to conserve essential materials.

SHAPED WIRE: Use standard shapes. That can be done easily. **PAGE** has a wide variety, including ovals, hexagon, octagon, square, channel, keystone, flat, half-round, etc.—in diameters to ⅜"—with end section areas to .250 square inch.

WELDING ELECTRODES: Be certain that electrodes are correct in analysis for the job. Lean toward larger sizes for economy. See that no excess metal is deposited in the weld and that your men use electrodes right down to the holder.

GENERAL WIRE: The situation in such products as Spring Wire, Bond Wire, Telephone Wire, etc., is not subject to early improvement. It continues to be important to check waste.

If **PAGE** experience can help you work out any of these details, we will be glad to cooperate.

to **improve** your product

Pre-Forged to improve your product . . . Pre-Forged to reduce rejects in your plant . . . Pre-Forged to make your job easier and to help you make a better profit. Follansbee's unique Pre-Forging process presents these and numerous other definite advantages.

Follansbee steel is made in small basic open hearth furnaces—poured into small ingot molds—then *forged* into billets by a 1,000 ton press. The pressure exerts a direct kneading action to the very center of the ingot, resulting in a denser, more homogeneous structure than any other process can impart to steel. The uniform cross-sectional structure of Follansbee steels consistently provides high transverse and longitudinal values . . . more uniform response to heat treatment . . . greater resistance to fatigue—hence longer life in your finished product.

Follansbee's exclusive Pre-Forging process assures high quality, sound steels.

Nine-Point Plan Aims at Speeding Termination Payments

New York

• • • A nine point recommendation summarizing ways whereby the procedure for settling terminated contract claims might be made more effective has been issued by the National Credit Office, Inc., here. These recommendations would unify so far as possible the procedures of the various procurement agencies, place decisive authority with the contracting officers, create necessary legislation to implement such procedure, put subcontract settlement in the hands of the prime contractor and guarantee loans against terminated contracts as well as expedited payments.

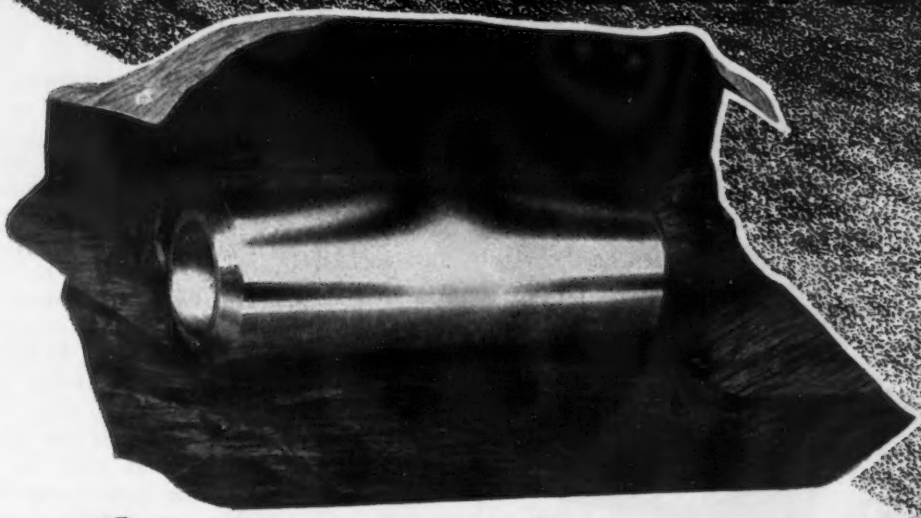
Settlements of terminated contracts may now be effected either by application of the formula which is included in the termination clause of government contracts, or by negotiation. Under the former, the formula most frequently employed specifies that the contractor is to be reimbursed for completed units at the contract price; for his investment in work-in-process and raw materials; for the cost of settling outstanding claims and commitments; and for such profit as may be allowed. The profit allowance is to be determined by approximating the profit that would have been realized were the entire contract completed and multiplying that figure by the percentage of completion of the uncompleted portion of the contract. Thorough audits are conducted. Although this is a satisfactory method in normal times, it became evident more than a year ago it would not suffice under the present volume of cancellations. The government simply does not have the requisite number of auditors necessary to do the job quickly enough.

The basic principles of present termination procedure are sound. The following recommendations suggest several ways whereby that procedure can be speeded up and made even more effective:

1. All procurement agencies should issue manuals outlining their procedure. Contractors should thoroughly familiarize themselves with those provisions so that their claims can be prepared quickly and promptly.
2. Congress is urged to enact legislation recognizing and affirming the authority of the contracting officers to make conclusive negotiated settlements; to provide for speedy partial payments on an installment basis; and to stipulate that contracts subsequently deemed to be informal because of deficiencies in language or form, letters of intent, and contracts not including a termination clause be

CORROSION

THE TOUCH OF DEATH TO STEEL



But This Part Didn't Corrode

For over a year this oil-slushed part has traveled in a packaging engineer's briefcase throughout the United States. It has been unwrapped many times, and touched by hundreds of corrosion-starting fingers in all sorts of weather — then wrapped up again in its original ANGIER INDUWRAP* Inhibitive Dual Wrapper. Not a trace of corrosion developed on its mirror-like surface.

Anticipate now your peacetime needs when ANGIER INDUWRAP will be generally available to industry. Write today for free folder, "The Touch of Death to Steel". It describes the new ANGIER corrosion-preventive method which has revolutionized the packaging of airplane engine and other finished metal parts shipped to fighting fronts throughout the world.

subject to settlement under the same regulations.

3. The Government should not assume liability for sub-contractors' claims. It is not in keeping with our philosophy of business; it would nullify much of the present procedure; and it would be administratively impossible.

4. Prime contractors should be encouraged to speed settlements with their sub-contractors and suppliers without too much dependence on the prior approval of the contracting officer. They have that right—implement it by agreeing on the principles to be used in making the settlements.

5. Contractors should adjust their accounting records wherever feasible so as to use the inventory basis for presenting claims under the negotiated type of settlement. Avoid reliance upon the formula method.

6. The Government should go further in clarifying ambiguous accounting principles.

7. Correlate Government planning for disposal of inventory at the end of the war as far in advance as possible.

8. Standardize the procedure of the several procurement agencies to the extent necessary to make it possible for the contractor to develop all the accounting data required of him from the same set of records.

9. Authorize the procurement agencies to guarantee loans against terminated contracts which are cancelled after the cessation of hostilities.

Termination is new only in its present magnitude. A well defined set of principles had been built up prior to and after the last war. Not until August of this year, however, did the War Department issue its Termination Manual, officially designated as Procurement Regulation 15.

Procurement Regulation 15 is predicated on the belief the contracting officers have the right to bind the Government to negotiated settlements, and as indicated previously, the procurement agencies are firm in their conviction that they do have that right. The recent controversy has, however, created confusion in the minds of the contractors, and has emphasized the possibility that Congress can transfer powers now resting with the Services to the Controller General. To eliminate confusion and uncertainty of this sort, it is urged that Congress specifically recognize and affirm this authority in the contracting officers.

The government—the Prime Contractor—the Sub-contractor. Perhaps no other phase of termination is so broad in its implications and potentialities. Certainly it has already caused a considerable amount of ill-will. A simple statement of the basic facts will be useful in understanding the problem.

1. The government has no legal responsibility or mutuality with sub-contractors. It has no inherent rights whereby it can restrict the amount that the prime contractor is to pay to his sub-contractor.

2. Opposed to this absence of legal responsibility, the government does have a responsibility to itself to discourage the payment to sub-contractors of exorbitant and unsubstantiated amounts for which the prime contractors might seek reimbursement.

3. There are many who advocate the

STEEL MOST VERSATILE OF METALS IS LIMITED ONLY BY MAN'S INGENUITY—

BRIGHT FINISH HOT COATED, SOLDER COATED, ELECTRO-COATED WITH NICKEL, ZINC, COPPER, BRASS, AND LACQUER COATED—IN COLORS

A WIDE SELECTION FOR PARTICULAR APPLICATIONS

Steel has many valuable characteristics as a result of modern steel production and special finishing operations. Thomas specializes in cold rolled strip steel and offers the following refinements:

(1) Accurate gauges
(2) Finishes for painting and plating
(3) Uniform tempers ranging from dead soft to hard
(4) Special edges
(5) Non-scalloping deep drawing qualities
(6) Low and high carbon content
(7) Fine grain for special requirements
(8) Variety of non-ferrous and lacquer finishes.

As a result of this wide range of cold rolled strip steel qualities, Thomastrip has helped many engineers, designers, and fabricators. Many important problems have been solved by Thomas engineers who will gladly help you.

Thomastrip
COLD ROLLED STRIP STEEL

THE THOMAS STEEL CO. - WARREN, OHIO

assumption by the government of the responsibility to the sub-contractor. These include both prime contractors and sub-contractors.

The prime contractors who would like to see the government assume this role primarily are motivated by the hope it would relieve them of a substantial amount of work, and would absolve themselves of any responsibility for dissatisfaction of the sub-contractors with the final settlement.

The sub-contractors who favor this view hold the opinion their chances for a more liberal settlement would be better in dealing directly with the government. There is nothing in experience to substantiate that contention. Others envision the possibilities of credit losses if they must continue to look to their prime contractors for payment.

Today the government rightfully denies any direct liability to the sub-contractors, but does exercise a practical veto power through stipulating it will reimburse prime contractors for settlements with their suppliers, only when those settlements are approved in advance by the contracting officer. The result is the prime contractors as a rule refuse to make any disbursements to their suppliers until that approval has been obtained. Delays are inevitable.

The root of the trouble is the apprehension sustained by the prime contractor that he will be unable to obtain complete reimbursement for what he pays his suppliers. Knowing the basis upon which he will be compensated, he will have no hesitancy in making settlements with his suppliers on that same basis. The government has reiterated its intention of being fair and equitable, and its sincerity has been amply demonstrated in application. If the prime and the sub-contractors will agree to adhere to the same principles in reaching their settlements as used by the government, certainly the same result must be obtained.

The responsibility rests upon the contractor to demonstrate conclusively that his claim consists only of expenses actually incurred and that these expenses are clearly applicable to the contract. Any accounting system that will develop the facts from which that determination can be made is adequate. It is clearly within the right of the government to specify the standards for gaging the accuracy and nonesty of the accounting information and outline those standards in advance so that all who use them may prepare themselves. Even though further clarification is needed, contractors will do

SHE SIMPLY GUIDES AS THE LOAD RIDES

Automatic TRANSPORTER

NO STRAINING--TUGGING--PULLING NOR PUSHING

•

POSITIVE MECHANICAL BRAKE--CONTROLS IN STEERING HANDLE--FORWARD AND REVERSE SPEEDS--FRONT WHEEL POWER DRIVE--SHOCKLESS HYDRAULIC PLATFORM LIFT WITH EASY FOOT CONTROL

• *Miss War Worker and a* TRANSPORTER *can transport the same tonnage of material a given distance that would require the physical effort of three men handling in the conventional way.*

• *The* TRANSPORTER *is built in 4000- and 6000-pound capacity platform type lift trucks for skid transportation and in a pallet type fork lift truck for unit loads up to 4000 pounds on open- or double-faced pallets.*

★ Miss War Worker, whose job it is to transport materials, becomes a high efficiency employee with a TRANSPORTER. Her work consists only of guiding the TRANSPORTER and walking along with the load. This mechanized material-handling truck transports tons of bulk material of various sizes and shapes, or packaged products, doing all the heavy work and accomplishing it quickly and at low cost.

The TRANSPORTER is designed for short hauls within the plant — it handles loads in elevators, along narrow aisles, and is valuable for use in areas where floor loads are restricted. Get details on this modern material-handling truck that has the forward and reverse control buttons in the handle for easy guiding of loads.

ELIMINATE THE HOME-FRONT
BOOBY-TRAPS
FROM YOUR PLANT

Oil and grease on your floors are booby-traps that make casualties of the soldiers of production, by causing slipping and falling accidents, inviting costly fires, and side-tracking vital manpower into non-productive cleaning labor. Rid your plant of these aids-to-the-Axis quickly, efficiently and economically by using SPEEDI-DRI—a white, granular substance, easily spread by hand, that absorbs *all* oil and grease, sets up an immediate non-skid surface, retards fire, and saves a lot of labor needed elsewhere. Write for free sample or demonstration.

GRUMMAN AIRCRAFT says:

"We use SPEEDI-DRI in practically every plant," writes A. W. Stevens, Maintenance Supervisor of Grumman Aircraft. "Maintenance crews use it to dry up leaks on oil hydraulic breakdowns. It makes their work safer and cleaner."

well to appraise their accounting records now to see if they will meet minimum requirements.

Disposition of inventory is admittedly a problem of first magnitude which extends far beyond the area covered by termination. Not until the inventory has been sold, can the termination of the contract to which it applies be concluded. Although it goes beyond termination, its influence upon the promptness with which the termination can be wound up is too great to be ignored. Undoubtedly the proper agencies of government are appraising the need for all types of supplies and materials here and abroad. A system that will permit quick comparison of the items involved in a terminated contract with those needed supplies and materials may be one logical approach.

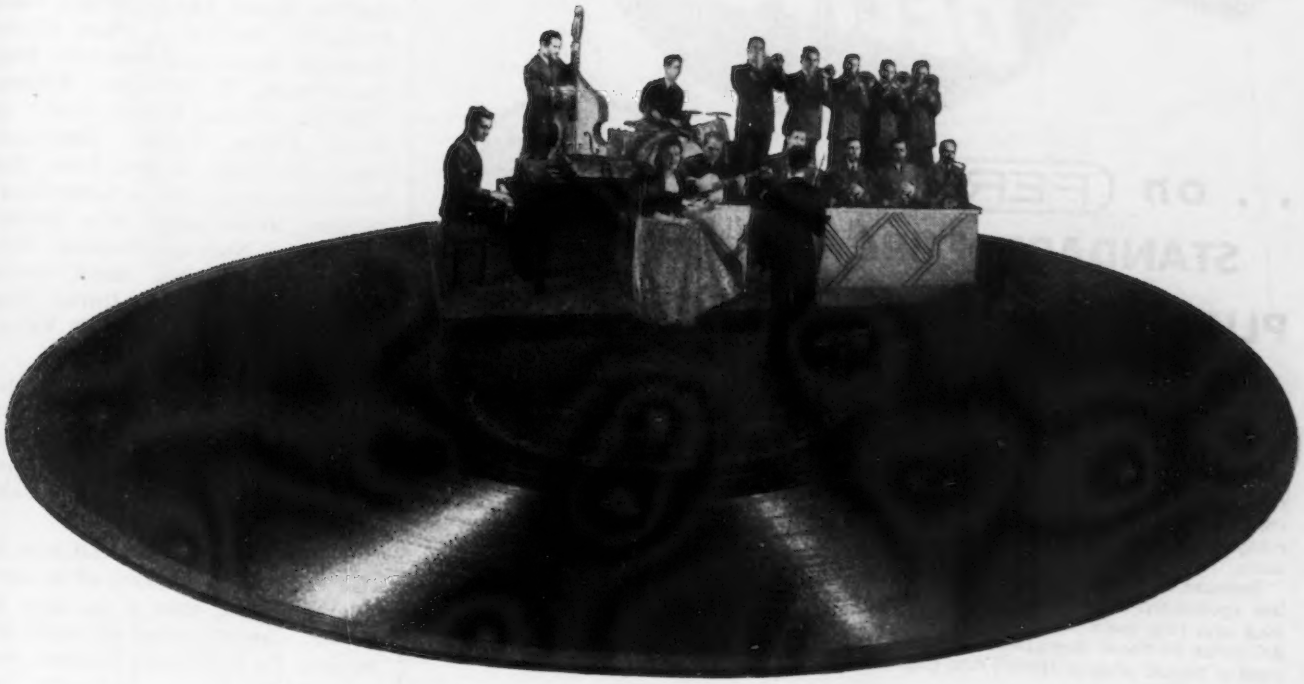
Many contractors are performing work for more than one procurement agency. Standardization among these agencies obviously then, will be of material assistance to them. Many proposals have been heard. The War Production Board has been endeavoring to devise a termination clause that can be used by all departments. Others have suggested that the agency having the predominant interest in a specific contractor be charged with the responsibility of negotiating the settlement of all his contracts. More recently has come the thought that a super-board of some kind be established to supervise termination work in all the services.

But to obtain a partial payment today, the contractor must prove conclusively that the amount is clearly due. A payment made on that basis is not a partial payment at all; it is complete reimbursement for that particular obligation. The proof cannot be gathered within a short enough interval under present restrictions.

There was announced several weeks ago the new VT loan, whereby the contractor may arrange for a commitment to be used after his contracts have been cancelled. We are heartily in favor of this plan. But it is very questionable if the government agencies have the right to guarantee loans to be made entirely after a contractor's orders have been terminated. Therefore it is urged Congress be requested to authorize the making of guaranteed loans against terminated contracts, at the close of hostilities. The availability of such legislation should not be permitted to relax our efforts in other directions to improve the general procedure.

A Record of Performance

. . . THAT WINS INDUSTRY'S APPLAUSE!



Like a giant orchestra, all of Industry plays a symphony of Victory. The blare of the starting whistle, the blast of the furnace, the rhythm of the riveting gun, the melody of the saw and hammer, the precision of the lathe . . . all these, rendered on a giant scale, will help to strike the final note of Victory!

Quite naturally, we're proud of our performance in 1943. . . . a record in tune with America's rising crescendo of production. That we hope to play an encore in the months to come goes without saying, for Levinson Steel is constantly seeking and developing new ways to improve and speed its service to Industry.

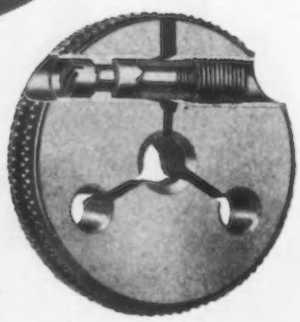
STANDARD THREAD

PLUG and RING GAGES



The above illustration shows a thread ring gage and a cut-away view of its locking device. Like all PERFEX gages these ring gages are made under the personal supervision of men who have had years of experience in precision gage and tool manufacture. Each PERFEX gage is checked and rechecked in air-conditioned inspection rooms before they are shipped. This insures extreme accuracy and eliminates costly delays in rejects by the customer.

The PERFEX GAGE & TOOL COMPANY carries 75% of standard thread plug and ring gages in stock to insure a 48-hour delivery service.

This announcement is in keeping with PERFEX's new "stepped-up" production schedules. It is just another reason why both large and small manufacturers have come to recognize PERFEX as a young progressive company that has made accuracy its creed for better work.

Because the PERFEX GAGE & TOOL COMPANY has specialized in the manufacture of standard thread plug and ring gages it is able to fulfill its promises on deliveries to those manufacturers who are urgently in need of thread plug or thread ring gages.

Lend-Lease Totals $18.6 Billion to Date

Washington

• • • **The United States** has furnished $18,600,000,000 worth of goods under lend-lease agreements out of $60,754,000,000 made available by Congress for this purpose, the President revealed in a report to the legislative branch.

The following is a list of all the countries that the President's report reveals as either receiving or eligible to lend-lease aid: Australia, Belgium, Bolivia, Brazil, Canada, Chile, China, Columbia, Costa Rica, Cuba, Czechoslavakia, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, Fighting France, French North and West Africa, Greece, Guatemala, Haiti, Honduras, Iceland, India, Iran, Iraq, Jugoslavia, Liberia, Luxembourg, Mexico, Netherlands, New Zealand, Nicaragua, Norway, Panama, Paraguay, Peru, Poland, Saudi Arabia, South Africa, Turkey, United Kingdom, Russia, Uruguay, and Venezuela.

The following countries have signed reciprocal lend-lease agreements: Australia, Belgium, Fighting France, French North and West Africa, Netherlands, New Zealand, and the United Kingdom.

The report says that lend-lease has received in the 2½ years of its operation only 3 per cent of the farm machinery output, valued at about $34,000,000. To the United Kingdom went $20,642,000 of this machinery. Australia and New Zealand received not quite $6,500,000 worth in addition. Another $1,250,000 worth was shipped to India.

Through October of this year value of lend-lease exports to the United Kingdom amounted to $5,980,379,000; to Russia, $3,550,443,000; to Africa, Middle East and Mediterranean area $2,168,299,000; to China, India, Australia and New Zealand $1,603,346,000; to other countries, $541,790,000.

The report says that reverse lend-lease amounted to $1,174,900,000 up to June, 1943. The United Kingdom contributed $871,000,000; Australia, $196,000,000; New Zealand, $51,000,000; and India, $56,900,000.

However, the report continues, the principal benefit the United States receives under the lend-lease program is the assistance given by its allies in waging war. The report declares that the war will be shorter because of the lend-lease assistance, and that this is a benefit beyond price.

Briefly Told—

• Diamond drilling in Pend Oreille County in northeastern Washington has added 9,000,000 tons of zinc and lead ores to the nation's known reserves of war minerals, The Bureau of Mines announced. Earlier exploration and development by some of the mine operators in the district, known as the Metaline area, had revealed more than 3,000,000 tons of zinc and lead ores. Although the Metaline area has been worked for zinc and lead since 1907, production was relatively small until recent years. Ample electrical energy can be made available for the Metaline region. A Grand Coulee Dam power line could be extended to that area if conditions demanded. Flanking the Pend Oreille River near Metaline and Metaline Falls, the mineralized area extends northward into Canada. A Canadian mine just north of the International Border has substantial reserves of similar ore. Three mines now are in active production in the area, the Grandview, Metaline, and Josephine workings. Two modern flotation mills treat the ores from these mines. Although the Bureau's program will determine the extent of the mineralization, supplemental details are expected to be provided by closer-spaced drilling and development of underground workings by the mining companies which already have made a partial development of the region.

•

• Hon. J. A. MacKinnon, Minister of Trade and Commerce, in his year-end review, stated that Canadian exports, exclusive of new gold, had an aggregate value of $2,379,000,000 for the first 10 months of 1943, an increase of $489,000,000 over the corresponding period of 1942. When the final returns for the complete year become available, Canadian exports will probably be found to have totaled about $2,900,000,000, or including new gold, will approximate $3,000,000,000. To a very large extent these exports consist of food products or munitions of war. Altogether, production of munitions of war is now at the rate of $55,000,000 per week, while the grand total production of the war industries since the outbreak of war is nearing $6,000,000,000. Altogether, the total number of persons in recorded employment in manufacturing, logging, mining, construction, transportation, communications, services, trade and finance, reached on Oct. 1 the record aggregate of 1,952,000. National income in 1943 is likely to be more than $8,500,000,000, double the pre-war figure.

•

• Test flying of a new troop carrying glider, the CG-13, has started at the Ford airport. The new model carries pilot, co-pilot, approximately 30 fully equipped soldiers and there is ample clearance for two jeeps or a howitzer and one jeep complete with crews and ammunition. The CG-13 was designed by Waco

Wickman

PROFILE GRINDER

THE Wickman Profile Grinder provides a method of grinding in which a fifty times size layout of the form, a pantograph system, microscopic inspection, and a universal grinder are coordinated to provide profile grinding to an accuracy within ±.0005". Because of the extremely accurate method by which the profile is transferred directly from the drawing to the part, no further inspection or checking of the part is necessary. Before the part is removed from the machine, the profile which was ground is known to be correct.

In the grinding of a wide range of regular or irregular shapes including those ground in tungsten-carbide, the Wickman Profile Grinder has reduced machining time to approximately one-fourth that required by usual methods.

With an average amount of profile grinding work in your plant, this machine can make possible extremely worthwhile production savings. Let us send you full information.

Aircraft Co., and is being built by Ford, which continues production of a smaller glider at its Iron Mountain plant.

•

• First substantial step toward alleviation of a manpower shortage in Alabama coal mines was seen by Governmental officials here in announcement that the Federal Housing Authority has approved housing construction for workers at Sayre, a small community near Birmingham where Republic Steel Corp. operates a coal mine. FHA has approved construction of 140 publicly-financed temporary dwelling units there. James A. Downey, Jr., area director of the War Manpower Commission, said the manpower shortage at Sayre, as in many other mining communities in the Birmingham district, could be traced directly to inadequate housing.

•

• With the cutting down of many plant operating schedules, abandonment of night shifts, and discharge of workers, the acute shortage of skilled workers no longer exists in Massachusetts. The labor bottleneck today is in unskilled male workers for heavy jobs.

•

• John F. Tinsley, Crompton & Knowles Loom Works, Worcester, Mass.; William S. Newell, president, Bath Iron Works, Bath, Me.; and Ralph E. Thompson, president, Reed Prentice Mfg. Co., Worcester, are members of the civilian committee investigating New England naval, marine, and coast guard shore stations as ordered by Secretary Frank Knox. Purpose of the investigation is to determine if such stations are using personnel to the best advantage. Portsmouth and Charleston Navy Yards were the first to be inspected. The investigation is part of a nation-wide survey.

•

• H. C. Houghton, assistant to the general manager, Mrs. Irene Stevens, personnel director for women, and Irene Damon, safety inspector, Bethlehem Steel Corp., addressed the Massachusetts Safety Council at a dinner meeting Jan. 13 in Boston on the problems of women workers in the shipbuilding industry.

•

• General Electric Co., Lynn, Mass., has made its peace with the director of the Massachusetts OPA. Company workers are again eligible for special gasoline rationing privileges. On Dec. 8 this privilege was taken from them for not fulfilling car-sharing requirements.

•

• Subject to approval of an incentive plan by the War Labor Board, the Electric Boat Co., Groton, Conn., will give its submarine workers bonuses running as high as 10 per cent monthly, depending on the increased production. A survey to determine the amount of increased work each employee can contribute has been completed.

•

• Lundquist Tool & Mfg. Co. 1943 production was 500 per cent greater than the 1942, and 1000 per cent greater than the 1939.

•

• Davis Engineering Co., Worcester, Mass., has devised an automatic strut-bending and forming machine that combines three formerly separate manufacturing operations. It is claimed this unit

POWER
IS OUR BUSINESS

POWER

Ready-Power manufactures a complete line of Power Units for: Industry • Transportation • Utilities • Construction • Agriculture • Oil Fields • Military and Naval Operations—and wherever electric power from Diesel gasoline or natural gas engines is needed. Since 1924, Ready-Power products have "covered the globe" and have built for Ready-Power in user satisfaction, a "reservoir of good will." Ready-Power is an Organization of Engineers with wide experience, modern plant facilities, and with pride in accomplishment. The Ready-Power Company likes their business — works hard at it and knows that by keeping faith, will continue to prosper.

Manufacturers of Ready-Power Gas-Electric Power Units for the operation of electrical industrial trucks.

Ready-Power gasoline, natural gas and Diesel-engined electrical plants, switchboards, etc., for all power needs.

Ready-Power Mobile Power Plants "Power stations on wheels" for utilities, construction, etc.

THE READY-POWER CO.

GENERAL OFFICES: 3841 GRAND RIVER AVENUE, DETROIT 8, MICHIGAN

Productioneered

FOR PRECISION PROCESSING

● "Shotgun Coverage" or precision processing? Manufacturers who put their production programs on "cost based on efficiency" schedules never hesitate in THEIR selection of sub-zero testing and processing equipment. . . . They know that Kold-Hold equipment is productioneered* to insure the capacity and temperature best suited to fit specific cold processing application.

They know that "shotgun coverage" gives them extra compression and excess refrigerant (which they can't utilize) at a higher initial cost . . . Kold-Hold's precision processing, obtainable with Kold-Hold Sub-Zero machines, assures you efficient handling of the job for which the unit was intended . . . Here are several suggestions from Kold-Hold's Standard lines.

400T45

2.0 & 4.0 Cu. Ft. capacities at —45° & —60° F. Kold-Hold's most popular models. High efficiency, low cost maintenance and portability have established their acceptance in rivet storing, aging of steel and steel parts, chemical processing and pitch removal from optical lens. Designed for heavy duty.

1100T45

5.4 & 11.0 Cu. Ft. Capacities at —45° & —60° F. Virtually every application utilizing sub-zero processing can use these units to good advantage. Wherever —45° to —60° F. temperatures in these capacities is specified for cold processing, Kold-Hold units in this series are selected. In expansion fitting, aging of metals, aluminum alloy storage and numerous other applications, these machines provide reliable, fast, efficient low temperature performance.

505T75

5.0 & 11.0 Cu. Ft. Capacities at —75° & —90° F. For real "bottleneck-breakers" these Kold-Hold machines are unequalled in processing and testing of materials (including expansion fits, stabilizing steel and hardening of metals). Rated heat extraction on the —75° machines approximately 300 BTU per hour attaining —75° in 1½ hours. . . . On the —90° unit an approximate extraction of 100 BTU per hour reaching rated temperature in 2 hours.

Let Kold-Hold engineers help you determine which capacity and temperature is best suited to your cold processing application.

KOLD-HOLD

*Engineered for Production

438 NORTH GRAND AVENUE LANSING, 4, MICHIGAN

NEWS OF INDUSTRY

will out-produce the machines before in use by the company by about 17 times.

●

● Norton Co. maintains one of the largest research laboratories in the east. Much of the current research activities are governed by war requirements. However, the company is confident some of the projects will have far-reaching effects in the postwar period. More than 100 trained specialists are employed in the laboratory department.

●

● The Botwinik Bros., of Massachusetts, Inc., Worcester, Mass., new plant is one of the three largest in the United States devoted to reconditioning of machine tools. The plant is modernly equipped, including a 10-ton electric traveling and smaller cranes. It also has an enclosed railroad siding, recreation lounge, and a modern kitchen.

●

● General Electric has leased 60,000 sq. ft. of floor space in the Appleton Co., Lowell, Mass., plant and within a few months will begin the manufacture of electrically-heated blankets and suits for stratosphere flying. Employment will be given to 500, mostly women.

●

● Another New England foundry is folding its tent after more than 80 years of operations, the E. D. Jones & Sons Co., Pittsfield. Peak foundry employment was 51, but is only 24 now. Suspension will be Feb. 1, because company officials claim it is more economical to purchase castings.

●

● Some 13,000 white collar employees of Westinghouse Electric & Mfg. Co., whose fixed salaries range from $2400 to $5000 annually, will receive a sum averaging $4.42 a week, retroactive to April 8, 1943, to cover time and a half for work over 40 hours per week. A petition for this increase for overtime employment was made jointly by Westinghouse and the CIO United Electrical Radio and Machine Workers Union. As a result, the company will disburse about $57,500 more weekly to the white collar group than it had paid heretofore. This CIO union represents 42 Westinghouse plants, totaling about 80,000 workers.

●

● More than 23,150,000 shells ranging in size from 20 to 105 mm. were produced by the Armstrong Cork Co., during 1943. The year's production figures for some other major munitions operations of the company were as follows: More than 30,170,000 sq. yd. of camouflage netting of several types. More than 2,950,000 yd. of duck in varying widths for tents, tarpaulins, etc., coated with a waterproofing and fireproofing compound. More than 4,790,000 magnesium incendiary bomb bodies, 730,000 bomb racks of several types, 1,250,000 anti-aircraft cartridge cases, and aircraft parts of many kinds and sub-assemblies of several types for more than 5750 military airplanes. Also, the company turned out large numbers of plastic gun turrets of four types for military planes. Many of the regular floor covering products of the company, which in peace time is a nonmetal working concern, also are going into military uses. Armstrong's shoe materials are widely used in military foot-gear and many others of the company's products, such as insulating materials, packings, gaskets,

Production Rhythm

with Titan Hot Pressed Parts

Trouble-free hot pressed parts by Titan help get uninterrupted rhythm into production lines everywhere. If you do your own machining, you will get a money-saving surprise in much longer tool life, minimum machining time, and very little scrap. Their dense, fine-grained structure, sharp outlines, and dimensional accuracy are the reasons. Intricate shapes and thin sections are no problem with Titan. Send us your blueprints—you'll find us mighty interested in helping you increase your production, decrease your costs.

STRAIGHT-GAS POWERED INDUSTRIAL TRUCKS EXCLUSIVELY—SINCE 1919

seals, glass containers and closures are being used, directly or indirectly, for military purposes.

•

• National headquarters of the Selective System announced that in the future Army, Navy, or other Government agency representatives in industries and plants may be asked, where production urgency requires, to make joint certification with employers as to the necessity of workers in such plants for whom deferments are sought. The certification plan and procedures will be extended to industries and establishments where production urgency exists, however, only when the director of Selective Service determines that such plans and procedures are required and the Army, Navy, or other Government agency concurs. Similar procedures have been in effect in West Coast aircraft and parts plants since Nov. 6 and were recently authorized for approximately 15 plane and parts plants outside the California-Washington-Oregon area.

•

• The management of New Departure Division of General Motors, Bristol, Connecticut, announced that in the months of November and December, 1943, that company alone made more ball bearings than it produced during the entire four years of World War I. Actual figures are, of course, a military secret. This is eloquent commentary on the increased use of ball bearings in mechanized warfare and emphasizes the superhuman efforts that are being exerted.

•

• Two novel war financing features are incorporated in the $30,000,000 "V" loan recently arranged for the Crosley Corp., Cincinnati, through the Federal Reserve Bank of Cleveland. One of the novel features of this credit is an accelerating working capital agreement. The Crosley Corp. agrees to increase its working capital each year of the loan by the amount of 50 per cent of its net profits after taxes and all charges, or $1,000,000 a year, whichever is the lesser. This line of credit will be used: (1) as working capital for war production; and (2) as insurance against tying up company working capital due to contract reductions and terminations. The commitment commission on the loan is 0.25 per cent per annum on the unused portion of the credit, and the interest rate on the borrowed portion of the credit is 3 per cent per annum. The borrowing formula is also a novel arrangement, with Crosley permitted to borrow 100 per cent of its net accounts receivable arising out of war production contracts, plus 90 per cent of the aggregate dollar volume of its inventories, plus 90 per cent of the outstanding amount of advances and progress payments made and of termination payments made, plus an amount of $3,000,000 or five per cent of the amount to become due on unperformed and uncancelled war contracts, whichever is lower.

•

• Announcement of pension and retirement provisions of the S. G. Taylor Memorial Pension Plan has been made to employees of S. G. Taylor Chain Co., Hammond, Ind., by the president, E. W. Taylor, grandson of the founder of the company, the late S. G. Taylor, Sr. The employee pension is based on the base wage or salary of the individual. Each em-

What's Ahead?

No. 1 in a Series

Experts are working experimentally on a universal sign language for use during the period of reconstruction following the war. It has a vocabulary of about two thousand words and can be learned in about a month.

★

Reshingling of homes may be entirely eliminated after the war. With plentiful cheap aluminum as one of the benefits of the great disaster, we expect to have aluminum shingles, and the glass industry has already developed a lifetime glass shingle.

★

Radio waves are now being used to spread the layer of tin on tin cans and thinner than it was before the war.

★

The Diesel engine is close to its long-sought ideal of one pound per horse power. This may indicate that this thrifty engine, already scheduled to power our postwar trucks, may also be suitable for our pleasure cars.

★

Little by little new ideas combine to make flying more practical for tomorrow's civilians. One of these is a simple device for night landing which uses two lamps aimed toward the ground. The beams of these lamps are focused so that they come together to form a single spot of light on the ground when the plane is at exactly the right height for "setting down."

★

A new fuse for artillery shells is said to be so sensitive that it will explode the shell on hitting a raindrop.

★

The use of aluminum can reduce the weight of a freight car from forty-five thousand to fifteen thousand pounds with a corresponding increase in capacity.

★

Factories have been built with heating pipes permanently laid in the solid concrete floor. The method seems to be practical, economical and suitable for the heating of our homes.

★

In spite of the war, the Dutch have been able to produce a new hybrid plant, a cross between the carrot and the beet called the "wobbie".

To supply a Pacific coast shipyard with 152' one-piece keels for Navy minesweepers, giant trailers are being used that haul 60 tons of Douglas fir logs of this length.

★

Experiments are being made with artificial teeth held in place by magnets.

★

It is expected that vast amounts of magnesium will be used after the war, and it is encouraging to know that our supply is large and beyond the reach of the enemy. Although there is only fourteen one-hundredths of one percent of magnesium in sea water, there are four and one-half million tons in a cubic mile.

★

Fifty thousand patents, formerly the legal property of our enemies, are now available to American industry.

★

The electron microscope will now measure particles as small as one-millionth of an inch.

★

The Civil Aeronautics Administration expects us to have half a million private and commercial airplanes by 1950.

★

A new synthetic textile filament, the finest yet produced by man or nature, is so small that it takes twenty thousand miles of it to weigh a pound.

Automobile tires are now being checked for invisible flaws by passing high-frequency sound waves through them.

★

Plastic bearings for machinery will require no lubricants for moderate speeds and loads, and in many cases water has been found to give sufficient lubrication for even high speeds and heavy loads.

★

"Facsimile", a method of printing a miniature newspaper by radio in individual homes, was tried experimentally before the war began. By this method the printing is done during the night and a newspaper, complete with illustrations and advertising, is ready at breakfast time.

★

There is a very good chance that we may have television in full color and three dimensions. It may also be possible to store up television broadcasts to be re-run later.

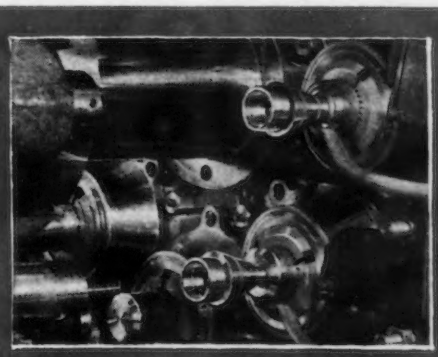
★

A micro-hardness tester is now made that can test a single microscopic grain of metal.

★

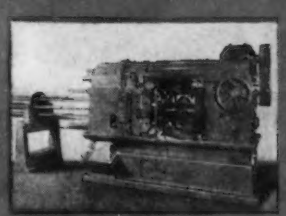
Shipwrecked sailors will soon have the benefit of a tiny searchlight no bigger than a walnut that is visible for 60 to 70 miles and good for 100 hours of use.

★



This big 8 spindle Conomatic completes seventeen operations required in the machining of an artillery shell fuse body *in 18 seconds.*

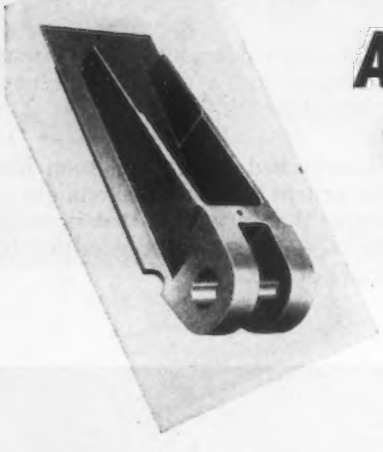
This is real production—the sort of production needed to win the war. Manufacturers will need this sort of production *after the war* if they are to meet competition, particularly if new ideas and better merchandise are to be put in the hands of all our people.



CONE

AUTOMATIC MACHINE CO., INC.

WINDSOR, VERMONT, U. S. A.



A Small Part on which the SAFETY of all Hinges . . .

The Vought Corsair, the Navy's newest shipboard fighter and the fastest plane of its type in the world, is powered with a Pratt & Whitney Aircraft 2,000 horsepower Double Wasp engine. It is built with folding wings which operate efficiently and positively on wing hinges designed to withstand tremendous stress. These hinges are Fenn made to the rigid specifications of Chance Vought. On them safety depends.

FENN FOR SPECIAL MACHINERY

Years of experience in the design and building of Special Machinery has given the Fenn organization a skill and know-how that may prove helpful to you in the days which lie ahead. We have the plants and facilities for handling almost any size and kind of special machinery job and we welcome inquiries from those who are looking for a dependable source.

PLANNING NOW FOR 1944 PRODUCTION

When the time comes for reconversion to peace time production, Fenn engineers, toolmakers and machinists will be ready to serve you. It is not too early to think of planning now.

THE FENN MANUFACTURING CO.
HARTFORD, CONNECTICUT

ployee comes under the Plan after five years of continuous service (the five years then being counted in on the pension) at the age of 65. Employees in the armed services are given leaves of absence and lose nothing in the Pension Plan if they return to employment with the company within six months after discharge from war duty.

●

● *The Jones and Laughlin Steel Corp., which operated at 102 per cent of capacity in 1943, announced a total of 598 new production records during that year at its Pittsburgh, Aliquippa, McKeesport and Cleveland works.*

●

● In a report to stockholders, Arthur G. McKee & Co. pointed out that while the dollar volume of new construction contracts taken during 1943 was considerably under that of 1942, during the latter half of the year there was a large volume of contract work involving foreign delivery of materials and construction in foreign countries. Furthermore, there are a number of investigative and consulting contracts on hand for both domestic and foreign clients looking to post-war plans for reconstruction of plants or plant changes to meet post-war requirements.

●

● With production and sales reaching new high levels, output of industrial storage batteries totaled an estimated $66,000,000 in 1943, an increase of 10 per cent over the preceding year. While working almost 100 per cent on war projects, the industry's facilities are practically the same as in peacetime. When war needs diminish, production for civilian purposes can be resumed almost immediately and the "reconversion problem" is absent. With orders on hand for some months yet and with the deferred needs of various industries that are accumulating, the heavy duty industrial storage battery industry is assured of another active year that may surpass 1943.

●

● Stanley J. Harley, controller of the tool and gage division of the Ministry of Supply for the British Empire, recently conferred with industrial leaders in the United States. While in Dayton, Ohio, for a meeting with Louis Polk, president of the Sheffield Corp., Harley stated he hoped his visit would lead to a more interchangeable system for gages and kindred measuring devices from an international standpoint. He made it clear that conversations are only in the preliminary state with the groundwork being laid for a more definite and detailed program after the war.

●

● The problem of supplying ammunition for oddly calibered guns of 5 ships of our Allies has been solved, according to the Rheem Mfg. Co. One of Rheem's Chicago plants working under the direction of Naval Ordnance, is turning out thousands of 152 mm. drawn brass shell cases for the French battleship Richelieu. The cases are 3 ft. 7 in. long and weigh about 40 lb., contrasted with the 38-in. length and 28 lb. weight of our own 6-in. cases. The Richelieu is the only type of ship to use 152 mm. cases.

●

● *Employees of Foote Bros. Gear & Machine Corp., Chicago, reached their goal of 1,000,000 high precision aircraft gears produced in 1943, on Dec. 30, an increase of 53.3 per cent over 1942 production. At a short and simple ceremony the mil-*

NEWS OF INDUSTRY

lionth gear was presented to the executives of the company by Miss Lois Rodman, gear inspector. These gears are made for the Pratt and Whitney aircraft engine which powers such famous American warplanes as the Liberator, Hellcat, Corsair and P-47.

•

• Eighteen Milwaukee men in supervisory capacities at various plants are being sent to school with all expenses paid by their bosses connected with Allis-Chalmers, Nordberg, Ampco Metal, Chain Belt and Harnischfeger. For two weeks at the Illinois Institute of Technology in Chicago they will study management for industrial supervisors. The idea originated with Harry Rogers, works manager at Nordberg.

•

• Chain Belt Co., Milwaukee, reports lower earnings for the fiscal year ending Oct 31 despite a sharp gain in sales to a new record high, $37,049,000 against $19,373,000 for the previous period. Earnings for 1943 were $863,625 or $1.77 a share against $912,600 or $1.87 a share in the previous year.

•

• Seven empty flag-draped chairs at the head of the banquet table featured the 50th anniversary celebration of the Optenberg Iron Works, Sheboygan, Wis., held in the Grand Hotel there. M. H. Busse, president of the firm, was master of ceremonies that also honored five employees who had been with the company for 25 years.

•

• The most attractive prospects in the post war foreign field will be for the export of American industrial "know-how," according to Arthur J. Brandt, president of National Tool Co., Cleveland.

•

• Bell Aircraft Corp., Buffalo, announces it built one helicopter during 1943.

•

• Despite greater supplies of synthetic rubber this nation enters 1944 with its rubber dilemma still acute, according to Dr. R. P. Dinsmore, Goodyear Tire & Rubber Co. The nation's natural rubber stockpile is diminishing fast, he said, and the nation faces the necessity to make conversions and, at the same time, to improve the product of the nation's new synthetic rubber plants.

•

• The nation has an untapped pool of 31,000,000 part-time workers, who should be utilized to alleviate manpower shortages, Paul V. McNutt, Chairman of the War Manpower Commission, said today. The WMC chairman divides the 31,000,000 potential part-time workers into three groups: Eight million students over 14 years of age—many of these are able to carry a part-time job in addition to their school work; more than 5,000,000 non-working women between 20 and 55 years of age and who are without children—most of these can accept full-time employment but are not able to work more than part-time in addition to maintaining their home; almost 18,000,000 workers in trade, service and government—some of whom are able to work a few additional hours a day on a second job.

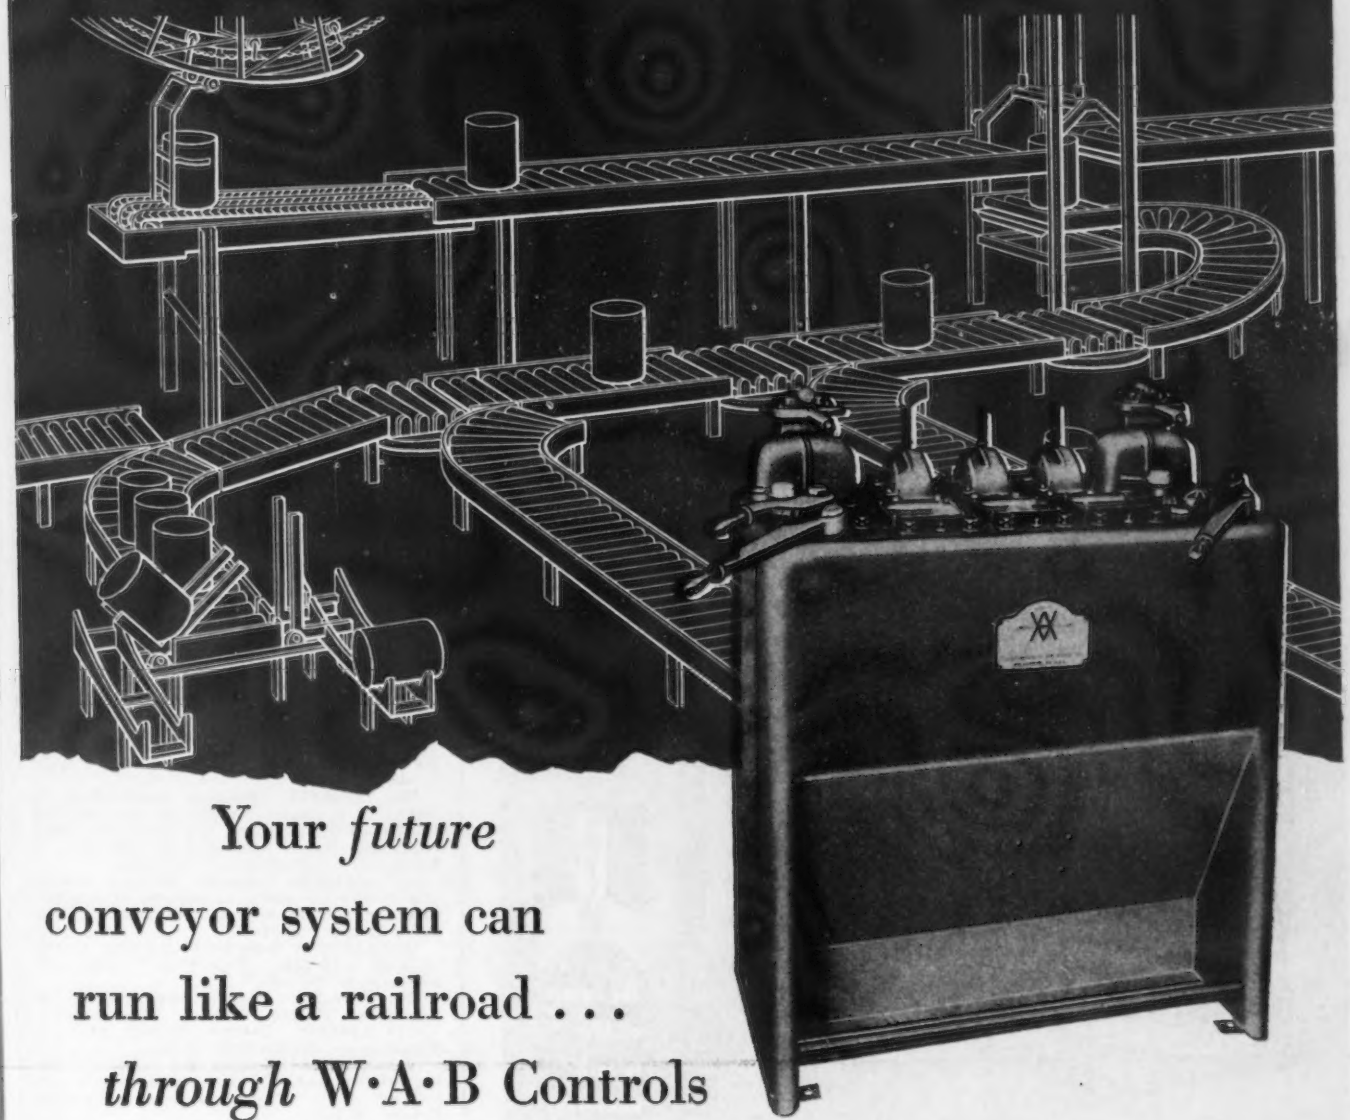
•

• A statement by Under-Secretary of War Patterson on contract renegotiation reveals that the War Department will have completed business concerning almost all 1942 war contracts subject to renegotiation by the end of January.

•

• A recent Bureau of Labor Statistics report estimated that 300 strikes involved 500,000 workers and caused 2,825,000 man-days of idleness in November.

GIVE W·A·B CONTROLS A PLACE IN YOUR PLANNING



Your *future* conveyor system can run like a railroad . . . *through* W·A·B Controls

When you're thinking of the materials handling and conveying system your plant will need tomorrow . . . don't overlook the contribution that W·A·B Controls can make.

All work can be dispatched and routed from a single control station. Delivery, shuttling, transfers, switching, handling and pick-up of materials can be precisely controlled by the touch of a lever. The operating force can be proportioned to the need . . . anything from a few ounces to tons. In any sequence of operations, the order cannot be altered through an operator's error. Speed can be controlled to hairline limits, and varied in any desired increment.

Conveyor systems are merely one of the many places where W·A·B Remote Control Systems can help to arm your post-war products and production against competition. Give W·A·B Remote Controls a place in your planning.

How clean is "Clean"?

Not clean enough in today's wartime zinc electroplating unless it includes *both physical and chemical cleanliness.*

Zinc plating, like cadmium or copper, will not adhere over traces of rust or scale. So – when work is cleaned for zinc plating—oxides, mill scale and corrosion products must be removed – as well as grease and dirt.

That's why TURCO'S new PROSOLV B cleaner is filling an essential need in American industry.

PROSOLV B goes to work in the cleaning tank like a fine precision tool. Its accurate, powerful action penetrates and removes grease and carbon smut, rust and scale. The resulting metal surfaces are physically and chemically immaculate . . . ready for a perfect plating job. PROSOLV B also is formulated to double as a cleaner and a stripping compound in Bullard-Dunn electro-pickling installations.

Try this specially formulated product that is solving plating problems in many warplants throughout the country. It is adaptable for practically any plant requirement because it can be used in any standard steel tank equipment.

Let an Ampco Field Engineer help you design for extra Dependability, Durability, and Service — in your post-war products

in Heavy Machinery

. . . standard equipment with leading makers of steel mills, sugar mills, excavators, etc.

in Aircraft

. . . specified at critical points in practically every type and make of plane now flying.

in Machine Tools

. . . over 90 leading machine-tool builders regularly use Ampco Metal.

. . . in Many Other Fields

with parts of

Ampco Metal

Ampco's nation-wide field organization of metallurgical specialists is at your service — to help you with engineered applications of this superior alloy of the aluminum bronze class. Ampco's remarkable performance in war service is bringing home the outstanding value of this unique metal. Ampco Metal is constantly demonstrating its ability to "stand up and take it" under conditions where ordinary bronzes fail. Ampco's longer life in your service means the elimination of costly breakdowns. Ampco's broad facilities and wide experience enable you to utilize Ampco Metal in many forms. Regardless of what your bronze problem may be, *we can help you!*

Write today for further information.

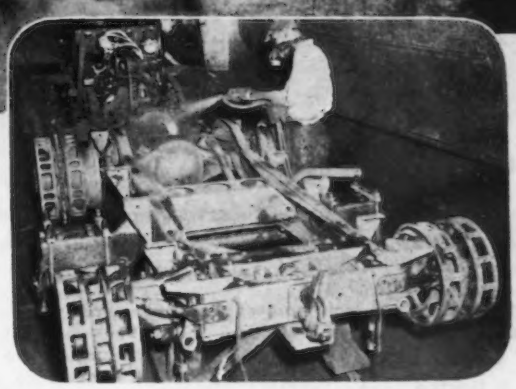
(39) **1,908,559.** Radiator provided with a fan for circulating the air and rapidly de-

Half tank, half truck...

ALL fighter!

Official Signal Corps Photo



The story of a "halfbreed" weapon that stole the show...

● Remember Salerno? One small group of U. S. half-tracks had just been landed when a host of Nazi tanks attacked. Outmaneuvering the foe with a hundred different tricks while their 75 mm. guns kept blasting away, those doughty half-tracks smashed or routed every one of the enemy.

So, time and again in this war, the show has been stolen by America's "halfbreed" weapon—half tank, half truck, but *all* fighter. Tops at smashing tanks or infantry on the ground or knocking planes from the air, the speedy, versatile half-track ranks high in the esteem of our fighting men.

Give us more of them, urges the Army. And to meet that request, Autocar, a leading half-track builder, is increasing production every month. In its finishing department Autocar employs a battery of DeVilbiss spray guns to apply protective paint over each unit in record-breaking time. The amazing speed of these DeVilbiss guns means that each Autocar half-track gets into the fight *sooner!*

Such time-saving, labor-saving devices, so important in war production, will be important in peacetime production, too. And now . . . or then . . . the correct DeVilbiss Spray System will put new speed into any finishing, painting or coating operation in your plant.

AT Ford WHERE
SPEED & EFFICIENCY ARE PRIME REQUISITES —

75 EUCLID CRANES AND HOISTS expedite handling . . .

The Ford Motor Co., one of the greatest single producers of war materiel in America, has products fighting gloriously on battle fronts around the world.

These pioneers in mass production methods expedite material handling in various departments of their plants with 75 EUCLID CRANES AND HOISTS, in capacities from ½ ton to 30 tons.

Euclid Cranes and Hoists are engineered to meet specific requirements of individual installations but detail parts are standardized and jig machined to assure interchangeability. Heat-treated alloy steel gearing and shafts, anti-friction bearings, brakes and controls are all designed to embody liberal factors of safety and assure long life.

WE CAN DELIVER a limited number of 5 to 10 TON Cranes in 60 to 90 Days

Write for descriptive catalogs and get a Euclid proposal covering your next material handling equipment.

★ Speed is the watchword for wartime production.
For every minute saved on a part may mean lives saved—
and a shorter war.

Production speed will be a vital factor in the post-war industrial world, also. Who will be *first* to win the post-war market? The plant that is geared to meet competition with low production costs!

Here at Acme our staff of consulting engineers can help you with your production problems, both today and after the war. You may need new dies, patterns, heat-treated aluminum castings. You may need special tools, which Acme can design and build. Recommendations of Acme engineers are available upon request.

Acme has helped many metal-working manufacturers to "make it *faster*." You incur no obligation in finding out what Acme can do for you.

New *triple-duty* Kelite Chemical

saves on processing and handling

Kelite Process K:

1. **Removes scale, corrosion and light oils**
2. **Insures superior plating or paint adhesion**
3. **Inhibits rusting**

Process K has achieved particularly spectacular economies in plants finishing low carbon steel. It thoroughly removes heat treat scale in much less time than accepted pickling acids, taking off all salt deposits as well. Not critical to handle, Process K does not attack healthy metal but leaves the surface with a tooth which is highly acceptable for painting or plating.

The action of rust is definitely inhibited by a soak in Process K. It provides adequate rust-proofing until prime coating can be applied in the normal routine of plant operations.

Write for laboratory reports on this new time and labor saving development of Kelite pH Control

Union Agents Blamed For Wage Violations

Cleveland

• • • **In recent weeks** a large number of complaints have arisen from employers who have relied upon the help of business agents of local unions to secure skilled union labor, that they have been induced or misled by certain business agents into paying a rate in excess of the established union scale, resulting in violations of the Wage Stabilization Act of Oct. 2, 1942, and the executive orders and regulations issued pursuant to it, which are the foundation of the War Labor Board's wage stabilization program.

These complaints fall into several categories, the most common of which are as follows: (1) That the business agent represented to the employers that men were not available at the established union scale rate, but that they could be obtained if the employer would pay a rate in excess of the scale. (2) That the business agents refused to furnish men unless the employer paid a rate in excess of the established union scale. (3) That the business agent misrepresented the union scale as being higher than it actually was, thus causing the employer to innocently pay the higher illegal rate. The out-of-town employer is particularly susceptible to this sort of falsification.

The employers who charge that they are subjected to these high pressure tactics and this unscrupulous treatment at the hands of such business agents argue that they are thereby forced to violate the Wage Stabilization Act, knowingly or otherwise, or else default on contracts for lack of labor and be mulcted in liquidated damages for the breach.

The Regional War Labor Board of Region 5 (Ohio, West Virginia and Kentucky) has recently had to cite employers in the above situations for violation of the Wage Stabilization Policy of the board and has applied civil sanctions which resulted in substantial financial loss to these employers. These employers now argue that they are being unjustly treated in that they and they alone are subjected to penalties when the unions, through the medium of their business agents and local representatives, have encouraged, induced or entrapped the employers into paying violative rates.

If the charges made by such employers are true, there would seem to be some merit to their contention of discrimination from an enforcement standpoint except for one fact, namely that the business agents or union representatives who may be guilty of the conduct attributed to them by the employers may be subjected to criminal prosecution under the so-called "conspiracy statute" of the penal code of the United States.

Title 18, Section 88 of the U. S. Criminal Code reads as follows: "If two or more persons conspire either to commit any offense against the United States, or to defraud the United States in any manner or for any purpose, and one or more of such parties do any act to effect the object of the conspiracy each of the parties to such conspiracy shall be fined not more than $10,000 or imprisoned not more than two years, or both."

It is the opinion of the board that any business agent indulging in the practices referred to by the employers may be charged with conspiring to commit an offense against the United States, to wit, violation of the Wage Stabilization Act of Oct. 2, 1942. It is conceivable that such agents may also be charged with conspiring to defraud the United States.

Chile's Coal Believed Good Basis for Chemical Industry

• • • **Chile's coal** only partially developed, offers important possibilities for a chemical industry. This is the belief of C. C. Concannon, chief of the Chemical unit of the U. S. Bureau of Foreign and Domestic Commerce, who has been loaned to Chile for a year to aid in chemical development. He expects to make Chile's coal one of his chief studies.

The largest coal producer in Latin America, Chile has reserves estimated at somewhat over 3,000,000,000 tons. Production has been around 2,000,000 tons a year.

Mr. Concannon plans to look into distillation of the coal, out of which might come many consumer products as well as chemicals needed industrially. He also will look into possible use of the coal to make industrial products like the cresols and cresylic acid, which could be useful in Chile's mining industries.

For the first three months of 1943, Chile produced 530,000 tons of coal, a gain of 25,000 over the like 1942 period. Heavier demand in Chile, as in other countries to the South, has resulted from increased wartime needs, and from the necessity to substitute coal for petroleum fuels normally imported.

VERSATILE PRODUCTION

Whether the job is Welding (Torch or Electric) . . . whether the job is Stamping, Coining, Forming, Drawing, or Annealing, the Metal Specialty Co. gives you years of versatile experience in Metal Working and Stamping. Specialists in Hydraulic cold drawing and embossing in all metals including stainless steel and aluminum. Deep drawing and embossing up to 850 tons capacity. Shells drawn up to 20" depth.

STRENES METAL
IN FRONT LINE OF SERVICE

BEFORE THE WAR

Strenes can be cast to shape. Most of the usual machining time is saved. Redressing is reduced. That is why before the war Strenes scored heavily as forming and drawing die metal. In one case around 2,000,000 stampings were obtained and the die is still in good condition, ready to resume operation at the end of the war. Runs of 100,000 pieces up are not uncommon. Hundreds of the largest plants in the country used it regularly in their tooling programs. Want the names of pre-war users of Strenes?

IN THE WAR

Strenes today is being used for draw pots, draw pot inserts, draw rings for draw bench operation, for progressing upsetting dies—all in shell manufacture. Glad to identify all such users and many others.

AFTER THE WAR

After the war, refrigerator, stove, metal casket, grave vault, farm implement and other manufacturers will resume with Strenes metal forming and drawing dies. Many of the automobile, truck and tractor builders are extensive users, for body, fender and hood dies. Will name them to interested inquirers.

Look into the merits of Strenes metal—Try it, at least once.

Contracts Awarded by DPC and War Dept.

• • • **Defense Plant Corp.**, RFC subsidiary, has authorized the following contracts:

Minerva Oil Co., St. Louis, to provide additional equipment at a plant in Hardin County, Ill., at a cost in excess of $55,000, making a total commitment of more than $425,000.

American Chain & Cable Co., Inc., York, Pa., to provide equipment at a plant in York County, Pa., at a cost in excess of $60,000.

The acquisition of additional machinery and equipment for installation at a plant in Cuyahoga County, Ohio, at a cost in excess of $2,000,000, making a total commitment of more than $7,000,000.

Consolidated Vultee Aircraft Corp., Nashville, Tenn., to provide additional equipment at a plant in Los Angeles County, Cal., at a cost in excess of $300,000, making a total commitment of more than $700,000.

Hills McCanna Co., Chicago, to provide additional equipment at a plant in Cook County, Ill., at a cost in excess of $45,000, making a total commitment of more than $240,000.

Mathieson Alkali Works, Inc., New York, to provide additional facilities at a plant in Calcasieu Parish, La., at a cost in excess of $900,000, making a total commitment of more than $51,000,000.

Packard Motor Car Co., Detroit, to provide additional facilities at a plant in Lucas County, Ohio, at a cost in excess of $1,000,000, making a total commitment of more than $7,500,000.

Clinton Products Co., Clinton, Iowa, to provide additional facilities at a plant in Clinton County, Iowa, at a cost in excess of $270,000.

Glencoe Distillery Co., Louisville, Ky., to provide additional equipment at a plant in Jefferson County, Ky., at a cost in excess of $30,000, making a total commitment of more than $45,000.

The War Department announced Jan. 7:

1. Authorization for construction of one runway, 150 ft. x 3500 ft., and four taxiways at Randolph Field, Texas. The authorized expenditure is $583,150. Work is to be supervised by the San Antonio district office of the Corps of Engineers.

2. Award of contract to Thompson-Starrett Co., Inc., New York, for construction of Fox Hills Cantonment at Stapleton, Staten Island. Estimated amount of contract is $1,003,795. Work to be supervised by the New York district office of the Corps of Engineers.

3. Award of contract to Brinson, Cone & Manly, Tampa, Fla., for clearing, grubbing, excavation, pavement removal, stabilization, etc., at Buckingham Army Air Field, Fort Myers, Fla. Amount of contract is $804,249. Work will be supervised by the Jacksonville district office of the Corps of Engineers.

4. Award of contract to Zoss Construction Co., Hollywood, Cal., for construction of additional warehouses at the AAF Supply Depot, Los Angeles. Amount of contract is $474,001. Work will be supervised by the Los Angeles district office of the Corps of Engineers.

Patent Interchange Speeds British-American Production

• • • **The little-known** British-American Patent Interchange Agreement, two years old on Jan. 1, 1944, has spurred the "battle of production." The U. S. Army and Navy today surveyed the results this agreement has brought about. Under the arrangement, there has been a free flow of patent rights and scientific and technical information. Aircraft, radio and ordnance particularly have benefited by this united effort.

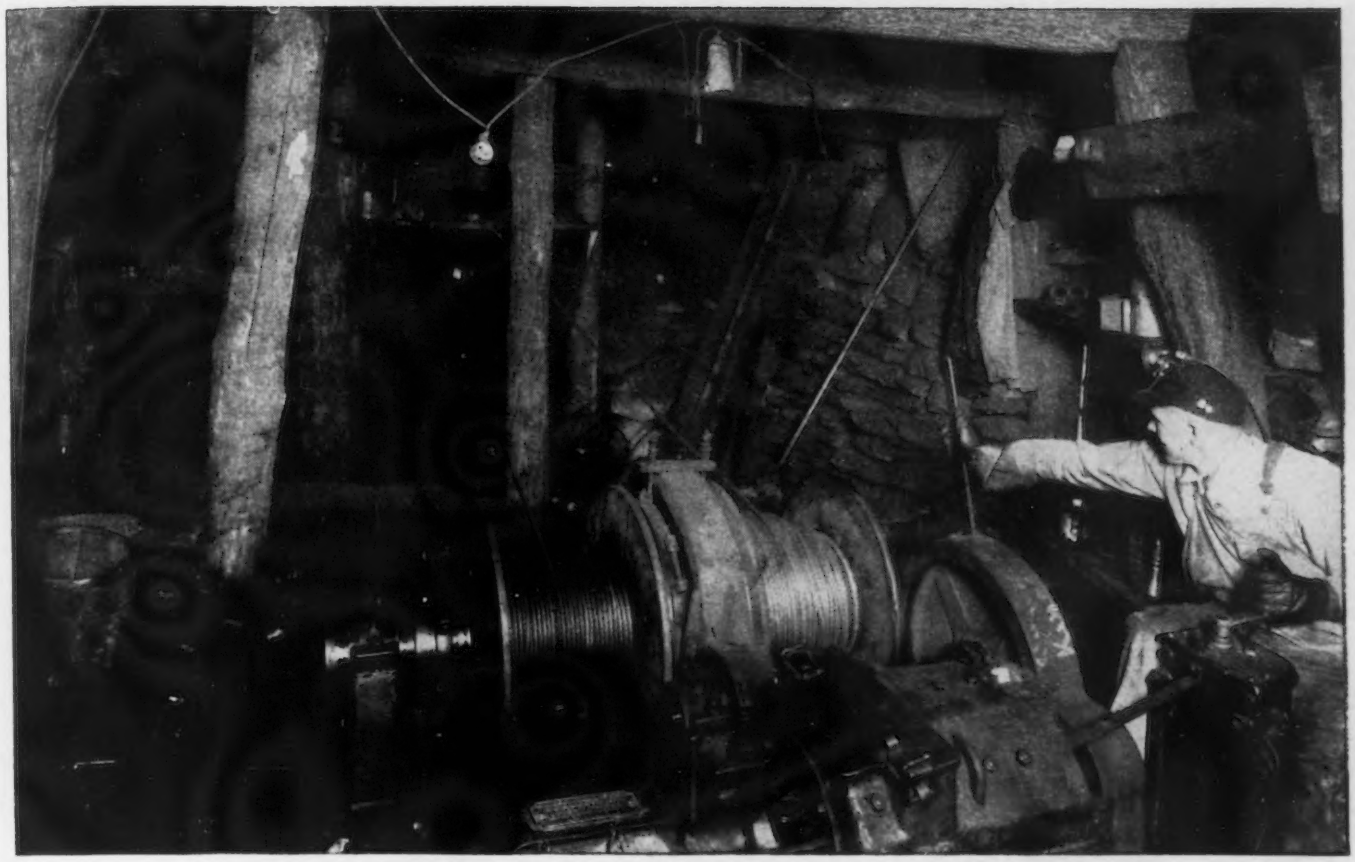
The program involves highly confidential equipment that is a major factor in the forthcoming victory. Government contractors, under the plan, have received absolutely free, in a great number of cases, patented and unpatented ideas of real value to the prosecution of the war. The agreement works both ways. American manufacturers are making war goods licensed under British-owned U. S. patents, and British concerns are manufacturing war products under American-owned British patents.

Officials point out that under the agreement, which runs for the war's duration, there is a wide opportunity for additional American manufacturers to avail themselves of free licenses to utilize British-owned inventions, including those patented in the United States, to aid them in their war production. The agreement is confined to manufacturing products required in winning the war. When the war is over, the patent rights will revert to their respective owners. Property interests in the post-war use of all kinds of industrial information are being properly safeguarded under provisions of the Lend-Lease Act.

Among the things being manufactured on both sides of the Atlantic, under the agreement, are: A kite, launched with a rocket-pistol, for sending out emergency distress signals; air compressors, range finders, illuminated gun sights, turrets, fuses, incendiary bombs, airborne lifeboats, lathes, bomb releases, catalysts, torpedoes, condenser tubes, warship propellers, periscopes, bearings, and lacquers.

The procedure whereby Government contractors take advantage of the services offered them under the terms of the Patent Interchange Agreement is relatively simple. The contractor files his request through the contracting officer or the technical representative of the service or agency with whom he has made his war contracts. A simple requisition is prepared and forwarded to the British representatives. Inasmuch as the British Government has broad powers under the Patents and Designs Act, the information and licenses can be made available promptly.

The directions and regulations under which such reverse lend-lease aid can be obtained from the United Kingdom and from several of the other Allies by War and Navy Department contractors are set forth in War Department Procurement Regulations, and Navy Procurement Directives.



A WAR MESSAGE...

To The Man Behind The Throttle

Wartime calls for extra deftness in your throttle hand. Not only is it vital to the war effort to get more work out of your machine but at the same time do it with the least wear and tear.

Wire Rope especially must be given every possible care in order to last just as long as it possibly will. The chance of replacing wire rope is apt to continue limited. Great quantities of it still must be produced for our armed forces. As our offensive power gains momentum and invasions increase in number and scope, the greater becomes the tonnage of war materiel which must be hoisted, handled, loaded and unloaded all around the globe.

In the white heat of battle when lives depend upon it, wire rope must take abuse necessitating replacement long before its time. So it is that the important matter of conserving wire rope falls heavily on the throttle hand of users on the home front. To help you save wear and tear on your wire rope and keep it working, Union Wire Rope engineers have prepared and offer five different booklets entitled: *1. Correct Handling of Wire Rope. 2. Lubrication of Wire Rope. 3. Splicing Wire Rope. 4. Socketing Wire Rope.* These give you specialized information. *5. Rope Dope* amplifies on abuses of wire rope and the remedies. All are written in non-technical terms. Put into practice, the information contained in these booklets will help you contribute to the war effort now by conserving wire rope and it should stand you in good stead in safer and more satisfactory wire rope operation post-war. All are FREE for the asking. A penny post card request will bring any or all of the booklets.

DO YOU NEED WIRE?

Manufacturers using high carbon steel wire functionally are invited to investigate the dependable source of supply afforded by our extensive facilities. Our engineers will submit interesting proposals on your requirements.

LARGEST EXCLUSIVE MANUFACTURERS OF COOLANT PUMPS

Among the Week's Trade Notes

Oliver Iron & Steel Corp., Pittsburgh, has formed an industrial fasteners division, to handle all matters pertaining to the sale of products in the industrial, transportation, and jobbing fields, which will include bolts, nuts, rivets and railway accessories. James G. Graham is general manager and Edward M. Welty assistant general manager of sales.

•

South Chester Terminal & Warehousing Co., Chester, Pa., has changed its name to Chester Tidewater Terminal, Inc.

•

McCarty Co., industrial advertising counsellor, has opened offices in the Koppers Building, Pittsburgh 19. The offices will be under the management of R. S. Reed, Jr.

•

Robert H. Clark Co., Los Angeles, announces the completion of its new plant at 9330 Santa Monica Boulevard, Beverly Hills, Cal. The plant will house manufacturing and service departments, tool development and research laboratories, and executive and administrative offices.

•

St. Louis Spring Co., Moog Piston Ring Co., Moog Coil Action Parts Co., St. Louis, will now be known as Moog Industries, Inc. There is no change in management.

•

Continental Can Co. has acquired virtually all the capital stock of the Bond Mfg. Corp., maker of bottle caps, for $4,500,000 cash. The property will be operated as a subsidiary of Continental Can.

•

Russell Mfg. Co., Middletown, Conn., announces that orders for machinery belting have been received from the Belgian Congo, Birmingham, England, Haiti, Puerto Rico and the Dominican Republic.

•

Meehanite Metal Corp., New Rochelle, N. Y., announces that arrangements have been made with African Malleable Foundries, Ltd., Benoni, Transvaal, South Africa, who are going into the manufacture of Meehanite castings.

•

National Supply Co., Pittsburgh, which recently arranged for a $20,000,000 Victory Termination loan at the rate of 2½ per cent with a ⅜ per cent commitment fee, announced that it has paid off half of the outstanding balance of its $6,000,000 2⅝ per cent ten year term loan due serially 1942 to 1952, with the Manufacturers Trust Co., New York.

•

T. C. Weiser, Griffin Wheel Co., Chelsea, Mass., was elected president, and M. A. Hosmer, Hunt-Spiller Mfg. Corp., South Boston, vice-president of the New England Foundrymen's Association at the 48th annual meeting in Boston, Jan. 12.

•

Arthur W. Gibby, East Boston, Mass., was reelected treasurer, and Ernest F. Stockwell, Barbour-Stockwell Co., Cambridge, secretary. The executive committee is now composed of the following: M. A. Hosmer, Hunt-Spiller Mfg. Corp., South Boston; B. W. Hagerman, Rice-Barton Corp., Worcester; D. L. Parker, General Electric Co., Lynn; Arthur F. Dockey, H & B American Machine Co., Pawtucket, R. I.; Frederick M. Fitzgerald, Draper Corp., Hopedale, Mass.; and Charles A. Reed, Rogers-Brown-Lavino Co., Cambridge.

•

Youngstown Sheet & Tube Co. plants made the following new production records during November: Brier Hill round mill produced 29,665 tons as compared with August, 1943, record of 26,994 tons; Campbell Works No. 1 butt weld furnace set 8 and 24-hr. production records; Campbell Works rod and wire mills, straighten and cut department, set a new 24-hr. record.

A 4 STAR PERFORMANCE

that may be of great interest to you

Naturally we are grateful for these star awards, which with the flag, total five "E" awards to Pollak. Each star added to our Army-Navy "E" flag symbolizes an additional six months of exacting service to our Army and Navy producing smoke screen generators, bomb racks, bomb shackles, fuzes, and other precision devices.

If your postwar plans include the necessity for having a part or all of a product manufactured for you, these awards have a direct significance for your company. It is a definite merit rating for the Pollak Manufacturing Company for doing the kind of job you will want done on your products.

No doubt you appreciate the advantage you will have in postwar business if your products are ready to sell and deliver in record time when the war is over. This demonstrated capacity of the Pollak organization to develop, engineer, and manufacture products correctly designed and efficiently made, in a required volume—and delivered on time—can be a valuable asset to your company.

The very same kind of service and skill which the Army and Navy have recognized can work for you when the war is over. We suggest that you plan with us on the manufacture of your peacetime products now.

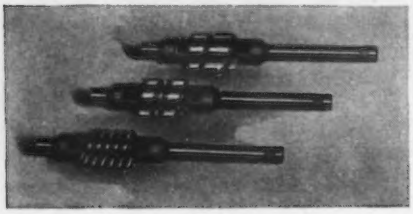
PRECISION PARTS

WORMS

To Bait the Enemy



The worm as turned.

Precision-machined parts for what it takes to destroy the enemy—Ace is turning them out by the thousands. (Ace has an Axis to grind!) These hardened-steel worm-shafts, for example, are part of vital radio equipment. The triple-lead worm-thread is ground right from the solid blank, after hardening. This insures the concentricity between the pitch-diameter of the worm and the bearing-diameter. The bearing-diameter itself is ground to a total tolerance of .0003".

Since the war began, Ace has been supplying America's outstanding manufacturers with small parts and assemblies calling for stamping, machining, heat-treating, or grinding. Ace has provided not only the industry's most modern equipment, but the skill, the background, and the ingenuity to use those machines in new ways to improve results, shorten schedules, and get the work out. Keep Ace up your sleeve for post-war plans. Occasional capacity is available for current work.

Modern equipment . . . modern management.

Swedish Sponge Iron

(CONTINUED FROM PAGE 59)

ticed. For temperatures of max. 650 deg. C. (1200 deg. F.) the fan problem therefore can be considered as solved. It would, however, be highly desirable if the fan could be operated at a higher temperature, as this would eliminate the need of cooling the gas before it enters the fan. Operating the fan at the maximum temperature of 800 deg. C. (1470 deg. F.), for which it was actually designed, has not been found advisable, however.

Carburetor Problem Solved

The carburetor problem has been the hardest one to solve, the principal reason being the fact that the gas and the electric arcs do not seem to "get on" together. The gas on entering the carburetor cools the fuel, thereby decreasing its conductivity. The arcs naturally follow the path of least resistance, the result being that in the early carburetor designs the gas and the arcs separated, resulting in poor regeneration of the gas. Further, the arcs damaged the furnace walls and the electrodes became unevenly eroded.

With the present carburetor design the difficulties mentioned above have been eliminated. The gas is well carbureted and can be kept at an even temperature. The temperature of the carburetor walls is low, maximum about 1100 deg. C. (2000 deg. F.) and only mechanical wear is experienced, as evidenced on an inspection made after six months of operation. Electrode breakage has given no trouble in spite of the fact that the electrode mixture used in the Söderberg electrodes has been of inferior quality.

As to the durability of the furnace shaft proper, the following might be mentioned: When the sponge iron furnace was shut down the last time for repairs, the shaft had been in use for three years without relining. It should be noted that during this period of operation much experimenting had taken place, causing abnormal wear of the shaft. Upon inspection of the shaft it was found that the lower part thereof had become covered with a layer of sponge iron. The upper part of the shaft, on the other hand, was mechanically worn and in the preheating zone the brick lining was partly fluxed. As the shaft in spite of the irregular and abnormal operation during the early experiments still was able to stand up for three years without any relining, it is not too much to assume that it will stand five years of normal operation. As the temperature in no part of the shaft ever exceeded 1000 deg. C. and as the fluctuations in temperature are slight, the wear and tear of the shaft should be of little consequence.

After the last repair of the sponge iron furnace it was restarted in November, 1941. In 18 months of operation only the following shutdowns caused by factors pertaining to the sponge iron process proper were experienced. (See table below.)

At certain periods a decrease in the normal output was noted, the reason for this being inferior sinters that crumbled in the shaft. Due to the fact that the sintering plant at Söderfors is of rather a primitive character, particularly in the matter of mixing, charging, etc., it was found impossible to provide regularly sinters of first class quality.

(TO BE CONTINUED NEXT WEEK)

Date	Interruptions No. of days	Reasons for Interruptions
Feb. 11 to 13, 1942	3	Hangings in the gas intake level
Nov. 20 to 27, 1942	8	Dismantling of the fan for the purpose of cleaning and inspection
Jan. 25, 1943	½	Changing bearings in the circulating fan
Total	11½ days in 18 months of operation	

Increased Tin Plate Output Expected in 2nd Quarter, 1944

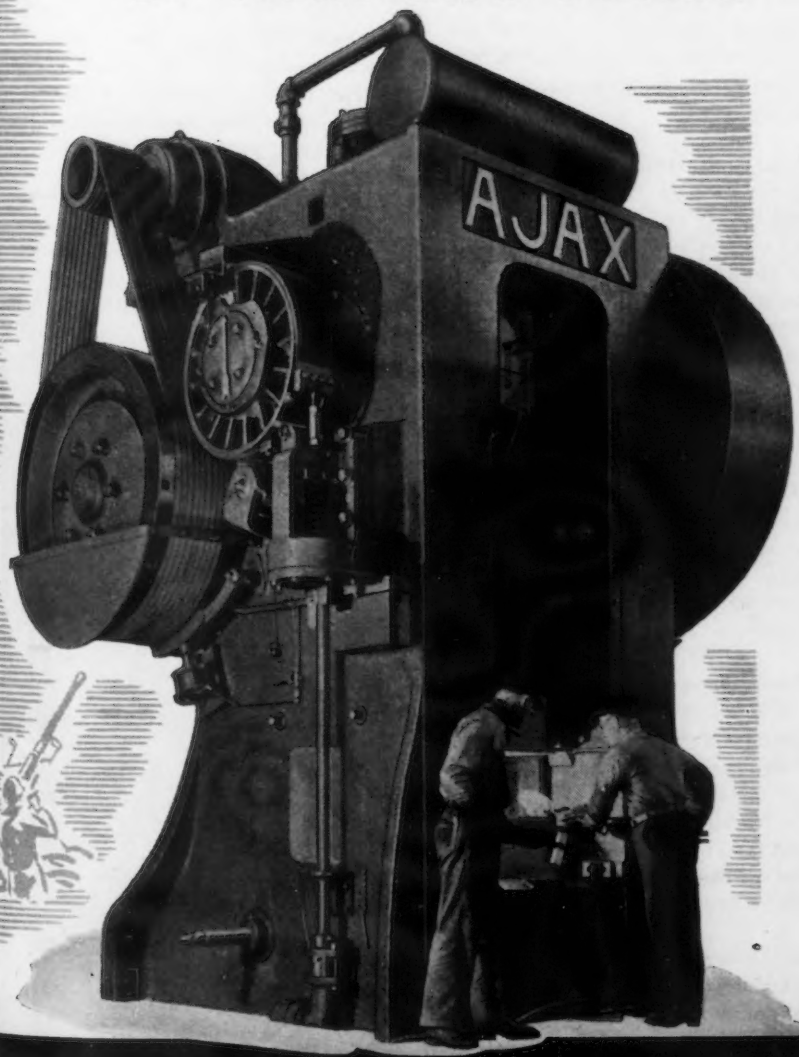
Washington

• • • **While tin and** black plate production during the second quarter of 1944 may be 20 per cent greater than in the first quarter, WPB is not likely to relax any of its controls over these items. The increased output will be utilized in the packing of food products during the coming year and be absorbed in the increased food requirements for essential purposes.

WPB officials stated that second quarter production of tin plate and black plate for 1944 probably would exceed first quarter production by more than 125,000 tons. Total tin and black plate production for the first quarter is to be 627,000 tons, with the second quarter figure expected to be about 750,000 tons.

Industry's Striking Power

for Forging the Products of WAR and PEACE



Today, in forge shops all over the country AJAX Forging Machines and Forging Presses are performing a vital role in the high speed production of material for war, such as parts for ships, guns, tanks, airplanes, bombs and shells—adding their full share to industry's all out effort toward speeding victory. And when that goal has been attained and the requirements for war are curtailed, with merely changing of the dies these same machines and presses will produce, economically at high production rates, accurately forged parts for automobiles, refrigerators, farm implements, railroad cars, and many, many more products to immediately meet the requirements of a new and greater peacetime economy.

THE AJAX MANUFACTURING COMPANY
EUCLID BRANCH P. O. CLEVELAND, OHIO
621 MARQUETTE BUILDING • CHICAGO, ILLINOIS

PERSONALS

• **Raymond E. Bloye** who has been assistant superintendent of the Milwaukee works of the International Harvester Co. has been appointed general superintendent to succeed **V. A. Guebard. Menno Felber,** assistant to Mr. Bloye, will succeed him as assistant superintendent.

• **Harry W. Fortey** has been appointed secretary of the public relations department of the American Hotel Assn., New York. He had been assistant to the president of the De Walt Products Corp., Lancaster, Pa., and in charge of sales promotion, advertising and public relations.

• **Howard L. Stilley,** veteran employee of R. G. LeTourneau, Inc., Peoria, Ill., has been promoted to chief field engineer. He succeeds **Ken F. Park,** resigned to join the Caterpillar Tractor Co.

• **Philip S. Hill** has been promoted to the position of assistant manager, Eastern division of Willamette Hyster Co., Peoria, Ill. He has for the past two years been manager of the Washington, D. C., branch office. **Frank McMillan** has been advanced to manager of the Washington, D. C., office to fill the vacancy left by Mr. Hill.

• **Hugh M. Fenwick,** former assistant to the executive vice-president of Consolidated-Vultee Aircraft Corp. and a close observer of military aviation in the United States and abroad, has joined Curtiss-Wright Corp.

HUGH M. FENWICK joins Curtiss-Wright Corp.

• **Sylvester V. Williams,** former inspection director of the oil field products division at the A. O. Smith Corp., Milwaukee, has been made an executive of the Struthers Wells Corp., Titusville, Pa., where he was employed before joining Smith in 1937.

• **A. Maxwell Jones** has tendered his resignation to Buffalo Bolt Co., North Tonawanda, N. Y., as vice-president in charge of sales. **Charles L. Turner** has been elected to the office of vice-president sales.

• **Fred G. Stebbins** has been appointed manager sales, capacitor section, and **Edward V. Dillon** is assistant manager sales, feeder voltage regulators, in the transformer division of the central station divisions, General Electric Co. Mr. Stebbins succeeds **Charles F. Miller** who will be senior transformer specialist for the New York district. Mr. Dillon's position has just been created.

• **John P. Roche** has been appointed assistant to the president of Oliver Iron & Steel Corp., Pittsburgh, continuing, also, his duties as counsel and assistant secretary. **E. C. Eaglen,** will head their new market research department.

• **George H. Sambrook** was appointed safety director of H. C. Frick Coke Co., and U. S. Coal & Coke Co., Pittsburgh, succeeding **Clyde L. Lutton,** who retired after 26 years' service. Mr. Sambrook became associated with this organization in 1920, and prior to his present appointment was assistant safety director. Mr. Lutton will remain, temporarily, in an advisory capacity.

• **B. C. Gould** has been elected vice-president of Murray Corp. of America, Detroit, and member of the board of directors. Mr. Gould has been operations manager of the corporation since June, 1942.

• **Robert W. Kierker,** manager of sales of Gary Screw & Bolt division, Pittsburgh Screw & Bolt Corp., Chicago, has been appointed general manager of sales. **Gerald J. Garvey,** assistant manager of sales, has been appointed manager of railroad sales. **Bernard C. Ruthy** has been appointed assistant manager of sales.

• **S. O. Bjornberg,** consulting engineer of the Illinois Tool Works, has been appointed a member of the sectional committee on small tools and machine tool elements of the American Standards Association, New York.

• **C. A. Young** has been appointed manager sales, hot rolled products division, Sheffield Steel Corp., Kansas City, Mo. Mr. Young has been with Sheffield ten years.

• **B. O. Bach,** manager of contracts, fabricated steel construction of Bethlehem Steel Co., has been appointed assistant general manager of sales.

• **Raymond E. Fisher,** formerly manager of the American Locomotive Co., Chester, Pa., has been elected president of the Bonney-Floyd Steel Castings Co., Columbus, Ohio.

• **Fred A. Kaiser** has been appointed assistant to **John A. Fry,** president of the Detroit-Michigan Stove Co.

• **James W. Yanda** has recently been made general manager in charge of research chemical development engineering of Chemical Research for Industry, Inc., Cleveland.

• **H. I. Boggs** has been made manager of the Autocar Co.'s branch in Cincinnati. Mr. Boggs is well known to motor truck users throughout the entire Ohio area.

• **Norman Thompson,** former general superintendent of Republic Steel Corp.'s ore mines, Southern division, has been appointed assistant superintendent of the 76th and 34th Street plants of the Rheem Mfg. Co. at Chicago.

• **A. C. Hamilton,** for many years actively connected with industrial manufacturing in the Detroit area, has been appointed Michigan representative of the National Smelting Co., Cleveland.

A. C. HAMILTON, Michigan representative, National Smelting Co., Cleveland

• **R. A. Maxwell** has been appointed in charge of all tire sales except airplane in the combined automotive, aviation and government sales divisions of the B. F. Goodrich Co., Akron, Ohio. Mr. Maxwell has been with the company for 10 years, mainly in truck and bus tire sales.

• **North E. Bartlett** is retiring as vice-president of the Pennsylvania Salt Mfg. Co., Philadelphia. Mr. Bartlett started with the company in 1894.

• **Edward Mackasek** has been appointed development engineer of the Porcelain Enamel Institute of Washington, D. C. He was formerly executive vice-president of the Beaver Enameling Co. of Ellwood City, Pa.

• **David P. Finney** has been appointed assistant general superintendent of Carnegie-Illinois Steel Corp.'s Clairton Works, succeeding **Hobart W. Seyler**, recently named general superintendent of the plant. **James McIntosh** will succeed Mr. Finney as division superintendent in charge of coke plant operations.

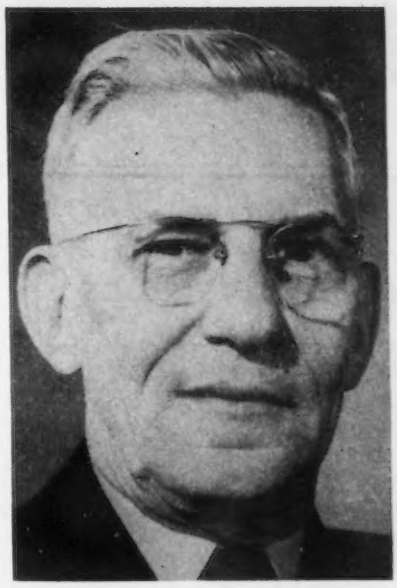
• **Edward C. Hoenicke**, assistant to the general manager, foundry division, Eaton Mfg. Co., Detroit, is consultant to the newly created gray iron castings section of the WPB. Also named to the new section was **A. Douglas Hannah**, senior industrial specialist. He is a director of the Barnett Foundry & Machine Co., Irvington, N. J.

• **W. H. Harter** has been elected a director of Continental Steel Corp., Kokomo, Ind., to fill the vacancy caused by the recent resignation of **W. W. Irwin**. Mr. Harter also is secretary and assistant treasurer of the corporation.

• **T. W. Bowers** has been elected a director of the Buda Co., railway equipment manufacturer, Harvey, Ill.

• **Frank G. Sorensen**, president of United Aircraft Products, Inc., and of American Precision Products, Inc., has been named a director of Pittsburgh Metallurgical Co., Inc., Niagara Falls, N. Y., and Charleston, S. C. Mr. Sorensen also is associated in an executive position with Cincinnati Gear Co.

• **Jerome J. Colby**, former engineer with the Milwaukee ordnance works and later production engineer for the Army Air Corps at Milwaukee, died in a Milwaukee hospital Jan. 1 of pneumonia.



RALPH H. HEBERLING, vice-president, Edward Valve & Mfg. Co., Inc., East Chicago, Ind.

• **Ralph H. Heberling**, for the past two years assistant to the president in charge of manufacturing, has been appointed vice-president of the Edward Valve & Mfg. Co., Inc., East Chicago, Ind.

• **Robert W. Kress**, formerly with the research department of the Follansbee Steel Corp., Pittsburgh, Pa., who joined the special chemicals division of the Pennsylvania Salt Mfg. Co., Philadelphia, last November, has been assigned to the Chicago office of that company.

• **E. J. Anglin** has resigned as vice-president in charge of operations of Weirton Steel Co., a subsidiary of National Steel Corp., but will continue in the employ of the company as general consultant. Mr. Anglin has been succeeded by **J. S. Williamson**, former general superintendent. **E. W. Rieger**, former assistant to the president, has been appointed vice-president in charge of engineering and development work. **W. A. Murphy** has been appointed vice-president and also will continue to serve in the capacity of secretary. **J. J. Munns** was appointed vice-president in charge of quality control, and **C. E. Bayer**, former manager of the steel works department, has been appointed general superintendent. **E. O. Burgham**, former manager of the Weirton Tin Mill, has been appointed assistant general superintendent.

• **Harold W. Buus** has renewed his former position as supervisor of technical operations in the laboratory division of Stearns Magnetic Mfg. Co., Milwaukee.

• **Stuart H. Betsinger** has been made sales manager of Kinney Aluminum Co. Mr. Betsinger, who has been connected with Kinney for over a year as sales engineer, was previously employed by Western Pressure Control Co. and Union Oil of Calif. in various engineering capacities.

• **Allen N. Candee**, mechanical engineer of the Gleason Works, has been appointed a member of the sectional committee on the standardization of gears.

OBITUARY...

• **Garnet W. McKee**, 66, head of Eclipse Fuel Engineering Co., Rockford, Ill., died Jan. 4 at Madison, Wis., following a heart attack. Mr. McKee had headed the Eclipse company, which he founded, for the past 34 years.

• **Arthur B. Mead**, vice-president of Peter A. Frasse & Co., Inc., died after a protracted illness on Dec. 25. He had been connected with the Frasse firm for 30 years, 20 of which were spent managing the company's Philadelphia sales district. Mr. Mead moved to the New York office in 1938, where he was vice-president and a director of the company until his death. He was 55 years old.

• **Irwin E. Lang**, assistant chief engineer of the Pioneer Engineering & Mfg. Co., Detroit, Mich., died suddenly on Dec. 27, at the age of 41.

• **Henry E. Miller**, president of the Chicago Wheel & Mfg. Co., died Jan. 10. He was 80 years old, and one of the oldest grinding wheel manufacturers in the United States. The firm which he headed was founded by him in 1895.

• **John M. Keenan**, 54, formerly associated with Illinois Steel Co., and one of the last so-called foreigners under contract with Tata Iron & Steel Co., Jamshedpur, India, died recently at Kunming, China, following an illness.

• **J. Harry Harley**, auto industry pioneer who was manufacturing superintendent of Chalmers Motor Car Co. from 1910 to 1915, died recently.

• **George W. Botham**, 78 years old, chairman of the board of the Wisconsin Foundry & Machine Co., Madison, died at his home there recently after a long illness. He was a specialist in the manufacture of water supply systems and furnished equipment for many cities in Wisconsin.

MACHINE TOOLS

. . . News and Market Activities

Railroads Buying; Used Market Drops

Chicago

• • • **New machine tool demand** in this area by no means is dormant, although backlogs have dwindled and orders are spotty as to types of equipment. Sales aren't even approaching 1942 and 1943 levels but, belying prophecies made several months ago that new orders would suddenly and completely cease, current sales give rise to talk that 1944 volume may approximate one-third of 1943 for many types of equipment.

Continued tooling up of a certain mammoth Chicago area aircraft engine plant, whose construction was one of the last to be programmed, and inquiries from other plants in the area whose production orders have been revised, along with a handful of entirely new plants, have kept the orders rolling in here in diminished volume, but steadily.

Another supporting factor in the local market has been actual and projected orders from the railroads. During the surge of urgent war plant demand several months ago, many of the roads seized the opportunity to dispose of obsolete shop equipment at attractive prices. Now, for the first time in years, the railroads have the ready cash to modernize their shops.

Conditional inquiries, "if and when" automobile production is resumed, have been reported on the manufacturer level. Apparently some of the more optimistic automobile manufacturers feel that at least limited production may be authorized before the end of this year. Aside from these glimmerings, however, tool demand for the production of civilian products is non-existent. Civilian goods producers seemingly hold the belief that catch-as-catch-can stocks of surplus material will be insufficient for mass production even though production limitations are eased.

This attitude on the part of civilian goods manufacturers has completely knocked the props out from under the erstwhile booming second hand market. Such war plants as are still buying tools now are able to secure early or moderate delivery of new equipment and, having ready cash, shun the second hand mart. OPA ceilings for the most part have become a happy memory, dealers' lists now being circulated offering equipment as much as 50 per cent below permitted maximums. Likening the current market to the days of 1932 and 1933, one large Chicago used equipment dealer stated that his firm had received no inquiries whatsoever for two or three days at a time during recent weeks. The severity of the situation is tempered, however, by the fact that many dealers' stocks have been nearly cleaned out. For the future, there hangs over the trade an estimated 200,000 government owned machine tools, valued at $1 billion, in the Chicago territory.

•

Subcontracting Increasing

Cleveland

• • • **The machine tool business** has had a busy week here producing both an increasing volume of special machines and subcontracting innumerable components for war materiel. Reports would seem to indicate that with the backlog of orders being eaten into rapidly and new standard tool orders declining, subcontracting will continue to grow increasingly. The invasion program has been a recent and urgent stimulus and individual ingenuity has served to fill up many programs which were beginning to thin.

Individual efforts to maintain volume are reflected in the production of the Clark Utilitruck by Cleveland Automatic Machine Co.; a campaign to rebuild old turret lathes on a fixed fee basis by Warner & Swasey Co., and growing parts production of all kinds by many other firms having contract departments.

Undoubtedly the leading problem in the minds of machine tool men is that of the disposition of tools which will become idle when DPC and other war-born plants are permanently thrown out of production. A decision on the part of the government is eagerly awaited not only as to method of disposal but also as to prices.

Machinery makers suggest that the machines be directed into replacement of old machines now in service, thus raising the tool efficiency of the nation's industries to a maximum degree. There is fear that such tools may be termed idle and excess upon the closing of such plants and be channeled through the WPB redistribution branch much the same as idle steel now is being handled. This could be a practical method, tool men say, providing the tools are not permitted to fall into the hands of speculative buyers at near scrap prices.

•

Cutting Tool Group Organized

Detroit

• • • **The Cutting Tool Manufacturers Association** has been incorporated in Delaware as a non-profit corporation, it was announced by W. G. Robbins, chairman of the Board of Directors and president of Carboloy Co., Inc., Detroit. Organizational meetings will shortly be held in other industrial sections of the country. Membership is available to individuals, partnerships, firms or corporations engaged in manufacturing of cutting tools for use with power driven machinery.

Purposes of the association are listed as assistance to the cutting tool industry generally, as well as to federal and local agencies, on such subjects as renegotiation, taxes, contract cancellation and termination, disposal of surplus cutting tools by the armed forces, standardization of cutting tools to permit greater simplification of production equipment and methods, problems arising from cancellation, etc., of pool orders, and post-war disposal of emergency manufacturing facilities.

•

New Tax Bill Being Watched

Cincinnati

• • • **Manufacturers continue** to ponder over renegotiation figures and some are keeping an eye on the new tax bill going through Congress in the hope that some renegotiation relief will be forthcoming before they are required to make final decision on Board reports. Others, of course, have forwarded their checks with corresponding protest letters so that advantage may be taken of any relief subsequently granted. At the same time, the preparation of tax returns also takes on a tentative appearance, since the same tax bill may change these preparations.

MAINE STEEL, INC. *Reports . . .*

"Greatest Time and Money Saver in Die-sinking Machinery in 25 Years!"

"You may remember that about a year ago you sold us a Rotary Head Die-Sinking Machine. We feel that it is time that we told you what we think of it.

The Rotary Head principle has saved us more time and money than any other improvement in Die-Sinking Machinery since Cherrying Attachments were invented more than twenty-five (25) years ago.

The principal reason is that we can sink four (4) impressions complete without moving the work on the table.

This saves three (3) setups out of four (4) when compared to a Rotary Table Machine.

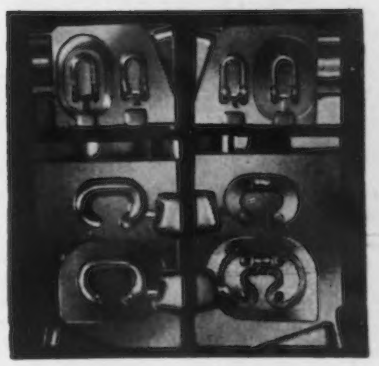
This saving would of course be increased where more than four (4) impressions are needed.

Besides this — the various movements built into this Rotary Head enable us to sink our dies without first laying them out on the Die Blocks.

The machine does its own layout work.

And after a year's experience we can say that these two features have averaged to save us over 30% of our die-sinking time.

Yours very truly,
MAINE STEEL, INC.
A. A. Rines
Foreman—Die Sinking Dept. "



This is typical of the forging dies produced by Maine Steel, Inc. The Milwaukee Rotary Head Miller has saved this firm over 30% in die-sinking time on dies of this type.

Kearney & Trecker's Rotary Head Miller is regarded by the majority of users as the most versatile machine ever designed for die and mold work. Direct — fast — accurate — it reduces initial job preparation and set-up time to the minimum — saves operator's time and assures rapid production of dies and molds. Write for Bulletin No. 1002C for full information on this unusual machine tool.

So. California Aluminum Plants to Stay Open

• • • **Continuance of the** present aluminum industry in southern California was recommended to Washington Jan. 14 by the Los Angeles Area Production Urgency Committee following an extended investigation by a subcommittee composed of military and civilian production experts.

Chairman Louis M. Dreves, in announcing the decision, revealed that the committee at the same time revised employment ceilings at the three Los Angeles area plants involved, permitting recruitment of several hundred additional workers.

The study was taken at the request of WPB's aluminum and magnesium branch in Washington, which is considering a cutback in the industry nationally because output has begun to outstrip current war needs.

"Our local production of extrusions and forgings right now is less than our factories require and we are having to import some from the East," Dreves said. "On some items for aircraft, for example, plants are dependent upon hourly delivery of parts and the time lag is seldom more than 12 hrs. With the pressure now on for more fighter planes, we cannot afford to risk interruptions because of slow transportation from the East."

Finding that "local production of aluminum is not meeting needs for all types of aluminum on the Pacific Coast," the committee held that:

1. Closing of Southland plants would further burden the already overtaxed transportation lines to the West.

2. Southland production operating on electricity generated by waterpower, is not threatened by shortages of fuel as are Eastern Plants dependent upon coal.

3. Closing of the plants would release little manpower to other local war industries because skilled workers imported from Eastern areas show an inclination to return home, rather than transfer to new lines of work.

The urgency committee recommended also that serious efforts be made to step up output of the fabricating or extrusion plant at Phoenix, Ariz., and that a study be made with a view towarl eliminating cross-movement of aluminum pigs, ingots and billets between Eastern points and Los Angeles.

Summary of U. S. Duty Free Copper Statistics Reported by Members of the Copper Institute

* Mine or smelter production on shipments, and custom intake including scrap.
** Beginning March, 1941, includes deliveries of duty paid foreign copper for domestic consumption.
† At refineries, on consignment and in exchange warehouses, but not including consumers' stocks at their plants or warehouses.

Refrigerator Specifications Eased

• • • **WPB has changed** specifications to permit greatly increased use of copper and aluminum strip and tubing in the manufacture of commercial and industrial coil and tube assemblies for refrigeration condensers or coolers. This action, effective Jan. 11, was taken to make field service operations easier and to relieve producers of certain restrictions in the manufacture of coil and tube assemblies.

Relaxation of the specifications covering use of these critical metals will allow the industry an approximate increase per quarter of 300,000 lb. of copper strip, 660,000 lb. of copper tubing, and 200,000 lb. of aluminum strip. There will be a corresponding decrease of 500,000 lb. of steel strip and 400,000 lb. of steel tubing used per quarter as a result of the substitutions.

Since copper and aluminum are easier to handle than steel, the industry, consisting of some 25 companies, estimates that 700,000 man-hours per year will be saved, equal to 30 to 40 per cent of the entire total of industry man-hour operations.

The two amendments, which alter Schedule III and IV of Limitation Order L-126, will permit the following changes in the manufacture of coil or tube assemblies for refrigeration condensers or coolers:

1. Permit the use of non-ferrous metals in the fabrication of coil or tube assemblies for coolers of the finned type only, for coil or tube assemblies to be used in farm milk coolers of the immersion type and for pipe and tubing in water and brine coolers of the shell and tube type.

2. Remove the restrictions on the thickness of fins used in the fabrication of coil or tube assemblies for air cooling.

3. Permit the use of non-ferrous metals in the fabrication of replacement coil or tube assemblies when the assembly is to replace an existing assembly of like metals.

In addition to the relaxations permitted on the manufacturing processes, servicemen or repairmen will be permitted to use copper or copper base alloy pipe or tubing for refrigerant connections.

Scrap Inventories Close to Safety Margin Says Barringer

Cleveland

• • • **Edwin C. Barringer,** president of the Institute of Scrap Iron & Steel, Inc., meeting here Wednesday and Thursday of last week in the Institute's sixteenth annual convention, emphasized the importance of dealers as a means of removing excess and obsolete material from government and contractors' hands for re-cycling into civilian supply and pointed out the conservation of raw materials being effected through the use of scrap.

Mr. Barringer pointed out the continuing need for scrap flow by stating that purchased scrap inventories represented only about a nine weeks' supply, while home scrap supplies had fallen to about two weeks' requirements. Pig iron stocks also were stated as representing only about a 10-day supply. This margin for national safety was declared by Mr. Barringer to be "obviously none too large."

The future supply of scrap was illustrated by the statement that approximately 1¼-billion tons of metal now in use represent potential scrap. The role of the scrap industry as a means of re-cycling excess and obsolete materials into re-usable channels, thus removing it from the hands of the government and contractors' hands, was also stressed.

Julian C. Hammack, general counsel for the Institute of Scrap Iron & Steel, discussed the dealer problem with contract termination. In outlining the situation he said that because dealers supply a basic material their contracts are with sub-contractors and not with the government direct. Hence, termination by the government does not affect them directly except as the customer fails to fulfill scrap contract terms due to terminations of the prime contract requiring the scrap as one of the raw materials. Since scrap contracts are legally valid instruments, their eventual fulfillment is not questioned but extended delivery postponements which could be caused through termination of prime contracts confronts the dealer with possible long periods of slack business without recourse to the government for funds.

The Institute's aim as expressed by Mr. Hammack is that the tie-in of scrap contracts with the prime contracts requiring the use of scrap be established so that scrap dealers too may file compensation claims against terminated contracts mueh the same as would be done by a sub-contractor.

•

PHILADELPHIA — Demand for all open hearth grades increased slightly this week. One mill that halted receipts finds that it is not getting the quantity it expected, while another after similar action is receiving heavier shipments. Cast continues in good demand while low phos is hard to sell. With better weather and increased labor, scrap shipments from the South have improved.

•

NEW YORK—As the demand for open hearth scrap increases, the bottlenecks of labor and transportation appear more acute. All premium grades are slow and because of this situation rather than prepare low phos scrap, the material is added to the open hearth grades and sold as such.

•

BUFFALO — Demand for scrap remained firm this week with all consumers in the market and all items moving in fair quantity. Sales of alloy turnings with premium waived were reported in the trade. The improved situation revived an old sore, the inability of yard operators to obtain adequate labor, particularly during cold weather.

•

CHICAGO—Although district mills that had been out of the market by WPB request now have no purchase restrictions, mill buyers are wary and are buying for immediate requirements only. The purchase holiday plus the short-lived strike in the mills served to cushion and provide better balance for stocks. Lifting of restrictions on use of alloy grades in the open hearth has aroused no particular enthusiasm as a means of consuming excess alloy scrap. Some mills here are being forced to avoid any further alloy additions to scrap charges.

•

CINCINNATI — Dealers are putting into practice advice, suggestions and ideas obtained at the recent Cleveland meeting. As a result, dealers are becoming cautious about permitting yard supplies to accumulate and are moving material as fast as it can be prepared. Correspondingly, there has been a modest upturn in demand for old materials and with price relief granted on alloys, the trade generally expect some relief from the heavy glut in this type of scrap. Consumers are accepting materials as shipped, so that by and large the market appears to be in reasonable balance.

•

BOSTON—Yards and brokers report business no better. Because of a lack of light material three of the large yards have stopped operating presses. One important maker of shells for the government has stopped such work and another is scheduled to do so this week and many plants supplying borings, turnings, etc., are producing 50 per cent less than a year ago. Much battlefield scrap available is not particularly desirable, and peddlers find pickings poor. The scrap situation unquestionably is tight.

•

NEW ENGLAND — Although yards complain about the labor situation, they consider themselves lucky. One yard with 25 workers on the payroll reports 23 out due to sickness or some other reason, another hiring 12 men had only four this week, and so it goes. However, all say that in a way they are lucky because of the scarcity of scrap. If scrap was flowing into yards in large quantities it would be impossible to handle it with all available help working overtime.

Barringer Reelected For One-Year Term

Cleveland

• • • The election of officers held last Thursday during the sixteenth annual convention of the Institute of Scrap Iron & Steel, Inc., here reinstated Edwin C. Barringer as president for another year and continued his post as executive secretary. The vice-presidency was won by William J. Wolf, Wolf & Co., Hamilton, Ohio; Secretary, Walter Erman, Erman-Howell Co., Chicago. The retiring officers were Everett B. Michaels and Hiram Winternitz who formerly held these posts. Remaining in office were: Treasurer, Samuel G. Keywell; General Counsel, Julian C. Hammack and Comptroller, Thomas F. Kelly.

The board of directors of the institute established two new chapters, one in Indiana and a second in Oregon. All directors-at-large were reelected and two new directors were added. These were William J. Ross, Hyman Michaels Co., Chicago, and Milton K. Mahler, Morrow Steel Co., Detroit.

* Baled turnings are $5 per gross ton higher.

BUNDLES: Tin can bundles are $4 below dealers' No. 2 bundles; No. 3 bundles are $2 less than No. 1 heavy melting.

AT NEW YORK CITY or Brooklyn, the maximum shipping point price is $15.33 for No. 1 heavy melting, f.o.b. cars, f.a.s. vessel or loaded on truck. Minimum set at $14 per gross ton at any shipping point in U. S. Other grades carry differentials similar to those in table. New Jersey prices must be computed on basis of all-rail. At Boston the maximum is $15.05 for No. 1 f.o.b. cars, f.a.s. vessel or loaded on trucks. Shipments from a New England shipping point to a consumer outside New England carry maximum transportation charge of $6.66 per ton.

SWITCHING CHARGES: Deductions for shipping points within basing points (cents per gross ton) are: Pittsburgh, Brackenridge, 55c.; Midland, Johnstown, Sharon, Youngstown, Warren, Weirton, Cleveland, Toledo, Los Angeles, San Francisco, 42c.; Butler, Monessen, Canton, Steubenville, Cincinnati*, Portsmouth, Ashland, Coatesville, Harrisburg, Phoenixville, Bethlehem, Kokomo, Duluth, St. Louis, 28c.; Buffalo, Claymont, 36c.; Conshohocken, 11c.; Atlanta, Birmingham, 32c.; Pittsburg, Cal., 42c.; Middletown, 14c.; Sparrow's Point, 11c.; Chicago, 84c.; Detroit, 53c.; Alabama City, 26c.; Minnequa, 22c.; Seattle, 38c. At Cincinnati, for basic open hearth grades, foundry steel and auto springs and crankshafts, deduct 80c. per ton.

PITTSBURGH basing point includes switching districts of Bessemer, Homestead, Duquesne, Munhall and McKeesport, Cincinnati basing point includes Newport, Ky., switching district. St. Louis includes switching districts of Granite City, East St. Louis, Madison, Ill. San Francisco includes switching districts of S. San Francisco, Niles and Oakmont, Cal. Claymont, Del., includes the switching point of Chester, Pa. Chicago includes Gary, Ind., switching district.

MAXIMUM SHIPPING POINT PRICE—Where shipment is by rail or vessel, or by combination of rail and vessel, the scrap is at its shipping point when placed f.o.b. railroad or f.a.s. vessel. In such cases, the maximum shipping point prices shall be: (a) For shipping points located within a basing point, the price listed in the table above for the scrap at the basing point in which the shipping point is located, minus the lowest established switching charge for scrap within the basing point and (b) for shipping points located outside the basing point, the price in table above at the most favorable basing point minus the lowest transportation charge by rail or water or combination thereof. In lieu of dock charge add 75c. a ton, but 50c. if moved by deck scow or railroad lighter. Shipping by motor vehicle: The scrap is at its shipping point when loaded. For shipping points located within basing points take price listed in table minus applicable switching charge. If located outside a basing point, the price at the most favorable basing point minus lowest established charge for transporting by common carrier. If no established transportation rate exists, the customary costs are deducted. Published dock charges prevail. If unpublished include 75c.; at Memphis, 50c.; Great Lakes ports, $1; New England, $1.25. For exceptions see official order.

UNPREPARED SCRAP: For unprepared scrap, maximum prices shall be $3.50 (and in the case of the material from which No. 1, No. 2, and No. 3 bundles are made $4) less maximum prices for the corresponding grade or grades of prepared scrap. In no case, however, shall electric furnace and foundry grades be used as the "corresponding grade or grades of prepared scrap." Converter may charge $2.50 per ton on consumer-owned unprepared remote scrap (see order). A preparation-in-transit charge for allocated unprepared scrap is provided.

NEW LISTED GRADES: Priced in dollars per gross ton less than No. 1 heavy melting steel. Pit scrap, ladle skulls, slag reclaim, etc., of 85% or more Fe priced—$2; 75 to 85% Fe—$4; under 75% Fe—$3 per ton. Mill scale of 65% or more Fe—$8 per ton. Mill cinder and grindings, shipping point maximum price of $4 per gross ton at all U. S. shipping points.

CHEMICAL BORINGS: No. 1 (new, clean, containing not more than 1 per cent oil), $1 less than No. 1 heavy melting; No. 2 (new, clean, containing not more than 1.5 per cent oil), $2 less than No. 1 heavy melting. If loaded in box cars add 75c.

Weighted index based on steel bars, beams, tank plates, wire, rails, black pipe, hot and cold-rolled sheets and strip, representing 78 per cent of the United States output. Index recapitulated in Aug. 28, 1941, issue.

Based on averages for basic iron at Valley furnaces and foundry iron at Chicago, Philadelphia, Buffalo, Valley and Southern iron at Cincinnati.

Based on No. 1 heavy melting steel scrap quotations to consumers at Pittsburgh, Philadelphia and Chicago.

. . . Prices of Finished Iron and Steel

Steel prices shown here are f.o.b. basing points, in cents per lb., unless otherwise indicated. Extras apply. Delivered prices do not reflect 3% tax on freight. (1) Mill run sheet, 10c. per 100 lb. under base; primes 25c. above base. (2) Unassorted 8-lb. coating. (3) Widths up to 12-in. (4) 0.25 carbon and less. (5) Applies to certain width and length limitations. (6) For merchant trade. (7) For straight length material only from producer to consumer. Discount of 25c. per 100 lb. to fabricators. (8) Also shafting. For quantities of 20,000 to 29,999 lb. (9) Carload lot in manufacturing trade. (10) Prices do not apply if rail and water is used. (12) Boxed. (13) Portland and Seattle price, San Francisco 2.50c. (14) This base price to be used in figuring annealed, bright finish wires, commercial spring wire.

EXCEPTIONS TO PRICE SCHED. NO. 6

Slabs—Andrews Steel Co. $41 basing pts.; Wheeling Steel Corp. $34 Portsmouth, Ohio; Empire Sheet & Tin Plate Corp. $41; Phoenix Iron Co. (rerolling) $41, (forging) $47; Granite City Steel Co. $47.50.

Blooms—Phoenix Iron Co. (rerolling) $41, (forging) $47.

Sheet Bar—Empire Sheet & Tin Plate Co. $39 mill; Wheeling Steel Corp. $38 Portsmouth, Ohio.

Billets, Forging—Andrews Steel Co. $50 basing pts.; Follansbee Steel Corp. $49.50 Toronto, Ohio; Phoenix Iron Co. $47.00 mill.

Billets, Rerolling—Continental Steel Corp. may charge Acme Steel in Chicago switching area $34 plus freight from Kokomo, Ind.; Northwestern Steel & Wire Co. (Lend-Lease) $41 mill; Wheeling Steel Corp. (small) $36 Portsmouth, Ohio; (blooming mill sizes) applicable base, f.o.b. Portsmouth, Ohio; Stanley Works may sell Washburn Wire Co. under allocation at $39 Bridgeport, Conn.; Keystone Steel & Wire Co. may sell Acme Steel Co. at Chicago base, f.o.b. Peoria; Phoenix Iron Co. $41 mill; Continental Steel Corp. (1¾ x 1¾) $39.50, (2 x 2) $40.60 Kokomo, Ind. (these prices include $1 size extra); Keystone Steel & Wire Co. $36.40 Peoria; Connors Steel Co. $50.69 Birmingham; Ford Motor Co. $34 Dearborn, Mich.

Structural Shapes—Phoenix Iron Co. $2.35 basing pts., (export) $2.50 Phoenixville; Knoxville Iron Co. $2.30 basing pts.; Sheffield Steel Corp. $2.55 St. Louis.

Bar Size Shapes—(Angles) W. Ames & Co., 10 tons or over, $3.10 mill.

Rails—Sweet Steel Co. (rail steel) $50 mill; West Virginia Rail Co. (lightweight) on allocation based Huntington, W. Va.; Colorado Fuel & Iron Corp. $45 Pueblo, Colo.

Hot Rolled Plate—Granite City Steel Co. $2.65 mill; Knoxville Iron Co. $2.25 basing pts.; Kaiser Co. $3.20 Pacific Ports.

Merchant Bars—Sheffield Steel Corp. $2.75 St. Louis; W. Ames & Co., 10 tons and over, $2.85 mill; Eckels-Nye Steel Corp., $2.50 basing pts. (rail steel) $2.40; Phoenix Iron Co. $2.40 basing pts.; Sweet Steel Co. (rail steel) $2.35 mill; Joslyn Mfg. & Supply Co. $2.35 Chicago; Central Iron & Steel Co. $2.20 basing pts.; Granite City Steel Co. $2.35 Granite City; Calumet Steel Div., Borg Warner Corp. (8 in. mill bars) $2.35 Chicago; Knoxville Iron Co. $2.30 basing pts. Laclede Steel Co., sales to LaSalle Steel granted Chicago base, f.o.b. Madison, Ill.

Reinforcing Bars—W. Ames & Co., 10 tons and over, $2.85 mill; Sweet Steel Co. (rail steel) $2.35 mill; Columbia Steel Co. $2.50 Pacific Ports.

Cold Finished Bars—Keystone Drawn Steel Co. on allocation, Pittsburgh c.f. base plus c/l freight on hot rolled bars Pittsburgh to Spring City, Pa.; New England Drawn Steel Co. on allocation outside New England, Buffalo c.f. base plus c/l freight Buffalo to Massfield, Mass., f.o.b. Massfield.; Empire Finished Steel Corp. on allocation outside New England, Buffalo c.f. base plus c/l freight Buffalo to plants f.o.b. plant; Compressed Steel Shafting Co. on allocation outside New England, Buffalo base plus c/l freight Buffalo to Readville, Mass. f.o.b. Readville; Medart Co. in certain areas, Chicago c.f. base plus c/l freight Chicago to St. Louis, f.o.b. St. Louis.

Alloy Bars—Texas Steel Co. for delivery in U. S. except Texas and Oklahoma may use Chicago base, f.o.b. Fort Worth, Tex.; Connors Steel Co. when shipped outside Alabama, Mississippi, Louisiana, Georgia, Florida, Tennessee, Pittsburgh base, f.o.b. Birmingham.

Hot Rolled Strip—Joslyn Mfg. & Supply Co. $2.30 Chicago; Knoxville Iron Co. $2.25 basing pts.

Hot Rolled Sheets—Andrews Steel Co., Middletown base granted on shipments to Detroit or area; Parkersburg Iron & Steel Co., $2.25 Parkersburg.

Galvanized Sheets—Andrews Steel Co., $3.75 basing pts.; Parkersburg Iron & Steel Co. $3.85 Parkersburg; Apollo Steel Co. $3.75 basing pts.; Continental Steel Co., Middletown base granted on Kokomo, Ind., product; Superior Sheet Steel Co. granted Pittsburgh base except for Lend-Lease.

Pipe and Tubing—South Chester Tube Co. when priced at Pittsburgh, freight to Gulf Coast and Pacific Ports may be charged from Chester, Pa., also to points lying west of Harrisburg, Pa.

WAREHOUSE PRICES

Delivered metropolitan areas per 100 lb. These are zoned warehouse prices in conformance with latest zoning amendments to OPA Price Schedule 49.

*Recommended for large sections only. Note: The extras shown are in addition to a base price of 2.70c. per 100 lb., on finished products and $54 per gross ton on semi-finished steel major basing points and are in cents per 100 lb. and dollars per gross ton in semi-finished. When acid open-hearth is specified and acceptable add to basic open hearth alloy differential 0.25c. per lb. for bars and bar strip, $5.00 per gross ton for billets, blooms and slabs. The ranges shown above are restricted to sizes 100 sq. in. or less or equivalent cross sectional area 18 in. wide or under with a max. individual piece weight of 7000 lb.

BASE QUANTITIES

Standard unless otherwise keyed on prices.

HOT ROLLED: Sheets, strip, plates, shapes and bars, 400 to 1999 lb.

COLD ROLLED: Sheets, 400 to 1999 lb.; strip, extras on all quantities; bars, 1500 to 39,999 lb.; NE alloy bars, 1000 to 39,999 lb.

EXCEPTIONS: (1) 150 to 499 lb. (2) 150 to 1499 lb. (3) 400 to 1499 lb. (4) 450 to 1499 lb. (5) 500 to 1499 lb. (6) 0 to 1999 lb. (7) 400 to 1999 lb. (8) 1000 to 1999 lb. (9) 450 to 3749 lb. (10) 400 to 3999 lb. (11) 300 to 4999 lb. (12) 300 to 10,000 lb. (13) 400 to 14,999 lb. (14) 400 to 39,999 lb. (15) 1000 to 39,999 lb. (16) 1500 to 39,999 lb. (17) 2000 to 39,999 lb. (18) 3500 to 39,999 lb.

(*a*) Philadelphia: Galvanized sheets, 25 or more bundles.

Extra for size, quality, etc., apply on above quotations.

CAST IRON WATER PIPE

	Per Net Ton
6-in. and larger, del'd Chicago	$54.80
6-in. and larger, del'd New York	52.20
6-in. and larger, Birmingham	46.00
6-in. and larger f.o.b. cars, San Francisco or Los Angeles	69.40
6-in. and larger f.o.b. cars, Seattle	71.20

Class "A" and gas pipe, $3 extra; 4-in. pipe is $3 a ton above 6-in. Prices shown are for lots of less than 200 tons. For 200 tons or over, 6-in. and larger is $45 at Birmingham and $53.80 delivered Chicago, $59.40 at San Francisco and Los Angeles, and $70.20 at Seattle. Delivered prices do not reflect new 3 per cent tax on freight rates.

LAKE SUPERIOR ORES

(51.50% Fe, Natural Content, Delivered Lower Lake Ports)*

	Per Gross Ton
Old range, bessemer, 51.50	$4.75
Old range, non-bessemer, 51.50	4.60
Mesaba, bessemer, 51.50	4.60
Mesaba, non-bessemer, 51.50	4.45
High phosphorus, 51.50	4.35

*Adjustments are made to indicate prices based on variance of Fe content of ores as analyzed on a dry basis by independent laboratories.

PRICES

SEMI-FINISHED STEEL

Billets, Blooms and Slabs

Pittsburgh, Chicago, Gary, Cleveland, Youngstown, Buffalo, Birmingham, Sparrows Point (rerolling only). Prices delivered Detroit are $2.00 higher; delivered E. Michigan, $3 higher; f.o.b. Duluth, billets only, $2.00 higher; billets f.o.b. Pacific ports are $12 higher. Delivered prices do not reflect three per cent tax on freight rates.

	Per Gross Ton
Rerolling	$34.00
Forging quality	40.00

For exceptions on semi-finished steel see the footnote on the page of finished steel prices.

Alloy Steel

Pittsburgh, Chicago, Canton, Massillon, Buffalo, or Bethlehem, per gross ton 54.00

Shell Steel

	Per Gross Ton
3 in. to 12 in.	$52.00
12 in. to 18 in.	54.00
18 in. and over	56.00

Basic open hearth shell steel, f.o.b. Pittsburgh, Chicago, Buffalo, Gary, Cleveland, Youngstown and Birmingham.

Prices delivered Detroit are $2.00 higher; E. Michigan, $3 higher.

Note: The above base prices apply on lots of 1000 tons of a size and section to which are to be added extras for chemical requirements, cutting, or quantity.

Sheet Bars

Pittsburgh, Chicago, Cleveland, Youngstown, Buffalo, Canton, Sparrows Point, Md.

	Per Gross Ton
Open hearth or bessemer	$34.00

Skelp

Pittsburgh, Chicago, Youngstown, Coatesville, Pa., Sparrows Point, Md.

	Per Lb.
Grooved, universal and sheared	1.90c.

Wire Rods

(No. 5 to 9/32 in.)

	Per Lb.
Pittsburgh, Chicago, Cleveland	2.00c.
Worcester, Mass.	2.10c.
Birmingham	2.00c.
San Francisco	2.50c.
Galveston	2.25c.

9/32 in. to 47/64 in., 0.15c. a lb. higher. Quantity extras apply.

TOOL STEEL

(F.o.b. Pittsburgh, Bethlehem, Syracuse)

	Base per lb.
High speed	67c.
Straight molybdenum	54c.
Tungsten-molybdenum	57½c.
High-carbon-chromium	43c.
Oil hardening	24c.
Special carbon	22c.
Extra carbon	18c.
Regular carbon	14c.

Warehouse prices east of Mississippi are 2c. a lb. higher; west of Mississippi 3c. higher.

CORROSION AND HEAT-RESISTING STEEL

(Per lb. base price, f.o.b. Pittsburgh)

Plates	18.00c.*
Sheets	19.00c.

*Includes annealing and pickling.

FOUR UDYLITE BARRELS FOR BULK HANDLING OF SMALL PARTS

In one of Udylite's four types of barrels you will find exactly what you need.

Udylite barrels are designed by engineers who *know* the plating and finishing business through years of experience. These barrels have been tested under actual plant conditions — hundreds of them are giving "better than satisfactory," continuous service under today's abnormal strain. They have proved themselves worthy of your consideration and trust.

THE HORIZONTAL PLATING BARREL. Udylite's conventional, rotating cylinder type barrel. Product of years of practical experience in plating. Proved by years of service. Built to your requirements in "Lift arm", "Multiple cylinder" or "Bail" type.

The barrel which built Udylite's reputation for A-1 trouble-free equipment.

THE MULTI-PURPOSE BARREL. A "Jack of all work" for cleaning, drying, plating, rinsing or pickling of small parts. Fast, sturdy and economical. Batch type. Loads and unloads quickly. Capacity one peck or 50 to 70 pounds. Equipped for cyanide or acid plating or for tumbling, pickling, rinsing, etc., as you specify.

THE AUTOMATIC CLEANING AND PLATING MACHINE. A practical, compact unit which cleans, pickles, plates, rinses and dries large quantities of small parts automatically. Can be used for any combination of operations. May be converted to new cycles quickly and inexpensively. No manual handling of parts in process. An ideal unit for war or peacetime quantity production.

THE HANDIPLATER. The handiest little plating outfit in any plant. Plates that double handful of odd parts which are always such a problem. Can be carried anywhere in the plant and plugged into regular light socket. A complete unit in every way.

If you need information on bulk handling of small parts write or call Udylite—our experienced engineers are at your service.

THE UDYLITE CORPORATION

1651 E. Grand Blvd., Detroit 11, Mich.

Chicago 12, 1943 Walnut Street

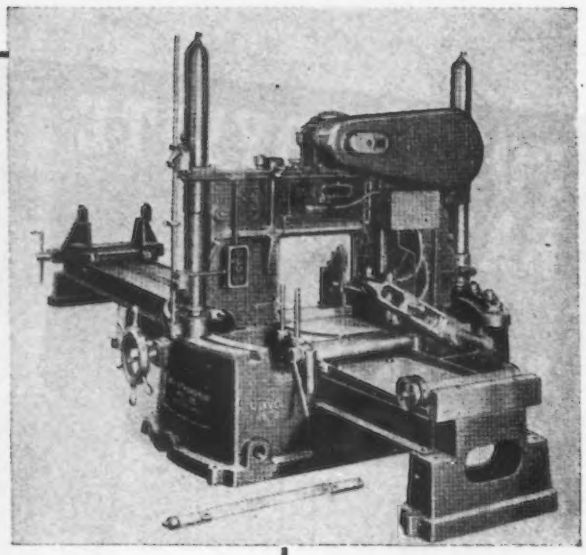
Cleveland 3, 4408 Carnegie Ave.

CUTS the Toughest Steels and Largest Sizes *easily.*



This giant hydraulic metal - cutting saw is more than just a larger hack saw. It is a new development in metal-cutting methods that introduces a new principle of metal sawing — the Roll-stroke blade action makes it possible to cut the toughest steels in the largest sizes easily and rapidly. It also permits a simple and efficient, very low pressure Hydraulic Feed System.

Built for heavy work, completely enclosed in heavy housing, this machine will stand up under the rough usage of the average steel mill warehouse and forge shop, where it will speed cutting-off, and reduce material loss.

MARVEL No. 18
Giant Hydraulic Hack Saw
Capacity 18"x18"

Cuts angles up to 45° by simply swiveling upper machine housing.

2 in.	33½	15½
2½ to 4 in.	39	22½
4½ to 6 in.	37½	21

On butt weld and lap weld steel pipe jobbers are granted a discount of 5%. On less-than-carload shipments prices are determined by adding 25 and 30% and the carload freight rate to the base card.

F.o.b. Gary prices are two points lower discount or $4 a ton higher than Pittsburgh or Lorain on lap weld and one point lower discount, or $2 a ton higher on all butt weld.

Forming, Welding, Fabricating—

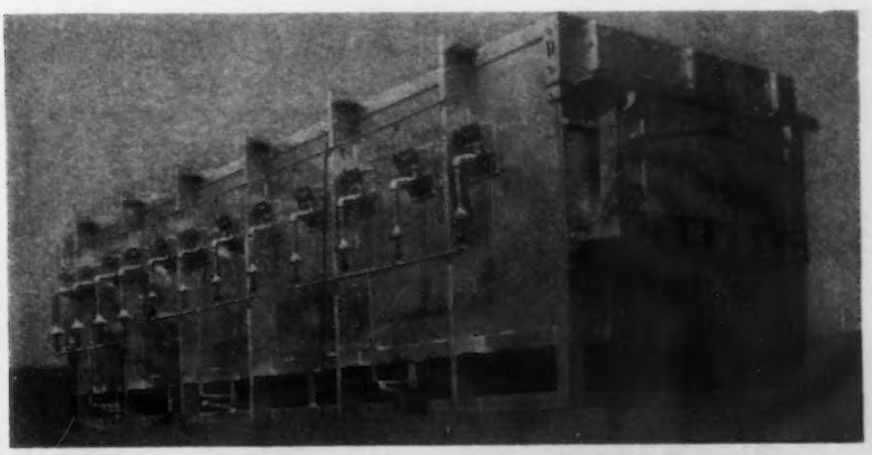
3000 lb. Electro Processing Oven of ¼" steel plate (50" long x 36" inside diameter) shown with rock wool jacket removed . . . fabricated by Brandt for a large cork board plant.

Call BRANDT of Baltimore

for Precision in Heavy Plate and Sheet Steel Work

Here, at your command, is an 8½ acre plant . . . with the most modern equipment for shearing, rolling, forming, welding and completely fabricating ferrous, non-ferrous and alloy metals to your specifications . . . from the lightest gauge up to and including 1¼" mild steel or ¾" armor plate. Address: Charles T. Brandt, Inc., Baltimore-30, Maryland.

BRANDT of Baltimore—*Craftsmen in Metal Since 1890*



BELLEVUE FURNACES

are designed for the job.

In the construction of Bellevue Furnaces, painstaking consideration of the job to be done comes first. Every factor must be evaluated, every condition studied. Only then do Bellevue engineers attempt design and recommendation of furnace type.

The soundness of that policy is being demonstrated in plant after plant. Hundreds of executives in scores of varied companies have proved, to their own satisfaction, the efficiency, speed, high production level and operating economies of Bellevues that were "designed" for the job.

You, too, will find Bellevue experience and facilities a profitable investment for your own furnace needs.

Send for full details.

BELLEVUE INDUSTRIAL FURNACE CO.
2974 BELLEVUE AVENUE DETROIT, MICH.

PIG IRON

All prices set in bold face type are maxima established by OPA on June 24, 1941. Other domestic prices (in italics) are delivered quotations per gross ton computed on the basis of the official maxima. Delivered prices do not reflect 3 per cent tax on freight rates.

GRAY FORGE IRON: Valley or Pittsburgh furnace $23.50

(1) Pittsburgh Coke & Iron Co. (Sharpsville, Pa., furnace only) and the Struthers Iron and Steel Co., Struthers, Ohio, may charge 50c. a ton in excess of basing point prices for No. 2 foundry, basic, bessemer and malleable.

(2) Price shown is for low-phosphorous iron; high-phosphorous sells for $28.50 at the furnace.

(3) Eastern Gas & Fuel Associates, Boston, is permitted to sell pig iron produced by its selling company. Effective Feb. 1, 1944, Mystic Iron will be sold without the above OPA price relief grant of $2 per ton.

(4) E. & G. Brooke Co. permitted to charge $1.00 per ton extra.

(5) Pittsburgh Ferromanganese Co. (Chester furnace only) may charge $2.25 a ton over maximum basing point prices.

Basing point prices are subject to switching charges; silicon differentials (not to exceed 50c. a ton for each 0.25 per cent silicon content in excess of base grade which is 1.75 per cent to 2.25 per cent); phosphorous differentials, a reduction of 38c. per ton for phosphorous content of 0.70 per cent and over; manganese differentials, a charge not to exceed 50c. per ton for each 0.50 per cent manganese content in excess of 1.00 per cent. Effective March 3, 1943, $2 per ton extra may be charged for 0.5 to 0.75 per cent nickel content and $1 per ton extra for each additional 0.25 per cent nickel.

METAL POWDERS

Prices are based on current market prices of ingots plus a fixed figure. For ton lots f.o.b. shipping point, in cents per lb.

Copper, electrolytic, 150 and 200 mesh	21⅛ to 23⅛c.
Copper, reduced, 150 and 200 mesh	20½ to 25⅛c.
Iron, commercial, 100 and 200 mesh, 96 + % Fe	13½ to 15c.
Iron, crushed, 200 mesh and finer, 90 + % Fe	4c.
Iron, hydrogen reduced, 300 mesh and finer, 98½ + % Fe	63c.
Iron, electrolytic, unannealed, coarser than 300 mesh, 99 + % Fe	30 to 33c.
Iron, electrolytic, annealed minus 100 mesh, 99 + % Fe	42c.
Iron, carbonyl, 300 mesh and finer, 98-99.8 + % Fe	90c.
Aluminum, 100 and 200 mesh	*23 to 27c.
Antimony, 100 mesh	20.6c.
Cadmium, 100 mesh	$1
Chromium, 150 mesh	$1.03
Lead, 100, 200 & 300 mesh, 11½ to 12½c.	
Manganese, 150 mesh	51c.
Nickel, 150 mesh	51½c.
Solder powder, 100 mesh, 8½c. plus metal	
Tin, 100 mesh	58¾c.
Tungsten metal powder, 98%-99%, any quantity, per lb.	$2.60
Molybdenum powder, 99%, in 200-lb. kegs, f.o.b. York, Pa., per lb.	$2.60
Under 100 lb.	$3.00

*Freight allowed east of Mississippi.

PRICES

BOLTS, NUTS, RIVETS, SET SCREWS

Bolts and Nuts
(F.o.b. Pittsburgh, Cleveland, Birmingham or Chicago)

Machine and Carriage Bolts:

	Per Cent Off List
½ in. & smaller x 6 in. & shorter	65½
9/16 & ⅝ in. x 6 in. & shorter	63½
¾ to 1 in. x 6 in. & shorter	61
1⅛ in. and larger, all length	59
All diameters over 6 in. long	59
Lag, all sizes	62
Plow bolts	65

Nuts, Cold Punched or Hot Pressed:
(Hexagon or Square)

½ in. and smaller	62
9/16 to 1 in. inclusive	59
1⅛ to 1½ in. inclusive	57
1⅝ in. and larger	56

On above bolts and nuts, excepting plow bolts, additional allowance of 10 per cent for full container quantities. There is an additional 5 per cent allowance for carload shipments.

Semi-Fin. Hexagon Nuts	U.S.S.	S.A.E.
7/16 in. and smaller	..	64
½ in. and smaller	62	..
⅝ in. through 1 in.	..	60
9/16 to 1 in.	59	..
1⅛ in. through 1½ in.	57	58
1⅝ in. and larger	56	..

In full container lots, 10 per cent additional discount.

Stove Bolts

Packages, nuts loose	71 and 10
In packages, with nuts attached	71
In bulk	80

On stove bolts freight allowed up to 65c. per 100 lb. based on Cleveland, Chicago, New York on lots of 200 lb. or over.

Large Rivets *(½ in. and larger)*

	Base per 100 lb.
F.o.b. Pittsburgh, Cleveland, Chicago, Birmingham	$3.75

Small Rivets *(7/16 in. and smaller)*

	Per Cent Off List
F.o.b. Pittsburgh, Cleveland, Chicago, Birmingham	65 and 5

Cap and Set Screws

	Per Cent Off List
Upset full fin. hexagon head cap screws, coarse or fine thread, up to and incl. 1 in. x 6 in.	64
Upset set screws, cup and oval points	71
Milled studs	46
Flat head cap screws, listed sizes	36
Fillister head cap, listed sizes	51

Freight allowed up to 65c. per 100 lb. based on Cleveland, Chicago or New York on lots of 200 lb. or over.

RAILS, TRACK SUPPLIES
(F.o.b. Mill)

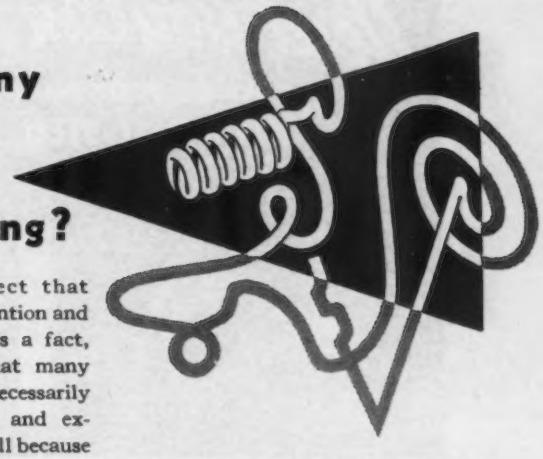
Standard rails, heavier than 60 lb., No. 1 O.H., gross ton	$40.00
Angles bars, 100 lb.	2.70
California Ports	$3.15
(F.o.b. Basing Points)	*Per Gross Ton*
Light rails (from billets)	$40.00
Light rails (from rail steel)	39.00
	Base per Lb.
Cut spikes	3.00c.
Screw spikes	5.15c.
Tie plates, steel	2.15c.
Tie plates, Pacific Coast	2.30c.
Track bolts	4.75c.
Track bolts, heat treated, to railroads	5.00c.
Track bolts, jobbers discount	63-5

Basing points, light rails, Pittsburgh, Chicago, Birmingham: spikes and tie plates—Pittsburgh, Chicago, Portsmouth, Ohio, Weirton, W. Va., St. Louis, Kansas City, Minnequa, Colo., Birmingham and Pacific Coast ports; tie plates alone—Steelton, Pa., Buffalo. Spikes alone—Youngstown, Lebanon, Pa., Richmond, Oregon and Washington ports, add 25c.

ROOFING TERNE PLATE
(F.o.b. Pittsburgh, 112 Sheets)

	20x14 in.	20x28 in.
8-lb. coating I.C.	$6.00	$12.00
15-lb. coating I.C.	7.00	14.00
20-lb. coating I.C.	7.50	15.00

How many BENDS in a Spring?



Here's a subject that deserves close attention and investigation. It's a fact, sad but true, that many springs are unnecessarily intricate, difficult and expensive to make, all because of lack of understanding of the ultimate purpose. Ofttimes, a simplified design—or a different type of material can do wonders in the way of reducing costs and "upping" performance. Here's where experience in spring design pays off. Let the springmaker in on your requirements—in the early stages if possible.

A good spring in time saves nine!

Crack Down on Your METAL CLEANING Costs!

Hundreds of manufacturers in the metal working industry actually save more than half of their former metal cleaning costs with Magnus Emulso-Clean . . . Emulso-Dip for cold tank cleaning and Emulso-Spray for use in mechanical washing machines.

Emulso-Clean reduces cleaning labor costs and eases manpower shortages . . . does away with scrubbing, wiping and hand brushing . . . eliminates rejects . . . and steps up production. It promptly and completely emulsifies and suspends dirt, drawing and buffing compounds and other "smut." Provides maximum speed in thoroughly wetting immersed objects. Leaves the work with physically clean surfaces.

Let us help you crack down on your metal cleaning costs. Tell us about your particular problems. Our service representatives and laboratory will be glad to help you solve them, without obligation on your part.

METAL CLEANING HANDBOOK

72-pages, with illustrations, of priceless data on metal cleaning. Gives latest developments, tested methods and machines for cleaning all types of metal objects. Send for your copy of this short-cut to better cleaning today.

Did you Know?

Over 50% of furnace wall radiation losses alone can be stopped? **Therm-O-Flake** Insulation is preferred for this work in most steel plants.

Here's why!

Highest insulating value — easy to apply — low maintenance — low cost — high reclamation — sticks tightly to silica or basic brick — permits closer control of fuel-air ratios — reduces cold air infiltration.

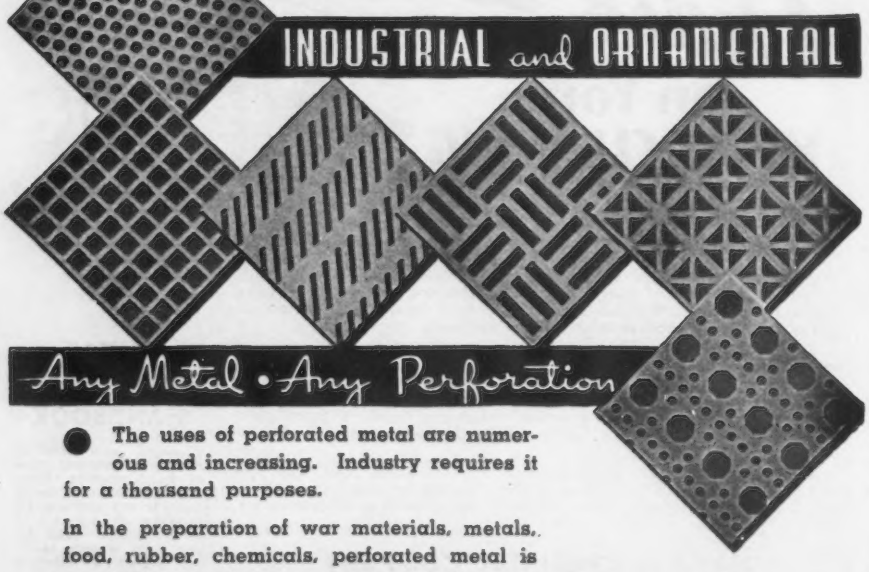
PERFORATED METAL

INDUSTRIAL and ORNAMENTAL



Any Metal • Any Perforation

● The uses of perforated metal are numerous and increasing. Industry requires it for a thousand purposes.

In the preparation of war materials, metals, food, rubber, chemicals, perforated metal is required to perform an important role.

PRICES

Ferromanganese

78-82% manganese, maximum contract base price per gross ton, lump size, f.o.b. car at Baltimore, Philadelphia, New York, Birmingham, Rockdale, Rockwood, Tenn.

Carload lots (bulk)	$135.00
Ton lots (packed)	141.00
Less ton lots (packed)	143.50

Premium, $1.70 for each 1% above 82% Mn; penalty, $1.70 for each 1% below 78%.

Electrolytic Manganese

99.9% manganese, maximum base contract price per lb. of metal, bulk, f.o.b. shipping point, with freight allowed to destination. Size 1" x D.

	Eastern Zone	Central Zone	Western Zone
Carload lots	37.60c.	37.85c.	38.15c.
l.c.l. lots	39.60c.	38.60c.	40.65c.

Spiegeleisen

Maximum base contract prices, per gross ton, lump, f.o.b. Palmerton, Pa.

	16-19% Mn 1% max. Si	19-21% Mn 1% max. Si	26-28% Mn 1% max. Si
Carloads	$35.00	$36.00	$49.50
Less ton*	47.50	48.50	62.00

Electric Ferrosilicon

OPA maximum base price cents per lb. contained Si, lump size in carlots, f.o.b. shipping point with freight allowed to destination.

	Eastern Zone	Central Zone	Western Zone
50% silicon	6.65c.	7.10c.	7.25c.
75% silicon	8.05c.	8.20c.	8.75c.

Spot sales 45c. per lb. higher for 50% Si; 30c. for 75% Si. For extras and premiums see MPR 405.

Silvery Iron

(*Per Gross Ton, base 6.00 to 6.50 Si*)

F.o.b. Jackson, Ohio	$29.50*
Buffalo	30.75*

For each additional 0.50% silicon add $1 a ton. For each 0.50% manganese over 1% add 50c. a ton. Add $1 a ton for 0.75% phosphorus or over.

*Official OPA price established June 24, 1941.

Bessemer Ferrosilicon

Prices are $1 a ton above silvery iron quotations of comparable analysis.

Silicon Metal

OPA maximum base price per lb. of contained Si, lump size, f.o.b. shipping point with freight allowed to destination, for l.c.l. above 2000 lb., packed.

	Eastern Zone	Central Zone	Western Zone
96% Si, 2% Fe.	13.10c.	13.55c.	16.50c.
97% Si, 1% Fe.	13.45c.	13.90c.	16.80c.

Ferrosilicon Briquets

OPA maximum base price per lb. of briquet, bulk, f.o.b. shipping point with freight allowed to destination. Approximately 40% silicon.

	Eastern Zone	Central Zone	Western Zone
Car lots	3.35c.	3.50c.	3.65c.

Spot prices ¼c. higher per lb. of briquet. For premiums and extras see MPR 405.

Silicomanganese

(*Per gross ton, delivered, carloads, bulk*)

3.00 carbon	$120.00*
2.50 carbon	125.00*
2.00 carbon	130.00*
1.00 carbon	140.00*
Briquets, contract, basis carlots, bulk freight allowed, per lb.	5.80c.†
Packed	6.05c.†
Less ton lots	6.55c.†

*Spot prices are $5 per ton higher.
†Spot prices ¼c. higher.

Ferrochrome

(*65-72% Cr, 2% max. Si*)

OPA maximum base contract prices per lb. of contained Cr, lump size in carlots, f.o.b. shipping point, freight allowed to destination.

	Eastern Zone	Central Zone	Western Zone
0.03% carbon	25.00c.	25.40c.	26.00c.
0.06% carbon	23.00c.	23.40c.	24.00c.

How to Reduce Costs on

PRECISION PARTS FOR TODAY AND TOMORROW

• A large share of the machine work on parts for planes, tanks, guns and ammunition has been produced on Acme-Gridley Automatics.

These machines have proved their capacity to turn out identical parts by the million, at the highest speeds modern cutting tools will stand—without the slightest sacrifice of precision. Tolerances are finer than mass production has ever before dealt with.

The new standards that have been set by Acme-Gridleys are certain to have their favorable effects on postwar products—in both greatly improved quality and performance, and in greatly reduced costs.

New Acme-Gridley Chuckers are engineered for new production and accuracy records—to produce more at lower costs.

Cheapness Superlative

DESPITE the old adage, all talk is not cheap. Witness Lincoln's Gettysburg address.

Unfortunately, however, Lincolns are exceptions and cheapness *has* invaded our speech market. But there are three degrees of cheapness: Cheap, cheaper and cheapest.

Cheapest of all talk is that deliberately designed to stir class hatred for the purpose of personal advancement, political or otherwise. This is the most disreputable deuce in the dirty deck of the demagogue.

There are two kinds of demagogues, the promiser and the smearer. But usually the line of demarcation is not sharply drawn. Each sort slops over a bit.

The promising demagogue tells you bedtime stories and promises you the moon—at some future date. The smearing demagogue picks out a minority with small vote power, builds it into a ferocious straw man and then proceeds to tear him apart to the delight of the same sort of rabble that enjoyed watching witches burn.

The smearer never calls his shots. He intentionally mentions no names nor does he bring out specific and therefore refutable evidence. For the latter would put him in the category of a reformer instead of a wholesale slanderer of classes and there are but slim vote pickings in reformation. I doubt if Pegler could be elected dogcatcher although he has sent quite a few mad dogs to the pound.

Chief straw man of the smearing rabble rouser is big business, whatever that may be. It is never specified but the intent seems to be to include most successful bankers, business and industrialists in this category. (Where we would be today if these same people had not put themselves wholeheartedly back of our war effort is, of course, never mentioned.)

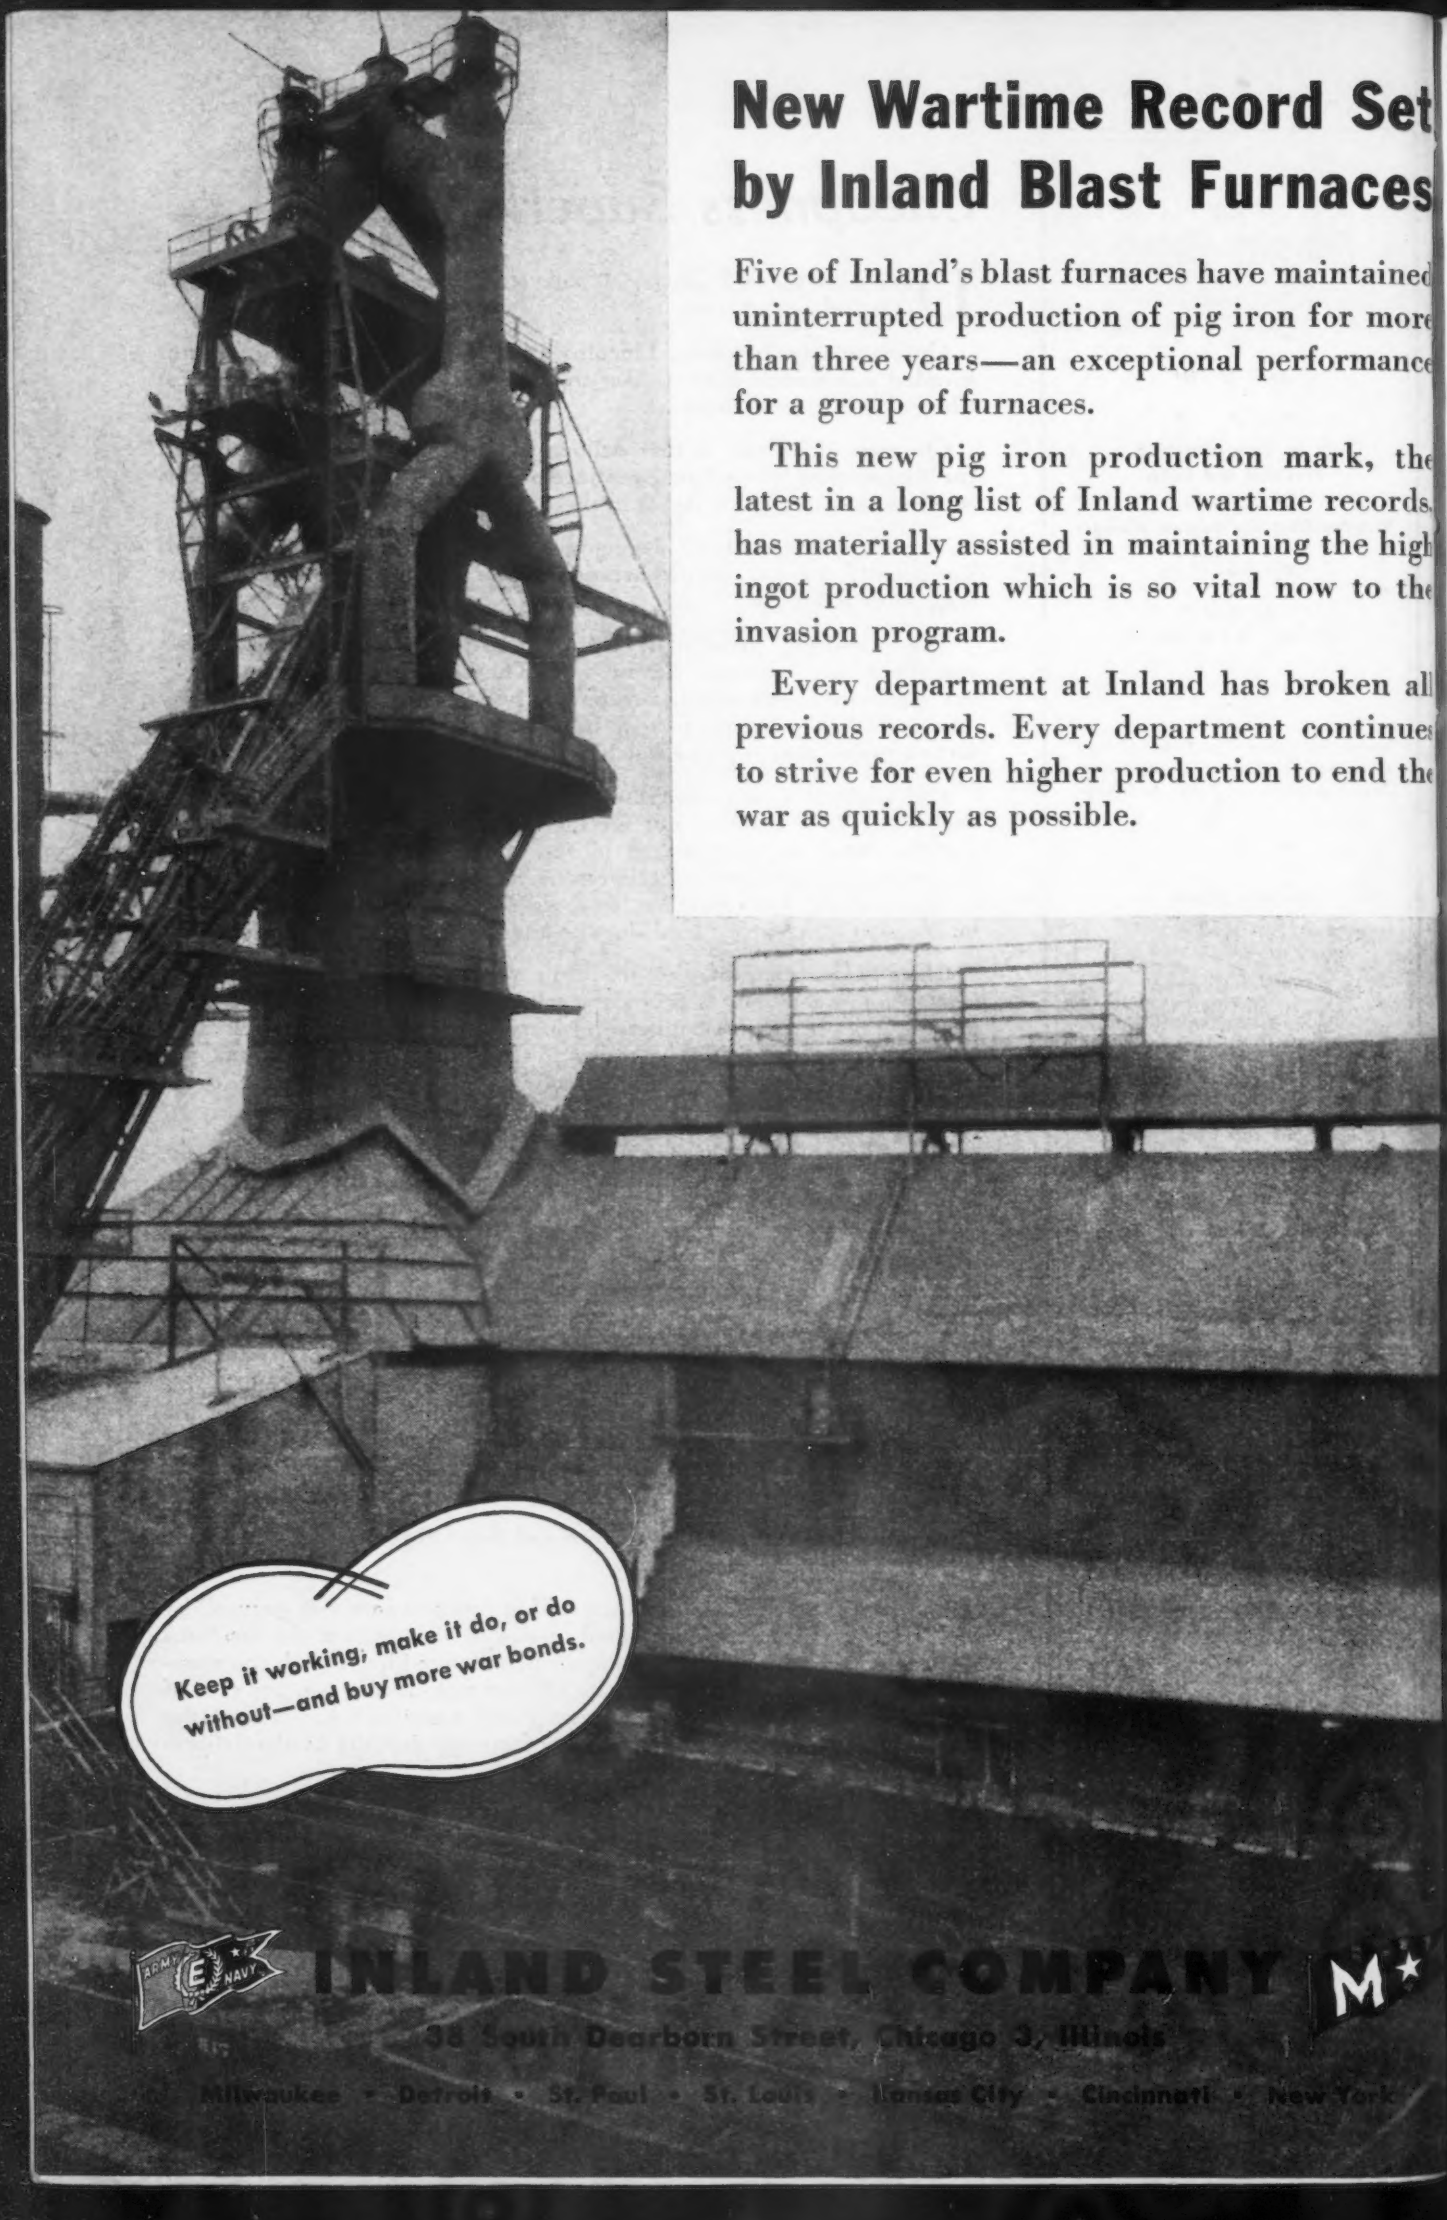
Thus Henry A. Wallace who was so enthusiastically booed into the vice-presidency by the delegates to the Democratic convention of 1940 took time off a few days ago to tell assembled delegates to the CIO Political Action Committee in New York that "big business is divided into two groups, one of which is fostering disunity in the war effort." Some among these groups, he asserts, are anxiously awaiting the opportunity to resume profitable relationships with big German trusts after the war.

Some of these people, according to Wallace, finance anti-Semitic movements. Some organize hatred of the President and discord in the Democratic Party. Others promote isolation in the Republican Party. Certain isolationist politicians have been and will be beneficiaries in their campaigns, of the money of these big business isolationists.

Murder, incest and arson are omitted from these charges, probably by oversight rather than intent.

The implication of this "division of big business into two groups" by Mr. Wallace is that they are equal in size or that at best the insidious element is a considerable percentage. I challenge him to pick the thousand biggest businesses in the United States and classify two per cent of them in this category. And in return I will name 100 per cent of the Vice-Presidents of this country who are fostering disunity by the deliberate spreading of class hatreds.

J. H. VanDeventer



New Wartime Record Set by Inland Blast Furnaces

Five of Inland's blast furnaces have maintained uninterrupted production of pig iron for more than three years—an exceptional performance for a group of furnaces.

This new pig iron production mark, the latest in a long list of Inland wartime records, has materially assisted in maintaining the high ingot production which is so vital now to the invasion program.

Every department at Inland has broken all previous records. Every department continues to strive for even higher production to end the war as quickly as possible.

Keep it working, make it do, or do without—and buy more war bonds.

The IRON AGE
JAN. 27, 1944

NEWS FRONT

► General Motors is starting production on a new very long-range fighter which likely ultimately will be the running mate for the B-29 super-bombers, of which operational squadrons are now about completed. The new fighter is heavy, continuing the recent weight trend of long-range fighters into the area previously occupied by light bombers.

The GM fighter will be powered by a completely new Allison liquid-cooled motor of a power equal to the best of air-cooled motors currently in operational use.

The super-bombers, which will be pounding the enemy by midsummer, will all be of the B-29 design. A somewhat similar craft, the B-32, has apparently fallen by the wayside.

► Older battleships have been rebuilt and new battleships are so designed that serious consideration can be given to the use of their 16-in. guns as anti-aircraft weapons. Incoming fleets of enemy aircraft, plotted by screening ships and radar, will be met at a great distance by salvos of time-fused 16-in. shells capable of clearing out a cubic mile or so of air at a crack.

If attacking planes disperse to avoid such annihilation, they are just so many better set-ups for protecting fighter craft.

► Jet-propelled aircraft are enjoying a great deal of attention from all the magazines and newspapers. All the information presented, however, is from previously published English data, much of it ten or more years out of date.

None of the drawings present data approaching a true picture of the English-American design currently in production, a design far different than the early experimental models.

A mistake was made last week in saying that these jet-propelled planes will not be in operational use for several years. Operational squadrons are actually being built up now, for use later this year. First operational use, because of high rate of climb but short range, will be as interceptors behind Allied lines. This also will keep downed craft from falling into enemy hands.

► First move to invade the automobile industry is Kaiser's incorporation of the Michigan Kaiser Co.

► Efficiency of enemy espionage is very erratic. Whereas published information in Allied countries reaches Germany sometimes in a matter of hours, it is interesting to note that German fighters (to their sorrow) were jumping on the tails of Flying Fortresses for three weeks after full descriptions appeared in the English press of the installation of tail guns (stingers).

► The halogen electrolytic tinning lines (du Pont) are operating at full capacity at the Weirton Steel Corp. One of the Weirton lines is operating at 1050 ft. per min. Each coiler accumulates 25,000 lb. of coated strip.

► While the WPB continues to cancel partially completed steel mill construction projects, there is much discussion regarding the competitive fate of the DPC and privately-financed mills built over the past several years.

Much of this new capacity was built at a cost of $125 to $150 per ton of ingot capacity, as against book values of many existing plants at $35 to $50 per ton of ingot capacity. Come what may, it would appear that there will need be considerable subsidizing or wringing out of water in much of the new capacity to bring its capital structure down to a competitive level.

► If unfair freight rates prevent Pittsburgh mills from reaching consuming markets, Pittsburgh will decline after the war as an important steel center, Benjamin Fairless predicts.

► According to the Swedish paper Affarsvarlden, bomb damage in Germany has resulted in a much easier scrap supply situation for the German iron and steel industry.

► 152 mm. brass shell cases are being made for the French battleship Richelieu. Cases are 3 ft. 7 in. long and weigh about 40 lb. Standard American 6 in. cases are 38 in. long and weigh 28 lb.

► Cutbacks in the Army's projected truck program will probably lift the civilian production program to 200,000. Already earmarked for domestic use are 88,000 trucks.

Procedures For Testing M

By H. INGHAM
Chief Engineer
and K. WILSON
Development Engineer
Metallizing Engineering Co., Inc., Long Island City, N. Y.

o o o

IT is of great importance that standard testing procedures be developed and accepted by the metallizing industry so that consistent results can be predicted and obtained by all users, and so that results can be compared on a uniform basis throughout the country. As there are at present quite a number of different methods of bonding sprayed metal, it is obvious that more should be known about the difference in bond strength between them so that the right selection can be made for the job. Furthermore, accurate bond tests will contribute greatly to the control of any given bonding method.

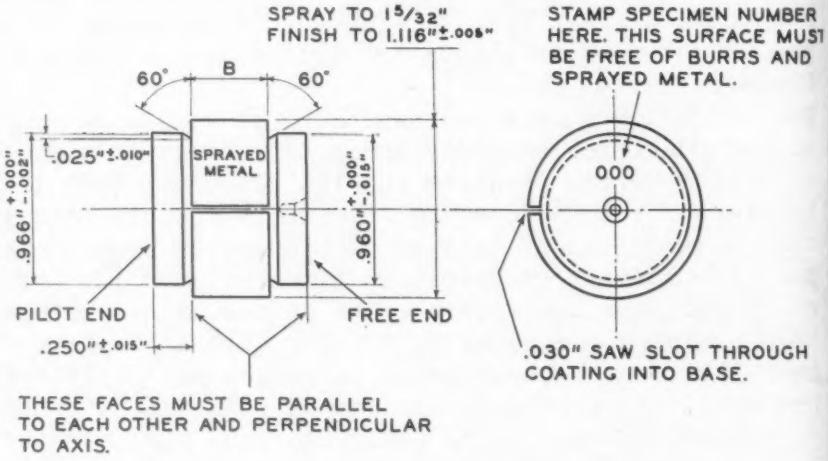
With this objective in mind, these test specimens and procedures are being offered to the metallizing industry in the hope that they will eventually be accepted as standard, either as originally presented, or with any modifications that may be deemed advisable. For these test procedures to fulfill their objective, they must first prove an accurate means for comparison of different methods of bonding. Secondly, they must provide accurate values in pounds per square inch for each bonding method and for each metal used.

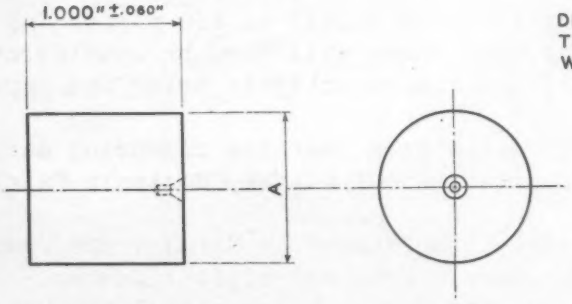
The nature of the failure of the bond between sprayed metal and base metal is somewhat complex. The most common failures occur either on flat or nearly flat surfaces, or shafts which have been cut with a keyway. In both cases most failures occur first by a shearing of the bond due to a shrinking of the sprayed metal layer. This shear action is not necessarily sufficient to cause complete failure, but may simply weaken the bond. After the bond is weakened, the final failure is a failure of the bond in tension as the sprayed metal layer is lifted off either by the curling action resulting from shrinkage or by actual mechanical means. This would depend upon the service encountered. Because this type of failure caused by the shrinkage of the metal is the most common, the strength of the bond in shear is most important. However, as both shear and tension affect the bond strength, methods for testing both have been developed.

Shear Test Specimen

The various proportions of the standard shear test specimen were decided upon after considerable experimentation. It is important that the thickness of the sprayed coating and the bonded area of the sprayed coating be so proportioned that all of the failure takes place at the bond area. If too great a bond area is presented, some of the sprayed metal may fail in compression during test. It is obvious that even the slightest failure of the sprayed metal layer will produce inconsistent results in the bond test values.

The standard bond test shear specimen is shown in Figs. 1 and 2, together with all dimensions and tolerances. It was decided to make the specimen cylindrical because this shape lends itself best to the application of all bonding methods, including those obtained by various methods of machining. The base metal is selected in the form of a bar approximately 1 in. in diameter. This is machined first throughout its length to the diameter listed in Fig. 1. The





DIMENSION "B" IS .500" ±.002" EXCEPT WHERE CAPACITY OF TEST MACHINE WILL BE EXCEEDED. IN THIS CASE USE "B" WHICH IS .333" ±.002".

DIAMETER "A" BEFORE PREPARATION FOR SPRAYING:
FOR METCO AND OTHER MACHINING METHODS .966" ±.002"
FOR BLAST .960" ±.002"
FOR FUSE-BOND .950" ±.002"

ABOVE
FIG. 2—Completed specimen, sprayed, machined and slotted.

o o o

LEFT
FIG. 1—Specimen blank before spraying and machining.

Metallizing Bond . . .

. . . In an effort to standardize testing methods for the adherence strength of sprayed metals, the authors have worked out two procedures described in this article. One is a test for shear strength, the other for tensile strength, since both shear and tension affect bond strength. These tests are useful for controlling quality of surface preparation in production and in working out procedures on new metals and coatings.

length of the specimen is given as 1 in., but this may be varied depending upon the method to be used to hold the piece for machining. The pieces may be made longer and held between centers, but it is recommended that a tapered hole be made in one end of the specimen and that it be mounted in the lathe on a tapered arbor. This method seems best adapted to removal and replacement of the piece for accurate repositioning. In any case, provision must be made for finish machining after spraying in such a way that the free end (where the numbers are stamped) of the specimen and the edges of the sprayed band can be faced off parallel to each other and perpendicular to the axis of the piece. It is also essential that the finish machining be concentric with the base.

is also important to approximate the same temperature conditions as would be expected in the actual job of the class being tested. As most actual jobs are much larger than the test specimen and are normally kept quite cool, it has been found desirable to direct a blast of cooling air at the free end of the specimen while it is being sprayed, in order to stimulate the usual temperature prevailing on an actual job.

After spraying to 1 5/32 in. in diameter over the entire prepared area, the specimen is machined to the dimensions given in Fig. 2. Care should be exercised to see that the finished machined surfaces are concentric and square with the base.

After machining, a slot is sawed completely through the sprayed coating into the base material. The purpose of this saw slot is to eliminate any bond between the coating and the base which might result from shrinkage of the coating, and thus obtain a condition such as would exist either on a flat surface, or on an interrupted cylindrical surface.

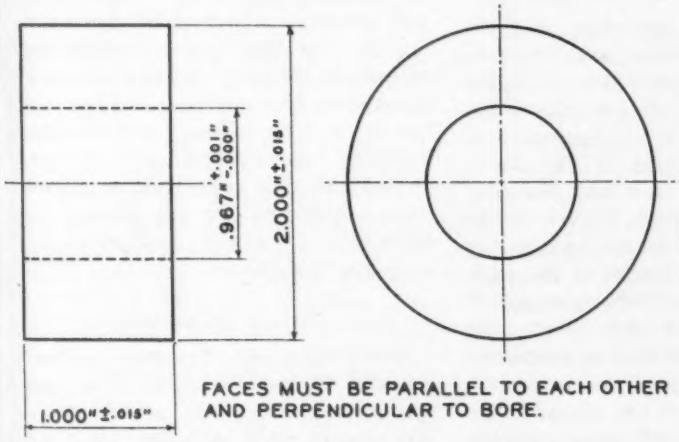


FIG. 3—Die block used in shear testing of sprayed metal bond.

Testing Shear Strength

A shear die block is prepared in accordance with Fig. 3. Only one die block is required as there is little wear on this block, and it will test a great many specimens. The complete specimen is placed in the die block with the free end up and the pilot end in the die. The assembly is placed on the lower platen of a compression testing machine and the load applied to the numbered end of the specimen as shown in Fig. 4.

Occasionally pieces of the coating

The specimen is prepared for bonding sprayed metal by the method being tested, throughout its *entire length*. Great care should be exercised to see that both preparation and all spraying conditions are under strict control and approximate the conditions which it is desired to test. This control should include wire speed, gas and air pressure of the gun, rotational speed of the specimen while being sprayed (taking into account surface speed), distance between the gun and the work, etc. It

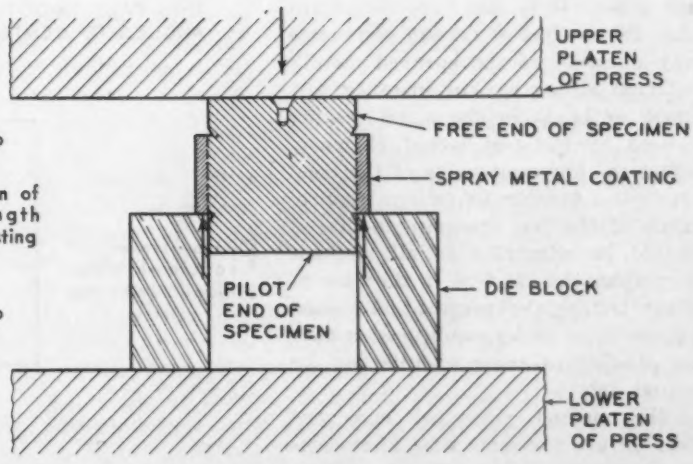

FIG. 4—Section of shear strength specimen in testing machine.

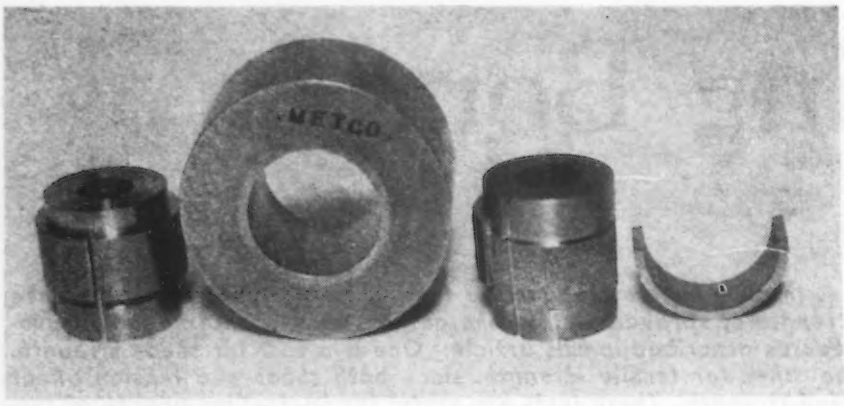

FIG. 5—Shear test specimens before and after breaking. Shown in center is die block used in test.

will break and fly off when the bond is broken. For this reason, a guard should be provided in front of the press.

The length of the sprayed coating *B* in Fig. 2 is preferably made equal to 0.500 in. In some cases, such as where grooves are used in the bonding method, this length may result in a bond strength that exceeds the capacity of the testing machine. In this case, the length *B* may be made 0.333 in. and the force necessary to test the specimen will be reduced by one-third. When specimens are constructed with dimension *B* equal to 0.500 in., the bond area is 1.5 sq. in. When *B* equals 0.333 in. the bond area is 1.0 sq. in. Thus, the total load necessary to shear the coating divided by this factor equals the shear strength in p.s.i. for the bond strength of the specimen tested. Fig. 5 shows a shear test specimen before and after breaking.

Tension Testing Procedure

There have been a number of fundamental problems connected with tension testing and bond strength. One problem is that results obtained in laboratory tests should be applicable to surfaces which are of different shapes, such as flat and cylindrical areas. It is also very important that the method of testing eliminates any question of the sprayed metal's internal strength. For instance, any crack or break in the metal coating caused by the test would obviously affect the apparent value of the bond strength. Another important requirement of the test specimen is that it should be adaptable to all methods of preparation, and as in the case of shear testing the preparation should be conducted under conditions as near as possible to those existing on an actual job.

The method presented here has been in use for some time and seems to have satisfactorily met all requirements. The specimen, Fig. 6, consists essentially of a shaft which has been provided with a hole clear through it and perpendicular to its axis. A stud is fitted in this hole, with one end flush with the surface of the shaft. All methods of surface preparation, including rough threading and the METCO method—in which a rotary tool is used, can be applied to this specimen under the same conditions as to a shaft in actual practice.

Preparation of the Blank

Preparation is applied all over the surface of the cylinder and, hence, to the end of the stud. After spraying and bonding, the stud is pulled out of the shaft in a testing machine. With the dimensions of the shaft, coating thickness, and stud diameter properly proportioned, failure of the bond takes place on the end of the stud. There is no chance of the coating itself failing anywhere except at the destruction of the bond. The diameter of the stud has purposely been made quite small in proportion to the curvature of the sprayed surface so that any difference between results obtained with a cylindrical surface and a flat surface can be disregarded for all practical purposes.

Actual dimensions of the tension test blank is shown in Fig. 7, and specimen stud or plug in Fig. 8. Tension test blank should be made of mild steel, and specimen plug made of the base material to be tested. Plug is assembled in the blank, and fastened firmly by a set screw as shown in Fig. 6. Next, the end of the plug is machined or ground to match the cylindrical surface of the blank. The ⅜ in. shoulder on the blank is provided for convenient chucking in a lathe.

With the plug firmly secured in place, the surface of the blank is then prepared for spraying by any desired method. After preparation the plug is taken out of the blank and removed of burrs caused by preparation—thus enabling the plug to slide freely in the hole. Both blank and specimen plug must be kept scrupulously clean. Even finger marks should be washed off with clean carbon tetrachloride. No oil should be used in machining.

Before spraying, the plug should be replaced in the blank in *exactly the same position it was previously.* The spraying mask, illustrated in Fig. 9, is then screwed into the end of the stud at *A*, Fig. 6. This mask will prevent sprayed metal from filling up the hole and covering the threads of the plug. Specimen is then sprayed in a lathe with metal selected for the test. It is important that the spraying operation be closely controlled and that gas pressures, exact wire speed and air cap setting be recorded to permit duplication of spraying conditions.

Testing in Tension

After spraying, the mask is unscrewed from the end of plug, and specimen machined or ground to a diameter of 0.170 in. larger than the diameter before spraying. After ma-

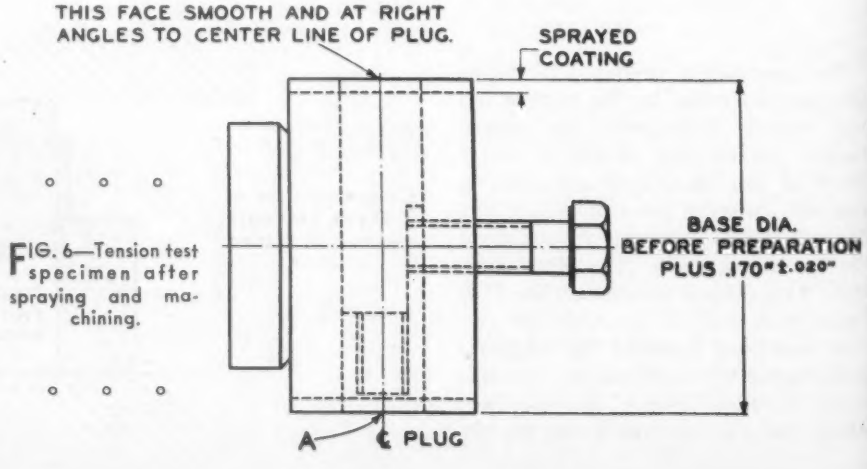

FIG. 6—Tension test specimen after spraying and machining.

chining, any sprayed metal particles around hole *A*, Fig. 6, should be re-removed.

The specimen is then assembled in the test rig as shown in Fig. 10. Figs. 11 and 12 show two parts of the test rig. After screwing the pull bar (Fig. 12) onto the specimen plug, set screw shown in Fig. 6 should be removed. This screw should not be removed earlier as there is danger of damaging the bond when assembling into the rig. Rig is then mounted in a tension testing machine having a capacity of at least 5000 lb. Fig. *B* shows a tension plug after pulling.

As the prepared area of the specimen plug is 0.196 sq. in., breaking load as indicated on the testing machine multiplied by 5.1 will give tensile strength of the bond in pounds per square inch.

While making the test, particular care should be taken to see that:

1. Specimen plug is machined to a good fit in the blank and will slide in the hole without any friction or scraping.
2. Set screw holds plug tight without burring edges of the flat section, and particularly that set screw is removed before plug is pulled in tension machine.
3. Specimen is pulled in a straight line.
4. Plug is not twisted or pulled in handling and machining sprayed specimen, especially when set screw is removed.

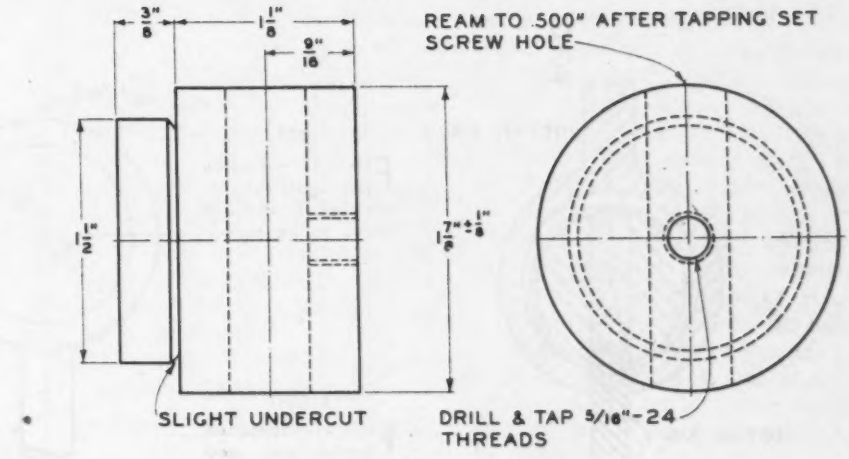
Wide tolerances are given on the diameter of the blank. Blanks may be machined to the upper limit when first used, and then cleaned up and re-used until the lower limit of diameter is reached. This will permit use of the same blank for a number of tests.

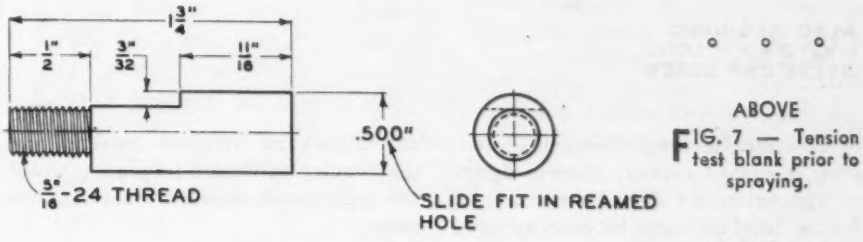
While the tension test specimen described requires considerable machine work, the consistent results obtained with it have justified the design. The ease with which standard methods of surface preparation can be applied is also much in its favor.

Analysis of Bond Failures

The theory of the structure of the bond between the spray metal coat and the base metal is fairly well understood. In ordinary metallizing, done under normal conditions, the bond is almost entirely mechanical in nature. The spray metal particles interlock with the mechanical projections and indentations in the base surface, depending upon the method used for surface preparation. While some slight amount of fusion between particles of spray metal and particles of base metal may take place at isolated spots, the general effect of such welding or fusion is practically insignificant.

There are, however, special uses of metallizing where the bond is not mechanical. Metcolized coatings, for instance, become bonded to the base





ABOVE

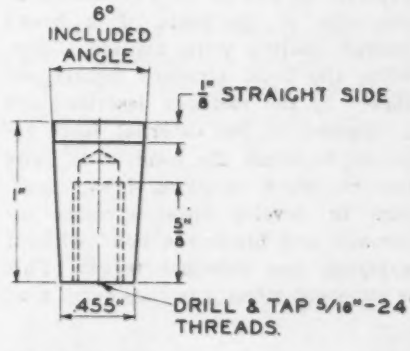
MATERIAL: AS REQUIRED FOR TEST

FIG. 8—Tension test specimen plug. This is inserted in the blank, Fig. 7, before spraying.

metal by actual alloying. They are applied primarily to protect steel from heat corrosion and the alloying takes place either during a special heat treatment or when subjected to the normal heat applied in the use of the article.

The theory of bond failure is not as well established as the nature of the bond itself. In general, it can be said that bond failure is caused by any stress, either internal with respect to the sprayed metal coatings, or external to it, that pulls the coating from the base by distorting the interlocking projections and particles. It appears that in most bond failures the major part of this stress originates in the sprayed metal itself, due to shrinkage of the layers of sprayed metal as they are applied. If spray metal is applied on a flat surface, each layer tends to shrink as it is applied, causing two effects: First, the coating tends to slide over the base and produce a shearing force at the bond; second, as successive layers are applied, each in turn tends to shrink. These shrinkage forces, acting on each other, cause the coating to tend to curl upward, and thus produce a lifting force or tensile stress at the bond. Of these two, the shearing force seems to be the more important. One theory is that the



MATERIAL:
STEEL -
HARDEN & POLISH

FIG. 9—Mask for protecting threaded end of tension specimen plug during spraying.

shearing action first distorts the interlocking particles, tending to weaken the bond so that the bond is at least partially destroyed by this shear, permitting the coating to lift relatively easily with a light tensile stress.

Effect of Internal Stresses

This general conclusion is partially confirmed by observing that spray metal bonds very firmly to a very small area and less firmly to a large area. For instance, the method

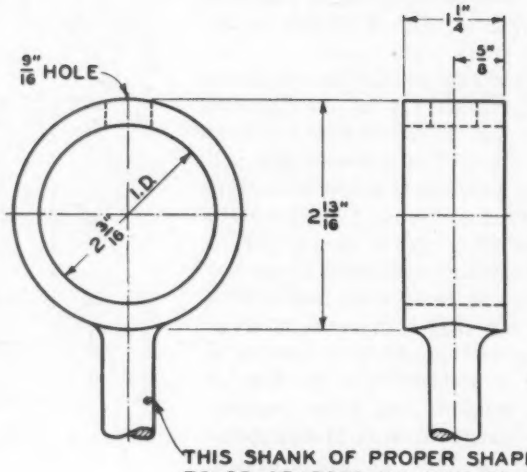
o o o

RIGHT

FIG. 11—Specimen anchor ring used in tension test rig.



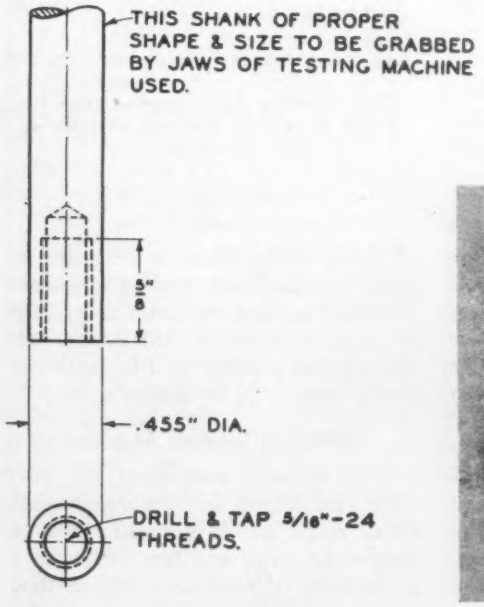
of determining bond strength in tension, described earlier, gives a figure of approximately 3000 lb. per sq. in. for the bond strength between sprayed metcoloy No. 1 and a very heavily grit blasted mild steel base. This strength was measured purposely on a small area of only 0.196 sq. in. This is a high strength, and yet if the same spray were applied to a large plate, the coating would be expected to lift of its own accord at the edge of the plate, if a heavy enough coating were applied. Thus, while the bond strength figures obtained by the methods described are a measure of the external force required to break the bond, it is quite possible when spraying heavy coatings to develop these stresses internally and break the bond without applying any external forces. This is apparent when it is considered that the shrinkage stresses increase as the coating thickness increases, while the unit bond strength remains the same.

Therefore, the important point to consider is that most bond failures are caused by internal stresses in the spray metal. There are very few applications where any appreciable load is applied externally to a spray metal coating to cause it to come loose from the base. Bond strength test values, therefore, should be considered in terms of the likelihood of the coatings coming loose by themselves rather than in terms of the relatively light external loads that can be applied.

Interpretation of Test Data

The measurement of shear strength is most important as most of the internal stress is in shear. However, shear strength alone would not be sufficient. Supposing that the base metal were grooved with deep square-sided grooves and then sprayed. The shear strength crosswise of the grooves would obviously be high and yet a coating having low tensile strength could easily be lifted off. Therefore, at least a minimum of tensile strength is required. This point must be watched in interpreting results, particularly when using grooving methods of preparation. Where such methods have adequate tensile strength, however, they do give high shear values, and for this reason give very satisfactory bonds.

A relatively high bond strength in tension with a relatively low shear strength is not good for most applications, as tensile strength will be largely destroyed by the shear action of the metal. Therefore, the two



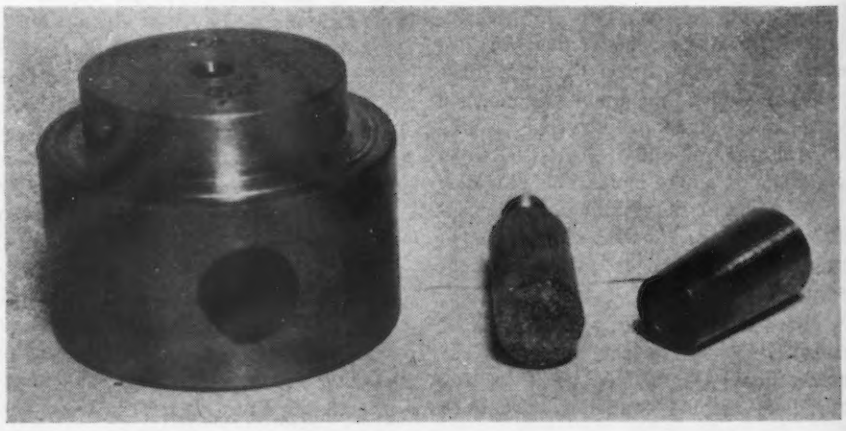
LEFT

FIG. 12—Specimen plug pull bar used in tension test rig.

o o o

BELOW

FIG. 13—Tension test blank specimen and hardened mask used in spraying.



tests, tension and shear, must be considered together to give a true picture of bond strength on an actual application. The relative values required from these two tests must be decided and interpreted broadly in accordance with the type of application being considered. For instance, a shaft which has no keyways and no force applied to the coating tending to rotate it can be prepared and sprayed satisfactorily with a method which gives relatively low shear strength and tensile strength of the bond. However, it has been found that cracking of coatings on shafts usually result from lack of sufficient bond strength in shear, which permits the metal to slip slightly around the shaft and concentrate all of the shrinkage stress at one point. Thus, where heavy coatings are applied the bond should have a fairly high shear strength to avoid cracking. Where flat surface or shafts with keyways, etc. are sprayed, methods of preparation having as high a shear strength as possible should be used at least at the edges of the flat surface or keyways.

There are so many good methods of producing adequate bond available today, there is really no excuse for not playing safe in obtaining an adequate bond strength in both tension and shear on all jobs.

Serve as Control Criteria

The test results obtained from shear and tension bond tests have two very important uses. One is for comparing values between methods known from experience to be satisfactory and new methods or variations of methods which it is desired to use. The test results have relatively little value in an abstract sense, since the internal forces of the sprayed metal which cause the failure are not known. The other important use is for control of the surface preparation method in the shop by checking an operator technique and on equipment and supplies used. The test for bond, for instance, is the only adequate means of testing the effectiveness of blasting grit.

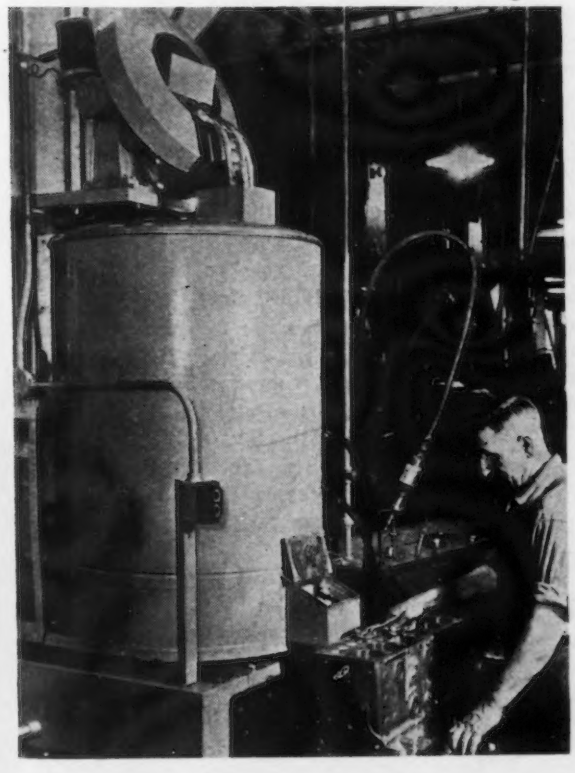
In conclusion, it should be pointed out that good bond strengths are easy to obtain and are desirable, if not always required, for all heavy coatings on machine element work. Therefore, the main use of bond tests is to help in obtaining and maintaining good bond strengths by the proper selection and control of bonding methods. Future articles will be published giving values of bond strengths for different metals and different methods of surface preparation.

Subzero Unit on the Assembly Line

AUTOMATIC feeding of steel valve inserts through a standard Deepfreeze unit is being accomplished by the Dodge Div. of Chrysler Corp. at its main plant in Detroit. Progress of the inserts through the cold chamber, which is held at minus 120 deg. F, precedes their shrink fitting into motor cylinder blocks.

The steel alloy rings, about 1⅞ in. o. d. by 5/16 in. thick, are poured into a hopper just above the cylinder of the freezing unit. The hopper revolves under electric control and distributes the inserts downwards to two tracks which feed into the top of the freezing unit. The rings traverse a winding downward course through tracks to the bottom and are fed out through a special device which alternates the ejection of the insert from either track. The apparatus permits handling of about 360 valves an hour.

The apparatus is electrically operated, with buttons to start and stop. Temperature is controlled thermostatically, with visual record on an exterior chart.



LEFT

THIS is the Deepfreeze installation at Dodge. Valve inserts are tumbled into the tracks at top, and emerge into the box immediately in front of the operator, with progress controlled by a manually operated plunger near the worker's knee.

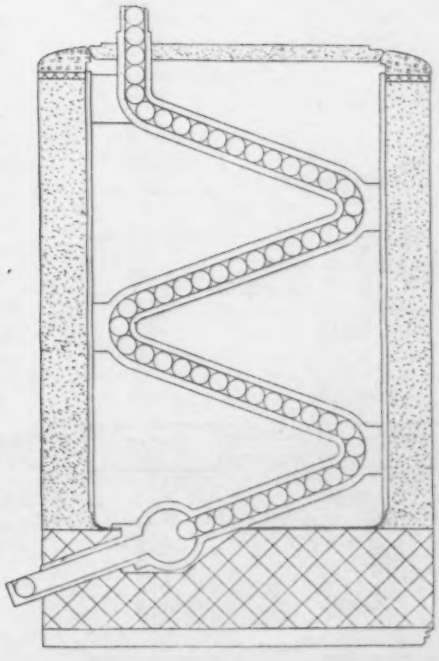
RIGHT

THIS diagram shows the path of the valve inserts through the inner chamber of the freezing unit. The special section of the track indicated at bottom feeds the inserts alternately from the two tracks.



▲ ▲ ▲ Heat Treatment and Aging of

By MAX E. TATMAN
Chief Metallurgist
and
RAY A. MILLER
Chief Structural Research Engineer, Consolidated Vultee Aircraft Corp.

DURING the past several months there has been much public interest in the artificial aging of clad 24S aluminum alloy. Most data and specifications previously published indicated that each temper of clad 24S alloy would require an individual aging cycle; however, from a production standpoint, it would be very advantageous to have a single aging cycle for all tempers of 24S aluminum alloy. With this in mind, time-temperature tests at 360 deg., 370 deg. and 380 deg. F. were made on 0.091 and 0.125-in. clad aluminum alloy sheet, with the tempers investigated, their designations, and the process used in each case shown in Table I.

With an increase in the aging temperature, it is necessary to age the various tempers of 24S aluminum alloy for less time in order to obtain the maximum tensile and compressive yield strengths. It should also be noted, however, that with a constant aging temperature, the time required to obtain the maximum yield strength is found to decrease with increasing amounts of cold work.

The following are two extreme examples of the above-mentioned conditions: (1) The 24S-O aluminum alloy specimens, which were solution heat treated and then aged at 360 deg. F., reached a maximum yield after aging for approximately 20 hr.; those specimens which were aged at 370 deg. F. took approximately 12 hr., and those specimens which were aged at 380 deg. F. took approximately 7 hr. at temperature; (2) a maximum yield for the 24S-RT (as-received) aluminum alloy was attained after aging at 360 deg. F. for 9 hr., at 370 deg. F. for 5 hr. and at 380 deg. F. for 3 hr.

The test data obtained for the various tempers aged at 360 deg., 370 deg. and 380 deg. F. indicate that maximum yield strengths may be obtained by a definite aging period at either 365 deg. F. ± 5 deg., or 375 deg. F. ± 5 deg.

A single aging cycle for all of the various tempers of the 24S aluminum alloys investigated would result in one of the following two conditions, depending on the selection of the aging time: (1) If the aging time were selected so that the highly cold worked material were aged for its maximum yield strength, the material with little or no cold work would be under-aged; (2) if the aging time were selected such that the material with little or no cold work were aged so that it would reach its maximum yield strength, the highly cold worked material would be considerably over aged.

Inasmuch as the highly cold worked material will likely be used wherever possible, a single aging cycle in which time and temperature are selected so that the more highly cold worked materials will be aged properly to give their maximum yield strengths, would be the most satisfactory. Such a single aging cycle should be 375 deg. ± 5 deg. F. for 6 hr. ± ½ hr. For design purposes, the mechanical properties shown in Table II can be consistently attained by the above treatment.

It was found that in most instances, for the properly aged material, the compressive yields varied from 1000 to 2000 lb. per sq. in. below the values obtained for the tensile yields.

A ± 5 deg. F. variation is the maximum permissible, while 375 deg. F. ± 5 deg. is at present considered to be the maximum practical aging temperature that should be used in production, because of the difficulty in maintaining corrosion resistance and adequate control of mechanical properties at higher temperatures.

Previous to the aging tests at 360 deg., 370 deg. and 380 deg. F., referred to above, five tempers of 24S were aged at 350 deg. F., with results graphically shown in Fig. 1. The 350 deg. F. temperature has the advantage of ease of control due to longer holding time.

Typical values for the mechanical properties of Alclad 24S-T and 24-RT* when subjected for 7½ hr. to a temperature of 350 deg. F. are shown in Table III. The values shown for Alclad 24S-T are derived from material processed from Alclad 24S-O. When the material is processed from as-received Alclad 24S-T the finished product will have properties approximating aged Alclad 24-RT due to inherent cold work caused by rolling to straighten.

The desired mechanical properties are obtained in 24-RT by the 7½ hr. aging treatment. Longer periods of

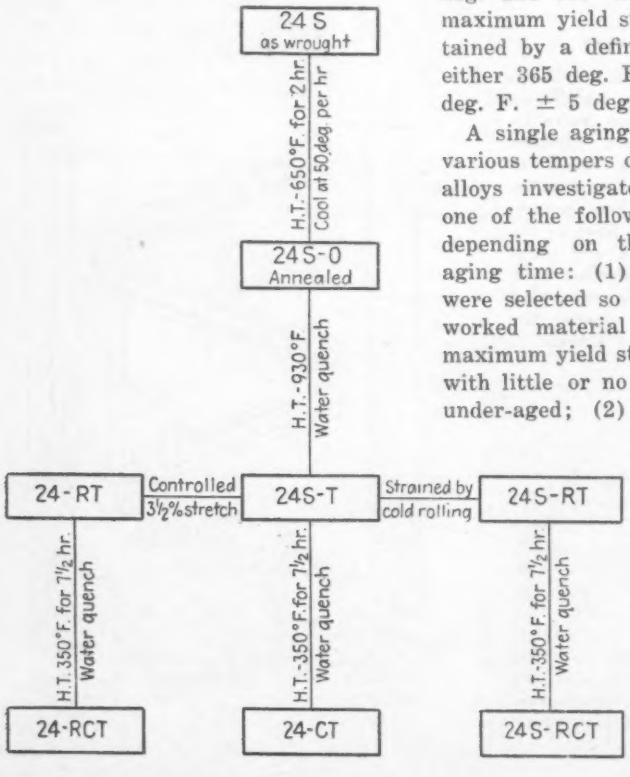


FIG. 1 — Diagrammatic chart of processing of clad 24S aluminum alloys, in tempers tested.

24S Aluminum Alloys

. . . Tests on 24S clad aluminum alloy sheets and 24S extrusions, undertaken by Consolidated Vultee Aircraft Corp., are here summarized. These reports embrace investigations on aging at temperatures from 325 deg. to 400 deg. F.; the effect of plastic deformation on aging characteristics and the degree to which variations in deformation affect aging results; corrosion tests on aged alloys; and the effect of heat on mechanical properties and on color of protective coatings and camouflage finishes. All mechanical properties noted in this paper are taken with the grain of the sheet.

time cause reduction in ductility below the previous arbitrarily accepted value of 7 per cent. Although Alclad 24S-T will develop higher yield strength when aged for longer periods of time, if the 350 deg. aging temperature is used, standardizing the time interval for both types of material while still maintaining the desired ductility necessitates the use of the 7½-hr. aging treatment for production purposes. The processing used in obtaining the various tempers of 24S aluminum alloy is diagrammatically shown in Fig. 2.

**Consolidated designation for material formed in the 24S-O condition, solution heat treat, and stretched to 3½ per cent permanent set.*

Various thicknesses of material have essentially no effect upon the mechanical properties of aged material. Mechanical properties of material quenched in water from 350 deg. F. were found to vary only slightly from air cooled material. However, a slight decrease in yield strength and a corresponding increase in elongation could be noted, and therefore it is advisable to quench in water in order to take advantage of the increased elongation and also to expedite removal of residual salt from the material in case a salt bath is used for the aging operation. No distortion could be noted on large specimens which were quenched in water from 350 deg. F. or from higher aging temperatures investigated.

Material subjected to the 350 deg. F. aging treatment immediately following the stretching operation will develop approximately the same mechanical properties as material which is stored at room temperature, after stretching, for various periods of time prior to the aging treatment. This material may therefore be aged at 350 deg. F. at any time after stretching or at any time after heat treatment.

These 350 deg. aging temperature tests were further supplemented by additional tests of several tempers aged at various temperatures between 325 and 400 deg. F. Results indicated that the mechanical properties of 24S aluminum alloy aged at lower temperatures for long periods of time are approximately equal to the mechanical properties of identical material aged at higher temperatures for much shorter lengths of time. The structural changes are probably the same irrespective of the time-temperature combination used to attain the high strength properties.

The time-temperature combination in the 350 deg. for 7½-hr. specification for the aging of 24S-T and 24-RT was the same for both materials and was based on a minimum elongation of 7 per cent for the 24-RT material. This latter test indicated that an aging temperature of 362½ deg. F. for 11 or 12 hr. would produce optimum mechanical properties in 24S-T. However, due to the fact that the yield strength decreases rapidly due to an 11-hr. aging time at temperatures above 362½ deg. F., it would seem advisable to age 24S-T at a temperature below 362½ deg. The 7½-hr. at 350 deg. aging cycle for 24-RT appears to be satisfactory for obtaining 24-RCT* material with a

TABLE I

Tempers and Processes Used in Aging Tests at 360, 370 and 380 deg. F.

Material Desired, (Army Spec. 11354)	Basic Material	Processing		
		Solution[1] Heat-Treated	Per Cent Permanent Set	Aging Cycles
24S-T80	24S-O	Yes	None	360 deg. F—0 to 20 hr. 370 deg. F—0 to 20 hr. 380 deg. F—0 to 16 hr.
24S-T81 (Low Yield)	24S-O	Yes	1	Same
24S-T81	24S-T (as-received)	No	None	Same
24S-T84	24S-O	Yes	3½	Same
24S-T84	24S-O	Yes	4	Same
24S-T86 (Low Yield)	24S-O	Yes	5	Same
24S-T86	24S-RT (as-received)	No	None	Same

[1] Solution heat treatment was 30 min. at 930 deg. F., followed by a cold water quench.

minimum of 7 per cent elongation. If, however, the minimum permissible elongation were reduced to 6 per cent, much higher strength properties could be consistently produced by a longer aging time or a higher aging temperature or both. An aging cycle of 365 deg. F. for approximately 9 hr. would produce in 24-RT very desirable strength properties with a minimum elongation of about 6½ per cent.

In general, the aging characteristics of 24S-RT are similar to those of 24-RT. The yield strengths were slightly higher in the case of the aged 24S-RT and frequently were in excess of 70,000 lb. per sq. in.

It should be noted that the increase in yield strength due to the aging of 24S alloy at the several aging temperatures was dependent upon the amount of cold work present in the material prior to the aging treatment. The yield strength of 24S-T which contained no cold work was increased to only slightly over 50,000 lb. per sq. in., while the yield of the 24-RT material which had been stretched to 3½ per cent permanent set was increased to nearly 70,000 lb. per sq. in.

The data plotted in Fig. 3 show the results of a limited number of tests in which both the tensile and compressive properties were determined. It should be noted that the tensile yield is much higher than the compressive yield in the case of the unaged cold worked specimens. However, the aging operation tends to bring the tensile and compressive yield together. Any change in tensile yield due to aging is considered to represent a comparable change in compressive yield.

**Consolidated designation for material formed from 24S-O, solution heat treated, stretched 3½ per cent permanent set, and aged for 7½ hrs. at 350 deg. F.*

TABLE II

Typical Mechanical Properties for a Single Aging Cycle (375 deg. F.)

Material[1]	Temperature, Deg. F.	Time, in Hr., at Temperature	Stress = Lb. per Sq. In.			
			Tension			Compression Yield
			Ultimate	Yield	Elongation Per Cent	
24S-T80	375±5	6±½	65,000	48,000	12.0	46,000
Low 24S-T81	375±5	6±½	65,000	57,000	9.0	56,000
High 24S-T81	375±5	6±½	66,000	59,000	8.0	56,000

(4%) 24S-T84	375±5	6±½	67,000	65,000	7.0	64,000
Low 24S-T86	375±5	6±½	70,000	66,000	7.0	65,000
High 24S-T86	375±5	6±½	72,000	67,000	7.0	67,000

[1] Material was 5 per cent clad on each surface.

TABLE III

Typical Values for Physical Properties of Alclad 24S-T and Alclad 24-RT After Aging 7½ Hr. at 350 Deg. F.

Material	Tension		Elongation, Per Cent in 2 In.	Compression		Shear Stress, Lb. per Sq. In.
	Stress, Yield	Lb. per Sq. In. Ultimate		Stress, Yield	Lb. per Sq. In. Ultimate	
Alclad 24S-T	48,000	65,000	14.0	54,000	60,000	40,000
Alclad 24-RT	65,000	68,000	8.0	65,000	68,000	43,000

TABLE IV

Typical Values for Physical Properties of 'As-Received' and Aged (350 Deg. F. for 7½ hr.) 24S-T Extrusions

Material (Extrusions)	Tension		Elongation Per Cent in 2 In.	Compression Stress, Lb. per Sq. In. Yield
	Stress, Yield	Lb. per Sq. In. Ultimate		
As-Received 24S-T	48,000	64,000	16	39,000
Aged 24S-T	56,000	67,000	10	52,000
Aged 24-RT	71,000	74,000	6	66,000

Aging 24S Extrusions

A study of the effect of aging 24S extrusions at 350 deg. F. from 0 to 24 hr. indicated that the tensile and compressive yield strengths of as-received 24S-T extrusions are increased approximately 17 and 33 per cent respectively by aging at 350 deg. F. for 1½ hr. The tensile and compressive yield strengths of 3½ per cent stretched and aged extrusions are increased approximately 46 and 69 per cent respectively as compared to as-received extrusions.

Typical values of as-received and aged 24S-T extrusions are shown in Table IV. The mechanical properties of the extruded sections over ⅜ in. in thickness were higher than the values shown in the table. It appears that optimum mechanical properties in aged as-received 24S-T extrusions are obtained by treating at 350 deg. for 10 to 12 hr. The as-received extrusions, having very little cold work, did not respond to aging nearly as well as those stretched 3½ per cent.

In general there was no evidence of intergranular corrosion on the unaged or aged extrusions; there was however, one spot on the 24-ST, specimen after subjection to an accelerated corrosion medium (sodium chloride and hydrogen peroxide) for 24 hr., indicating that slight intergranual corrosion is possible in the aged 24S extrusions unless a surface finish, such as anodization, primer or paint, is applied.

Stretching Variations

Considerable reference has been made above to the effect of plastic deformation on aging characteristics of 24S aluminum alloy. An investigation, with a 355 deg. F. aging tem-

perature, of the effects of variation in the amount of plastic deformation and of the variation in the time interval between quenching and stretching showed, in conformance with indications from previously mentioned aging tests, that the amount of plastic deformation greatly affects the aging characteristics of 24S material. The greater the amount of plastic deformation given 24S-T, the higher will be its strength properties upon subsequent aging.

The time interval between the quenching and stretching operation has, in general, only a slight effect on the aging characteristics of Alclad 24-RT. If the stretching operation is accomplished between 1 and 24 hr. after the quenching operation, the mechanical properties of the aged 24-RT will not be appreciably affected by the variations in the time interval between quenching and stretching.

The compressive yield strength of aged Alclad 24-RT was found to be slightly lower than the tensile yield, the difference being about 6000 lb. per sq. in. for short aging times and approximately 1000 lb. per sq. in. for longer aging times.

A variation of ½ per cent in the plastic deformation of 24-RT (3½ per cent stretch), upon subsequent aging at 355 deg. F., resulted in variations in the yield strength of as high as 3500 lb. per sq. in. However, after the maximum yield strength was attained, the expected variations would be only about 1200 lb. per sq. in. Inasmuch as higher yields are desirable and since there are several variables which may at times be additive, it is advisable to establish as close a tolerance on the amount of plastic deformation as it possible from a production standpoint.

Stretching to 3½ per cent, ½ per cent ± 0 per cent permanent set should not be too objectionable as far as production is concerned; and, if the aging time were 9 hr. or more, the variations in yield strength due to stretching should be only approximately 600 lb. per sq. in.

Both the tensile and compressive yield of the unaged 24-RT varies as much as 4000 lb. per sq. in. due to variations in time interval between the quenching and stretching operations. It should be noted, however, that the variance in both the tensile and compressive yield strength is reduced to approximately 2000 lb. per sq. in. after aging at 355 deg. F. for 9 to 12 hr. To further minimize the variances in the mechanical properties of 24-RT, it appears that the stretching operation should be accomplished between 1 and 24 hr. after the quenching operation. This would reduce the expected variations in tensile and compressive yield strengths, due to the differences in time interval between quenching and stretching, to 1200 lb. per square inch.

The corrosion tests accompanying the tests previously mentioned herein were meager. A later, comprehensive study of the effects of aging on corrosion resistance of both clad and unclad 24S alloy (the unclad material being used to show the corrosion tendencies of the core of the clad 24S alloy) indicated that clad 24S alloy, when properly aged, does not have its corrosion resistance decreased in the process. On one test, however, a slight tendency towards stress corrosion cracking was noted in the core at the cut edge.

The rate of diffusion of copper in aluminum at 350 to 400 deg. F. is negligible; therefore this aging treatment does not reduce the corrosion resistance of Alclad 24S alloy due to copper diffusion from the core.

Plain 24ST aluminum alloy material aged at 375 deg. F. is slightly less sensitive to corrosive media than similar material aged at 350 deg. F.

It is believed that stress-corrosion cracking cannot take place in aged 24S aluminum alloy if the attacking medium is prevented from coming in contact with the highly stressed aged 24S alloy. The pure aluminum of the clad serves this purpose.

Heat Effects

The effect of temperatures ranging from 60 to 650 deg. F. on the physical properties of 0.064 in. 24-ST aluminum alloy sheet are summarized in Table V.

It would seem that increasing the temperature up to 650 deg. F. does not affect the modulus of elasticity in tension on specimens tested at room temperature after cooling from the various temperature to which they were subjected. The average value for the modulus of elasticity in tension of the 24-ST sheet subjected to this heating test is 10.5×10^6 lb. per sq. in.

The ultimate strength of the material appears to drop off gradually with an increase in temperature. There is a decided drop in per cent elongation when the material is

heated much above 400 deg. F.

More recent tests indicate that the comparatively rapid decrease in mechanical properties above 400 deg. F., which take place when the material is heated for 5 min. or more above that temperature, continues until a temperature of 650 to 700 deg. F. is reached (annealing temperature). Thereafter, the material undergoes an increase in mechanical properties until the hardening temperature of 910 to 930 deg. F. is reached. The mechanical properties immediately decrease after the temperature is raised above this level.

Contrary to previous conception, heating 24S-T aluminum alloy at temperatures below 800 deg. F. for 5 min. has no effect upon the ability at the material to resist the corrosive effect of a 20 per cent NaCl salt spray, at 95 deg. F. for 250 hr. Heating at temperatures between 600 and 930 deg. F. for longer periods of time would probably cause a decrease in the corrosion resistance of the material.

The protective coatings used on 24S alloy were found to undergo a definite color change when the material was heated for 5 min. at temperatures above 400 deg. F. Since both mechanical properties and colors of protective coatings undergo a change when heated above 400 deg. F., it is possible to make an estimate of the mechanical properties by determining, from Table VI, the temperature to which the material was heated.

Camouflage finishes, for the most part, do not change in color until the material they are used to coat is heated to a temperature of 550 deg. F. Therefore no correlation may be made between mechanical properties and color unless the material has been heated above this temperature.

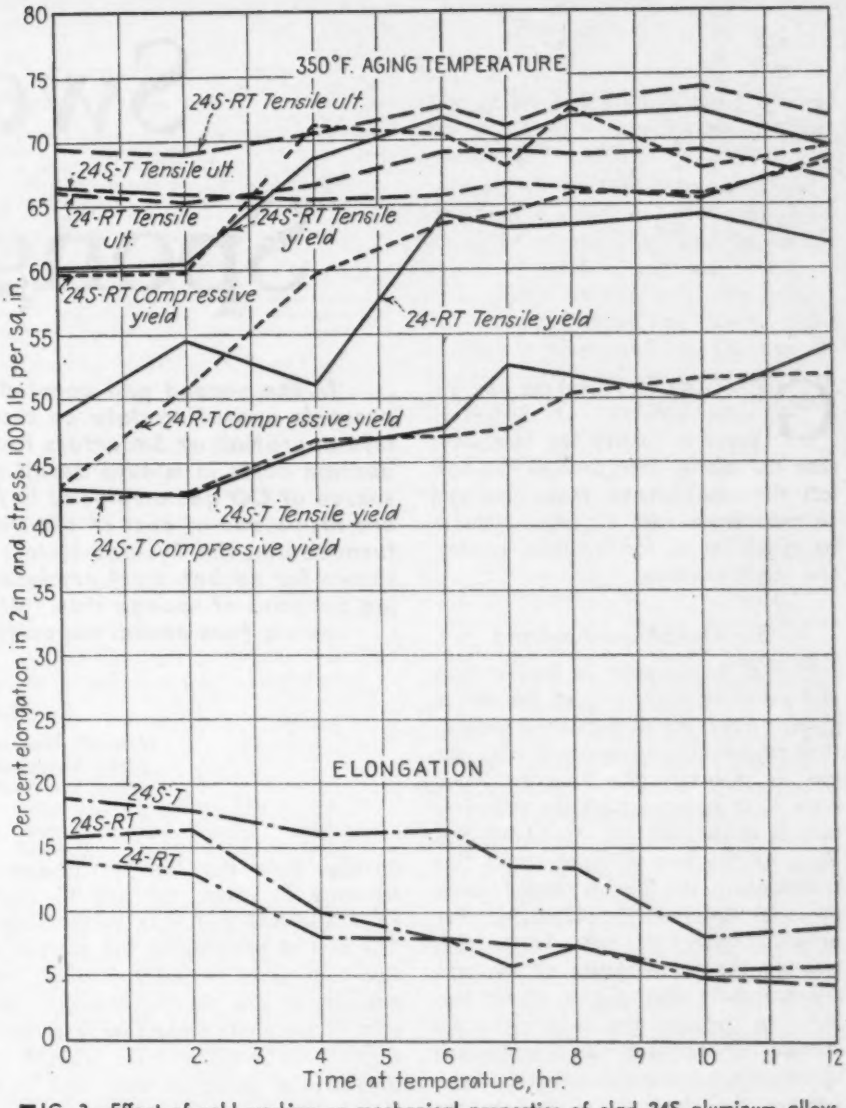

FIG. 3—Effect of cold working on mechanical properties of clad 24S aluminum alloys aged at 350 deg. F.

Fatigue Strength of Nitrided Surfaces

IN an article in *Metal Treatment* by W. E. Bardgett the results of investigations of the effects of case hardness, case depth, degree of cleanness, stress concentration and corrosive influences on the fatigue strength of nitrided specimens of chromium-molybdenum steels are reported.

Because of compressive stresses in the nitrided case, nitriding increases the limiting fatigue stresses. Increasing the tensile strength by heat treatment decreases the effect of the nitrided case in raising the limiting fatigue stress; this increase is very much greater in notched than in plain specimens. The effect on the limiting fatigue strength of increasing the time of nitriding at 1095 deg. F. for 7 to 16 hr., thereby increasing the case depth from 0.0155 to 0.020 in., is negligible but lowering the nitriding temperature to increase the hardness without changing the case depth results in a decrease in the value for the limiting fatigue stress. The stress distribution and intensity of the junction between a nitrided and an unnitrided portion do not appreciably affect the limiting fatigue stress of the unnitrided portion.

Inclusions, even of the size and quantity found in normal, clean steel, appear to have a marked lowering effect on the limiting fatigue strength of nitrided specimens.

Tests on the effect of notches on nitrided steels indicated that: (a) Provided that the stress gradient and/or stress concentration are insufficient to cause failure to commence from the surface of a nitrided specimen, the decrease in limiting fatigue stress with increase in stress concentration will be less than that of an unnitrided stress. (b) If the stress gradient and/or stress concentration are such that failure commences from the surface of the nitrided specimens, the decrease in limiting fatigue stress with increase in stress concentration is greater than that of the unnitrided steel. (c) The occurrence of a fracture from the surface of a nitrided specimen does not necessarily indicate a low limiting fatigue strength; consequently notch sensitivity, as measured by the loss in fatigue strength due to a notch, may be low in a specimen showing fracture starting from the surface.

Swedish Sponge Iron

. . . In the second and concluding part of the article, Mr. Améen presents operating data on the perfected sponge iron furnace put into operation at Soderfors in 1941 and analyzes sponge iron production costs in minute detail with charcoal, wood or coke as the source of CO gas employed in the reduction process. Comparisons are also made of cost of pig iron produced in a shaft type electric furnace and the Tysland-Hole electric furnace. Cost data are also shown for carbon steel produced in the electric furnace with varying portions of sponge iron. Although the present unit is of 10,000 metric tons annual capacity, a 20,000 ton unit is projected.

By EINER AMÉEN

General Manager, Söderfors Works, Stora Koppersbergs Bergslags Ab., Sweden

GENERALLY speaking the results obtained at Söderfors seem to justify the statement that the sponge iron process has now left the experimental stage and can be considered just as dependable in its operation as, for instance, an electric shaft furnace.

Gas Conditions Analyzed

In Fig. 6 a diagram of temperature and pressure conditions of the gas is given. Studying at first the temperature conditions and starting with the gas as it leaves the final reduction zone A, it appears that the temperature is about 950 deg. C. (1740 deg. F). As the fan will not stand this temperature the gas is cooled down to about 650 deg. C. (1200 deg. F.) before it enters the fan. In the carburetor the temperature of the gas reaches about 1000 deg. C. (1830 deg. F.). In the gas flue, leading to the sponge iron furnace, the temperature is somewhat reduced so that the gas reaches the shaft at a temperature of about 975 deg. C. (1785 deg. F.). The reaction $FeO + CO = CO_2 + Fe$, being exothermic and the radiation losses of the shaft being comparatively slight, the temperature in the final reduction zone is only slightly lowered. Occasionally a slight increase in the temperature has been observed with the result that the gas leaving the final reduction zone has a temperature somewhat higher than that of the gas entering below. The temperature of the gas continuing through the prereduction zone drops to about 850 deg. C. (1560 deg. F.) since the reaction $Fe_3O_4 + CO = 3\ FeO + CO_2$ is endothermic.

In the combustion zone the temperature of the gas reaches an average of 1000 deg. C. (1830 deg. F.). In preheating the ore the temperature of the gas finally drops so that the gas leaving the shaft has a temperature slightly above 100 deg. C. (212 deg. F.).

As to the pressure conditions in the shaft, it is shown in Fig. 6 that the gas after leaving the fan has a pressure of about 250 mm. (10 in.) H_2O. In the carburetor and in the final reduction zone the loss in pressure amounts to about 120 and 95 mm. (4.75 and 3.75 in.) H_2O, respectively. The loss of pressure in the prereduction zone is of little importance, the quantity of gas passing through this part of the shaft being comparatively slight. To avoid a back draught a pressure of about 20 mm. (0.8 in.) H_2O is kept in the chimney.

The table below gives an indication of the composition of the gas in the system during normal operation.

As shown by the table the carburation of the gas is satisfactory. The gas entering the shaft contains 2 per cent of CO_2 only. The ratio $\frac{CO_2}{CO + CO_2}$ in the gas entering the carburetor is about 30 per cent, thus equal to the theoretical value. The raction $CO + H_2O \rightleftarrows CO_2 + H_2$ (the usual watergas reaction) is also balanced, as could be expected.

Regarding the composition of the gas just below the combustion zone, it is well to point out that the values are uncertain, due to the fact that there is no fixed boundary separating the combustion zone and the reduction zone. Consequently, it is difficult to obtain an exact analysis of the gas in this zone.

Heat Balance

Based on very careful measurements of all necessary data under the supervision of Mr. Wiberg during a week of normal operation, Table I was established. It will be noted that a certain heat value is put on the combustion gases, due to the fact that occasionally gas passes through the combustion zone without being ignited, as for instance when the air blast has been shut off for the sake of sample taking or measurements. Furthermore, a certain quantity of gas has to be let out without completely using it for the reduction, due to the fact that the degree of oxidation of the sintered ore has been comparatively low. The oxidizing con-

Analysis of the Gas, Per Cent

	Entering the shaft	Entering the carburetor	Before combustion	After combustion
CO	82.5	59.0	34.0	0.0
CO_2	2.0	25.5	50.5	16.5
H_2	13.0	8.5	7.5	0.0
H_2O	0.5	5.0	6.0	2.5
N_2	2.0	2.0	2.0	68.0
O_2	0.0	0.0	0.0	13.0
Total	100.0	100.0	100.0	100.0

ditions in the preheating zone therefore produces excess heat, for which reason less gas is required to be burnt with the consequence that a surplus thereof arises. The losses in cooling water from the carburetor and the fan, together with electrical losses and radiation losses make a total of 310 kg. cal., corresponding to 358 kw. hr. per metric ton of sponge iron. As previously noted, the power consumption should theoretically amount to 675 kw. hr. per metric ton of Fe reduced. In the present case 623 kw. of Fe is reduced per ton of sponge iron and the theoretical power consumption should therefor amount to 420 kw. hr. per metric ton of sponge. As a matter of fact, 750 kw. hr. per metric ton of sponge have actually been used. Calculating in this manner, the radiation and other losses should amount to 750 minus 420 = 330 kw. hr. per metric ton of sponge iron, which closely agrees with the figure of 358 kw. hr., as revealed by the heat balance. In normal operation the losses per hour in the form of radiation, etc., should therefore, if the above figures are used, amount to 325 kw. hr. per hour.

Analysis of Concentrates

In the perfected sponge iron furnace at Söderfors, the ore mostly used has been concentrates from the Vintjärn mine, analyzing about 63 per cent iron. Although it was possible to obtain richer material from the mine, the Fe content was not kept higher than 63 per cent for the reason that richer concentrates would be too fine grained to permit proper sintering in the existing sintering plant. To obtain denser and stronger sinters it was found of advantage to mix the Vintjärn concentrates with about 10 per cent of fines from Dannemora. The ores used analyzed as follows:

Constituents	Vintjarn Concentrates Per Cent	Dannemora Fines Per Cent
FeO	27.20	22.70
Fe_2O_3	60.40	47.80
SiO_2	5.75	10.60
Al_2O_3	1.25	0.57
MnO	0.55	3.15
CaO	0.50	5.15
MgO	2.63	5.95
P_2O_5	0.021	0.009
S	0.008	0.073
Ignition loss	0.00	4.60
	98.309	100.602
Total Fe	63.4	51.2
P	0.009	0.004

In some quarters the argument has been advanced that the Wiberg-Soderfors process could not be adapted in the United States because domestic ores do not compare with the high-grade ores available in Sweden. This is true of many of the Lake Superior ores. On the other hand, over 6,000,000 tons of sintered magnetite concentrates were shipped in 1943 from New York and New Jersey mines containing 64 to 68 per cent Fe (72.4 per cent theoretical for pure magnetite, Fe_3O_4). In this sinter silica is as low as 2 to 3 per cent in the higher Fe analyses; sulphur runs 0.020 to a mere trace, at Mineville. Chateaugay low phosphorus ore now being worked by Republic averages 0.005 per cent P, but phosphorus runs up as high as 0.25 per cent in some of the Port Henry concentrates. Generally, however, it averages 0.030 and under for eastern magnetites. Incidentally, the Brassert-Cape sponge iron plant to be erected by Republic under DPC auspices will operate on Port Henry concentrates containing 68 to 69 per cent Fe but running fairly high in phosphorus. The silica is much lower than the Swedish sinter tabulated above. The Dannemora fields are generally considered Sweden's best ore deposits.—Ed.

After the reconstruction of the furnace it was put in regular operation in 1941 and for 18 months of operation the following average figures were obtained:

Output in 24 hr.	19.5 metric tons Per Metric Ton	21.5 net tons Per Net Ton
Power consumption	860 kw-hr.	780 kw-hr.
Charcoal	10.8 hl.	27.8 bu.
Electrode	2.7 kg.	5.4 lb.

The sponge iron produced had the following approximate composition:

	Per Cent
Metallic iron	about 65
Total Iron	" 77
Degree of reduction	" 85
Gangue	" 19
Carbon	" 0.5—1
Phosphorus	" 0.012
Sulphur	" 0.012

That the furnace was operated in a manner so as to obtain a degree of reduction of about 85 per cent depended on the fact that the power consumption as well as the charcoal consumption was found to increase out of proportion with an increased degree of reduction. (See Fig. 7.)

In the production figures for the whole 18 months' period given above, there is included the increased power consumption caused by re-starting of the furnace after shutdowns that cannot be attributed to the actual sponge iron operation, such as lack of power, etc. During the last six months no such interruptions were experienced, having as a consequence a lower power consumption or an average of 730 kw.hr. per net ton of sponge iron.

In Fig. 8 a diagram is given, showing the power and charcoal consumption with varying rates of production. As shown there is, within the limits of operation, a considerable saving in power and charcoal with an increased production.

If the sponge iron reduced contains 65 per cent metallic iron, the theoretical power consumption would be 440 kw-hr. per metric ton (400 kw-hr. per net ton). If the charcoal has a weight (dry) of 14.5 kg. per hl. (11.2 lb. per bu.) and a carbon content of 87 per cent, the charcoal consumption would amount to 8.5 hl. (21.9 bu. = 245 lb. per net ton). On basis of the theoretical figures, given above, a diagram has been drawn up, Fig. 9, showing the efficiency of the charcoal and the power with different rates of production.

As shown by the diagram the efficiency of the charcoal with a production of 24 metric tons (26.5 net tons) per 24 hr. equals 81 per cent and that of the power 60 per cent. The charcoal consumption, at this rate of production, is very near the theoretical figure and no considerable saving can therefore be expected on this score in a further development of the process. As to the power consumption, it should be possible to effect some saving, although a power consumption of only 740 kw-hr. per metric ton (670 kw-hr. per net ton) has actually been achieved at a production of 24 metric tons in 24 hr. One way to decrease the power consumption with the present installation would be to increase the rate of production, thus reducing the radiation losses, etc. The possibilities for an increased rate of production of the present installation, will be discussed below.

With the dimensions of the shaft given, the rate of production depends on the following factors:

The analysis and temperature of the incoming gas

The speed of the gas circulation

The character of the ore

No considerable improvements in the analysis of the gas can be anticipated as the gas already is well carbureted. Neither is it possible to increase production by increasing the temperature of the gas as this might lead to adhesions of material to the walls of the shaft, thereby causing hangings. By these means it is therefore impossible to increase production to any great extent.

An increase in the speed of the gas circulation, however, would increase production. Such an increase, if it passed a certain limit, would cause a lowering of the CO_2 content of the gas entering the carbureter. This is due to the fact that the ore would not be reduced with sufficient speed to form the 30 per cent CO_2 which theoretically is desirable in the gas. A decrease of the CO_2 in the circulating gas would theoretically be followed by an increased consumption of power and charcoal. (See Fig. 10.) On practical grounds the speed of circulation cannot be increased above a certain limit for two reasons, one being the increase in the head of pressure in

the furnace, the other being that too much dust might be carried along with the gas. With the conditions existing at Söderfors a certain increase in the speed of circulation could be permitted but at present the capacity of the fan is insufficient.

The properties of the ore have a great bearing on the output of the sponge iron furnace. As already mentioned, the quality of the sintered ore leaves a great deal to be desired. A modernizing of the sintering plant is planned, however, thereby improving the conditions.

Upon the completion of the improvements discussed above it should be possible to increase the production from 7000 metric tons (7750 net tons) per annum to about 10,000 metric tons (11,000 net tons) per annum.

By extending the curve in Fig. 8 showing the power consumption to the point corresponding to a production of 27.5 metric tons (30.5 net tons) in 24 hr. (about 10,000 metric tons per annum) one arrives at a figure, for the power consumption, of about 710 kw-hr. per metric tons (642 kw-hr. per net ton) which figure thus would be attainable with the present installation. This does not exhaust, however, the possibilities for a lowering of the power consumption. For local reasons the carburetor is at present placed at a considerable distance from the furnace and this causes unnecessary radiation losses. For the sake of the runner of the circulating fan it has been found necessary to cool the gas to about 650 deg. C. (1200 deg. F.) before it enters the fan. By employing in the runner a heat resistant steel of an improved quality it should be possible to increase the temperature of the gas. In a new installation, designed for an increased production, the radiation losses from the shaft would be less per ton of sponge iron. An estimate is given below of the saving possible in a new installation, producing 20,000 metric tons (22,000 net tons) of sponge iron per annum, it being further assumed that the circulating gas be cooled to 800 deg. C. (1470 deg. F.).

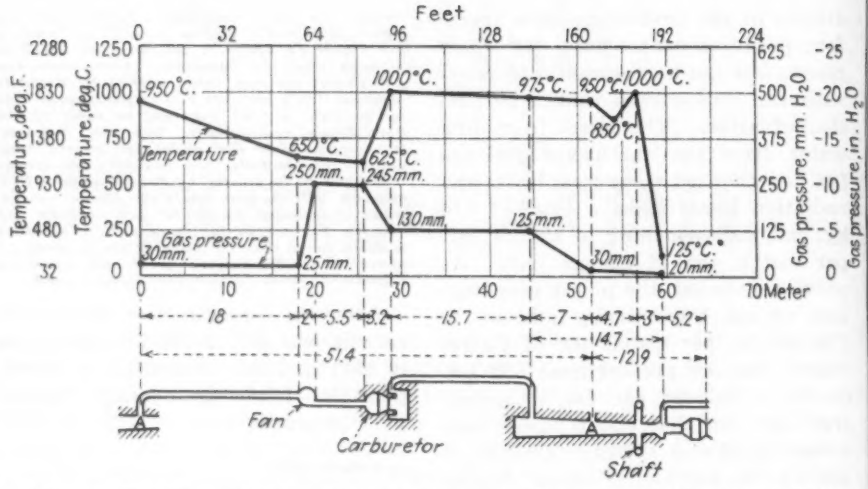

FIG. 6—Conditions of temperature and pressure in the sponge iron furnace at Söderfors. Point A at left and at right are at the final reduction zone.

Table I

Heat Balance for Wiberg-Söderfors Furnace Per kg. sponge iron, containing 73.54 per cent Fe, 0.58 per cent C and with a degree of reduction of 84.5 per cent. Production in 24 hr. = 22.5 metric tons, using a sintered ore with 59.52 per cent Fe and with a degree of oxidation of 86.7 per cent.

Averages from Feb. 16 to Feb. 21, 1943

Supplied	Kg. cal.	Per cent

Saving by decreased radiation losses from shaft and gas flue ..... about 50 kw-hr. per metric ton
Saving by reduced cooling of the gas before entering the fan ..... about 50 kw-hr. per metric ton

Total about 100 kw-hr. per metric ton

As already stated, the power consumption with the present installation and with a production of 10,000 metric tons per annum amounts to 710 kw-hr. per metric ton (642 kw-hr. per net ton). With a new, improved installation, having a yearly capacity of 20,000 metric tons, it should be possible to lower this figure by 100 kw-hr. per ton, the actual power consumption thus being 610 kw-hr. per metric ton (550 kw-hr. per net ton) of sponge containing 65 per cent metallic iron and having a degree of reduction of 85 per cent.

Remelting the Sponge Iron

At Söderfors the remelting of the sponge iron is done in electric arc furnaces, this type of furnace being well adapted for the purpose. Experiments previously made in remelting sponge iron in high frequency furnaces have not proven satisfactory, this being substantiated by trials on a small scale with sponge iron of the Söderfors quality. As no open health furnace was available at Söderfors, melting in that type of furnace has not been tried. In the following, arc furnace melting only, as conducted at Söderfors, will therefore be discussed.

The electric steel furnace, ordinarily used at Söderfors, is Scott connected and provided with two top electrodes and a conducting hearth. The lining is basic. The furnace originally had a capacity of 6.5 metric tons (7.2 net tons) but has recently been rebuilt for a capacity of 10 metric tons.

It is possible to reduce and melt in the electric steel furnace without difficulty a sponge iron with 85 per cent reduction and as already mentioned it has been found uneconomical to operate the sponge iron furnace in a manner to obtain a higher degree of reduction. On the other hand it has not proved profitable to melt an iron sponge having a degree of reduction much lower than 85 per cent.

LEFT

FIG. 8—Consumption of power and charcoal at different rates of production.

although it is technically possible to handle a 75 per cent material.

Steel Making Practice

When producing a 1 per cent carbon tool steel in the 10-ton furnace, 2.5 tons (2.75 net tons) of mill scrap is charged on the bottom of the furnace. Through an opening in the furnace roof about 4.5 tons (5 net tons) of sponge iron is charged, this being the maximum quantity possible to charge at any one time, the weight by volume of sponge iron being only 1.3. The charging of the sponge iron causes no difficulty as it is possible to charge about 3 tons (3.3 net tons) in about 30 sec.

When the charging is completed the power is put on, causing a great number of small arcs to be formed in the heap of sponge iron. The furnace operates very smoothly and it is not necessary to connect any choke coils. In this respect the conditions are much better than when melting ordinary steel scrap. After 2 hr. of operation an additional quantity of sponge iron, weighing about 3 metric tons, is charged and finally, 1 hr. later, another quantity of about 3 tons. In charging the last two batches of sponge iron the furnace is tilted somewhat so that the slag formed during the melting is forced out through the furnace spout into a slag bucket. The removal of the slag is hereby facilitated. When everything is melted, the remaining slag is completely removed and a new slag is added, the charge being finished under a white slag and with normal additions of deoxidizers. No abnormal wear on the furnace lining has been experienced in melting the regular sponge iron.

Further data are given below and in Fig. 11. Charged:

P	0.013
S	0.010

Due to the fact that for local reasons the sponge iron used has been rather low in iron, it might be well to point out that the figures given above are by no means ideal. Using higher grade concentrates on the sponge iron furnaces, thereby diminishing the percentage of gangue in the sponge iron, will facilitate considerably the work connected with remelting.

Variations in Slag Volume

In Fig. 12 is shown how the composition of the sponge iron varies with the percentage of iron in the concentrates, assuming that the degree of reduction is kept constant (85 per cent). Another curve in the diagram shows the volume of slag formed in comparison to the volume of iron when melting sponge iron with varying contents of iron. As shown by this curve the volume of slag, when using concentrates with 60 per cent Fe, amounts to not less than 82 per cent of the steel volume. By an increase in iron in the concentrates, the quantity of slag rapidly decreases. With 65 per cent Fe in the concentrates, for example, the volume of slag will be one half of what it is when using 60 per cent Fe concentrates and with 68 per cent Fe in the concentrates only one-quarter part thereof. That this greatly influences the operation of the steel furnace is evident.

As a further illustration Fig. 13 gives data as to power consumption, electrode consumption and production per hour in melting sponge iron produced from concentrates with varying Fe content. The data given were obtained in the 6.5 metric ton furnace earlier in use. Unfortunately the degree of reduction is not exactly the same with the different grades of sponge iron. This difference should not be of great consequence, however, and therefore the curves will show approximately how the contents of Fe in the sponge influence the operating results in the steel furnace. As shown, the results improve greatly with the increase of Fe in the sponge iron. That the figures for the power consumption are higher than those earlier given is due to the fact that the figures refer to results obtained in the

6.5-ton furnace instead of in the 10-ton furnace. It is further to be noted that the furnace practice was different, the carbon being brought down low for more complete dephosphorization.

Mixtures with Pig Iron

Some preliminary tests in melting down sponge iron with a low degree of reduction together with liquid pig iron have also been made, since this was considered a practice with good promise. As an example the results of the following trial heat are given:

Charged:	Kg.	Lb.
Mill scrap	2,400	5,300
Sponge iron, total Fe 71.6 per cent, degree of reduction 71.4 per cent.	7,700	17,000
Liquid pig iron, Carbon, 3.6 per cent	5,200	11,500
Concentrates (dried), Fe 63 per cent	200	440
Received:		
Ingots	12,740	28,100
Loss	about 3 per cent	

Time:	Min.
Patching	60
Charging	30
Melting	165
Slagging and deoxidation	75
Total 5 hr. 30 min.	

Used:	Per Metric Ton	Per Net Ton
Power, kw-hr.	620	560
Electrodes, Söderberg (See note 4, Table II)	5 kg.	10 lb.
Time, min.	26	23.5

Analysis of product:	Per Cent
C	0.60
Si	0.50
Mn	0.70

In the tests conducted with liquid pig iron it developed that more oxygen was needed to oxidize the carbon than would be needed if the carbon was removed in the form of CO only. The explanation is probably that the carbon monoxide rising through the heap of sponge iron in the furnace causes a reduction thereof, whereby CO_2 is formed. This is of great advantage as it permits the use of sponge iron with a still lower degree of reduction than ordinarily could be used, or it would permit the addition of a certain quantity iron ore.

Since during the melting down of the sponge iron CO and CO_2 is formed, one might say that the sponge forms its own protective gas. In a few cases samples of the gas have been taken so as to ascertain the composition. The result of such a test is given in Fig. 14. As the percentage of nitrogen in the steel furnace atmosphere is low, the risk for nitrogen absorption by the steel is slight. In the sponge iron furnace the possibility for nitrogen absorption is also slight, as the gas in that furnace is very low in nitrogen. For these reasons one is justified in expecting a very low percentage of nitrogen in the finished steel. The following values will prove this:

ponge iron	about 0.004 per cent N_2
Finished steel	about 0.008 per cent N_2

Phosphorus Kept Low

Using sponge iron instead of pig iron in the production of steel results in a low percentage of phosphorus in the steel. In the sponge iron process the phosphorus contained in the charcoal will not influence the percentage of phosphorus in the steel, as is the case in the production of pig iron. Assuming a charcoal consumption per metric ton of pig iron to be 24 hl. (62 bu. per net ton) in an electric shaft furnace and 43 hl. (110 bu. per net ton) in a blast furnace and assuming further about 0.015 per cent phosphorus in the charcoal, it follows that about 0.005 and about 0.010 per cent respectively of phosphorus is introduced in the steel by the pig iron. A corresponding decrease in phosphorus is experienced when using sponge iron made from the same ores.

The results obtained at Söderfors have proved the sponge iron to be a very high grade material from a qualitative point of view. For several years all the types of steels produced at Söderfors, such as tool steel, magnet steel, rustless steel, construction steel, spring steel, etc. have been manufactured with sponge iron as the base and the results have been highly gratifying. The properties of the steel produced in regards slag inclusions, hardening range, porosity, etc. have excelled the requirements demanded in such grades of steel.

20,000 Ton Unit Projected

As already stated, it should be possible to produce in the furnace at Söderfors about 10,000 tons (11,000 net tons) yearly. In future installations larger units evidently should be considered. This would reduce the cost of operation as radiation losses as well as the cost of labor and charges for interest and depreciation, etc. per ton of sponge iron would be lower. As regards the maximum size of furnace of this type that can be built, the major problem is to decide how much the size of the shaft can be increased without causing difficulties in the preheating of the charge and without preventing the gas from reaching the center of the shaft in the final reduction zone. One way in which to solve these problems would be to make the shaft of oval section. If the lower part of the shaft is made oval, however, it would be impossible to retain the circular discharging table, which might lead to complications. It should be possible, on the other hand, to let an oval section in the gas intake level change into a circular section in the lower part of the shaft, this making it possible to retain the circular discharging table. Even by retaining a circular section all through

FIG. 9—Efficiency of charcoal and power at different rates of production.

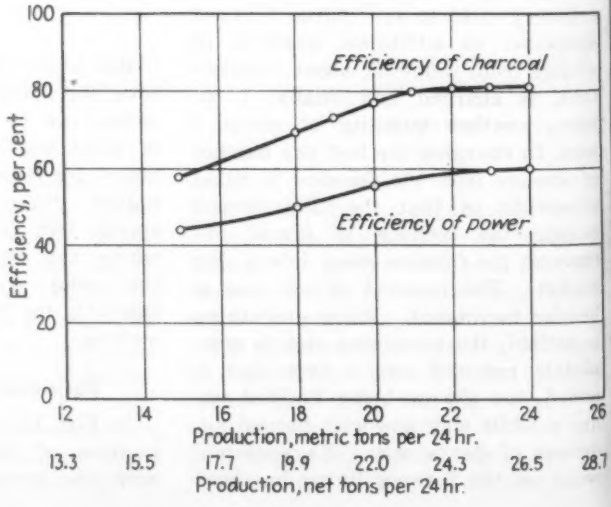

FIG. 10—Consumption of power and charcoal with varying percentages of CO_2 in the circulating gas.

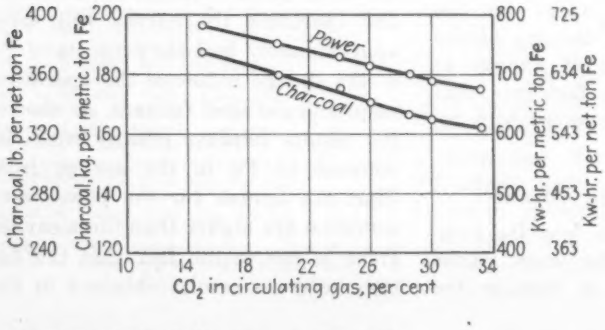

the shaft it should be possible to build larger units but it is difficult to tell when the limit would be reached.

Assuming that a furnace of twice the capacity of the present one, namely with a yearly output of 20,000 metric tons, is to be designed and that this increase is to be accomplished solely by an increase in the cross-section of the shaft, it would be necessary to increase the diameter in the combustion zone from 1200 mm. (47.5 in.) to 1700 mm. (67 in.) and the diameter in the gas intake level from 2000 mm. (79 in.) to 2800 mm. (110 in.). Consequently the radial depth of penetration of the gas must be increased by 250 and 400 mm. respectively. This certainly should not be impossible of attainment. In this connection it is well to point out that even if the degree of reduction should be somewhat lower in the center of the shaft, this would have little influence on the average degree of reduction. Assuming, for instance, that as a result of the increase in the diameter of the shaft as proposed above, the core of material in the central column has a diameter of 800 mm. (31.5 in.), corresponding to the total increase in diameter and that this core has only one-half the degree of reduction as the balance of the material. Considering the volumes involved per unit of height, this would mean that the average degree of reduction would be lowered from 85 per cent to 81.5 per cent, or only 3.5 per cent.

TABLE II

Cost of Production of Sponge Iron (Per Ton Fe in the Sponge) & Pig Iron

[1] The Swedish electric shaft furnace for reduction of pig iron from the ore has a circular crucible in which six electrodes protrude at an angle and upon which is superimposed a shaft similar to a blast furnace but less than half as high. Ore and charcoal are charged in the shaft and are preheated by hot gases. No air is admitted to the charge and the only gases produced are those liberated by reduction of the ore. The Domnarvet Iron & Steel Works of Stora Kopparsberg has four such shaft furnaces producing pig iron.

[2] The Tysland-Hole (Spigervert) pit type electric furnace is of Norwegian design. Three large size electrodes are suspended vertically through the arch and the ore is fed through short shafts surrounding the electrodes. No preheating takes place and the gases produced are utilized in other parts of the works. This furnace uses less power than the shaft furnace but consumes more carbonaceous material, in this case coke. It can be used for making all grades of pig iron. Both types of furnaces are illustrated in the article, "Pacific Coast Steel Industry," THE IRON AGE, March 21, 1940, p. 29. A more complete description of the Tysland furnace is given in the article, "Smelting Iron Ores Electrically," by Herman Cowes, THE IRON AGE, Dec. 3 and Dec. 10, 1942. For complete data on the operating characteristics and costs of the Swedish shaft furnace and the Tysland-Hole Norwegian furnace the reader is referred to the exhaustive report prepared by R. M. Miller for the North Pacific Division, Corps of Engineers, U. S. Army, entitled, "The Feasibility of Establishing an Iron and Steel Industry in the Lower Columbia River Area Using Electric Pig Iron Furnaces," March 1, 1936.

[3] Equivalent to 2.5 mills per kw.-hr. Hydroelectric power at Niagara Falls costs about 5 mills in big blocks. Bonneville Dam power on the Columbia River was estimated at 1 to 1.5 mills per kw.-hr. for the purpose of producing pig iron in that area by the electric shaft furnace of the Tysland-Hole furnace. (See notes 1 and 2.)

[4] Soderberg electrodes are made in this country by the National Carbon Co., unit of Union Carbon & Carbide Corp. Current selling price for the mix is 2.25c. per lb., f.o.b. Niagara Falls, plus 1c. per lb. royalty. Mixing the ingredients at the point of use somewhat reduces the freight charges, making a net cost of materials 2c. per lb. or under.—Ed.

Using a sponge iron with an uneven degree of reduction might be objectionable but from the experience gained at Söderfors, this would be of little consequence if only the average degree of reduction is sufficiently high.

It is difficult to state if the carburetor can be increased to twice the present capacity. Even if this could be accomplished, which is quite possible, it would be impracticable to operate with one carburetor and one fan only. For the sake of safety it would be advisable to have a double set of carburetors and fans so that in case repairs are needed on one set, it still would be possible to operate with the other. Besides it would be easier with two carburetor systems to obtain an even and symmetrical distribution of the gas in the shaft.

From the above remarks it seems as if it should not be impossible with a new furnace installation to reach a production of 20,000 tons (22,000 net tons) per annum. Based on pre-war prices the cost of installation of a furnace of this capacity is estimated to be about Kronor 750.000 ($187,500), including the cost of the building.

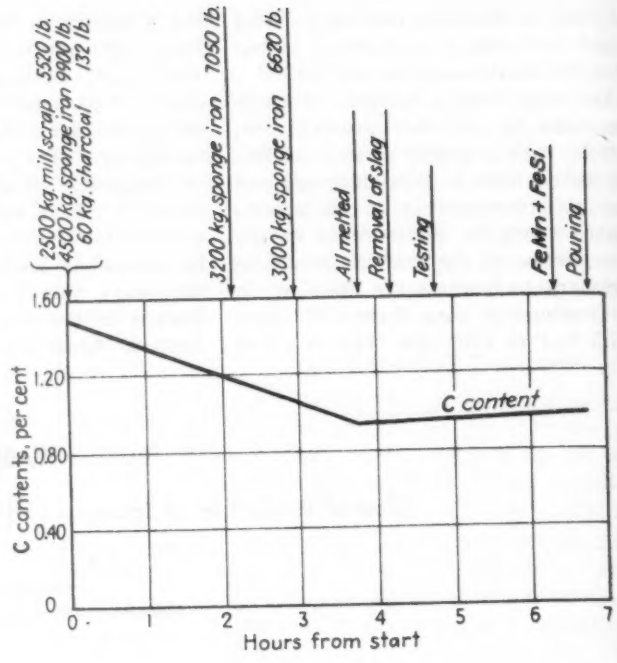
Use of Other Fuels

In operating the furnace at Söderfors, charcoal has chiefly been used in the carburetor as it was considered of primary importance to establish the process with that type of fuel. It was tempting, however, to use wood in place of charcoal, since wood is cheaper than charcoal and easier to procure. In order to ascertain how the addition of wood would influence the operation of the carburetor, wood was added in gradually increasing quantities. It was found that 30 per cent of wood, in chopped up pieces could be added. In adding wood in proportions above 30 per cent, difficulties were experienced due to the moisture contained therein. For this reason it will be necessary to dry the wood and experiments along such lines are being continued.

Running the carburetor with coke in place of charcoal would also cheapen the process. Some preliminary experiments with additions of coke in gradually increasing quantities, have been carried out, until a mixture of 40 per cent coke and 60 per cent charcoal was used. With the addition of coke it was feared that the carburizing would be less satisfactory since it is stated in the handbooks that the carburizing reaction, when using coke is slower than when employing charcoal. In practice it was shown, however, that the percentage of CO_2 in the gas formed when using coke in the carburetor actually decreased somewhat. This is probably due to the higher conductivity of the coke compared with that of charcoal, causing a better and more even heat distribution in the carburetor. Not being designed for operation with coke, the carburetor at Söderfors was not provided with any equipment for sulphur absorption and it was therefore only natural that the sulphur content of the sponge iron would increase by the addition of coke to the carburetor. The contents of sulphur in the sponge iron

RIGHT

FIG. 11 — Progress of carbon reduction in melting of sponge iron in an electric arc steel furnace.



BELOW

FIG. 12 — Relation between the composition of the sponge iron and the Fe content of the concentrates, also the volume and weight of slag.

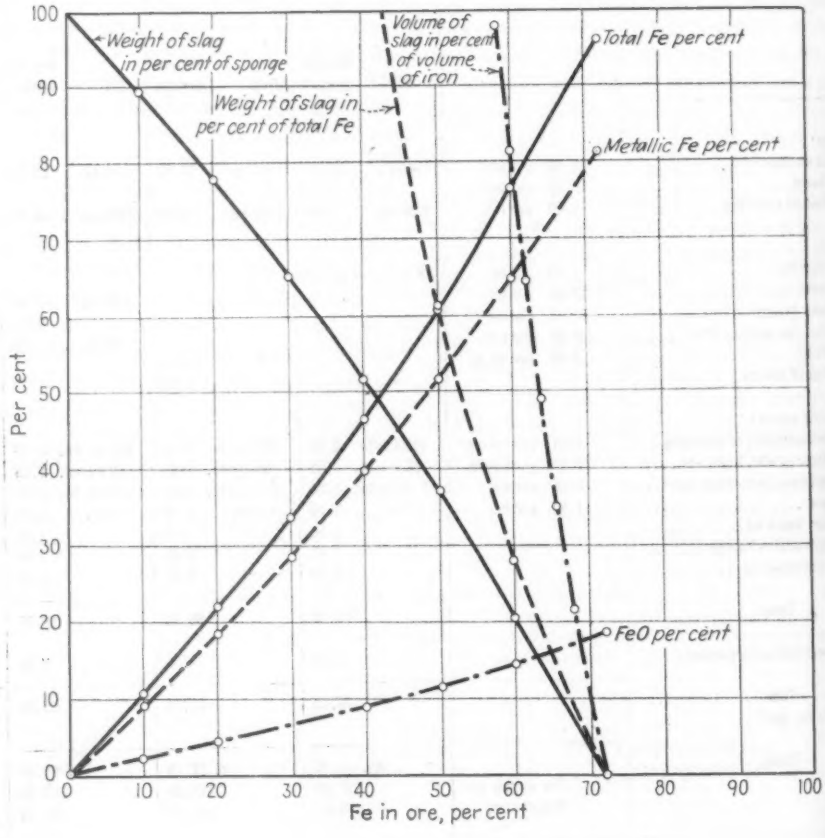


TABLE III

Estimated cost in melting a sponge iron with a degree of reduction of 85% and containing 85% Fe in a 20-ton electric steel furnace.

Time per heat—7 hr.
Production—410 tons weekly = 2.85 metric tons per hr. (3,14 net tons)

	Per Metric Ton	Per Net Ton
Power— 850 kw-hr. per metric ton at Kr. 0.015 (0.375 c.) per unit.	Kr. 12.75	$2.90
Electrodes—6 kg. at Kr. 0.35 per kg	2.10	.48
Wages	2.65	.60
Refractory materials and fluxes	3.50	.80
Tools and sundry material	1.50	.33
Repairs	1.00	.23
General expense	2.00	.46
Interest and depreciation	7.50	1.70
Total cost of conversion	Kr. 33.00	$7.50

Assuming a loss of iron of 4 per cent in melting the sponge, the total cost of the finished liquid steel at the spout would be:

	Per Metric Ton	Per Net Ton
Using sponge made with charcoal	about Kr. 115.50	$26.20
Using sponge made with wood	about Kr. 108.50	24.60
Using sponge made with coke	about Kr. 101.50	23.00

with different additions of coke on the carburetor is given below.

Coke Added in Carburetor Per Cent	Sulphur Content of the Sponge Iron Per Cent
0	0.008
10	0.014
20	0.022
30	0.028
40	0.038

In order to lower the sulphur content in the gas a lime filter will be installed.

Cost of Production

In Table II calculations of the probable cost of production of a plant producing 20,000 metric tons yearly are given. In the cost estimate the figures given are based on the use of charcoal, wood or coke. For comparison the cost of producing charcoal pig iron in a blast furnace and in an electric shaft furnace, as well as of producing coke pig iron in a Tysland-Hole furnace are also given. In all cases the base prices are the same and based on the prices that may be expected after the end of the war. The estimate is figured on the iron contained in the sponge and not on the tonnage of sponge iron. This permits a direct comparison with the pig iron figures. The following data are also assumed:

In all cases the sintered ore used is produced from concentrates containing 65 per cent iron. In the sintering operation it is calculated that 20 per cent of the sinters will be returned when used for producing pig iron, and 30 per cent when used for producing sponge iron, since it is of greater importance to have in the latter case a raw material as free from dust and fines as possible. The sponge iron produced has a degree of reduction of 85 per cent and a total of 85 per cent iron. The volume of the charcoal refers to the capacity by volume of the incoming cars. Due to the more strict requirements on the fuel it is figured on a 15 per cent loss in charcoal breeze when producing sponge iron. In the blast furnace and in the electric furnaces this figure is put at 10 per cent.

As shown in the table the cost of production of iron in the form of sponge iron would be about Kr. 80 per metric ton ($18 per net ton) when using charcoal; about Kr. 73 per metric ton ($16.50 per net ton) when using wood, and about Kr. 66 per metric ton ($15 per net ton) when using coke, against Kr. 104 ($23.50 per net ton) for charcoal pig iron and about Kr. 86 per metric ton ($19.50 per net ton) for coke pig iron produced in the Tysland-Hole electric furnace. When using charcoal in the carburetor, the cost per ton of iron in the form of sponge iron will therefore be about Kr. 24 cheaper than that in the form of charcoal pig iron. In using wood or coke the decrease in cost will be about Kr. 31 and 38 respectively.

Cost of Carbon Steel

In order to establish from an economic point of view the usefulness of sponge iron in the production of steel, it is necessary to carry the calculations further and in Table III the cost of producing a carbon steel in a 20 metric ton (22 net ton) electric steel furnace when using sponge iron as a base is therefore given. The calculation refers to finished, liquid steel in the furnace. Consequently the pouring costs are not included.

In using sponge iron produced with charcoal or wood in the carburetor the cost of the finished steel would be only slightly higher than the cost of charcoal pig iron. In using coke in the carburetor the cost of the steel would be somewhat cheaper than that of the charcoal pig iron. Generally speaking, in using sponge iron it should therefore be possible to save almost the entire cost of converting the charcoal pig iron into finished steel.

Comparing on the other hand steel produced with sponge iron, using coke in the carburetor and pig iron made in the Tysland-Hole electric furnace, the cost of the finished steel would be about Kr. 15 per metric ton more expensive than the pig iron in question. Producing finished steel from coke pig iron with a cost of conversion of Kr. 15 per ton not being out of the ques-

TABLE IV

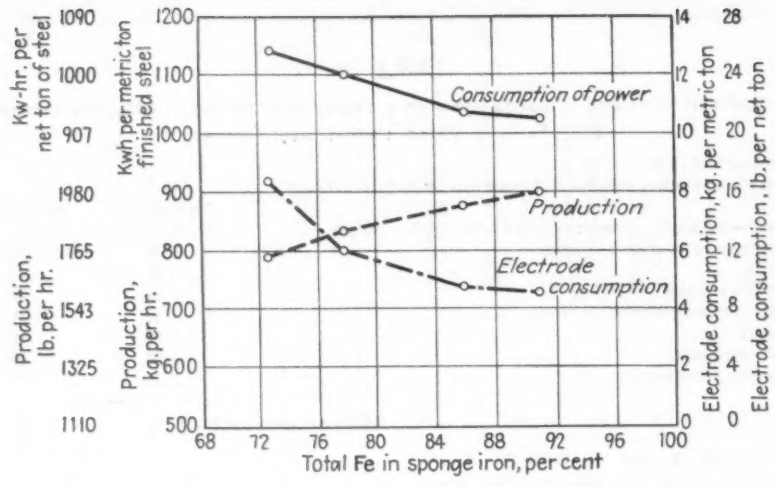
Estimated cost in melting 50% sponge iron with a degree of reduction of 70% + 50% pig iron in a 20 ton electric steel furnace.

Time per heat—5 hr.
Production—570 tons weekly = 4 metric tons per hr.

	Per Metric Ton	Per Net Ton
Power—600 kw-hr. per metric ton at Kr. 0.015 per unit	Kr. 9.00	$2.04
Electrodes—5 kg. at Kr. 0.35 per kg	1.75	.40
Wages	1.90	.43
Refractory materials and fluxes	3.50	.79
Tools and sundry material	1.50	.34
Repairs	1.00	.23
General expense	1.50	.34
Interest and depreciation	5.50	1.25
Total cost of conversion	Kr. 25.65	$5.82
Material charged:		
Pig iron—520 kg. at Kr. 103.20 = Kr. 53.65		
Sponge —520 kg. at Kr. 73.00 = Kr. 38.00	Kr. 91.65	20.78
Grand total	Kr. 117.30	$26.60

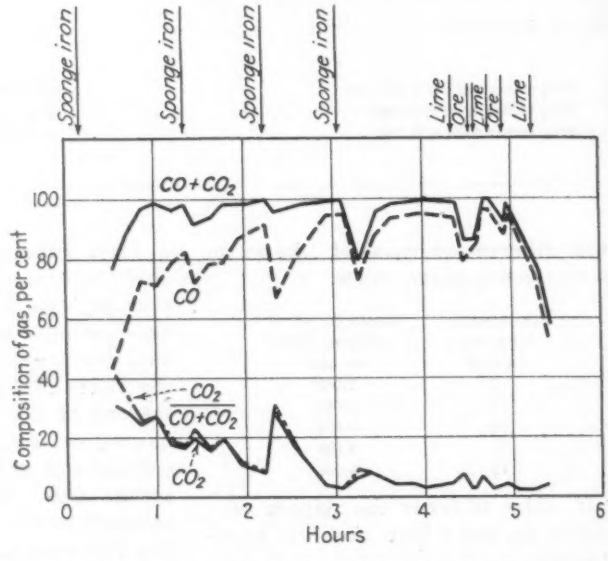
tion, steel produced with sponge iron, using coke in the carburetor, should also be competitive with steel produced from coke iron made in the Tysland-Hole furnace.

In the estimate above the saving in power and time resulting from use of preheated sponge in the electric steel furnaces has not been given any consideration. When the sponge leaves the reduction zone it has a temperature of about 1000 deg. C. (1830 deg. F.) and a sensible heat of about 163 kg. cal. per kg. of iron. Evidently it is impossible to recover all this energy but it should be possible to transfer the sponge to the steel furnaces at a temperature of about 600 deg. C. (1110 deg. F.) and with a sensible heat of 84 kg. cal. per kg., thereby lowering the consumption of power with 100 kw-hr. per metric ton, corresponding to a saving of Kr. 1.50 per metric ton (33c per net ton) with a cost of power of Kr. 0.015 (3.75 mill) per unit. The time of melting will also be shortened somewhat, as already mentioned.



ABOVE

FIG. 13—Variations in production of steel, consumption of power and electrodes with different percentages of iron in the sponge iron.



RIGHT

FIG. 14—Composition of furnace atmosphere during the progressive melting of sponge iron in an electric arc steel furnace.

Other Economic Factors

Even if the calculations indicate that it would be of economical advantage to change from pig iron to sponge iron in the production of high quality steel, it is hardly to be expected that such a change could be accomplished immediately. It would involve considerable investments, besides the question of power supply, the types of iron ores available and other local conditions would have to be investigated. Finally it would be necessary to consider the influence on the character of the steel in changing from one process to another. For this reason the changes would have to be gradual. Should, however, an increase in the tonnage of high quality steel be found necessary, the question of a production of sponge iron must be carefully examined. In this connection, the feasibility of a combined pig iron and sponge iron process has to be considered. What might be gained in this respect in combination with the open hearth process will not be discussed here, as at Söderfors all steel making is done in electric furnaces.

By the use of liquid pig iron and sponge iron in the electric steel furnaces, trials as Söderfors, have shown that the time of melting can be shortened. Further the degree of reduction of the sponge iron can be lowered, this being followed by a lower cost of production. By using 50 per cent pig iron and 50 per cent sponge iron in the charge the degree of reduction of the sponge iron can be lowered to 70 per cent without any material decrease in the average degree of reduction in the steel furnace charge as compared with melting sponge iron of 85 per cent reduction without any pig iron. Lowering the degree of reduction of the sponge iron from 85 to 70 per cent would effect a saving of about Kr. 7 per ton ($1.60 per net ton). Table IV gives a cost estimate when operating with 50 per cent liquid pig iron and 50 per cent sponge iron.

As shown by the estimate, the cost of production with the assumed combination will be only slightly higher than the cost of production when melting 85 per cent reduced sponge iron only.

It is of interest to investigate what would be the national saving in fuel for Sweden in case of a general adoption of the sponge iron process. A calculation of the savings possible if half the present pig iron output is replaced by sponge iron is given below. The figures on charcoal and power consumption in Swedish blast furnaces and electric shaft furnaces are the official figures issued for 1939.

For the sponge iron production it would therefore be necessary to use about 37,000,000 additional units of power than are now used by the electric shaft furnaces, operating on charcoal. This increase in power consumption corresponds to an effect of about 4200 kw. The saving in charcoal would be about 510,000 cu. m. per year. Due regard must be given to the

Type of furnace	Consumed: Charcoal	Consumed: Power	Produced: Metric Tons
Charcoal blast furnaces	1,540,000 cu. m.		303,530
Electric shaft furnaces	140,000 cu. m.	120,000,000 kw-hr.	48,689
	1,680,000 cu. m.	120,000,000 kw-hr.	352,219
To replace with sponge iron one-half of the pig iron produced, about 175,000 metric tons, would require:			
Charcoal		270,000 cu. m.	
Electric power		157,000,000 kw-hr.	

decrease in the blast furnace gas produced which gas must be compensated for by producer gas, involving an increased consumption of mineral coal. The quantity of coal thus required would amount to about 32,000 metric tons.

In computing the above, the following figures are arrived at:

The sponge iron would be used as a base for the production of high quality steel in electric steel furnaces and in acid open hearth furnaces.

If found advisable, the quantity of charcoal saved, viz. 510,000 cu. m. per year, could be used for the production of an additional 330,000 metric tons of sponge iron which would mean a considerable addition to the Swedish steel output without depletion of the forest reserves. The power needed to produce this additional tonnage of sponge iron would amount to about 300 million units of power per annum.

Saving in changing to sponge iron		
Charcoal, 510,000 cu. m. at Kr. 13		Kr. 6,630,000 per year
Deduct:		
Increased consumption of power		
37 mill. kw-hr. at Kr. 0.01 per unit (2.5 mills) Kr. 370,000		
Increased consumption of mineral coal		
32,000 tons at Kr. 30	Kr. 960,000	1,330,000 per year
Total saving		Kr. 5,300,000 per year

In opening the 1930 spring meeting of the Swedish Iron Masters' Association (Jernkontoret) K. F. Göransson, managing director of the Sandviken Steel Works, pointed out that we were about to cross the threshold to the solution of the sponge iron problem. Many problems have had to be solved before reaching this stage but I do not hesitate in stating that the major difficulties are now behind us. To predict the magnitude of the future production of sponge iron is difficult but it is quite certain that it will have an important bearing on future developments of the Swedish steel industry.

DeBurring Aluminum and Light Steel Parts

By G. O. ROWLAND
Osborn Mfg. Co., Cleveland

o o o

THERE are numerous parts in aircraft and motor car production which contain small burrs. Many of these parts have recesses, slots or uneven surfaces and are not only difficult to handle but present problems in production which affect design when hard-to-get-at burrs are only partially removed or else removed in a manner which affects design dimensions.

Hand burring methods often are inadequate on today's production line of precision parts, and it is to the credit of production engineers that modern tools and techniques are available so that these small parts contribute their maximum to the strength and operating efficiency for which they are specified.

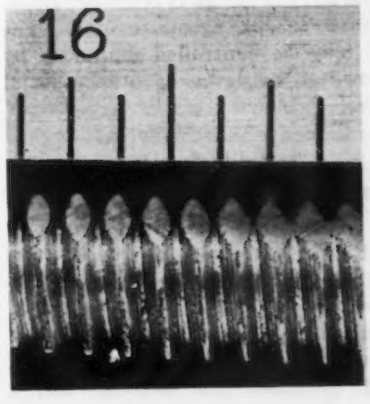
Removing burrs is a surface finishing operation. In view of the important relationship between the fatigue life of a part and its surface finish, a properly finished surface must include the strengthening or elimination of any point where fatigue stress might concentrate. Burrs, whether on the cut edges of a gear tooth or on the edge of any other metal part, constitute a point where fatigue stress will center, and unless they are removed, the fatigue life of the part will be shortened. According to accepted authority, practically all failures that occur in service are fatigue failures. Even minute scratches left by the finishing operation itself have a bearing on fatigue life. In this connection, it has been established that more than 15 per cent increase in fatigue life has been obtained by paralleling the power brushing motion to the direction of the principal stress.

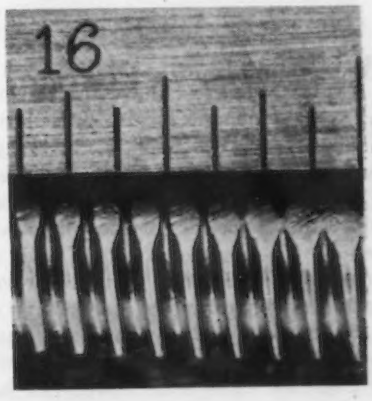
In one aircraft plant, the removal of burrs and sharp edges from an aluminum bearing retainer presented a serious production problem until the proper brush application was suggested, a 6-in. dia. fast cutting tampico wheel used with suitable burring compound and operated at a speed of 2400 to 3000 r.p.m.

Other successful applications of power brushing included such items as small machine steel adjusting screws, wherein brushing wheels removed lead and heat treat scale from the threads in a fraction of the time required by older methods.

Removing burrs from the slots and upper portions of the threads of castellated nuts posed another problem which has been successfully met with power brushing. An 8-in. dia. wheel was filled with 0.0095 in. crimped steel wire and operated at approximately 3000 r.p.m. A simple hand-held fixture consisting of a dowel pin made of hard wood fits the inside diameter of the nuts, upon which the nuts revolved freely from the power of the brushing wheel. The work was first held firmly up to the brush from one side so that the fixture was at an angle of about 20 deg. from the horizontal and about 20 deg. from a line running through the brush face. This operation removed the burrs from one side of each slot in the nut. By holding the fixture at 20 deg. from the horizontal, but in a line running through the plane of the brush with the nut in contact with the brush, the burrs on the top of the slots and the upper threads were cleaned. By repeating these two operations on the opposite side of the brush the entire slot and upper thread are finished. The operation is also adaptable to automatic equipment.

AT the left is shown a photomicrograph of a threaded steel clamp before brush deburring. At right are shown the threads after brushing, with burrs removed.



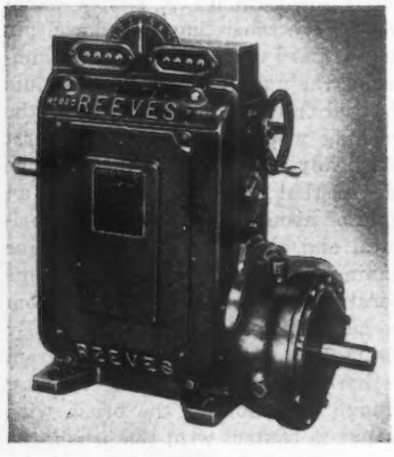


New Equipment . . .

Power Transmission Apparatus

New developments in gear reducers, speed drives, couplings, gear and wheel pullers, motors, transformers, switches and coatings are described in the following pages.

A VARIABLE speed transmission with built-in speed reducer has been developed by *Reeves Pulley Co.*, Columbus, Ind., for accurate speed control and speed reduction combined in one compact completely enclosed unit. It is available in horizontal and vertical designs in a wide range of



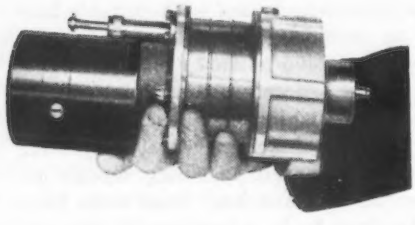
speeds and in capacities from 1 to 7½ hp. Various sizes produce ratios of speed variation from 2:1 through 12:1 and the reduction gears provide ratios up to and including 6.9:1. Speed changes are effected by turning a handwheel, or by mechanical or hydraulic methods.

Speed Test Drive

A COMPACT, self-contained variable speed test drive for testing aircraft tachometers also has been announced by *Link-Belt Co.* A ½-hp. electric motor is integrally mounted on one end. It utilizes the basic Link-Belt V.R.D. speed variator, has an over-all speed ratio of 10:1, and is furnished with four vertical drive shafts for mounting of tachometers, or with special swivel head to permit testing in either horizontal or vertical position. The four drives can be supplied all alike or in any desired combination. The unit permits selection of direction of rotation of each shaft, making it possible to operate two tachometers in one direction and two in the opposite direction and test all simultaneously.

Midget Speed Drive

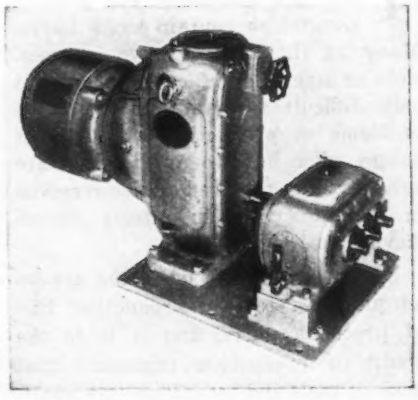
WEIGHING only 8 lb. complete with motor, the Model 15 drive for use with motors of not more than 1/15 hp. has been offered by *Graham Transmissions, Inc.*, 2706 North Teutonia Avenue, Milwaukee 6. Torque ranges from 4 in.-lb. at maximum



forward speed (for 3600 r.p.m. input) to 8 in.-lb. in reverse; or from 1 in.-lb. at maximum forward speed (for 1800 r.p.m. input) to 2 in.-lb. at reverse. Output speed range is from 700 r.p.m. to zero, or if it is desired to reverse the output shaft without reversing the motor, the range is from 400 r.p.m. forward to 400 r.p.m. reverse. The unit may be controlled manually by handwheel, by lever or other special control.

Portable Test Rig

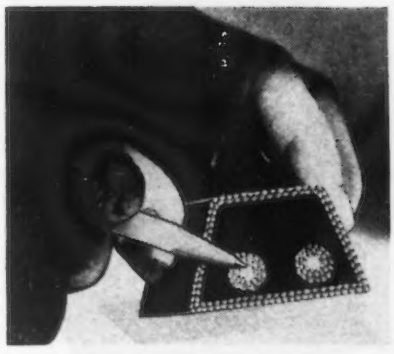
THE LINK BELT CO., Philadelphia 40, has added a new unit to its P.I.V. gear variable speed test rigs. It features a vertically mounted 2-hp. motorized P.I.V. gear of 6:1 overall speed range, connected to a helical gear box having three output shaft extensions for testing, and a fourth extension, on opposite side of box, for connection to a tachometer. The three output shafts in line have speed ranges of 600 to 3600, 300 to 1800 and 150 to 900 r.p.m. respec-



tively. The speed range of shaft extension for tachometer is 150 to 900 r.p.m., and a triple-scale indicator is used for the three speed ranges.

Gearmotors

A NEW line of horizontal parallel shaft type gearmotors which meet speed reduction requirements over a range of 1 to 75 hp. is announced by *Westinghouse Electric & Mfg. Co.*, East Pittsburgh. The use of adaptor castings between motor and mechanical parts allows the use of standard Westinghouse N.E.M.A. frame motors with each type of unit, permitting shifting the assembly between unit types to meet changes in speed requirements. Gears and pinions are lubricated by a positive splash system, and new case design allows oil to circulate freely. The units are compact and foundation stability is improved through heavy exterior ribbing of the housing at each mounting hole.



Wire Reinforced V-Belts

TWO types of wire reinforced V-belts are being built by the *B. F. Goodrich Co.*, Akron, a cable cord construction and a grommet construction which incorporates a wire cord placed in the center of a cotton or rayon grommet. Designed for the most rigorous services, advantages claimed are greater power capacity, increased tensile strength and low stretch. The company emphasizes that only after full engineering details of the equipment on which the belt may be used and operating conditions are studied will it be able to decide whether a wire belt will be practical.

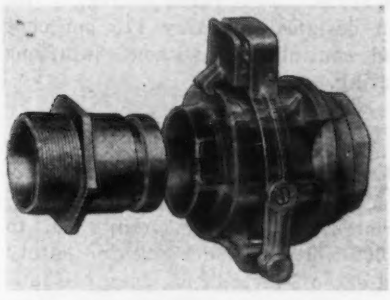
Left-Hand Output Transmissions

LEFT-HAND output models of both the Master (1-5 hp.) and Major (5-10 hp.) transmissions for motorizing cone driven machine tools are announced by *Western Mfg. Co.*, 3400 Scotton Avenue, Detroit. The company offers also three models of Multi-Motor Mount. There is also a Super (up to 30 hp.) transmission which has eight changes of speed in geometric progression of 1.29 with

a total reduction of 6:1, which is used to replace the gear box in large boring mills, radial drills, planers, and engine and turret lathes.

Quick Disconnect Couplings

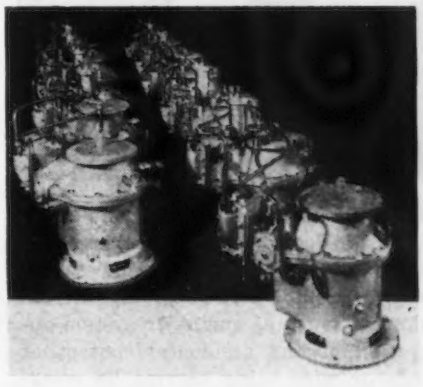
INDUSTRIAL and marine couplings from 2 to 10 in. in size, offered by *E. B. Wiggins Oil Tool Co., Inc.*, 3524 East Olympic Boulevard, Los Angeles, are said to be instantaneously disengaged by releasing a latch and throwing a lever. Connection is made by placing the two ends of the coupling together and raising the lever. The couplings are made in accordance with Federal specifications and the larger sizes are individually tested for pressure and porosity. Sizes ¾ to 2 in. are die cast from Zamak and larger



sizes are machined from brass or aluminum. A special line of couplings includes single and double self-sealing models as well as the open type.

Turbine Reduction Units

A LINE of standardized, completely self-contained, industrial turbine reduction units has been announced by the Cone-Drive Div., *Michigan Tool Co.*, 7171 East McNichols Road, Detroit 12. They are available in 26½ and 37 hp. base ratings, designed to operate on input speeds of 5000 to 6000 r.p.m. Standard ratios range from 3½ to 8 to 1. Self-contained, they are equipped with built-in oil pump and oil cooler, oil



filter and pressure relief valve, pressure-gage, thermometer and oil level gage. The lubrication system is of the force feed type.

Gear and Wheel Pullers

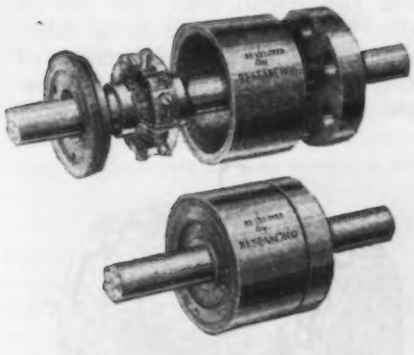
ARMSTRONG-BRAY & CO., 5364 Northwest Highway, Chicago, have announced the addition to their line of Steelgrip Rigid-arm gear and wheel pullers, which will handle a wide range of jobs, covering factory

work, tank, tractor, truck and farm machinery maintenance. They are available in three sizes. The forged steel arms, forcing screw and other parts are heat treated for strength and wear resistance.

Protected Motor

GENERAL purpose, open-rated motors in a new protected design, in sizes from 1½ to 15 hp., are

available from *Century Electric Co.*, 1806 Pine Street, St. Louis 3. Two fans located behind the bearing brackets draw cooling air through the bearing bracket openings, around the bearings, across the windings and to the air passages between the outer surfaces of the magnetic core and the frame, the heated air being expelled through openings at the side and bottom of the frame.



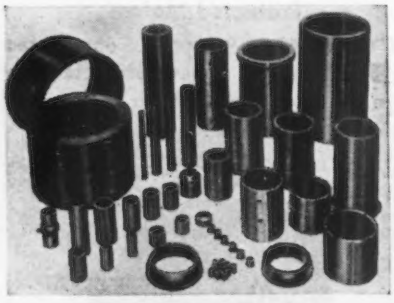
Centrifugal Clutch

A NEW type of automatically engaging and self-disengaging centrifugal clutch, the Torkontrol, has been announced by the *Amalgamated*

Engineering & Research Corp., 100 West Monroe Street, Chicago. A partially filled oil chamber is fitted with a freely rotating hub, which carries a series of movable wedge shaped flyweights. As the hub revolves, these weights fly outwardly and engage the internal rims of the outer case, binding the hub and shell into a functionally solid pulley or coupling. The unit works in either direction and is set to engage or release at a given speed and to slip in case of overload.

Molded Fabric Bearings

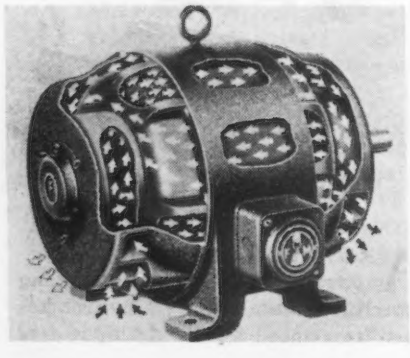
THE oil-lubricated non-metallic molded Lubritex bearings, developed by the *Gatke Corp.*, 228 North LaSalle Street, Chicago, are made of various material combinations to meet



all kinds of service conditions using grease or oil lubrication. It is said they stand up under impact loads that are too great for metal bearings, have much greater wear life and lower friction. They can be furnished in all shapes and sizes.

All-Purpose Motor

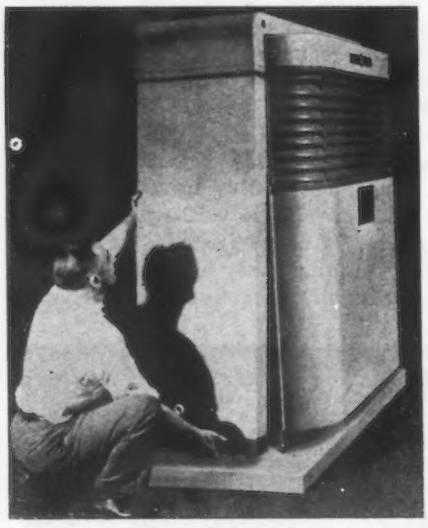
AN all-purpose, continuous-duty, polyphase squirrel-cage induction motor for use in all kinds of industry has been put on the market by *Fairbanks, Morse & Co.*, Chicago. Constructed with the centrifugally-cast F-M Copperspun rotor, the unit is fully protected against flying chips, falling particles, dripping liquids and other industrial motor hazards. Cross-flow ventilation is obtained through



protected inlets and exhausts at each end of the motor. There are no moving external parts, the frame being cast in one piece with rib sections to give added strength without increase in weight. Where space is limited, the conduit can be brought up between the motor feet to the tapped hole in the motor frame and the conduit box cover assembled flush with the frame. It is rated 40 deg. C rise and designed to carry 115 per cent load continuously without injurious heating.

Dry-Type Transformers

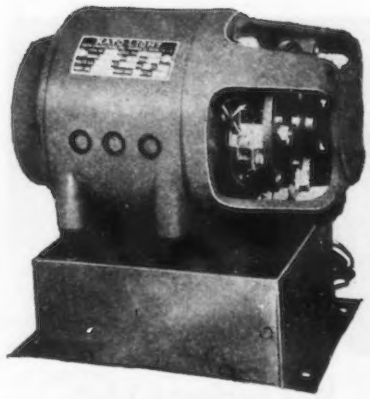
A NEW design of *General Electric* indoor dry-type transformers for primary circuits 601 to 15,000 volts provides greater safety and ease of installation than previous dry-type designs. Horizonally louvered sections on two sides of the case can be removed easily, making the interior accessible for cleaning and tap changing. All live parts are metal enclosed, various portions of the case being separately removable.



The solid sheet-metal top and sides and the deeply pitched louvers protect the unit from hazards which might result with open-screen enclosures, such as sprinkler system operation or the accidental contact of rods or wire being carried by workmen. Length of the transformers is about twice the width so they can be installed in dead spaces between pillars of a building or in out-of-the-way corners on a factory floor.

Rotary Converters

A NEW line of two-pole rotary "Konverters" has been announced by the *Kato Engineering Co.*, Mankato, Minn., in 225 and 350 volt-amperes continuous load capacities at



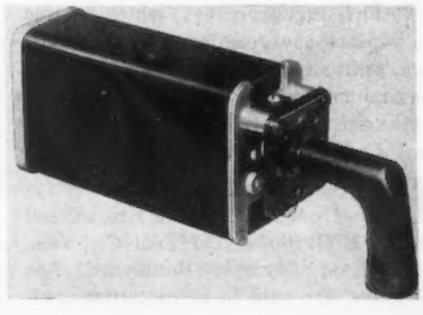
3600 r.p.m. with 40 deg. C. temperature rise. They are available for changing 32, 110 or 220 volts d.c. to standard 110-volts, 60-cycle a.c. Speed governor can be furnished for close frequency control with a variable d.c. input.

Identification Coatings

TO expedite the winding of electrical equipment, the *Sterling Varnish Co.*, Wilson & Fink Streets, Haysville, Pa., has made available the S-184 identifiers, a group of colored identification coatings for tracer wire applications. The wire is run through the varnish or the entire coil of wire dipped in it. It gives a smooth finish and dries quickly, permitting handling in less than 1 min. after application. The coatings can be supplied in any color.

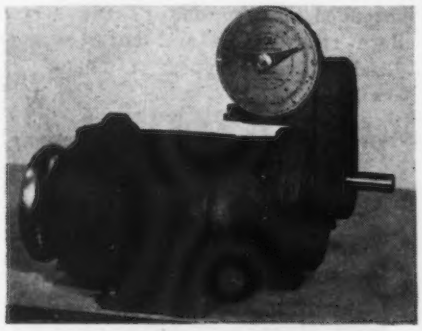
Master Control Switch

A MASTER CONTROL switch for heavy-duty service is announced by the *General Electric Co.*, Schenectady, for use wherever repetitive operations of electrically operated devices run into many thousands per week. It can be mounted on panels varying in thickness from ⅛ to 2 in. It is rated at 600 volts, 200 amp. continuous or 250 amp. for 3 sec. Its interrupting rating is dependent upon the voltage and character of the circuit and upon the number of contacts arranged in series.



A.C. Coil Winders

AVAILABLE either as a bench or pedestal model, in any backgear ratio from 2:1 to 18:1, the No. 1 back-geared a.c. coil winder has been added to the universal series manufactured by *Globe Tool & Engineering Co.*, 428 Davis Avenue, Dayton, Ohio. The winding torque increases with the ratio of the backgear, while the top speed decreases by the same ratio. A floor mounted foot pedal controls the operation of the winder. Motor speeds range from about 10 to 2000 r.p.m. in the 2:1 backgear unit. Wire in sizes from No. 16 to 42 may be wound into coils up to 5 or 6 in. in diameter and 4 in. long. An easily read counter indicates the number of turns accumulated.

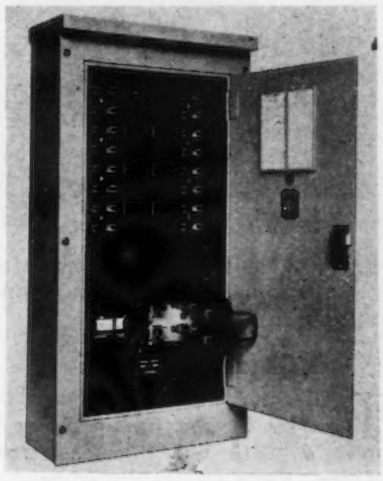


Slip Ring Induction Motor

A PRECISE, quick. easy-to-use method of spotting, or slowly rotating, a 3-phase synchronous motor or slip-ring induction motor has been developed by *Electric Machinery Mfg. Co.*, 1331 Tyler Street, N. E., Minneapolis, Minn. Slow-motion high torque rotation of the motor is provided by using commutated d.c. to supply a slowly revolving 3-phase inching current to the motor. The E-M incher is said to be particularly valuable in steel mills for positioning or rotating rolls for dressing and changing, backing out cobbles and for other purposes.

Marine Type Panel Boards

COMBINATION power and lighting panels for marine use are being manufactured by the *Square D Co.*, 6060 Rivard Street, Detroit 11. The panels are made to meet either low or high shock specifications of the U. S. Navy. The panel illustrated was built to meet low shock requirements and has eight 2-pole, 30-amp. lighting circuits and two 2-pole 60-amp. power circuits. The box is dripproof. The company has also developed the Multi-breaker convertible panel plan for the complete conversion of obsoleted fusible panelboards to circuit breakers with considerable increase in the number of circuits as well as in the capacity of circuits and mains.



Resistor Coil Coating

THE Pemco Corp., Baltimore 24, has announced production of Lectraseel, a vitreous low-loss resistor coating. It is said to be highly resistant to thermal shock and corrosion, and that the co-efficient of expansion and contraction will parallel that of ceramic cores.

Solderless Cable Connectors

FOR welding cable of the flexible type in various sizes without requiring special tools, soldering irons, etc., the *Chicago Tool & Engineering Co.*, 8348 South Chicago Avenue, Chicago 17, has developed the Palmgren solderless cable connectors in sizes ranging from Nos. 1 to 3 inclusive. The solderless connectors are interchangeable with the standard solder type. After insulation is removed, the taper plug is forced into center of cable. Then by screwing nut and body together, it forces taper plug flush with threaded end of nut, making a tight connection with positive conductivity.

Push Button Units

A NEW line of standard-duty push-button units designed for flush or surface mounting on machine tools, welding controls and similar equipment has been announced by the Industrial Control Div., *General Electric Co.*, Schenectady. Available in both pendent and oilproof types, with buttons of various colors and with interchangeable, labelled nameplates for easy identification, the units are made of a smooth, hot-molded, moisture-resisting phenolic compound. The responsive, double-break contacts are of fine-silver and have a steel back projection, protected by rust-resisting plating, welded to the contact supports. The oilproof units are

similar except that they are provided with an especially treated leather ring packing, which serves to wipe the oil from the surfaces from which it might otherwise seep into the mechanism.

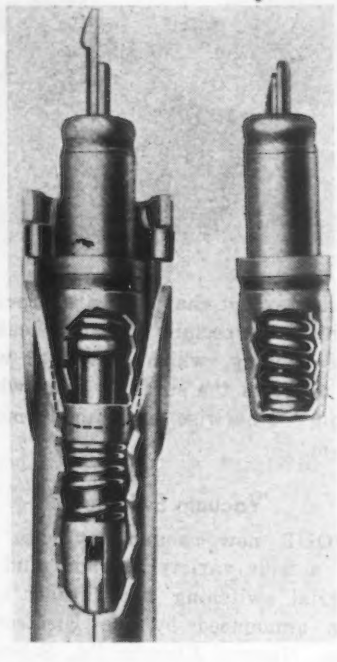
Vacuum Switches

FOUR new vacuum switches for a wide variety of radio and industrial switching applications have been announced by the Electronics Dept., *General Electric Co.*, Schenectady. They can also be adapted to oil or water-immersed operation and are especially applicable where fire and explosion are a constant risk, as in magnesium finishing rooms and similar dust-laden atmospheres. Two of the switches are also designed for high altitude applications. The contacts of the switches are mounted in a vacuum, which gives the switches a high current rating for their size and permits them to handle enough power to operate equipment at greatly reduced voltages. No self-contained coil or other operating mechanism is built into the switches, movement being obtained from the mechanism to be controlled. The contacts close without vibration, making it possible to mount the switches on or near delicate instruments.

Fastening Devices . . .

Airplane Skin Fasteners

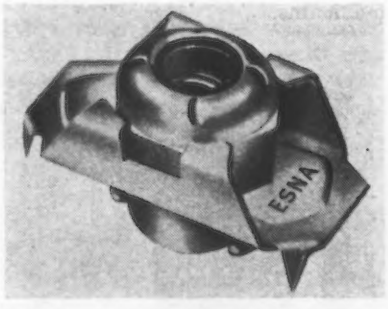
THE addition of a cap to their conventional airplane skin fasteners, which prevents retrograde movement of the spring and fastening element in the event of failure, cuts accident hazards, according to the *Prestole Division* of the Detroit Harvester Co., 5450 West Jefferson, Detroit. Another development is a redesign of the Prestite safety gun so that the plunger which actuates the



fastener extends within the cup, thereby eliminating the possibility of the fastener shooting out of the gun or becoming disengaged due to the improper placing of the fastener in the inserting tool.

Stop Nut for Plywood

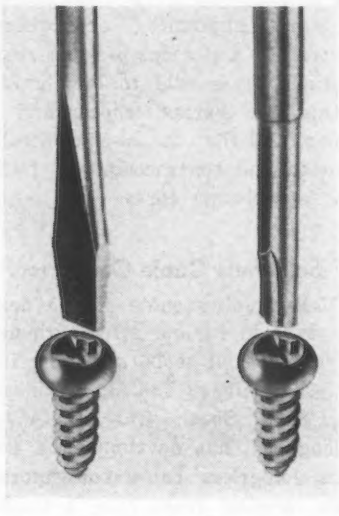
A SELF-LOCKING fastening device for use on plywood construction has been developed by the *Elastic Stop Nut Corp.*, 2321 Vauxhall Road, Union, N. J. A regular elastic stop nut, with the red cellulose locking collar, is used interlocked with a basket that locks into the plywood and holds the nut securely. Four prongs at the corner of the basket sink into the surface of the plywood and two feet inserted in the hole firmly anchor the basket. Spring



fingers at the top clasp the nut after it is seated and hold it firm against axial play.

Clutch Head Screw

THE clutch head screw put on the market by the *United Screw & Bolt Co.*, 2513 W. Cullerton Street, Chicago, has a special shaped head of such form that in an emergency a flat sided screwdriver may be used to



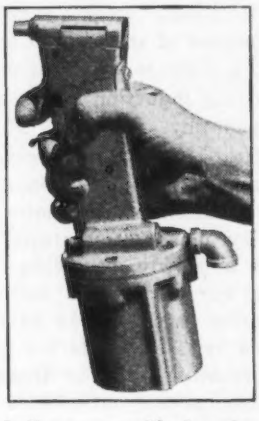
tighten or loosen it. The center pivot assembly bit used with the clutch head screw is self-centering in the head of the screw. Three sizes of center pivot bits cover the popular range of all standard machine screws and thread-forming types.

Blind Rivet

THE development of the Preco, a blind rivet that is applicable in almost any place where riveting is used, has been announced by the *Pacific Railway Equipment Co.*, 960 E. 61st Street, Los Angeles. The rivet is the combination of three parts, a steel cadmium-plated recessed head screw inserted into the hollow stem of a high strength aluminum alloy rivet, and a knurled nut of Dural threaded on the end of the screw. Both rivet sleeve and nut are anodized. Several types of heads are available.

Rivet Gun

FOR the high speed application of cherry blind rivets in double surfaced structures where access to one side of the work is obstructed, the *Cherry Rivet Co.*, 239 Winston Street, Los Angeles, Cal., has designed the G15 gun. It is claimed that rivets can be installed at a rate of 1600 per hr. with this all-pneumatic gun, which will operate in any position. The gun weighs approximately 4¼ lb., and operates on 75 to 100 lb. per sq. in. pressure. Three interchangeable pulling heads handle



either hollow or self-plugging types of rivets.

Threaded Inserts

A DEVICE that remains permanently fixed when inserted in such materials as plastics, fiber, copper, bronze, aluminum, etc., is being offered by the *Marco Co.*, Wilmington, Del. By inserting a hand tool shaped to conform to the taper of the threaded insert, it is expanded, which causes it to mushroom out at the bottom, forming a star-like projection.

PARISH

METAL STAMPINGS

★

MODERN DESIGN AT LOW COST

★

HOUSEHOLD APPLIANCES

New refrigerators, cabinets, bathtubs, stoves, and a wide range of other household necessities will be a joy to the post-war housewife.

Pressed Metal Parts and stampings will make possible unparalleled efficiency, smart beauty, long life,—all those qualities that lower sales resistance in a competitive world.

No other method provides *all* characteristics required,—resistance to elements, ability to take hard knocks in every day use, relative low cost, tensile strength, beauty and so forth. Parish Pressed Steel has completely rounded facilities; engineering cooperation in the drawing board stage, all sizes of presses for most efficient production, welding facilities, painting and finishing departments, and full assembly facilities.

It is not too early to plan your new designs. We are ready to work with you in the preliminary stages.

And as our contribution to post-war progress, we are now equipped to stamp, fabricate, and heat treat aluminum, in addition to steel.

STANLEY H. BRAMS

• Truck program changes are being planned, with Army reducing needs, permitting increases for civilian requirements . . . Michigan Kaiser Co. is incorporated, indicating industrialist's entry in automotive industry.

DETROIT—The 1944 truck program, already under way, is still in the throes of readjustment. Industry people conferred here last weekend at WPB's request over the effect of forthcoming changes.

There is still scheduled for output this year an aggregate of about one million military and commercial vehicles. Of these latter, 81,366 have been earmarked for domestic use, and manufacturing circles say that the total has already been increased to about 88,000. And beyond that, the closed meeting last week produced inferences that the ultimate total for commercial use may run close to 200,000.

Cutbacks from the Army truck projections are now being planned in Washington, where the services are re-examining their inventories and logistics projections to determine where they can reduce their initial requirements. As soon as these military truck cutbacks appear, the commercial allocations will be enlarged.

The Rubber Administration has a stake in the outcome of this planning, too, for military vehicles require heavier tires, with higher proportions of natural crude intermixed with synthetic GR-S rubber, than do their commercial counterparts. Rubber Administration people in Washington appear of the belief that the program as now constituted may be actually a physical impossibility due to the limitations of the dwindling supply of natural crude still on hand.

Cutbacks on military vehicles will make possible the output of more than an equivalent number of civilian units. Reasons for this apparent anachronism lies in spare parts requirements and in duplication of critical components, like axles, bearings and gears. As example of the latter, big military trucks require more driving axles than do commercial jobs; cutback of one 6x6 military truck allows addition of three axles to the commercial program.

A SUBJECT of controversy between WPB and individual truck companies is how any forthcoming commercial output will be apportioned among the various makers. Up to now WPB has scheduled commercial production on the basis of the ability of the various producers to manufacture beyond their military commitments. The truck makers, however, generally advanced the viewpoint at the recent meeting that any further increases in their commercial volume should be on the basis of an historical average, projected from vehicle totals manufactured in a base year, such as 1941. Nearly all manufacturers represented at the Detroit conference backed such a program as a means of stabilizing their relative industry positions in a period when none could fill their share of the demand.

WPB did not comment on this suggestion, merely using the meeting as a fact-finding one. However, the Washington objection to such a proposal—it has been argued previously and at times a bit strenuously—is that the historical basis does not permit greatly amplified production by manufacturers whose other commitments give them margins of available facilities.

In addition to any shifting of production quotas from Army to commercial classifications, the civilian situation could be relieved during the forward period by turnback of military vehicles to general uses. This does not refer to such vehicles as the worn-out jeeps being sold in Chicago, but to new vehicles which have been idle since purchase because of changes in planning or specifications. Some of these are too heavy, too overburdened with driving axles, etc., to make them economical to use commercially. But there are others. For instance, considerable numbers of 6x4 trucks were ordered early in the war, mainly for Lend-Lease account. Many have never been shipped abroad and are still on this continent. The Army could do itself and the country a service by releasing such jobs for civilian requirements.

BESIDES the "always-with-us" problem of tires, bearings are popularly considered the bottleneck in the truck program, as in a great many other programs. It is true that shipments of bearings, ball somewhat more than roller, are running late and constitute a formidable obstacle to maintenance of production. But there are other current shortages as well. Back shop information is that the greatest bottleneck in the truck program today, interestingly enough, is malleable castings, used for such parts as carriers and housings. Producers using steel castings or stampings are filling their requirements without too much difficulty, but those utilizing malleable are currently in deep water.

Meanwhile, the bearing problem itself is being relieved by scaling down of Army spare parts requirements. Original Army ordering of spares in this classification ran from 30 to 50 per cent of original equipment needs, far beyond actual replacement requirements. As proportions of spares are cut, that much more leeway is afforded in the original equipment planning.

Henry J. Kaiser has made what appears to be his first move toward invasion of the automobile industry, with incorporation in Michigan of the Michigan Kaiser Co.

Directors are all Kaiser organization people, headed by Mr. Kaiser, and including E. E. Trefethan, Jr., G. G. Sherwood, Paul S. Marrin and Robert L. Bridges.

THE Michigan Kaiser Co. has taken over the organization and facilities of Probst and Harger, Detroit engineering firm which designed experimental vehicles submitted by the parent Kaiser Co. to the Army Ordnance Dept. in past months. Karl K. Probst, development engineer of this company, it will be recalled, was the designer of the American Bantam jeep, which has been considered the original vehicle in this midget size classification. His interests in past years have run largely toward development of lightweight vehicles, which would seem to chime well with Mr. Kaiser's expressed thinking on a post-war automobile. Trade circles in Detroit report that the new Michigan

THEY FLEW FOR 2 MINUTES . . .

"Boeing 314 Clipper" (Pan-American)

TODAY . . . *We Span the Oceans*

The contrast in performance between now and the first days of airplanes is one way of looking at their amazing progress. But it's *not* the most vital difference. The real difference between today and 1903 is that today we can build 8000 planes a month.

What has brought about this progress? Mass production? The assembly line? Yes, but before these were possible, there had to come STANDARDIZATION — the adoption of standard interchangeable parts which would assemble instantly without "hand fitting." This basic feat with its attending economies has made available to many, in all fields, products that were formerly available only to a few.

The use of *standard Screw Thread forms and sizes* has contributed enormously to this simplification of manufacture. A more universal adoption of these standards can carry their benefits still further in the years immediately ahead.

Standard Threads-
SAVE TIME - SAVE MONEY!

Full utilization of existing accepted sizes, pitches and forms can bring lowered costs to all manufactured products because: (1) it speeds production; (2) it reduces inventory. NOW, when plans for new and better products are taking shape —now is the time for a united effort to bring about greater standardization of threaded parts

GREENFIELD TAP AND DIE CORPORATION GREENFIELD MASSACHUSETTS

This Is No Bull

Washington

• • • Farmers don't like steel nose rings for bulls, according to WPB. So it has authorized the use of copper for this purpose. WPB estimated that about 240,000 lb. a year of "readily produced type of copper rod will be needed for bull rings." At the same time the board in announcing amendments to Conservation Order M-9-c, prohibited the manufacture of new brass or copper tubing, pipe or fittings for installation in gas and gas distribution systems.

Kaiser Co. already has engineering designs on paper for a lightweight car—a report, incidentally, which is also being attributed currently to a number of automotive firms.

Further developing the speculation over the new project are reports from the west coast that the Kaiser plant at Permanente hopes to produce magnesium at exceedingly low prices—which might make it a nominee for structural and functional parts of a motor car. Conceivably a Kaiser car could incorporate many "car of the future" innovations of this sort, for Mr. Kaiser's projects have never lacked imagineering and a bold approach and the same should hold true for his automotive ventures.

THE Pratt & Whitney engine plant at Ford Motor Co. has produced and delivered to the Army more than 20,000 units since Pearl Harbor. Censorship permitted release of that statement Monday.

Ford's average volume of close to 1000 engines monthly during a period which began with minimum production was largely due to changes in production methods which permitted mass assembly, such as centrifugal casting of cylinder barrels; to conveyorized subassembly, painting and inspection; to development of multiple-purpose tools; and to widespread subcontracting.

The engine produced at Ford is the 2000-horsepower radial job used in the Republic P-47 Thunderbolt, the Martin B-26 bomber, the Curtiss C-46 Commando troop transport and the Vega PV-1 naval patrol plane.

The Ford P & W plant, incidentally, has been the scene of a rather substantial shakeup in the upper management brackets recently. H. J. Robinson, who was superintendent of the Lincoln Motor plant of Ford before the war, has assumed charge, taking over duties previously handled by E. J. Wedge, who lacks a new assignment as yet at Ford. A number of others were included in the shifts which developed shortly after the year-end.

Same Maury Maverick

Washington

• • • "There's no new Maury Maverick," Maury Maverick, Small War Plants Corp. Chairman told THE IRON AGE this week.

"I am for private enterprise; I always have been, and I want to help the small business man as much as I can while I am on the job," he said.

Mr. Maverick had been asked his reaction to critics who predict a hard time for business under his control and had been calling him a "new dealer" and "socialistic."

Before spending two terms in Congress, Mr. Maverick was in the lumber business for 12 years. He has had more than two years' experience at WPB.

SAE Cited by Ordnance for War Engineering Endeavors

Detroit

• • • The Ordnance Distinguished Service Award recently was conferred by the U. S. Army Ordnance Department upon the Society of Automotive Engineers in recognition of outstanding engineering advisory service. First award of its type to be made by Ordnance to any professional society, the presentation came from Major General G. M. Barnes, Chief, Technical Division, Ordnance Department at the SAE War Engineering-Annual Meeting dinner.

Accepting the citation for SAE, President Mac Short and other members adopted a resolution pledging continuation of SAE advisory war engineering service for the duration and post-war development of permanent machinery for uninterrupted SAE service to Army and Navy. More than 500 engineers, representing scores of automotive vehicle and parts manufacturers, now are serving on committees which, under the SAE War Engineering Program, work out Ordnance engineering problems.

The award stated that the presentation was "in recognition of outstanding and meritorious engineering advisory services in war and peace in the design, manufacture, and maintenance of materiel." It was authorized Dec. 28, 1943, and was signed by Major Generals L. H. Campbell, Jr., Chief of Ordnance; G. M. Barnes; and T. J. Hayes, Chief, Industrial Division; and by Brigadier Generals J. S. Hatcher, Chief, Field Service Division, and W. P. Boatwright, Chief, Office, Chief of Ordnance, Detroit.

Power for Smaller Plants Corp. Proposed

Washington

• • • The Murray (Senate) Small Business Committee will propose a bill next week in which the Smaller War Plants Corp. is given sweeping powers over the reconversion of small business.

The Corporation shall have the "duty to take all possible steps to aid small business production concerns in problems connected with the termination of war contracts, the settlement of claims thereon, and the conversion to peacetime production or other types of war production."

Powers given SWPC are not exceeded by the authority given any other agency over industry during the war and the suggested legislation does not put a period to the length of SWPC's authority.

SWPC's powers may be to:

1. Buy contractors' claims against the government on account of money owed as contract termination charges.
2. Make or guarantee loans against money owed contractors on account of cancellation of contracts by the government.
3. Make or guarantee loans to cover reconversion costs. Identification and appraisal of individual claims won't be a necessary condition for receiving a loan.
4. Purchase, sell or lease machinery, plants or materials released through contract terminations.
5. Advise and help small business concerns on contract termination, including the selection of contracts to be terminated, obtaining authority to continue all or parts of contracts, accounting and record keeping systems.
6. Decentralize its activities.
7. Make rules and regulations.

Washington . . .

L. W. MOFFETT

• Industry faces big problem of industrial demobilization at end of war . . . Sen. Truman warns of continuing contract cancellations in coming year . . . Absorption into private industry of men released from armed services studied.

WASHINGTON—The problems of industrial demobilization after the war and partial demobilization before the cessation of hostilities are obviously the biggest industry has to face. The ability of industry to provide jobs in a peace time economy will largely determine the future existence of private enterprise.

The enormity of the problem can be realized in view of the prediction of the Bureau of Labor Statistics that $75,000,000,000 worth of war contracts would be outstanding if the war should end tomorrow. The total military output for World War I was slightly more than $17,000,000,000.

Senator Truman, whose committee has done an excellent job of keeping our war program in line, recently said that about $8,000,000,000 in Army and Navy contracts had already been cancelled. Other Washington sources have doubled this figure in their estimates.

Senator Truman said: "This is only the beginning of such cancellations, and almost daily during the coming year you will see newspaper notices of contract cancellations, of plant shutdowns, of elimination of graveyard shifts and of reduction in employees. * * * In some communities there will even be a serious unemployment problem."

Public utterances of General Hershey indicate that demobilization will be slow and that men will be released from the armed services only as fast as they can be absorbed elsewhere. In order to achieve efficient, orderly demobilization Selective Service feels that industry should prepare accurate estimates of their occupational needs. If General Hershey's plans are carried out, then demobilized men will be released as near as possible to their homes or points of induction.

THIS policy will enable industry to know approximately how many jobseekers will be in their area. It is possible that this would aggravate the employment problem in areas which were not heavily industrialized in pre-war years, but became so during the war, and are expected to drop back to a period of stagnation when war orders are cancelled.

By this time, many questions probably have arisen. How many men will be released from the services? Where will they be released? How many men and women will be demobilized from industry? How many will retire from the labor force? How large an Army will the United States maintain after the war? What will be the impact of demobilization on the labor force of pre-war years?

It is impossible to answer these

Demobilization, Related to Pre-War Employment, by States

TOOLS LEAD A DOUBLE LIFE

SUNICUT

increases tool life 100%... improves finish of parts

Tools can't take a holiday . . . not when there are guns to make, and bombers to build, and other war material to produce. But tools were taking holidays . . . far too many . . . for regrinding and resharpening at one of the largest mid-west war plants.

Production quotas were a headache to machine tool operators and foremen because the frequent "time-outs" for tool changes cut down the output. In addition the finish of the parts was not up to par. Many grades and brands of cutting oil were tested and tried, but all failed to correct the condition. So they called a Sun Doctor of Industry — a cutting oil expert — who studied the problem and recommended a change to Sunicut, the transparent, sulphurized oil.

Tools double parts produced for tool grind on many operations before they need changing . . . and the finish of the parts is everything that could be desired. Sunicut succeeded where the others failed.

Output is stepped up in this war plant because the high heat-absorbing and metal wetting properties of Sunicut permitted longer tool life and finer finish. How about investigating the production-boosting possibilities of Sunicut in your plant? A Sun Oil Engineer will be glad to discuss it with you. Write

NELSON HONORED: *Donald M. Nelson was honored at the second anniversary dinner of the establishment of WPB as well as the anniversary of his appointment as chairman of WPB.*

questions accurately, since there are too many intangibles to deal with. However, the Post-War Division of the Bureau of Labor Statistics, with its long experience in maintaining labor data, has made a preliminary study of the subject. A table prepared by the Bureau shows that 32.3 per cent of the 1940 employment, aggregating 45,166,000 persons, would represent the demobilized force.

This graphic illustration of what the various states will have to absorb to attain high level production and employment in the post-war world refers to the number of people demobilized, not unemployed.

THE Division bases this table on three assumptions: (1) the United States will maintain a standing army of 2,500,000 men in the early post-war years; the others in the services will be demobilized as quickly as transportation can be provided, (2) War production will be rapidly curtailed to meet requirements of an army of 2,500,000 men, (3) reconversion will occur rapidly, with no delays due to financial or market problems.

On the other hand, if reconversion is retarded or not permitted to begin as soon as manpower and materials situations warrant, then large unemployment will result. Recently WPB decided to defer large scale civilian production until after the invasion attempt, even though materials and manpower are now available.

But, if after the conquest of Germany is assured, artificial bonds are still maintained on civilian manufacture, then the full responsibility of resulting unemployment will rest on the shoulders of government. On the other hand it is hoped that WPB's new policy of permitting limited civilian production in relatively free labor areas will be extended beyond a few regions now chosen.

Labor also has a vital part in the unemployment picture. If present labor demands for increased wages and refusal to give up the 48 hr week pay are indicative of organized labor's mood, then labor leaders will have to bear much of the responsibility for stalling the economic machine and creating unemployment.

If industry is handcuffed now by excessive wage demands, and the government does not encourage post-war reserves looking to resumption of normal production, then industry will never have the money or power to absorb most of the demobilized labor force.

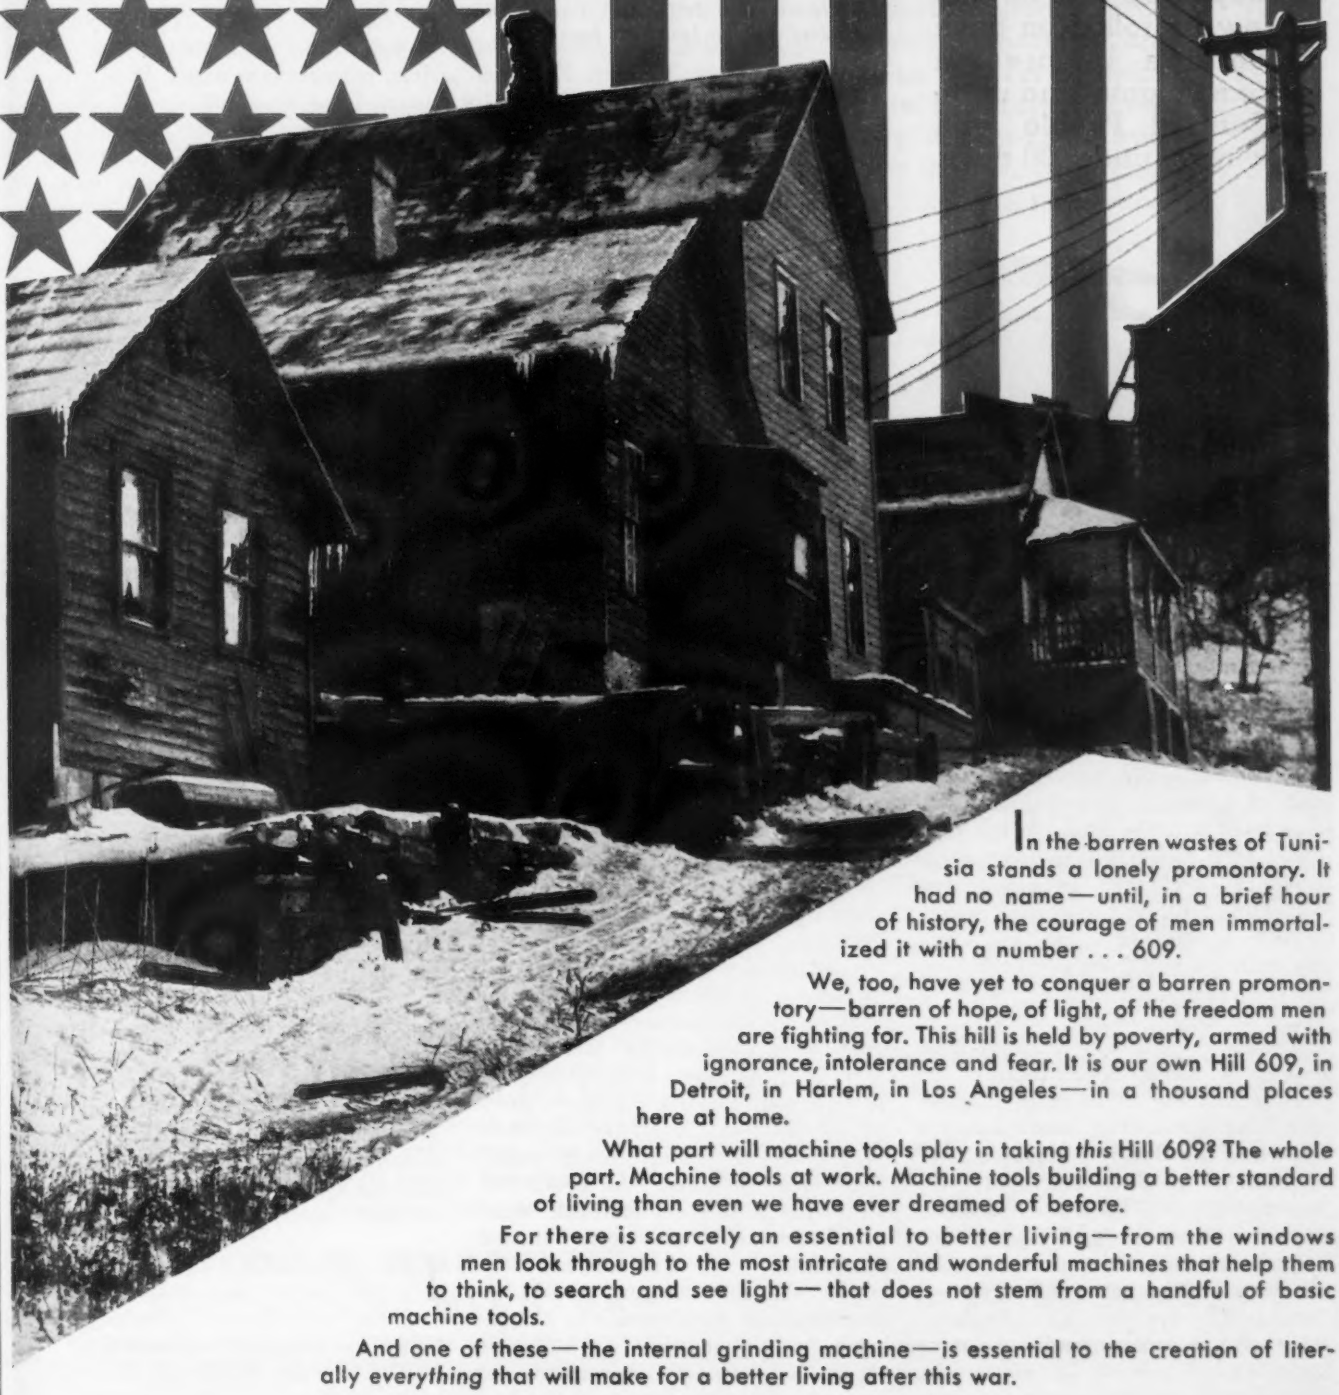
GOING back to the difficulty of the problem as illustrated by the table, the total of 8,500,000 men expected to be released from the services is obtained by subtracting 2,500,000 from 11,000,000, the number of men expected to be in the services at the war's end. The figure of 8,500,000 was allocated according to 1940 state population figures, assuming the majority of the servicemen will return to the states of their origin. Selective Service has already indicated that this is what will be done.

The 6,070,000 figure refers to the minimum number who will be unemployed, at least temporarily, during the reconversion period. The total number demobilized includes only those in the services and manufacturing, not indirect war jobs, government work, and the thousands of other trades that will be effected. Therefore, the problem may be greater than the table indicates.

The relative seriousness of each state's manpower situation after the war is measured by the total number demobilized as compared with the state's pre-war ability to provide jobs.

THE BULL OF THE WOODS — BY J. R. WILLIAMS

What part will machine tools play in helping to take this HILL 609?



In the barren wastes of Tunisia stands a lonely promontory. It had no name—until, in a brief hour of history, the courage of men immortalized it with a number . . . 609.

We, too, have yet to conquer a barren promontory—barren of hope, of light, of the freedom men are fighting for. This hill is held by poverty, armed with ignorance, intolerance and fear. It is our own Hill 609, in Detroit, in Harlem, in Los Angeles—in a thousand places here at home.

What part will machine tools play in taking *this* Hill 609? The whole part. Machine tools at work. Machine tools building a better standard of living than even we have ever dreamed of before.

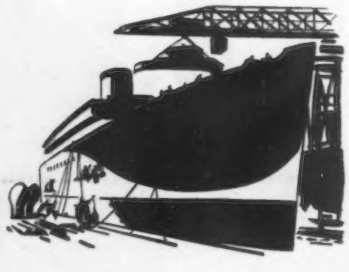
For there is scarcely an essential to better living—from the windows men look through to the most intricate and wonderful machines that help them to think, to search and see light—that does not stem from a handful of basic machine tools.

And one of these—the internal grinding machine—is essential to the creation of literally *everything* that will make for a better living after this war.

BRYANT CHUCKING GRINDER COMPANY SPRINGFIELD VERMONT, U.S.A.

WEST COAST . . . OSGOOD MURDOCK

• Despite home town and competitive clamor for completion of structural facilities at Geneva and Fontana, shapes up to 8-in. can now be rolled on open tonnage in present Coast plants, and up to 15-in. at Pueblo with delivery under 30 days.



SAN FRANCISCO — On Feb. 11 and 12 at Carbon City, the off-the-main-line, 10,000 population capital of the sovereign state of Nevada, Senator Pat McCarran (D. Nev.) will preside over a "hearing" by a sub-committee of the Senate Committee on the Decentralization of Industry, to principally concern itself with the future of the West Coast steel industry. In conspicuous evidence, according to plans now fomenting, will be the State Commissions from California and Utah, meeting with a similar Nevada host Commission, each appointed by the Governor to confer on any question of interstate cooperation. Attorney General R. W. Kenny is chairman of the California commission which includes also four other chief administrative officers of the Governor's cabinet, five members of the State Senate and five representatives of the State Assembly, or lower house.

According to present prospects, the "hearing" might better be termed a "sound-off," for in all likelihood there will be more renditions than auditions. Testimony seems to be wanted principally from proponents of home industry and equal opportunity will be had for all political subdivisions, trust busters and enemies of any octopus, and political office holders with a native passion for the industrial destiny of the Far West (particularly the Southwest) but with a cagey suspicion of Economic facts; axioms of steel production; and cold, detached, realistic analyses of future market possibilities especially if derived from the steel industry.

Report of McCarran Group's first meeting will be found on page 91.

IF the Carson City hearing should get down to particulars at all, its principal gripe is likely to center around the uncompleted structural mills at Geneva, Utah, and Fontana, southern California, each of which has been held up by WPB order and both of which are heartily desired by local interests in each locality. In behalf of the facilities at Fontana, Henry J. Kaiser himself has been at Washington, with the conspicuous sponsorship of Congressman Cecil R. King (D. Cal.), to try to get WPB's consent for $9,000,000 worth of priorities to complete the 29-in. structural mill and merchant bar mill at Fontana. Completed, they would roll 90,000 tons of heavy shapes and 82,000 tons of merchant bars and would balance the 1200-ton capacity blast furnace and six 185-ton open hearths, two of which are not now required to supply the plate mill alone.

At Geneva, the 24-in. structural mill when completed will have a capacity for 200,000 tons annually, a little over 20 per cent of the plant's entire capacity but representing less than 10 per cent of the entire cost. Such a storm has been raised in Utah because of the WPB decision to delay the completion of the structural mill at Geneva, and such pressure is being exerted by the Kaiser interests for permission to complete their structural mill that some analysis of prospective war demand for these products on the West Coast, and substitute supply thereof under present conditions seems justified. At South San Francisco Bethlehem can roll channels, beams and angles up to 6-in. and at Seattle 7 by 4-in. angles, 6-in. beams and 8-in. channels. At Los Angeles, both Bethlehem and Columbia roll 6-in. shapes. At all these plants there is now open tonnage and delivery within 30 days. At Pueblo, Colorado Fuel & Iron Co. rolls beams and channels up to 15 in. and at the present time there is open tonnage of shapes there also, with 30-day delivery.

Now that heavy facilities are complete, including such war plant structures as synthetic rubber and high octane gas plants, the principal demand for structurals is in ship construction, and for the coming year and during the emergency the actual requirements above the 8-in. that can be rolled by present facilities on the Coast will be negligible. Incidentally, the normal peacetime West Coast market has averaged about a quarter million tons of shapes annually, less than the combined capacities of Geneva and Fontana alone, without regard to existing plants. But half this normal demand has been for wide flange material that will not be rolled at either Geneva or Fontana.

It is held by the advocates that transportation will be saved by completing either or both of these mills, and on this slender thread emergency justification is hung. It is 590 miles from Pueblo to Geneva and that mileage would be saved by a Utah mill, on whatever minimum tonnage of shapes over 8 in. may be required for the balance of the duration on the West Coast. It is roughly 800 miles from Geneva to Los Angeles, San Francisco, Portland or Seattle, slightly less to Los Angeles, slightly more to Seattle. From Fontana, 50 miles east of Los Angeles, it is 1138 miles to Portland and 1338 miles to Seattle.

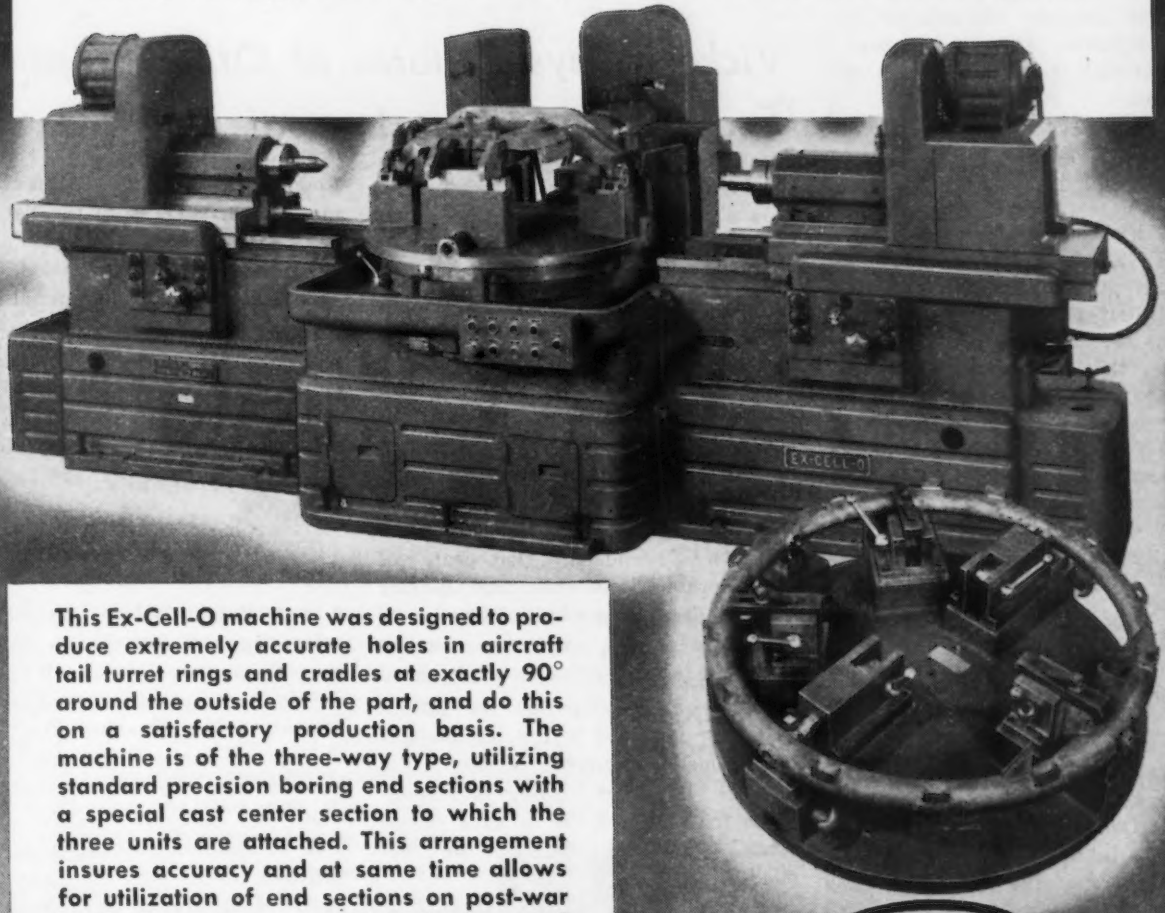
In the long-run post-war, both these facilities should be completed. Prudence and wisdom seem to justify modification of the plans for one or both of these plants, to provide wide flange sections and possibly to substitute tubular material particularly for the petroleum industry, not now obtainable west of Chicago. But cold-blooded, realistic, emergency consideration cannot argue with the WPB decision to hold up completion of these facilities during the emergency, to save manpower, to avoid a greater surplus and to hold war expenditure and outlay to those projects which are now required to finish the war.

LOS ANGELES—"Gentlemen, you will never get another chance like this in a lifetime," pleaded Watt L. Moreland, deputy regional director of WPB for the Pacific Southwest as he stood like an auctioneer before several hundred business men in the Embassy Auditorium at Los Angeles to open a campaign for the disposal of surplus material. "These are real bargain prices and it's not going to be difficult to buy," continued Mr. Moreland. And then he explained

The Standard for Tomorrow!

The Emphasis Will Be On More Accuracy . . . With Production

The trend for tomorrow's civilian production is definite . . . the increasing use of special or semi-special machines that will enable manufacturers in general to attain the extreme accuracy the users of high precision machines are now obtaining in the aircraft and other war industries. Typical of these precision machines is the one illustrated here, a practical application of the Ex-Cell-O precision boring process to vital aircraft parts. This Ex-Cell-O machine indicates the flexibility, accuracy and simplicity in use, with resulting money-saving, that will be demanded of *precision* machine tools tomorrow.



This Ex-Cell-O machine was designed to produce extremely accurate holes in aircraft tail turret rings and cradles at exactly 90° around the outside of the part, and do this on a satisfactory production basis. The machine is of the three-way type, utilizing standard precision boring end sections with a special cast center section to which the three units are attached. This arrangement insures accuracy and at same time allows for utilization of end sections on post-war work. Two parts are machined; one a tail turret ring of steel *(in insert)*; the other, a tail turret cradle of magnesium *(on machine)*.

that a great volume of this material was made and purchased prior to Pearl Harbor by aircraft makers principally, when prices were lower and values sometimes sounder. After several months of canvassing among high priority buyers and government agency procurement offices, the inventories are now being exposed publicly, open to purchase by any but dealers and auctioneers. In the catalogs of the six major aircraft firms alone there are 1000 pages of tightly listed material, and an additional 500 pages come from miscellaneous sub-contractors and smaller holders. Half of the material is owned outright by private firms. In 35 per cent of the material the government has an interest because of contract changes or fixed price contracts. Only 15 per cent of the material is owned by the government.

Regional WPB priority and redistribution offices have received authority from Washington to release certain goods to qualified wholesale buyers without usual priority restrictions. Manufacturers and consumers can also purchase most of this material fairly freely. A similar meeting has been held in San Francisco, in order that as much as possible of this idle and surplus inventory material may move into regular trade channels before terminations of war contracts deluge the market with additional quantities.

STARTING Tuesday morning, Jan. 18, a major work stoppage of foundry workers in the Pacific Northwest kept 9300 men idle out of an employee roll of about 10,350 in some 79 plants. Only in Bellingham's three shops (open and unpicketed) and in one small shop each at Sedro Woolley and Everett, Washington, were foundrymen at work in western Washington and Oregon. Of 1500 workers in 27 plants in the Portland area, only 436 members of the local voted and of these 293 opposed the strike. Tacoma foundrymen were reported in similar opposition to a strike, voting four to one to remain on the job, but the Seattle local voted decisively to strike and its will prevailed. The regional WLB's best offer was from 2½ to 5c an hour increase for unskilled help, whereas the union had held out for 8c an hour straight, retroactive to June 1. By an agreement machinists were free to pass through the picket line at the Renton plant of Pacific Car & Foundry Co. so that wing spars for Boeing could continue in production. Navy and Maritime ship construction was expected to be at a standstill within a week or two if the supply of castings and foundry material was not resumed. Local reports indicated that WMC and WPB had favored the raise to the foundrymen but Regional WLB was not persuaded. The dispute has naturally been referred to National WLB. The liberal and calm Oregon Daily Journal editorially comments that "chickens of irresolute labor policy come home to roost." There seems neither bitterness, violence nor passion from either labor or management in the Pacific Northwest but only the feeling that such tragic, costly steps as this are necessary to get action and secure the "best possible terms."

Vickery Says Failures of Other Ships Exceed Percentage Loss of Liberties

Portland, Oregon

• • • **Rear Admiral** Howard Vickery of the Maritime Commission, said here Jan. 20 that failures of Liberty freighters are exceeded "in proportion to the number built" by another type ship.

"It is not a problem of Liberty ships but of welding stresses," he added.

The best minds are probing welding stresses, Admiral Vickery said in answering charges by Representative Warren Magnuson, Democrat, of Washington, that structural defects have caused Kaiser-built Liberties to crack up at sea, and some changes were made last spring to offset them.

Most of the ships on the failure list were launched before the changes were made, Admiral Vickery disclosed. Improper loading is responsible for many of the failures rather than structural defects, he declared.

On Jan. 9 at Seattle, Magnuson, member of the House Naval Affairs Committee, added the names of five more Liberty ships to the list which he said had cracked open at sea, bringing the number listed to 14. This is believed to be a partial list.

Edgar F. Kaiser, manager of three Kaiser shipyards in the Portland area, on Jan. 10 stated that if Liberty freighters had gone to sea with structural defects, inspections by four separate agencies failed to reveal them.

Steel Division Resignations

• • • **Ralph Wilson,** metallurgical sales engineer for Climax Molybdenum Corp.. has left the WPB steel division to accept a position with Timken Roller Bearing Co. Frank Foley, assistant to the president of Midland Steel Co. is returning to his company.

S. C. Spaulding and George Sands will now act as part time consultants to the Metallurgical and Conservation Branch. Mr. Spaulding is a metallurgist in charge of steel purchases for the American Brass Co. and Mr. Sands is a sales engineer with the Electro Metallurgical Co.

Miles K. Smith, assistant steel division director in charge of the Ferro-Alloys Branch, resigned to return to Latrobe Electric Steel Co., Latrobe, Pa. E. G. Ploughman, former western traffic manager for Colorado Fuel and Iron Co., and head of the steel division transportation branch, has resigned to accept a vice-presidency with Carnegie-Illinois Steel Corp.

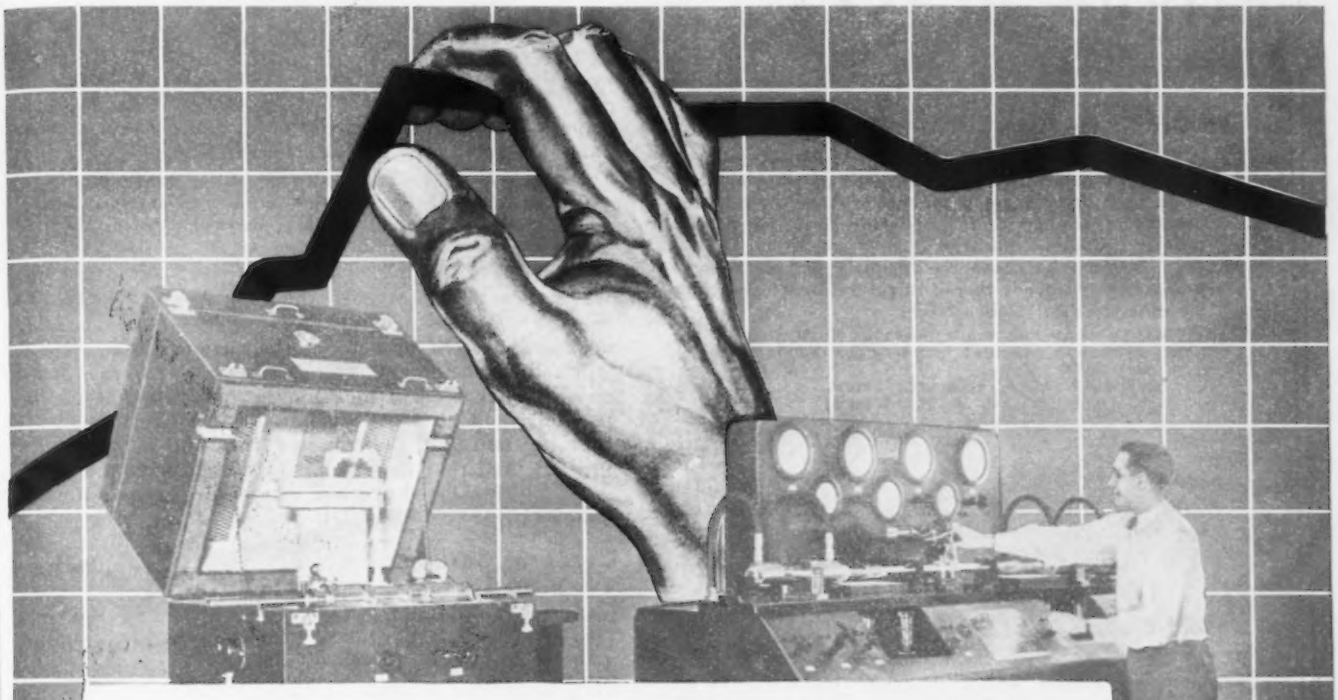
PULLING MAINTENANCE COSTS DOWN WITH INDUSTRY'S NEW RIGHT HAND



Making leather prove its mettle

Giving leather packings the third degree is the unusual job of this HydrOILic equipment.

The smaller unit tests assembled packings under controlled Fahrenheit temperatures of from 65 *below zero* to 200° above!

The larger unit makes continuous operational cycling tests at pressures up to 3000 pounds per square inch, to determine the life expectancy of packing materials. This special equipment illustrates, in just one way, how HydrOILic Engineering is pulling maintenance costs down in all branches of Industry. It is not only testing materials and equipment, but performing a multitude of production jobs as well.

Through the application of oil-hydraulic control of power and motion, Denison designers have made HydrOILics the key to *new* industrial achievements and *improved* industrial operations. They will be glad to show you how HydrOILics applies to your products or problems. Write to: The Denison Engineering Co., 1158 Dublin Rd., Columbus, Ohio.

TRADE-MARK

Fatigue Cracks . . . BY A. H. DIX

No Credit to Them

Your recent remark that your editor's Remington is set to produce nothing but gems was well put, for his works bring forth a loud clang on the oft-honored bell with astounding regularity. I particularly liked his Jan. 6 parable, "Consider the Ant."

But the ant has been the recipient of such fulsome praise from all hands that it might be well to consider the observation of Ogden Nash:

The ant has made himself illustrious
Through constant industry industrious.
So what?
Would you be calm and placid
If you were full of formic acid?

—Charles K. Brown,
American Rolling Mill Co., Middletown, O.

Aptronym

Desert Bloom

• • • Someone told us there was a reference to us in a recent issue of *The Nation*. We doubted that anything said about us in *The Nation* would be flattering, and we were right. By careful pruning, we are, however, able to isolate this orchid:

. . . the industrial press, of which The Iron Age is the perfect flower.

New Foreign Patent List Ready

• • • That first reprint of the lists of seized foreign patents for metal products and processes went like a sale of Irish whiskey at ceiling prices. A new reprint is now on the fire — a bigger one, including all installments up to this week's.

If you want a copy send 24c in stamps or 25c in coin to us at 100 E. 42nd St., New York 17. But before you risk your money we think it only fair to warn you that some people tell us they find the foreign patents worthless. Others, however, show evidence of moderate enthusiasm.

Whether the lists will elate or depress you depends upon what you are looking for. It seems that the foreigners' inventive ability gushes generously along certain lines, but in others merely trickles like an old hot water faucet in a hard water area.

For a sample of what the 24c or 25c would add to your "Postwar Plans" folder, see page 118 of this issue.

Don't Streamline Mother . . .

• • • Which reminds us to mention that mail from soldiers overseas reveals a mounting fear that they will return to a world they never knew. This feeling is fostered by the designers' wilder dreams of postwar homes, cars, percolators and so on, as pictured in the Sunday supplements. A sergeant voices the soldiers' alarm in a rhymed plea to postwar planners appearing in *Yank*. The poem, entitled "Please Don't Streamline Mother While I'm Gone," begins:

Sitting here, in my foxhole muddy
Please don't think me fuddy-duddy
If I say that I'm not fighting
For plywood pants and neon lighting.

We are glad to be able to tell the sergeant that what has frightened him are merely the first highly volatile vaporings from the postwar brew. They are not to be taken too seriously, for most of them will disappear when the serious problems of postwar readjustment are undertaken. In fact, hedging against too great expectations has already begun. E. C. (Willys-Overland) DeSmet recently told the SAE:

The stylist has a remarkable dislike for details of construction, a definite aversion to production problems and a superb contempt for anything pertaining to cost, with the obvious exception of his own fee . . .

And Dr. Frank B. (AT&T) Jewett says that the war has actually impeded the progress of science and that few of the technical discoveries since the war began will have peacetime applications. We hope it will relieve the sergeant's nostalgia to know that when he gets back he will pick up the dish towel where he left off and dry the dishes in the old-fashioned way, that his hair will be trimmed with the old-fashioned clippers, and that he will have to fiddle with the knobs in the old-fashioned pre-war way before he gets a clear image on his television set.

Cerebral Cutback

• • •. We are indebted to the Army Air Force's Captain W. G. Berger for the news that the Spokane (Wash.) Spokesman-Review put this headline on an item concerning a charge made by the head of the CIO Aluminum Workers Union:

COLLUSION IS CHARGED
IN MENTAL CURTAILMENT

Pancake Hoarder

• • • And that leads to a criticism of an item we had recently in which we made use of the well-worn gag about the man who was so worried about his mental state that he visited a psychiatrist. He was asked to inventory his symptoms, and began, "I am passionately fond of pancakes." The psychiatrist said, "There is nothing unusual about that. So am I." The patient said, "Then you must visit me sometime. I have trunksful in my attic."

A member of this page's loyal army of eighteen readers who is with the Sullivan Machinery Co., Claremont, N. H., asks if "trunksful" is correct? We suppose so. As we heard it, the patient had several trunks, each full. If he had only one trunk, and had to use that as a measure, we are wrong.

"Ltd." to "Inc."

• • • We have always felt a bond of kinship with A. B. Farquhar Co., Ltd., York, Pa., because so many letters intended for it have come to us, owing to the fact that it makes, among other things, a line of farm implements trade-named "Iron Age."

Another thing that fastened the firm in our mind was the "Ltd." This always mystified us, as we thought "Ltd.'s" flowered only in English climate. But the mystery is broken. A notice from Farquhar informs us that it was "a limited partnership under the laws of Pennsylvania," and on Jan. 1 became a corporation, thus acquiring an "Inc." but losing something precious.

Lingerie Lore

You ascribe the initials B.V.D. to the old firm of Bennett, Vorhees & Day. While technically factual, this is unromantic, and therefore futile. The original owner of the company always told inquirers that the initials meant "Best-Vearing Drawers."

I was with Sherman & Bryan, the young advertising agency that first handled the account.

—W. G. Watrous, Chicago

Puzzles

• • • Last week's frog made it in 18 days.

this red path IS REVOLUTIONIZING THE HEAT TREATING OF METALS

A COLUMN of super-hot air driven at terrific velocity from the heat source through the charge, is the revolutionary feature of the Lindberg Super-Cyclone Furnace. Heating solely with fan-driven hot air builds up temperature with rapid uniformity throughout the charge . . . up to as much as 1750 degrees F.

No radiant heat reaches the charge—no one-sided heat to cause distortion. Therefore the complete mass of each piece is heated at the same rate. Such high temperature with circulated hot air was always thought impossible. Yet users of Lindberg Super-Cyclones are daily saving time, saving space, saving cost of labor, fuel, straightening and handling, and turning out better work than ever before. Write us now for complete information and learn how Lindberg furnaces can save for you. Lindberg Engineering Company, 2452 W. Hubbard St., Chicago 12.

CYCLONE for accurate, low-cost tempering and nitriding
HYDRYZING for scale-free and decarb-free hardening

Dear Editor:

REUTHER RECONVERSION PLAN

Sir:

We are interested in post-war planning. The article in your Jan. 6 issue on Walter Reuther's reconversion plan, will, we believe, be of assistance to us in our work. Can you tell us how we may secure a copy of that plan?

MITCHELL FEIN
Consolidated Management Consultants,
521 Fifth Ave.,
New York 17

● The plan is not a formalized document as yet. In the "Assembly Line" of Jan. 6 (page 128) we sought simply to describe, in an advanced sort of way, the direction Mr. Reuther's thinking is taking.—Ed.

CENTRIFUGAL CASTING

Sir:

Please furnish us with the names of those companies that are United States or Canadian manufacturers of the latest types of centrifugal casting machines and equipment, as described in the article in your Jan. 6 issue.

J. V. CURTS,
Development Engineer,
Commercial Division
John Inglis Co., Ltd.,
14 Strachan Ave.,
Toronto, Ont.

● As far as we know there is only one company in the United States building centrifugal casting machines for sale. This is the Centrifugal Casting Machine Co., Tulsa, Okla. Most other companies producing centrifugal castings have devised their own equipment and are rather secretive about details of design and construction.—Ed.

MR. MACK COMES THROUGH

Sir:

I was in search of the author of the book "Know Your Steel" and you published my problem.

As a result, I received in the mail, not the address, but the book, from Mr. H. E. Mack, Vice President of LaSalle Steel Co., of Chicago, who happened to have an extra copy.

That's real service from IRON AGE and Mr. Mack.

J. A. OSBORNE
Westinghouse Electric & Mfg. Co.,
Dept. MV30,
East Pittsburgh, Pa.

GLUED METAL

Sir:

We are interested in obtaining a glue which is suitable for gluing steel to steel.

We are primarily interested in lighter gages but the gluing must be secure to such an extent that it would rival welding.

H. C. DAVIS,
Director of Purchases
Tyler Fixture Corp.,
Niles, Mich.

● Several companies have recently developed adhesives of this type. Write to: U. S. Stoneware Co., Akron, Ohio; B. B. Chemical Co., Cambridge, Mass.; U. S. Plywood Co., New Rochelle, N. Y.—Ed.

SILVER PRICES

Sir:

Page 127, Dec. 23, 1943 issue, quotes silver 44.75c. per troy oz. open market, New York. We take this to be troy oz. of 480 grains and that an adv. pound will be 14.5833 troy oz., making silver price $6.526 per adv. lb. on open market, f.o.b., New York.

However, we understand that industrial silver for solder, etc., must be bought at 71.04c. per oz. or $10.360 per lb. through the Metals Reserve Corp. If this is true, is there an open market in New York City, or should your figure be 71.04c. per troy ounce?

W. H. BROOKS,
Supt.
Carnation Co.,
Can Dept.,
Oconomowoc, Wis.

● The quotation for silver at 44.75c. a troy oz. is foreign silver which cannot be used for soldering alloys but for photography or medicine. Soldering alloys must be made from Treasury silver which sells for 71.04c. per troy oz. A third silver price quotation is 71.111c. per troy oz. for domestic silver used for jewelry, etc.—Ed.

SONIC TESTING

Sir:

In the Jan. 6 News Front you mention a method of testing castings and forgings sonically now being used in England.

Where can I get further information on this subject?

R. C. MURRAY,
Engineering Dept.
The Vendo Co.,
Aircraft Products Div.,
2500 Washington St.,
Kansas City 8

● So far we have been unable to track down the specific plants doing this work. The obtaining of additional data has likewise been difficult because of wartime restrictions. As soon as something more definite is known on the subject we will publish it.—Ed.

BORON DETERMINATION

Sir:

We have read your excellent article on important developments in metallurgy in 1943 published in your Jan. 6 issue, pages 108-113. We are especially interested in that part of the paper dealing with boron additions to steel and your discussion of the lack of suitable analytical procedures for its determination.

Since the interest in boron steel is so wide spread we are of the opinion that your statements beginning at the 3rd paragraph, column 1, page 109, are misleading and should be corrected. The facts are that a satisfactory analytical chemical procedure for the determination of small amounts of boron in steel was devised by L. C. Flickinger and G. A. Rudolph of The Youngstown Sheet & Tube Company in 1942.

Early in 1942 when we began to boron treat steel it was recognized that no suitable analytical procedure was available. With this in mind considerable time and effort was expended in our Laboratories toward the development of a procedure that would give accurate results in the low range of boron content, nil to .0030, or higher, that could be carried out in a reasonable length of time. As a result of this work a method was developed and has been in use since June of 1942 and is known as the Quinalizarin Method. A large number of chemical laboratories are now using this method for routine and check procedure and are obtaining satisfactory results. This procedure was published in *Steel* of April 5, 1943.

While we do not claim that the Quinalizarin procedure for the colorimetric determination of small amounts of boron in steel cannot be improved upon, we do feel that it provides the steel makers, and others, with a ready means of knowing whether their steel contains boron and how much. Accuracies of plus or minus .0002 per cent boron are readily obtained in the range of zero to .0040 per cent boron.

D. A. RUSSELL,
Chief Chemist
Youngstown Sheet & Tube Co.,
Youngstown, Ohio

HENRY BESSEMER IS NO MORE

Sir:

Having occasion to refer to the article on continuous casting appearing in your April 11, 1940 issue, we are very much interested in the article by Sir Henry Bessemer, on Page 48, but inasmuch as Sir Henry, on supposedly good authority, died in 1898, we would like to know the date and source of this quotation. Otherwise, we congratulate you on a very fine article.

JAMES T. MacKENZIE,
Chief Metallurgist
American Cast Iron Pipe Co.,
Birmingham 2, Ala.

● Sir Henry Bessemer made his original statement on the manufacture of continuous sheets of malleable iron and steel direct from fluid metal in the British Iron & Steel Institute reports of October, 1891—Ed.

HARDNESS CONVERSION TABLE

Sir:

I would appreciate if you would send me one copy of the article "Steel Hardness Conversion Tables," in your Dec. 9, 1943 issue, pages 65 to 67.

C. J. GASPAR,
Lieutenant, USNR
Navy Department,
Office of Inspector of Naval Material,
401 Old Post Office Bldg.,
Pittsburgh 19

CONSIDER THE ANT

Sir:

We would like to have 100 copies of the Jan. 6 editorial by J. H. Van Deventer, entitled "Consider the Ant." We will be glad to pay the necessary charges.

PHYLLIS WILEY,
Secretary to the President
Sheffield Corp.,
Dayton, Ohio

Are You Whistling in the Dark

ABOUT CLEANING COSTS AND PRODUCTION?

TYPICAL WHEELABRATOR PERFORMANCE

At Continental Motors Corp., Detroit, engine cylinder barrels which formerly required three full shifts to clean on an airblast table are now being cleaned in less than five hours on a Wheelabrator Multi-Tablast.

★

A Wheelabrator used by Detroit Diesel Engine Div., Detroit, Michigan, is cleaning 250 diesel engine parts in 5 minutes, whereas it previously required an hour to clean 50 pieces in a sandblast cabinet—25% to 50% of which required a final touch-up by handblasting because of imperfect cleaning on the interior of the parts.

★

The 36" x 42" Wheelabrator Tumblast at the Bierman-Everett Foundry, Irvington, N. J., cleans heavy loads of brass castings in 4 minutes and gray iron castings in 6 minutes. Cleaning time is only 1/3 of that required with their former tumbling barrel and airblast barrel.

A MYRIAD of production miracles have been wrought these last few hectic years—and more are on the way.

But on the other side of the ledger is the darker picture of myriads of production problems that are needlessly wasting time, money and effort.

The serious thing about many problems that lie dormant in the files of "unfinished business" is the fact that they tend to lose their real significance the longer they remain unstudied. This is invariably true of operations that are constantly "bulled through" under the pressure of heavy production.

Oftentimes the solution is simpler than conditions would seem to indicate. Especially is this true of problems involving blast cleaning, because there is convincing proof in the history of thousands of cleaning applications that airless Wheelabrators are earning their way by effecting unusual reductions in cleaning time, cost, manpower and space—and by speeding up and improving such operations as machining, grinding, inspection and final finishing.

A highly interesting, factual story about Wheelabrator performance in shops like yours, plus an actual demonstration of this performance on any or all of the difficult cleaning jobs which you encounter, are yours for the asking. Phone or wire us today for prompt action.

FOUNDRY EQUIPMENT CO.

510 S. BRYKIT ST. MISHAWAKA, IND.

This Industrial Week . . .

- **Steel Ingot Output Rises Under Pressure of Invasion Program**
- **Task of Holding Lid on Production Will Be Troublesome for WP**
- **Mill Cutbacks, Cartel Discussion among Other Highlights of Wee**

REFLECTING the emphasis being put on the expedited and enlarged landing craft program as well as other invasion equipment, the national steel ingot operations this week are up one-half point to 99 per cent.

Plate and sheet mills continue to bear the brunt of the heavy demand for invasion equipment, but requirements for components also are making themselves felt in heavier orders for certain products other than flat rolled steel. There are indications that the landing craft program may be spread over a longer interval this year than appeared likely a few weeks ago. Another new development is the transfer of a war requirement from cold rolled sheets to terne plate, with the vacated space on cold mill schedules likely to be taken by barrel stock orders which have been on hot mills previously.

Meanwhile, rising pressure in favor of a faster easing of Limitation Orders threatens to make WPB's unenviable task of holding down the lid upon civilian production more difficult as time goes on. As a matter of fact, despite official announcements stating that controls will be maintained for the time being, allotments have been issued recently for steel in small amounts for several consumer items which a few weeks ago never would have been applied for or approved.

That WPB faces an extremely troublesome problem is a foregone conclusion in view of the statements issued by WPB executives and other informed authorities warning that more plant shutdowns and contract terminations can be expected. Already at least $8 billion in Army and Navy contracts have been cancelled.

Another warning that conversion to civilian production on too large a scale might interfere with the war program and give a false sense of security was voiced by Donald M. Nelson last week. Confirming reports of plans for "test tube" production of civilian goods in a few areas, he revealed that the Philadelphia, Cleveland and Kansas City districts had been chosen for the experiment, which will start about Feb. 1 and make use of small lots of idle materials by small concerns in the production of consumer goods under controlled conditions to "strengthen the position of small business and to improve the balance of the war economy." The Smaller War Plants Corp. will administer the order.

Four More Leaving Steel Division

WPB Steel Division officials entertained at a dinner Tuesday in honor of four men who have just resigned. The four are W. F. Vosmer, chief, carbon bar and semi-finished steel branch, who is returning to Cleveland as district manager of sales for Republic Steel Corp.; A. A. Archibald, chief of the shell section of the carbon bar and semi-finished steel branch, who is returning to the Philadelphia office of Jones & Laughlin Steel Corp.; M. M. Chapman, chief of the steel sheet section of the sheet and strip branch, who is returning to the sales division of Carnegie-Illinois Steel Corp. in Pittsburgh; and James A. Rowan, special assistant to the steel division director, who has accepted a position in industry.

IN the interval before the resumption of civilian goods production, a resumption which is expected in official quarters to follow a successful invasion of the European continent, steel ingot operations may slump. Members of the Steel Industry Advisory Committee last week indicated that they expect soon a drop in ingot production to around 85 per cent of capacity, which will be utilized for repairing war-punished equipment that is sorely in need of attention. The committee meeting with Nelson consisted of Vice Admiral S. M. Robinson and Maj. Gen. Lucius D. Clay. If the invasion becomes stalled, and controls are maintained rigidly, steel output may slide considerably below 85, it was said.

Shortly after the Steel Advisory Committee adjourned, WPB announced that it had recommended to the Defense Plant Corp., termination of work on seven steel plant expansion projects estimated to cost about $97,000,000, headed by the Republic electric furnace plant 98 per cent complete with 900,000 tons annual capacity at South Chicago.

Figures released simultaneously with the news of the proposed cutbacks showed the severe decline in demand for alloy steel over recent months. September output at 1,024,000 tons was about 200,000 tons below the peak reached last March and in December production was down to about 800,000 tons.

The presence in this country of Sir Andrew Rae Duncan, British Minister of Supply, who is participating in the renegotiation of Lend-Lease agreements, is reported to have provoked discussion in the steel industry regarding the possibility of establishing by law an American counterpart of the British Iron and Steel Federation, an international cartel. Sir Andrew

formerly was director of the Federation. Presumably, existing anti-trust laws would have to be repealed, a highly improbable prospect. Three of seven members of the Senate Foreign Relations Committee, queried as to their attitude on the formation of an American Steel Cartel, indicated opposition, while two indicated approval and two were non-committal.

SENATOR McCarran's committee has mapped its plans for an aggressive study of the decentralization of heavy industries, including inquiry into the halting of the Geneva structural mill (which Russia is reported to be considering purchasing) and inquiry into the need for additional facilities at Fontana, Calif. A hearing is scheduled to be held at Carson City, Nevada, in February. The committee favors the creation of new industrial centers in the South and West through Government financing of new steel capacity. Projects at Tacoma, Wash., and Daingerfield, Texas, are reported to be among those closest to the committee's heart.

Possibilities that the Army's 1944 truck requirements may be cut back, allowing greater production for domestic commercial use are sighted in automotive circles. The ultimate total for commercial use may run as high as 200,000 units this year instead of the 88,000 earmarked for domestic use now. Another leading topic in automotive circles is the incorporation in Michigan of the Michigan Kaiser Co., a move interpreted as being Henry J. Kaiser's first step toward invasion of the auto industry with a light weight car.

Several leading steel companies recently have taken steps which will help protect post-war tonnage in an important consuming field, the steel barrel industry. Acquisition by Bethlehem Steel Corp. and by U. S. Steel Corp. have been announced during recent months. Previous asquisitions placed Inland, Republic, and J & L among the steelmaker operating barrel concerns. National output of drums in 1943 was about 10,000,000 units over the 1941 level of around 18,000,000 units. Heavy demand from the Navy is a feature of this market recently, with the cold rolled sheets being furnished with oxidized finish.

Some worry is reported being manifested in steel mill circles over their supplies of fuel oil. One of the largest mills in Pennsylvania has storage capacity of 3,000,000 gal. in its tanks, is said to have little over half that quantity on hand now. This mill uses about 500,000 gal. daily, replenishments coming in mainly by truck tank cars.

The rise in national steel ingot output to 99 per cent from 98.5 per cent last week was assisted by increases in output at Pittsburgh, up one point to 99 per cent; Chicago, up half a point to 103.5 per cent; Philadelphia, up half a point to 91 per cent; Cleveland, up four points to 100.5 per cent; Detroit, up four and a half to 103.5 per cent; and the Eastern district, up three and a half to 106.5 per cent. The only decline this week was the two point drop in the Cincinnati area to 95 per cent. Continuing at last week's level are Youngstown at 97; Wheeling at 95 per cent; and St. Louis at 101.5.

Canadian Roads Place Orders

Toronto

Large orders for rolling stock, on domestic account and for export, have been placed with Canadian builders, assuring capacity plant operations well into 1945. Contracts previously were reported from Canadian National Railways. W. M. Neal, vice-president of the Canadian Pacific Railway Co., announced orders for 70 locomotives and 2140 freight cars, the latter between Canadian Car & Foundry Co., National Steel Car Corp., Ltd., and Eastern Car Co. Canadian Pacific also will build 50 cabooses at its Angus shops in Montreal. The locomotive order calls for 25 freight locomotives of the Mikado type to be built at the Montreal Locomotive Works, Montreal, and 45 Pacific-type locomotives placed with Canadian Locomotive Co., Kingston, Ont.

National Steel Car Corp., Ltd., Hamilton, received orders for 140 overhead refrigerator cars of 50-ton capacity; 500 drop-end gondola cars of 70 tons capacity and 300 triple-hopper cars of 70 tons capacity.

R. S. Hart, president of National Steel Car Corp., Ltd., stated that his company started work Jan. 10 on a contract for steel cars for Canadian National Railways and the Canadian Pacific Railway Co.

McCarran Group Will Study Soviet Desire to Buy Unit of Provo Plant

Washington

• • • **The McCarran** (Senate) Committee on Decentralization of Heavy Industries held its first meeting last Thursday to lay out a program for future hearings.

High on the list of inquiry are the reported Russian Government negotiations for purchase of the halted structural mill at the Provo, Utah, plant of the United States Steel Corp.

Senator Abe Murdock, Democrat of Utah, is also interested in the fact that the White House has, according to reliable sources, promised the Russian Government that the United States will furnish 8,000,000 tons of new steel capacity to the Reds for postwar use.

The Committee which has set as its goal the creation of new industrial centers in the South and West through Government financing of new steel capacity will seek reasons for the lack of representation of West Coast states on the WPB Steel Industry Advisory Committee.

"A very good start," Senator McCarren said, "might be made with an effort to uncover the activities of officials within the WPB and other government agencies which have led to, or tended toward, the stifling of projects for the proper development of economic resources.

"Why should a contractor in Los Angeles be forced to buy his steel at eastern mills and transport it two-thirds of the way across the continent when there are rich deposits of iron ore less than two hours from his home city?"

Although the findings of the Truman Committee are available, the McCarran Committee will investigate the postwar potentialities of Henry Kaiser's mill at Fontana, Cal., and those of the Geneva mill at Provo.

See also the "West Coast" column, page 80

Another subject of investigation will be the contentions of the Cascade Alloy Steel Co., Chelan County, Wash.

The company, which is located on the Eastern slopes of the Cascade mountains, has received negative reports from the Bureau of Mines, on core-drillings from Bluette Pass and CheElum properties, on the Western slopes. The company is not satisfied with these findings according to Congressional sources and it is expected that the Bureau of Mines will be pressed to make new tests. The WPB Steel Division has recommended that the new tests be made.

The Committee's real ambitions, however, are to get government finances for a complete new mill to cost $40,000,000 at Tacoma, Wash., and a similar sum to build open hearths and finishing capacity at Daingerfield, Tex.

With this toehold on socialization of the steel industry, it is expected that other members of Congress will turn to the Federal feedbag for handouts for the building of new steel plants in their own backyards.

The Committee also is said to have an eye on getting surplus steel capacity built under the expansion program with Government funds. The program is in its final stages and is expected to be completed early in March.

When it is finished, steelmaking capacity will be 95,136,730 net tons annually, according to WPB Steel Division estimates. Broken down, this capacity will consist of 82,857,450 tons of open hearth, 6,205,280 tons of electric furnace and 6,074,000 tons of Bessemer converter steel. The final total capacity upon completion of the program will represent an increase of 10,984,438 tons over the capacity of 84,152,292 tons as of Jan. 1, 1941, as shown by the American Iron and Steel Institute. Actual construction on the expansion program got under way in the fall of that year.

Actually, when the program has been completed, 13,000,000 tons of additional ingot capacity will have been built, most of it with Government funds, but some by the industry itself. But the net increase in capacity will be about 11,000,000 tons due to the tearing out of old and high cost units. Estimates have been made that the industry will eliminate as excess at least 10 per cent of the expanded capacity and this is said to have inspired efforts of members of Congress to get some of this excess located in their own districts rather than letting it be shipped abroad.

• *Onto the shore: A loaded LST participates in the invasion of Cape Gloucester.*

Navy Takes Over Operation Of York Safe & Lock Co.

• • • **Immediate possession** by the Navy of the York Safe & Lock Co., York, Pa., was reported ordered Monday by President Roosevelt. The company is manufacturing 44 mm. gun mounts for the Navy which are needed in large quantities, along with other War and Navy Department products. According to the Navy Department the plant is being taken over "because of unsatisfactory management conditions."

There is no labor trouble involved in this action, and existing wages and working conditions will be maintained. The President said that government possession of the plant would end within 60 days after he determines that the plants will be operated privately "in a manner consistent with the war effort."

Easier Alloy Steel Situation Forces WPB to Recommend Halting of 7 Projects

Washington

• • • **Formal** recommendation by WPB to the DPC was made Jan. 22 for the termination of work on seven more steel plant expansion projects, involving $97,000,000, which were to produce and roll high carbon steel and alloy steel, the supply of which already is adequate.

The chief project on which stoppage of work was recommended was the new electric steel plant of the Republic Steel Corp., at South Chicago. That this project was to be halted was announced in THE IRON AGE of Jan. 20, page 95. This plant is 98 per cent completed and, according to WPB, cost $88,484,860. It was to have been a duplexing plant and consists of three open hearth, and nine 70-ton electric furnaces, with an annual capacity of 900,000 tons, together with a 36-in. bar mill, and cooling and other equipment. Three of the electric furnaces have been in production while three others are complete except for cable installations. This plant was designed chiefly to produce gun forgings and miscellaneous parts for aircraft.

The six other projects on which work-stoppage has been recommended consist of five Republic projects and the Andrews Steel Co.'s new plant at Wilder, Ky. The Andrews plant, whose DPC appropriation was $5,133,000, is complete except for some items of equipment and consists of one 20-ton and two 40-ton electric furnaces with a mill to roll semi-finished alloy blooms for gun forgings.

The remaining five Republic projects are:

One at South Chicago, which would provide annealing furnaces for conditioning 9000 tons of alloy steel monthly. This project is more than half-completed and was to have cost $1,044,000.

One at East Hartford, Conn., 75 per cent complete, consisting of a wire mill and a bar mill with other facilities to increase production of cold drawn aircraft steel bars and other products by 49,200 tons. The estimated cost of this project is $1,708,000.

One at Massillon, Ohio, which has not been started, to consist of three ingot-warming pits. This project was to have cost $67,780.

One at Canton, Ohio, not started, was to consist of facilities for crushing and briquetting 48,000 tons of alloy steel turnings. This project was to have cost $43,000.

One at Canton, half-finished, consisting of two cooling furnaces estimated to cost $295,000.

Steel originally scheduled to be produced by the projects, all Government-financed, is not now needed in the war program, John T. Whiting, Steel Division director, said. Requirements for alloy and high quality carbon steel, it was pointed out, have declined in recent months.

Five other steel projects previously recommended by the Steel Division for cancellation, to save manpower and prevent unnecessary government expenditures for unneeded steel capacity were in the Carnegie-Illinois Steel Corp. plants in the Pittsburgh and Chicago areas and in the Geneva Steel Co. plant at Geneva, Utah.

The WPB announcement said: "No more Federal funds will be supplied after DPC orders cancellation, but the plants will remain in the hands of the operating companies, with the money already advanced remaining a debt against the plants. The companies may complete the projects with their own funds if they wish."

NEW COKE PLANT: *Spurred by heavy demands for steel and chemicals needed in the war effort, the new coke and chemical plant of the Pittsburgh Steel Co., at Monessen, Pa., is operating at peak capacity. Helen Dudick, one of the many women employed at the plant, is shown operating a device to drench and cool the hot coke with water before it is carried by conveyors to railroad cars.*

Carnegie-Illinois Pittsburgh Expansions Near Completion

• • • **The final unit** of the largest addition to the U. S. Steel's Monongahela Valley project built for Defense Plant Corp., will be placed in operation in February. The project, described in the January issue of the Corporation's employee magazine, *U. S. Steel News*, is turning out steel ingots at a rate of more than 1,000,000 net tons annually. It was constructed by Carnegie-Illinois Steel Corp., for the account of the Government.

The new facilities are located at three Pittsburgh district plants—the Edgar Thompson Works, Duquesne Works, and Homestead Works. They include two blast furnaces, eleven open hearth furnaces, three electric furnaces, a slabbing mill, a plate mill, a forge shop, a machine shop and heat treating and steel conditioning facilities. The blast furnaces are the largest ever built by a U. S. Steel subsidiary.

Operations in the 45-in., two high slab mill engineered and erected at the Homestead Works, began last week. The new slab mill has an annual rated capacity of more than 1,350,000 tons of steel slabs and can roll and shear slabs up to 60 in. in width.

The mill is fed from 20 gas-fired soaking pits, each 15 by 16 ft., and capable of reheating ingots to rolling temperature in five to six hours.

Shall U.S. Set Up A Steel Cartel?
Presence of Briton Opens Up Discussion

By DONALD BROWNE

Washington

• • • **The presence** in this country of Sir Andrew Rae Duncan, British minister of supply who recently came from England to participate in renegotiation of lend-lease agreements has provoked much discussion in the steel industry regarding the possibility of establishing by law an American counterpart of the British Iron and Steel Federation, an international cartel.

Sir Andrew, who was former director of the Federation, is expected to again head this organization when the war is over, according to the English press. Consequently, there is much speculation that Sir Andrew may unofficially approach the heads of American steel companies and also government officials with the proposal.

Such a proposal would involve permanent abandonment of the anti-trust laws, in the opinion of federal attorneys. Membership in the cartel would be compulsory and it would not only apply to the export business, but to domestic as well, foreign trade experts say.

The government would supervise the cartel, and subsidize credit and prices if the cartel is set up parallel to the Federation. The purpose of the cartel would be world steel export control by the United States and Britain together with other countries of the continent with which Britain has similar agreements.

While Secretary of State Cordell Hull could not be reached for comment, his views are well known. His policy of reciprocal trade agreements and general attitude with respect to foreign trade, preclude possibility of his approval of such a scheme.

On the other hand, if Sir Andrew should approach the State Department it could be expected to say that Sir Andrew is being received in his official capacity as the British minister of supply and not as an unofficial representative of the British steel industry. The department might also say that if the British Government wishes to make such a proposal the State Department would give its due consideration when received through established channels.

The Department of Justice has shown its attitude toward cartels in its brief filed in the federal court in the Southern District of New York against Imperial chemical industries and American chemical interests. These companies have been charged with conspiring to divide world markets in contravention of the Sherman Anti-Trust Act.

It is known that Attorney General Biddle will enforce the anti-trust laws so long as they exist and would continue to oppose cartels. To call the Department of Justice off, it is assumed that the anti-trust laws would have to be repealed, a highly improbable prospect.

Seven members of the Senate foreign relations committee were asked the following question: "What would be your attitude toward a proposal or the formation of an American cartel similar to the British Iron and Steel Federation to control world steel export markets and involving price and credit subsidies?"

The following are spur-of-the-moment comments of the senators:

Chairman Tom Connally, Democrat of Texas—"I should have to have time to study the problem."

Gerald P. Nye, Republican of North Dakota—"American industry must be equipped to compete after the war. If there is no other way to do this except through the establishment of cartels, then we shall have to have them. We must give American industry an even break."

Henrik Shipstead, Republican of Minnesota—"Such things lead to war. I don't see how they do anything else. The fight for trade leads to war. Cartels stand for exploitation and international trouble."

Walter George, Democrat of Georgia—"I couldn't express an opinion on so large a question without study."

Guy M. Gillette, Democrat of Iowa—"Off hand, I am against it."

Arthur Capper, Republican of Kansas—"It's a big idea. At least, there's no harm in discussing it. I think we should maintain an open mind. I wouldn't say I was against it."

Elbert Thomas, Democrat of Utah—"I should be against it unless it were made a part of an international munitions agreement, or unless there were a world understanding. I am not for anything inconsistent with existing treaties or the Atlantic Charter."

Reject Steel Disposal

• • • **Producers and** distributors of steel, who have off-grade or rejected steel or idle and excess inventories of steel which they are unable to move under CMP Regulations, may apply to WPB for permission to dispose of such material. Applications for permission to make such sales should contain (1) the name of the proposed customer, (2) the product to be made, (3) description of the material, (4) location of the material, and (5) length of time held and reason holder has been unable to move it under CMP Regulations.

Steel producers applications should be addressed to the appropriate Products Branch of the Steel Division, War Production Board, Washington. Distributors applications should be addressed to the Warehouse Branch of the Steel Division also in Washington.

Alloy Steel Output 13,116,000 Tons in 1943

• • • **Production of alloy steel** in the United States during 1943 reached the record-breaking total of 13,116,000 net tons of ingots and castings, according to preliminary reports of the American Iron and Steel Institute. The 1943 total was nearly 14 per cent above the previous record of 11,526,000 tons of alloy steel produced in 1942. *Note: The WPB Steel Division late last week issued slightly different figures for March, 1943 (1,264,697 tons) and December (816,300 tons).*

The peak month for alloy steel output in 1943 came in March when 1,284,000 tons were produced. Since that month, almost without interruption, alloy steel production declined.

In December, production of alloy steels was 799,000 tons, compared with 1,185,000 tons in December, 1942.

Of the total tonnage of alloy steel output in 1943, open hearth furnaces produced 70 per cent, or 9,221,000 tons. About 30 per cent, or 3,895,000 tons were produced in electric and crucible furnaces. That same ratio of open hearth to electric furnace alloy steel production prevailed in 1942. Before the war, however, open hearth furnaces produced as much as 75 per cent of the total alloy steel tonnage. Production of ingots and castings, in other years follows (net tons):

Years	Open Hearth	Bessemer	Crucible	Electric	Total
1942	8,133,076	.....	522	3,392,776	11,526,374
1941	5,739,655	3,890	933	2,461,651	8,206,129
1940	3,674,926	3,990	255	1,286,716	4,965,887
1939	2,458,854	3,486	231	749,384	3,211,955

Nelson, Patterson Discuss Reconversion

• • • **Asserting** that American industry must go forward rather than return to prewar standards, Robert P. Patterson, Undersecretary of War, pointed out before the U. S. Conference of Mayors in Chicago that reconversion to the prewar production pattern was basically impossible and would "result in a 50 per cent reduction in the national income, extensive unemployment and reduced production capacity." Donald M. Nelson, chairman of WPB, at the same meeting warned that the country was "coming into a period in which there may well be a certain amount of idle manufacturing facilities, idle materials and scattered pockets of temporarily unemployed men and women."

Mr. Patterson outlined a four-point program for reconversion which consisted of: 1. Negotiations by a procurement agency for a final termination of war contracts to be reopened only on evidence of fraud, and to be made without interference from third parties. 2. Formation of a central government-wide agency to formulate the policy for reconversion. 3. Establishment of a central disposal agency for surplus government property. 4. Provision of a comprehensive system of financial aid for war contractors pending final settlement of their contracts.

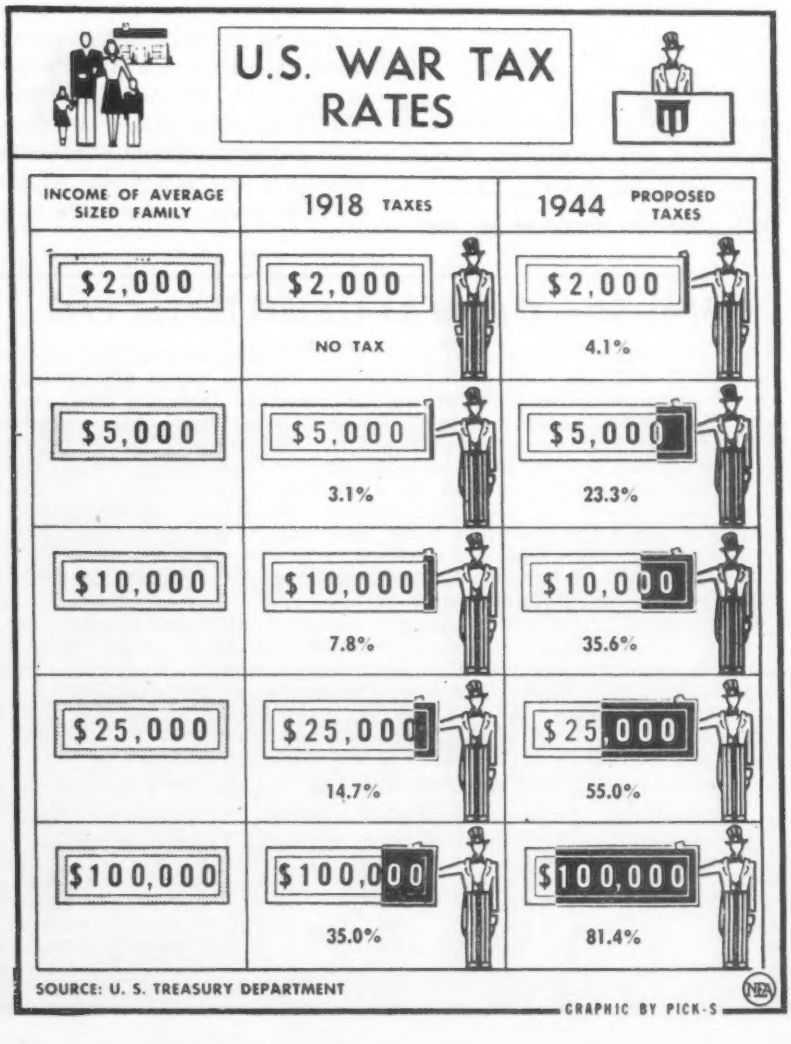
Jahco Workers Give $17 Million

Cleveland

• • • **In a request to 7400 associates** (employees) of Jack & Heintz, Inc., by the president, William S. Jack, to contribute $30,000,000 into non-voting preferred stock to replace post-war operating capital that the company is losing through "contracts renegotiation," associates were ready to contribute $17,000,000, according to Mr. Jack. He said that associates were being polled to learn the amount that might be expected, and the first contribution would be individual voluntary subscriptions.

Sources of money making up the $17,000,000 already subscribed included redemption of war bonds and subscription of war bond weekly deductions; working payless Sundays and turning back double time rates; production and Christmas bonuses; and cash subscriptions. Most of the $17,000,000 subscriptions were in cash, although part of them were in war bonds.

In commenting on renegotiation, Mr. Jack stated he would refer the order to pay back to the Government $7,000,000 to the highest legal authority in the country and fight it out to the end.



Won't Pay Income Tax

Westport, Conn.

• • • **Miss Vivien Kellems**, Westport war plant owner, stated at Kansas City that she has not paid her Dec. 15, 1943, income tax because she believed the tax law to be a violation of the Fifth Constitutional Amendment and possibly the Fourth. "It amounts to unreasonable seizure and its ultimate effect will be to deprive me of property without due process of law," she said. "Not only is the Government trying to collect a tax on profit but it is actually forcing me to anticipate profits on work not yet done."

Paper Work Reduced

Washington

• • • **Designed to reduce** paper work WPB on Monday announced that the Maritime Commission hereafter will use the single allotment number M-1 to identify all ship construction programs. This means that the Commission will discontinue using major program numbers M-2, M-3, M-4, M-5, M-6 and M-7. This does not, however, affect the use of the major program numbers M-8, M-9, or M-10, which identify programs of ship repair, other equipment and supplies, and construction and facilities.

In the future, manufacturers who have received allotments identified by any number from M-2 through M-7, may use the allotment number M-1 in placing orders for production materials or in making allotments for these programs.

Ease in Alloy Scrap Controls Will Not Cause Buying Spree

Chicago

• • • **Substantial additional** consumption of low alloy scrap by Chicago district mills in carbon steel melts has failed to materialize despite revision of WPB Order M-24-c, a survey of district mills shows. Most local mills already have been flirting dangerously close to molybdenum and nickel maximums in their carbon steel and a number of heats have been lost as a result of poor segregation of alloys from purchased carbon scrap. With carbon scrap plentiful and inventories relatively high, there is little disposition to purchase low alloy grades even though no price premium over carbon grades is charged.

Producers desiring high nickel content, up to 3.5 per cent nickel, have little incentive to trifle with low alloy scrap because of the bountiful supply of high nickel material in this territory representing a long lived hangover from the tank curtailment program. This high nickel scrap is being offered at little or no premium over carbon scrap prices with few buyers evident.

Despite the apathy of the mills to the M-24-c revision some miscellaneous buyers whose products would be benefited by alloy content are reported purchasing at carbon prices.

A further contributing factor to the lack of open market demand is the decreasing production of triple alloy steels resulting in generation of scrap exceeding requirements for new melting schedules. To the extent that the M-24-c order allows absorption of this excess production by mill producers it undoubtedly is preventing a more serious glutting of the open market.

Fears have been expressed in the trade that increased contamination of carbon scrap shipments from dealers will result from large tonnages of alloy material at this level because of inability to find a market on the segregated basis. Although order forbids such mingling it is believed that mounting desperation will make enforcement difficult until some outlet is found. One major mill has gone so far as to send a letter to brokers making a part of its contract terms that no alloys shall be included in this mill's purchases of carbon steel scrap. The difficulty is most acute on NE 8600, SAE 4100 and SAE 3100 grades with occasional trouble resulting from grades from off-alloy such as those containing aluminum. As stated, no market has developed for high nickel alloys (up to 3.5 per cent Ni), a headache here.

No threat has developed, however, to carbon scrap prices because of the fact that finished steel specifications prevent purchase of alloy scrap no matter what price inducements are offered. One district mill is out of the scrap market entirely and other mills are buying without enthusiasm. Those mills that consume alloy scrap in quantity have adequate inventories.

Therefore, direction four to Order M-21-a thus far has not caused any increase in demand although it may result in a slight increase in the proportion of scrap in alloy charges.

o o o

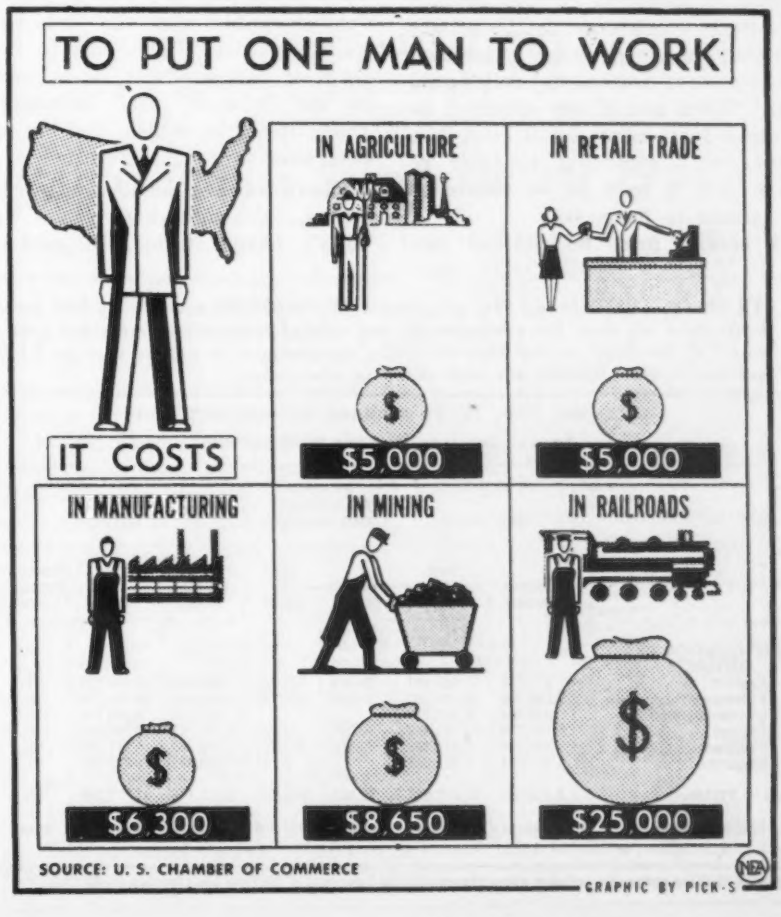
Ore Consumption Totals 89,027,689 Tons

Cleveland

• • • **With December Lake** Superior iron ore consumption in the United States and Canada totaling 7,509,096 gross tons, total annual consumption during the past year reached 89,027,689 gross tons. Of this amount, 86,585,241 tons were consumed by American furnaces and 2,442,448 tons were used by Canadian furnaces. This compares with consumption during 1942 of 83,714,331 tons by American furnaces and 2,511,018 tons by Canadian operations.

December consumption showed a slight increase over the 7,409,213 gross tons consumed in November, but was somewhat under December, 1942, consumption of 7,759,366 gross tons. Consumption by blast furnaces in United States alone was 7,313,034 tons last month.

Ore stocks at furnaces and Lake Erie docks on Jan. 1 amounted to 43,428,641 tons, which compares with 47,424,421 tons a year ago. With at the most five months to go before shipping opens up on the great lakes, these stocks represent better than 8,000,000 tons a month for blast furnace consumption. No concern is felt in regard to shortages of ore.



Small Steel Firms Plan for Lower Costs, More Equipment, Specialty Output

By TOM CAMPBELL
Pittsburgh Regional Editor

• • • **Small steel companies**, integrated and non-integrated, are planning aggressively for the postwar era, like their large competitors. Officials of some of these small units are not counting too much upon aid from the government or from bigger steel companies.

Although there has been considerable talk in the past that small steel companies, especially makers of flat rolled products, could not stay in business due to competitive conditions, it is noteworthy that the mortality of small steel companies in recent years has been negligible. Conditions over the past few years, however, which include higher raw material costs, and an unusual expansion in labor costs, may, according to some steel leaders here, present a far different problem for the small steel maker, not only in the postwar period but in the pre-postwar period.

Costs on semi-finished steel, which the large companies sell to the smaller ones, have risen substantially since 1939, and most observers look for an upward adjustment in the price of this item, which may not be proportionately matched by an adjustment in the price of finished flat rolled products. When and if this condition becomes a fact, many small steel companies will, according to their reports, find it hard to, or impossible to, remain in business.

A special price on finished steel products, to take care of the smaller companies, would be an empty gesture in a steel market where the potential supply exceeds total demand. This already has been proven by the falling-off in the volume of business at those steel plants where premium prices on specific products have been allowed. The WPB, and other consumers as well, have, where possible, shifted their business on specific products to plants charging the ceiling prices.

According to reliable sources, however, many small companies are taking a realistic attitude on potential steel markets, and already have set in motion plans or programs of their own which, if carried through, would seem to indicate that they do not expect to go out of business.

A typical program is believed to be somewhat along the following lines: complete studies on probable cost saving methods are already being made; every avenue wherein savings may be effected is being exploited to the utmost.

Knowing well that they cannot compete on a tonnage basis, for ordinary low cost flat rolled items, many small steel companies are laying plans to further expand what the trade knows as "specialties." This may be in the form of new products, or it may be in the form of small tonnages of those items in which the big steel companies are not interested.

Many of the smaller steel companies, although known as "hand mills", have, during the past few years, mechanized as far as possible their steel finishing operations. This trend is expected to become even more pronounced this year.

Other small outfits are said to be concentrating their attention on small tonnage orders of carloads or less, and are pointing to prompt and personalized delivery as a talking point. On this basis, some companies are attempting, with considerable success, to build up a great number of consumers, regardless of the quantity of steel involved in individual orders.

While there has been no definite undertaking, some small non-integrated steelmakers are known to have been thinking over the possibility of a common source of semi-finished material, owned and operated by several small steel finishers. According to one official of a small company, such a plan might possibly be feasible on the basis of a joint enterprise. In other words, ten or fifteen small companies making flat rolled material, conceivably could purchase a steel company with steel producing facilities. The program would call for the manufacture of nothing but semi-finished steel. The company could be owned and operated on a stock participation basis, with the profit or loss at the end of the year spread over the various small companies.

There are many in the trade, however, who consider such a plan as overly optimistic, especially in view of the high cost of steel ingot and semi-finished steel production. On the other hand, some of the smaller companies may toy with the idea on the basis that they will have a continuous, even though partial, source of basic supplies, with the possibility of "spreading the cost."

PIG IRON OUTPUT *during* 1943 *exceeded* 1942's 59,075,944 *net tons by* 3.17 *per cent, while total pig iron, ferro-manganese, and spiegel production during the past year was* 1.43 *per cent greater than in* 1942. *December iron output rose to* 5,139,541 *net tons from* 5,038,605 *net tons made in November.*

D. F. Austin Directs New C-I Production Planning Dept.

Pittsburgh

• • • **To coordinate** functions pertaining to the scheduling of orders and planning of production, the Carnegie-Illinois Steel Corp., here, has formed a production planning department. It will be under the direction of D. F. Austin, vice president of the corporation.

John A. Hagan, former superintendent of production and cost planning at the company's Ohio Works, was appointed general manager of this new department. James M. Morehouse, who was general manager of the company's order division, was made assistant general manager.

Fairless Airs Freight Inequities; Corp. Labor Policies; Expansion

Pittsburgh

• • • **In a speech** bristling with frankness and realism, Benjamin F. Fairless, president, U. S. Steel Corp. of Delaware, set Pittsburgh industrialists back on their heels last week, by warning that if unfair freight rates prevent Pittsburgh mills from reaching consuming markets of the country; in the postwar period, new facilities now being built may have been a mistake and the decline of Pittsburgh as an important steel center "must then be expected."

The occasion for this blunt warning was the annual Pittsburgh Chamber of Commerce dinner at the William Penn Hotel, but Mr. Fairless did not confine his remarks to freight rates and the future of Pittsburgh alone. On the question of steel capacity financed by the United States Government, he argued that the Government should dispose of its plants and facilities as promptly as possible after the end of the war, and should not attempt to go into business in competition with private industry.

In cases where Government owned plants were more efficient and low cost than private plants, "the Government should permit private industry to buy or lease these lower cost plants upon some equitable basis."

In those instances where Government owned plants cannot be economically operated after the war, "the Government should be realistic and either scrap the plant promptly or put it under lock and key for future national emergency use," Mr. Fairless argued.

After expressing frank views on Pittsburgh's future and the disposition of Government owned plants, Mr. Fairless struck out and reviewed the United States Steel Corp.'s labor policy, which, he said, "may not always have been clearly understood." He reiterated the company's labor policy of June, 1934, when the plan of employee representation was existent, and which in part said that the company would recognize the right of its employees to bargain collectively through representatives freely chosen by them, without dictation, coercion, etc. It also said that the company would negotiate with any group chosen to represent the employees and with any organization which represented its members, subject to the recognition of the principle that the right to work is not dependent on membership or non-membership in any organization.

Mr. Fairless insisted that this labor policy is still the labor policy of the U. S. Steel Corp., except for the change made necessary by the Wagner Act, which grants exclusive representation to a bargaining agent chosen by a majority of employees. He insisted that the first contracts of the Steel Workers Organizing Committee did not provide for a closed or union shop or for a check off, but were predicated on the labor policy of the company described above. He added that the compliance with the National War Labor Board directive, that the company sign a new form of agreement imposing maintenance of membership and the check off, was for one reason only—"That the country is at war and that your board has ordered this company to do certain things embodied in your directive. For the period of the contract under negotiations, this company bows to your decision and accepts that which it considers unnecessary, undesirable, and subversive of the workers individual freedom." Fairless ended his labor comments by flatly stating that the company's conviction is as firm today as it ever was that the right to work should not be dependent upon membership or non-membership in any organization.

On the subject of Pittsburgh, Mr. Fairless indicated that while there is evidence of his company's belief in Pittsburgh's potential future as an important steel center, he and his company were worried about the apparent disadvantageous freight rates on shipments moving from Pittsburgh to the east. Forty years ago, according to Fairless, Pittsburgh had an average freight disadvantage of only $1.00 per net ton on shipments of steel from Pittsburgh to New York, while today that freight disadvantage averages $3.80 a ton. "Nothing has occurred in the interval to justify such a 280 per cent increase in the differential," Mr. Fairless said. He added, "There may have been some reason for an increase in general freight rates from time to time in the past year, but there was no justification for penalizing the Pittsburgh steel industry by proportionally increasing this rate differential on each such occasion."

While indicating respect for railroad management in general, Fairless expressed disappointment that officials of the several railroads serving Pittsburgh have not taken action on their own initiative to remove an obvious discrimination against "a city of the potential traffic importance of Pittsburgh."

100,000 Planes Scheduled for 1944

Washington

• • • **An increase in** the urgently needed combat type airplanes with a general reduction of trainer and certain other types, will be the trend of aircraft production during 1944, according to C. E. Wilson, chairman of the Aircraft Production Board. The percentage increase in number of planes will drop sharply during the coming year as compared to the two preceding years, but using weight as a production measure, output will continue steadily upward. Schedules for 1944 combat planes indicate that these ships will all be substantially larger than those they supplant. As smaller tactical models and certain types of trainers are removed from the program, the available factory space and labor will be utilized for subcontracting work for plane assemblers.

The following table shows statistically U. S. Aircraft production:

Year	Number of Planes Accepted	Average Weight of Frames and Spares, Lb.	Frame and Spare Acceptances, Lb.	Weight Output Index, 1942=100	Equivalent Number Planes on Basis of Types Accepted in 1942	Per Cent Increase in Number Over Preceding Year
1941	19,290	4400	85,700,000	29	14,800	.....
1942	47,873	6110	292,600,000	100	47,873	148.2
1943	85,946	8630	741,800,000	254	122,000	80.8
1944*	100,000	10,000	1,000,000,000	350	167,000	16.4

* All of 1944 figures are estimated, of course.
The figures in the right hand columns show what production would be if all planes produced were of the sizes, types and proportions produced in 1942 when the President issued his call for production of 125,000 planes per year and the increase percentage-wise, in numbers of planes built over each preceding year.

Controversial Features of New Tax Bill Hinge on Renegotiation

Washington

• • • **The passages** by the Senate of the 1943 tax bill on Jan. 21, was not considered here so much a defeat for the Administration, as it was a portent of future drives for economy in Government by Congress. The bill now goes to conference.

Clearly, Congress thinks that the limit has been reached in the taxpayer's patience and ability to pay new higher taxes, as witnessed by the passage of a $2,000,000,000 bill instead of a $10,000,000,000 one as requested by the President. There are conflicting conjectures whether the President will veto the bill.

But the real tip-off is the new questioning attitude of Appropriation Committees of both houses of White House requests for money to operate Government departments. Deep slashes in the 1944 budget can be expected.

The most controversial feature of the bill deals with renegotiation. A brief summary of how more knotty provisions stood before conference follows:

Renegotiation after taxes—Senate Finance Committee finally gave up on this one. Renegotiation will be before taxes as usual. Administration pressure prevailed and killed the hopes of conservative bloc in the Committee.

Standard commercial articles—Mandatory exemption proposed originally by Senate Committee stricken by amendment on the Senate floor. This result from sniping of Administration supporter who threatened to read into the record cases of "outlandish" profits on standard commercial articles. Exemption is not discretionary with individual price adjustment boards to agree with the House proviso.

Subcontract definition—Senate first wrote a clause which would have exempted from renegotiation majority of machine tools and industrial equipment contracts of supplies. Compromise clause passed by the Senate exempts durable tools — "having a useful life of more than 10 years." This will exempt 1943 tool and equipment contracts of concerns whose fiscal year ended Dec. 31, 1943. If fiscal year ended June 30, 1943, only contracts for the last half will be exempted. Exemption will apply to all contracts entered into in 1944 and after.

Renegotiation cut off—Senate bill proposes Dec. 31, but gives President discretion to extend to June 30, 1945 or beyond, not a very satisfactory provision.

Administrative review—Both bills agree. A new War Contracts Price Adjustment Board is created composed of representatives from War, Navy and Treasury Departments, Maritime Commission, RFC and subsidiaries and WPB. The granting of review is discretionary with the Board, although it may entertain cases on its own motion.

Court review—The Senate muffed this one. House provision would have permitted retroactive application of review by Court of Tax Appeals. The Senate Finance Committee which first proposed that this right be extended to all past and future renegotiation and that appeals be permitted and de novo before the Court of Claims backed down. The Senate passed a court review provision which limits the right of appeal to cases where the departments have made unilateral determinations. No contractor who has signed a renegotiation agreement will have any appeal rights.

The War Department has officially said that there have only been 24 such unilateral determinations and at most for the rest of the departments the number would not be over 50, officials estimated. This means a fight in conference. Some change is certain.

Post-war reserves—Senator Harry Truman, Democrat of Missouri, proposed an amendment permitting contractors to get back a 20 per cent of net taxes to defray reconversion costs. Money was to be converted into non-negotiable bonds.

The amendment was knocked out in a fight led by Senator Taft, Republican of Ohio. Senator Taft pointed out that the amendment would cost more money than the bill is calculated to raise.

Repricing—Legislative experts say that Senate title on this subject is mere separation of what was contained in House bill. Second War Powers Act gave the right, in 1942.

The way the departments are considering this subject is that renegotiation is repricing on contracts completed in previous years. Repricing is renegotiation in advance and is prospective, according to these experts. In no case, will a contractor be subject to both renegotiation and repricing on the same contracts and the same period.

Steel Control Relaxed to Ease Tight Manpower Supply

Washington

• • • **As the steel** supply situation progressively becomes easier, there are growing examples showing how manpower has been lost and breakage caused through the use of substitutes. These substitutes, whose use had been ordered as a means to conserve steel, now are being either wholly or partailly discarded to permit the use of steel.

Indicative of this situation was a WPB announcement that manufacturers of conveying machinery and mechanical power transmission may now use small amounts of carbon steel in the fabrication of such equipment in place of the substitutes formerly employed. WPB estimated that the quantity of such steel to be released to these manufacturers will run about 800 tons quarterly. It has been unofficially predicted that this quantity will be increased.

WPB said that the use of substitutes has caused a considerable increase in the number of man-hours of labor to build conveying machinery and mechanical power transmission equipment and considerable losses due to breakage, according to industry representatives. The quantity of steel now authorized, WPB pointed out, is expected to be more than offset by the saving in manpower and elimination of breakage.

WPB's action was included in an amendment to L-193. It also adds pneumatic tube delivery systems to the list of machinery that requires an AA-5 priority to manufacture.

Plans Made to Show Public Seriousness of Manpower Problem

New York

• • • **Fitting available** material, manpower, productive capacity, and similar components together in jig-saw puzzle fashion to result in a coordinated maximum finished product output has been, since the start of the war, the main problem of Washington. Today, as the production capacity and material factors ease, manpower becomes continually scarcer and will be an increasing headache for production schedulers through to the end of the war. Appeals continue to stream from Washington for everyone to do his part on the production front, mostly in slogan style, but the problem eases none.

This week in Washington the Army, Navy, and war agencies of general information policies planned a campaign through the Office of War Information to increase public understanding of war production and employment problems. The object of the meeting was to set a definite policy in regard to the labor problem. The planned program is by and large an internal one that among other things seeks to: (1) Avoid speculation by military and civilian officials as to the end of the war; (2) exercise care among officials in discussion pre-post-war and post-war economic developments and reconversion; (3) emphasize that no extensive resumption of civilian output is possible; (4) fully and accurately explain the facts in public expressions of production cuts; and (5) to eliminate discussion of actions of agencies with which officials are not connected.

In spite of WPB putting Cleveland in the category of a "trial guinea pig" for civilian production, Cleveland WPB officials stated that new war contracts would take up all slack resulting from cutbacks and the city is still a No. 1 manpower shortage area. Consequently, little or no civilian production is possible. However, in Youngstown, the WPB is conducting a survey among 500 smaller plants to determine the nature of equipment, types of war orders now on hand, and in which plants it would be most suitable to make "tests" in reconverting to civilian production.

On the labor front, WLB this week certified the issues in the contract negotiations between the Republic Steel Corp., and the CIO-USWA. The case was referred to the WLB by the Secretary of Labor after negotiations were broken off.

• • • The WLB on Jan. 22 ordered inclusion of a standard voluntary check-off of union dues in contracts between American Can Co. and the USWA covering seven of the company's plants.

• • • Foundry workers in the Northwest who struck Jan. 18 voted to return to work on Jan. 21 in about 80 plants. Some 6000 were involved, striking in refusal to an 8c. an hr. increase granted by the WLB. . . .

A walkout of 650 Ford Motor Co. technicians, including metallurgists, chemists, and physicists on Jan. 19 was effected at the Rouge and Willow Run bomber plants in a dispute over the demands of these employees for union status. . . . Meanwhile, the week-old strike of Chrysler Corp. foremen spread to a sixth plant last week, leaving fewer than 400 of the 1432 supervisors to direct production of war materials.

• • • John A. Roebling's Sons Co.'s Trenton, N. J., plant stopped production during the past week because of a walkout of 2700 employees. The strike resulted from a "minor grievance between the firm and 19 employees in the aircraft department," according to company officials. However, a wage differential of about 15 per cent for women workers performing the same tasks as men was also reported to be the basis for the trouble. . . . A strike of 350 Bison Casting, Inc., Buffalo, employees over a WLB wage ruling tied up production during part of last week.

• • • Acting on a petition of the Sheffield Steel Corp., Houston, Texas, the National War Labor Board set a common labor rate for the company's plant at 60.5c. per hr., 2.5c. less than previously directed by the regional WLB, Dallas. An increase of 10 per cent an hour for classifications other than common labor as ordered by the regional board was also disallowed by the National board. These rates were ordered to be negotiated between the company and the USWA-CIO. . . . Eight U. S. Steel Corp. fabricating and other subsidiaries have asked that collective bargaining conferences with the USWA-CIO be immediately arranged. These companies previously suggested that such conferences be withheld pending the commencement of negotiations between the Union and the five steel producing subsidiaries of the U. S. Steel Corp. Companies making this request were American Bridge Co., Virginia Bridge Co., U. S. Steel Supply Co., U. S. Steel Products Co., Universal Atlas Cement Co., Oliver Iron Mining Co., Oil Well Supply Co., and Tubular Alloy Steel Corp., In November, 1943, average hourly earnings in these companies were $1.095, representing an increase of 32.7 per cent over the average hourly earning in effect in January, 1941.

Orders Affecting Alloy Steel Output and Alloy Scrap Announced

Washington

• • • **WPB last Friday** announced relaxation of restrictions on the manufacture of alloy tool steels and heat resistant steels and use of electric furnace facilities. WPB, at the same time, required alloy steel producers to use 50 to 60 per cent alloy scrap in all melts. Many melters, it is reported, now are not using more than 20 to 30 per cent alloy scrap. The remainder of the charge is being taken up in virgin alloys. WPB took this step undoubtedly in conjunction with its removal of restrictions on the use of ferro-alloys as a conservation measure. Reluctance to use 50 to 60 per cent alloy scrap is attributed to the high cost it involves through having to hold up production until higher grade scrap can be obtained.

The greater availability of alloying materials and the expanded electric furnace capacity of the nation made possible five moves by WPB, which together make a sweeping change in the alloy steel picture.

By revoking Direction 1 to Supplementary Order M-21-h and Supplementary Order M-21-g, WPB removed all restrictions on the formulae by which vanadium, tungsten, molybdenum, and nickel alloy steels and chromium-nickel alloy iron and alloy steel were produced. Hereafter, producers may use any alloy content they desire in making these melts. WPB estimated that by permitting the free use of alloys in tool steel and considering the present tonnage of tool steels being melted monthly, increases in the use of alloying elements would not exceed 5 per cent in any case.

Supplementary Order M-21-a was amended to permit producers to melt carbon steel in electric furnaces without filing schedules and obtaining permission from WPB. Direction 4 to M-21-a, covering all types of alloy steel except stainless and valve steels, which are covered by another direction to this order, was issued to provide that each producer must use alloy scrap in not less than the following amounts for melts in any one calendar month:

	Electric Furnace, Per Cent	Open Hearth, Per Cent
Scrap (solids and turnings)	60	50
Turnings, per cent of solids	5	8
Machine shop turnings, per cent of solids	4	4

An amendment to M-21-h revokes the requirement that producers of tool steels file melting schedules before making their melts. However, the amendment still provides that certification must be made that orders are for tool steel.

CMP Order Changes Clarified

Washington

• • • **Rules governing** changes in authorized controlled material orders have been clarified through the issuance of Interpretation No. 10 to CMP Regulation No. 1.

The interpretation chiefly concerns determination of when a change in an authorized controlled material order constitutes placement of a new order and when it does not. It is important for producers to know when a change constitutes a new order so that they may be in a position to adjust their production schedules of controlled materials accordingly.

Generally, any change in a customer's order constitutes a cancellation of the earlier order and placement of a new order on the date of the change, if (but only if) the change necessitates alteration of the producer's production schedule to a point which would interfere with production.

In illustration of this general rule, the Interpretation points out seven specific cases, as follows:

(1) The mere substitution of one allotment number for another which does not require alteration of the producer's schedule is not considered to constitute the placing of a new order. The customer must, of course, have an allotment identified by the substituted allotment number to support the change.

(2) A change in shipping destination does not constitute the placing of a new order.

(3) An increase in the total amount ordered constitutes the placing of a new order to the extent of the increase.

(4) An advancement or deferment of delivery, when made by the customer, will constitute entry of a new order.

(5) A reduction in the total amount ordered will presumably not require a change in the producer's schedule and will not constitute a new order. Of course, if the quantity is reduced below a minimum mill quantity, the producer may reject the order and remove it from his schedule, as provided in paragraph (t) (2) (i) of CMP Regulation No. 1, though he must not discriminate between customers in so doing.

(6) When the customer directs the producer to hold or suspend production on an order, without specifying a new delivery date, the order will not be considered as on a producer's books for the purpose of determining his obligation to accept other orders. When the customer instructs the producer to reinstate a suspended order, it shall be considered a new order as of the date of such instruction.

(7) Where minor variations in size, shape, gage, etc., are requested by the customer and can be arranged by the producer without interfering with his production, such changes do not constitute a new order.

Where changes constitute placement of new orders, the acceptance or rejections of the new order in the producer's schedule shall be governed by the conditions existing at the time the changes are received by the producer.

o

Controls Eased On Output Of Oil Country Tubing

Washington

• • • **Resumption of manufacture** of light-weight tubing, used largely by gas well operators in the eastern area, is permitted by WPB. Before fabrication of this tubing was forbidden in April, 1943, large quantities of it were used. Needs for this tubing by the eastern operators warrant fabricating it, and this production will contribute to worth-while economies in steel production due to the lighter weight achieved by the new specifications.

Production of the new light weights was authorized by amending Order L-211, Schedule 9. Specifications for these tubings follow:

PERMITTED SIZES OF CASING AND TUBING

Casing (Seamless and Electric Weld) Grade J-55

Size, Outside Diameter, In.	Wall Thickness, In.	Nominal Weight Per Ft., Lb.
8⅝	0.264	24.00

Standard Tubing (Non-Upset), Seamless and Electric Weld, Grades F-25, H-40, J-55 and H-80

Size, Nominal	Outside Diameter, In.	Wall Thickness, In.	Nominal Weight Per Ft., Lb.
2	2.375	0.167	4.00
3	3.500	0.216	7.70

These sizes for seamless and electric weld casing and tubing apply only to short thread casing and to standard non-upset tubing. In all respects other than wall thickness and weight per ft., such casing and tubing shall conform to the requirements of American Petroleum Institute Specification for casing, drill pipe and tubing, API Standard No. 5-A, dated May, 1942, and Supplement No. 1 thereto, dated December, 1942.

Lap-Weld Casing

Size, Outside Diameter, In.	Wall Thickness, In.	Nominal Weight Per Ft., Lb.
5½	0.304	17.00
6⅝	0.186	13.00
7	0.272	20.00
8⅝	0.304	28.00
10¾	0.307	35.75

Standard Lap-Weld Tubing (Non-Upset)

Size	Outside Diameter, In.	Wall Thickness, In.	Nominal Weight Per Ft., Lb.
2	2.375	0.167	4.00
3	3.500	0.216	7.70
4	4.500	0.237	11.00

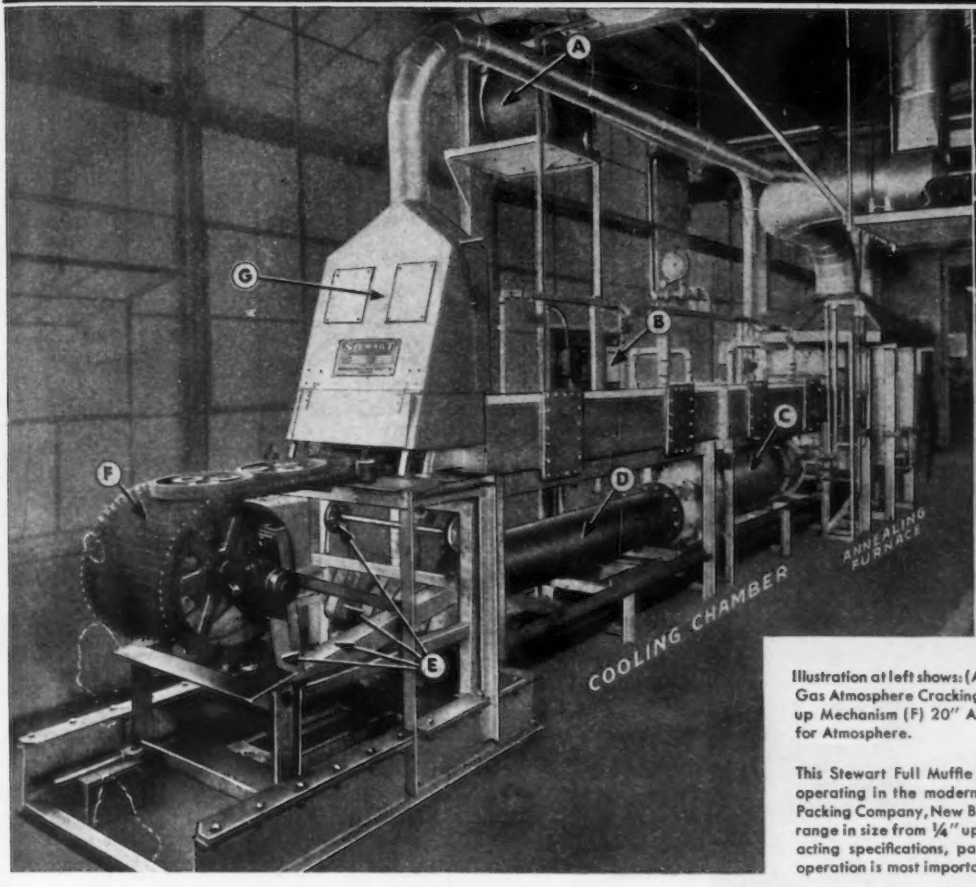
These sizes for lap-weld casing and tubing apply only to short thread casing and to standard non-upset tubing. In all respects other than wall thickness, weight per ft., and threading practice, such casing and tubing shall conform to the requirements of American Petroleum Institute Specification for casing, drill pipe and tubing, API Standard No. 5-A, dated May, 1942, and Supplement No. 1 thereto, dated December, 1942.

HEAT TREATING GASKETS with

STEWART

THE BEST INDUSTRIAL FURNACES MADE

No. 49 OF A SERIES of Typical Installations



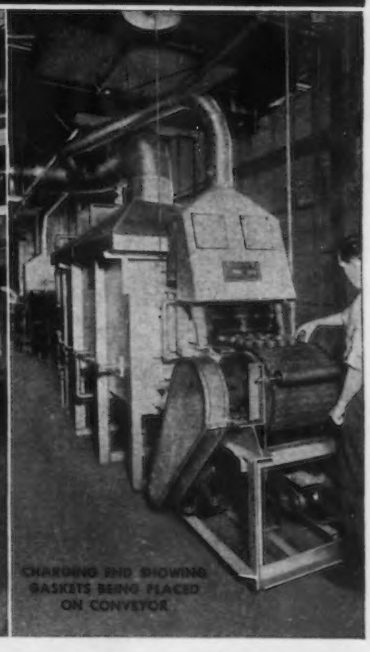


Illustration at left shows: (A) Blower (B) Strip-Chart Controller (C) Special Gas Atmosphere Cracking Unit (D) Gas Cooler (E) Automatic Belt Take-up Mechanism (F) 20" Alloy Mesh-type Belt (G) Vestibule Protection for Atmosphere.

This Stewart Full Muffle Conveyor-type Bright Annealing Furnace is operating in the modern, efficient plant of the Goetze Gasket and Packing Company, New Brunswick, N. J. Most of their solid metal gaskets range in size from ¼" up to 18". Because these gaskets must meet exacting specifications, particularly as to hardness, the heat treating operation is most important.

"Although as a usual procedure gaskets are washed and cleaned prior to going into the furnace, we can now put them on the conveyor with the oil and grease from the machining operation still on them, and they come out perfectly clean," reads a report on the operation of the Stewart Bright Annealing Furnace from the Goetze Gasket and Packing Company, New Brunswick, N. J., one of America's oldest and largest manufacturers of industrial gaskets. "We can machine the rings and anneal immediately as we have no scale or discoloration to contend with. Formerly we had trouble getting the scale off the gaskets and several men were required to do this work. The operation was hard on tools and took valuable time.

"Another advantage is the uniformity provided by our bright annealing process. We get a uniform ring every time—an important requirement of all Goetze gaskets. A third advantage is the increased production. It is possible, when desired, to get a production output far in excess of that for which the furnace was originally rated."

This installation is typical of the industrial furnaces Stewart engineers are building every day to meet the specified requirements of manufacturers all over the continent. Stewart builds, in addition, a full line of standard furnace types.

NEW FURNACE MAINTENANCE WALL CHART

Write for your free copy

A handy, ready reference, 17" x 23" chart giving suggestions for Proper Maintenance of Industrial Furnaces—Check Points for Care and Upkeep—Repair, Replacement and Installation Procedure—Tips on Burners—Notes on How to Make Your Pot Furnaces Last Longer. Designed as an aid in keeping your furnaces in AA-1 condition and simplifying the ordering of replacement parts. Printed on special glazed-finished stock to resist dust and dirt when posted in your heat-treating department.

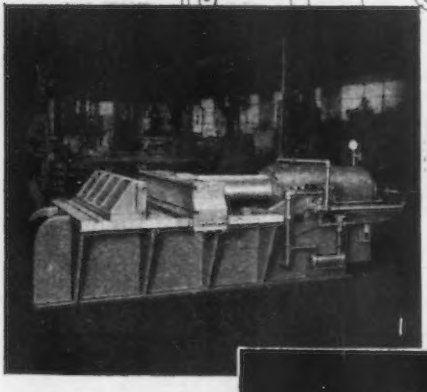
A letter, wire or 'phone call will promptly bring you information and details on STEWART Furnaces, either units for which plans are now ready or units especially designed to meet your needs. Or, if you prefer, a STEWART engineer will be glad to call and discuss your heat-treating problems with you.

STEWART INDUSTRIAL FURNACE DIV. of CHICAGO FLEXIBLE SHAFT CO.

Main Office: 5600 W. Roosevelt Road, Dept. 110, Chicago 50, Illinois

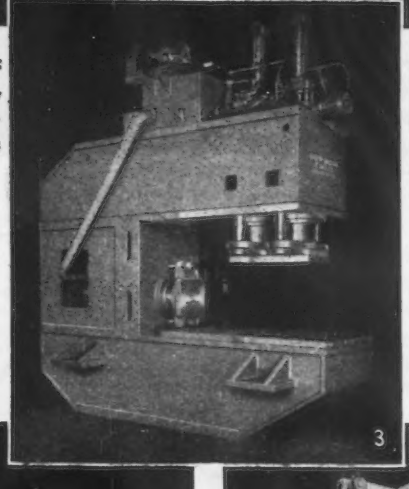
Canada Factory: (FLEXIBLE SHAFT CO., LTD.) 321 Weston Rd., So., Toronto

Metal Working Machines for WAR and PEACE

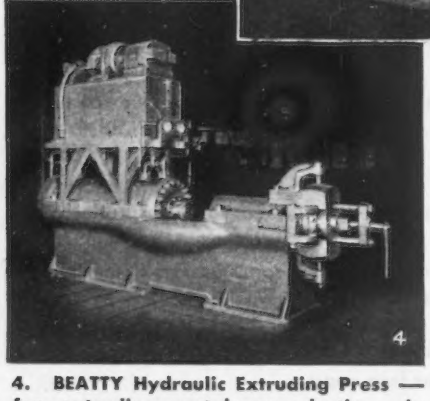


1. BEATTY Hydraulic Bulldozer. A rugged, modern design in capacities of 35-tons through 200-tons.

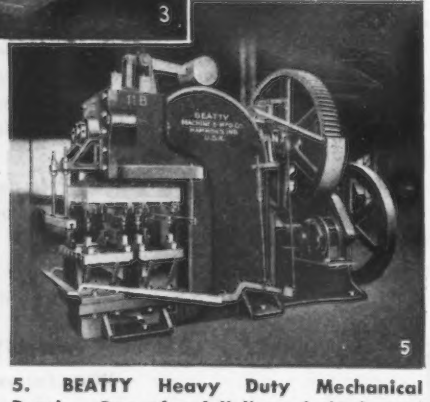
2. BEATTY Horizontal Hydraulic Bending Press. Fast, easily operated, in capacities from 35-tons through 200-tons.



3. BEATTY Hydraulic Forming & Flanging Press. Self-cooling oil circuit. Capacities of 200-tons and 400-tons.



4. BEATTY Hydraulic Extruding Press — for extruding metals or plastics. In three models, in capacities of 150-tons through 425-tons.



5. BEATTY Heavy Duty Mechanical Punch. One of a full line of single and double end punches — and spacing tables — for heavy metal working.

HYDRAULIC HEAVY METAL WORKING EQUIPMENT

BEATTY MACHINE AND MFG. COMPANY
HAMMOND, INDIANA

Priority Changes

L-53—Simplified version of order restricts the sale or delivery of new track-laying tractors to those having specific WPB authorization. (1-21-44)

●

L-158—Amended order removes time limitation of April 1 on the use of AA-1 ratings to cover production of replacement parts for specified vehicles. (1-20-44)

●

L-185—Amended order permits both new and used direct and indirect fired water heaters to be sold to consumers for replacement and maintenance purposes without ratings. (1-22-44)

●

L-193—Amended order permits manufacturers of conveying machinery and mechanical power transmission equipment to use small amounts of carbon steel in the fabrication of such equipment in place of the substitutes formerly employed. (1-20-44)

●

L-211—Sched. 9, as amended, prescribes certain standards for the manufacture of oil country tubular goods. The schedule does not relate to use; oil country tubular goods made in accordance with this schedule may be used for any purpose. (1-21-44)

●

M-1-g—Int. 1 rules that paint manufacturers may not deliver more than one gal. of aluminum paint or other aluminum coating, or 2 lb. of aluminum pigment in any one month to any retail outlet, whether or not the outlet is owned by the manufacturer, unless the outlet can furnish ratings of AA-5 or better. (1-20-44)

●

M-9—Order supersedes M-9-a and M-9-b which have been revoked, and permits more orderly release of copper. Dir. 1 maintains a steady flow of needed grades of copper scrap and prevents the accumulation of needed copper scrap in the hands of scrap dealers. (1-19-44)

●

M-9-c—Amended order prohibits the manufacture of new brass or copper tubing, pipe or fittings for installation in gas supply and gas distribution systems. (1-21-44)

●

M-21-a—Supplementary order amended to permit producers to melt carbon steel in electric furnaces without filing schedules and obtaining permission from WPB. Dir. 4 provides that each producer must use alloy scrap in not less than specified amounts for melts in any one calendar month. (1-20-44)

●

M-21-h—Amended order revokes the requirement that producers of tool steels file melting schedules before making their melts. (1-20-44)

●

M-293—Amended order transfers jurisdiction over scheduling of steam boilers. (1-22-44)

●

M-370—Order places certain chrome pigments under complete allocation. (1-21-44)

CMP Developments

● Int. 4 to Reg. 3 deals with use of production material ratings in ordering non-controlled materials and components for advance quarter delivery.

●

● Dir. 42 to Reg. 1 removes copper or copper base alloys powders from controlled materials list beginning Jan. 1.

●

● Dir. 44 to Reg. 1 permits producers and distributors holding off-grade or rejected steel or idle and excess inventories that cannot be moved under CMP to apply to WPB for permission to dispose of same.

NICKEL AIDS THE MACHINE TOOL INDUSTRY

to KEEP 'EM WORKING!

Everyone marvels at the speed of American production for war . . .

But how many realize that much of the credit should go to machine tool designers?

They are the ones who created the *tools* for doing the job.

They're making production miracles commonplace...with the most efficient machine tools that ever whipped raw material into finished product.

And the secret? For one thing, they try to design each component part of a machine so that it outlasts the machine itself.

They know that failure of a single machine in a mass production setup might bring whole assembly lines to a stop.

So they lean heavily on Nickel alloyed materials for the critical parts of machine tools.

Over the years they have learned that Nickel contributes toughness, strength, and fatigue resistance . . . properties vitally essential to many different kinds of tool parts . . . from grinder frames to tail shafts, from gears and spindles to drill chucks and lathe beds.

In the industries which use machine tools, it's an axiom that "a little Nickel goes a long way" to keep 'em working.

Whatever *your* industry may be . . . if you want help in the selection, fabrication, and heat treatment of alloys . . . we offer you counsel and data.

New Catalog Index

New Catalog C makes it easy for you to get Nickel literature. It gives you capsule synopses of booklets and bulletins on a wide variety of subjects — from industrial applications to metallurgical data and working instructions. Why not send for your copy of Catalog C today?

Standard Conveyors Synchronize Production All "Along the Line"

WORK in process is quickly shunted from one machine line to the next in this effective Standard Conveyor installation. The transfer table in the foreground consisting of a section of roller conveyor mounted on wheels, provides quick easy means of shifting the work-pieces from one line of roller conveyor to another. Two machine lines are thus continuously fed with work — without halt or interruption and with a minimum of manual handling.

Knowing how to apply power and gravity conveyors to best advantage is equally as important as building them well. An experience record of more than 35 years, serving all classes of industry and business, qualifies Standard Conveyor to be of service to you.

Write for valuable reference book—"Conveyors by Standard" — Catalog No. IA-1.

Plan Now for Post-War Construction

New York

• • • **Emphasis during** 1944 in the field of industrial engineering and building will be placed definitely on design work for post-war plant conversions, expansions and additions, according to the H. K. Ferguson Co., Cleveland.

Pertinent points summarized follow:

(1) Reconversions of plant facilities already are under way in some instances. Many Government plants have shut down. Some have been converted to other purposes while others are being dismantled.

(2) Some construction materials are now available for use in sufficient quantities but controls are still being maintained by Government agencies. By late summer it is hoped that WPB releases certain items. Top military and production men will then know better material requirements for the future because the European invasion pattern will be set.

(3) A shortage of designing and construction engineers is likely to develop. Corporations should plan in detail early, because men are now available and competent organizations are intact.

(4) The peak in building costs has not yet been reached. Post-war costs will be higher per unit than war costs. A run-away market is expected once post-war building starts.

(5) It is true that the country is "over-built" in total volume of factory floor space, but the floor space is generally not located in the proper places for economical use. The reasons are legitimate, the principal one being that sites for wartime plants and sites for peacetime plants do not have the same requisites.

Maintenance Arc Welding Subject of New Lincoln Book

• • • **First volume** of its kind on maintenance welding ever to be published by the trustees of the James F. Lincoln Arc Welding Foundation, "Maintenance Arc Welding" is the second book to be developed from the 1940-42 Industrial Progress Award Program. This compilation of 25 of the most outstanding maintenance studies in the group submitted deals with the use of arc welding in reclaiming broken and worn parts and also gives details on the application of welding in the fabrication of replacements.

Get all the facts about PLAST-O-LOCK GAUGES

● This three-color folder is just off the press. It tells you all about Turner's new Plast-O-Lock (pat. applied for) collet type gauge. This gauge is another first by the Turner Brothers in bringing to industry an improved type of standard plug gauge that will save you time and money in your inspection department.

WPB Maps Plan to Curb Industrial Accidents

Washington

• • • **With industrial** accidents claiming the lives of a full division of production soldiers each year—some 18,000 workers—the industrial health and safety section of the WPB labor production office has announced an anti-accident campaign. The campaign will be under the direction of a National Advisory Committee representing the A.F. of L., the CIO, the U. S. Chamber of Commerce, the National Association of Manufacturers, and the National Safety Council.

In the five-point plan proposed, the committee recommended and directed that the industrial health and safety section:

(1) In conformity with agreements reached with the Federal agencies having operational authority and technical staffs, should bring to the attention of such Federal agencies problems of industrial health and safety which are interfering with war production and which have been brought to the attention of the industrial health and safety section through the channels of the WPB, and that the industrial health and safety section should enlist the cooperation of such Federal agencies, labor and management in solving such problems.

(2) Establish procedures to assure the carrying out of remedial action suggested as a result of investigation by said agencies.

(3) Attempt to promote more intelligent and widespread acceptance by labor of its responsibility in the health and safety field. In this connection it was felt that top labor officials should be contacted immediately and their support and approval of an active campaign among labor unions be secured.

(4) Help promote the establishment of plant labor-management committees on health and safety. This is to be done wherever possible in conjunction with established labor-management committees, but it was felt to be vital that health and safety committees not be closely allied with committees dealing with wages and hours or other grievances.

(5) Assist in the establishment of classes on health and safety in cooperation with the U. S. Department of Labor and the U. S. Office of Education, and assist in the dissemination of literature prepared by Federal and other agencies interested in industrial health and safety.

Metals Export Club Elects E. C. Gyllensvard President

• • • **E. C. Gyllensvard,** export manager, Sullivan Machinery Co., was elected president of the Machinery-Metals Export Club, at its recent annual meeting in New York. Other officers elected are as follows: G. S. Gildersleeve, manager, export sales, Truscon Steel Division, Republic Steel Corp., first vice-president; E. H. Gaither, export manager, B. F. Sturtevant Co., second vice-president; F. J. Muller, Business Publishers International Corp., secretary-treasurer, and K. P. Bliss, Business Publishers International Corp., assistant secretary-treasurer.

BOHN

Station Wagons That Will Meet You

Magnificent new designs, like this one, will some day be popping up very rapidly. These advanced models will be powered with modern motors that will operate economically at high speeds. Bohn engineers will be of vital importance in developing these new engines. Light alloys by Bohn will be generously used. If your product can—or should be—made of a light alloy remember the Bohn organization. This is the only large scale operation in the world which engineers and fabricates aluminum — magnesium —and brass products within the one organization.

Tool and Die Makers Plan To Stave Off Business Failure

• • • A large 1944 promotion program is being planned by the Cleveland Tool, Die & Machine Shops Association under the direction of its new president, H. L. Freeman of the Industrial Machine Co.

As explained by F. W. Denning, treasurer and manager of the Denning Mfg. Co., the plight of the small tool, die and machine shops was somewhat alleviated in Cleveland when back in the days of the depression a small group of shop owners in the area formed an organization which was to become the nucleus of the present association. The association works to keep orders coming into Cleveland and, through a spirit of cooperation, eliminates unfriendly competition. Today, these little shops all over the country have helped greatly in lining up tool programs, engineering, designing, building tools and doing their part toward keeping assembly lines running smoothly in the entire war production machine.

The association's first president was Glenn Barth, and Joe Lyons, Fay McKinney and Al Sommer became its successive presidents. The group started out as a luncheon club which met each Wednesday. In 1943 under the administration of A. L. Sommer, president of Sommer & Adams Co., the organization was incorporated. The group is also affiliated with the National Tool, Die & Machine Association which was organized under the personal sponsorship of Mr. Sommer.

At a recent election the following officers were elected to the local organization's board of directors: H. L. Freeman, Industrial Machine Co., president; R. H. Cope, Bunnell Machine and Tool Co., vice president; F. A. Schmalz, Paramount Tool Co., secretary-treasurer. Charles J. Thomas of the Cleveland Chamber of Commerce was appointed executive secretary.

New England Foundrymen Elect T. C. Weiser President

• • • T. C. Weiser, Griffin Wheel Co., Chelsea, Mass., was elected president, and M. A. Hosmer, Hunt-Spiller Mfg. Corp., South Boston, vice-president of the New England Foundrymen's Association at the 48th annual meeting in Boston on Jan. 12. Arthur W. Gibby, East Boston was reelected treasurer, and Ernest F. Stockwell, Barbour-Stockwell Co., Cambridge, secretary.

PRECISION QUALITY CONTROL
• From raw materials to finished products, our system of thorough tests and checks assures precision accuracy in the manufacture of welded steel tube, tubular parts and assemblies. Your job is held rigidly to your specifications throughout all manufacturing operations.

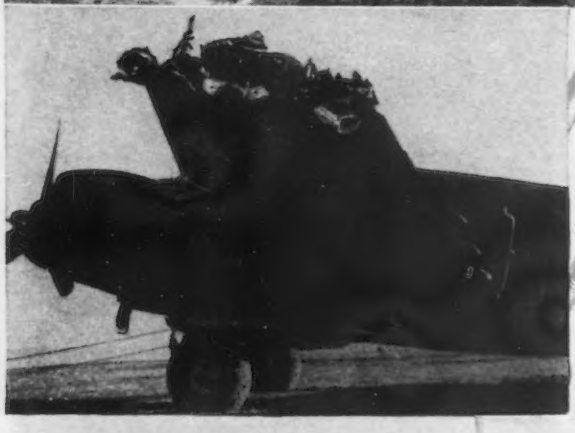
STILL BRINGING 'EM BACK-



Crippled, flak-riddled American built war planes are still bringing 'em back alive from the world's aerial battlegrounds — bringing 'em back in increasingly larger numbers to prove our supremacy of the air.

World mastery of air, land and sea can be credited to America's superior weapons, most of which are fastened with HOLTITE Screws, Bolts and allied fastenings.

BUY MORE WAR BONDS

Brazil Now Supplying War Goods, Seen As Big Post-War Market

• • • "**Brazil,** mineralogically richest country of South America, can be a major post-war market for United States industry only to the extent that North America assists in the development of that country's productive possibilities," Dr. A. Allen Bates, chemical and metallurgical manager of the Westinghouse Research Laboratories said following his return from a three-month stay in that country.

"Brazil," he said, "is the most fantastically rich country in the world in iron ore—the basic ingredient of industrialization." But, he added, "Brazil's industrialization has up to now been directed toward the provision of power facilities and transport, and the metallurgical sciences are just beginning to assume the importance there that they must have if the buried wealth of the land is to be turned into a commercial asset that will alter the whole economic and cultural structure of Brazil."

As an official representative of the U. S. government, Dr. Bates was invited by the government of Brazil to study technical education methods in that country and to set up a course in metallurgy at the Escola Politechnica, Brazil's leading technical school at Sao Paulo.

He was the first of three leading American metallurgists, working under the supervision of the Stevens Institute of Technology and the CIAA, who were loaned by this nation to help Brazil utilize her vast mineral wealth to turn from an agricultural economy to one based on strong domestic industrialization.

Dr. Bates said that "as an industrial metallurgist, I was deeply impressed by the wealth of ores and minerals in Brazil. In this country, we have already used the best of our iron ores, and are steadily depleting them further at a rate not pleasant to think about.

"Brazil, however, holds in her huge area one-third of the whole world's supply of this basic raw material. She also has extraordinary opportunities for the development of the electrical power so essential for the conversion of iron ore into the steels of industry." He pointed out that North America can use the fine Brazilian ores to bolster our own dwindling supplies, in return for coal for Brazilian steel mills.

"In that case," he said, "we can also

HERE'S YOUR ANSWER TO *Accurate Radii* —

• The form produced by a radius dresser is only as accurate as the diamond used to dress that radius form. It is because Wheel Trueing engineers know this—because they know the importance of extreme accuracy and precision in radius forming operations that the diamonds used in Wheel Trueing Radius Forming Tools are selected with the greatest care according to the particular radius each is to dress.

But careful selection of diamonds alone is not enough! The diamonds in these tools are set by experts who make certain that each diamond is concentric with the shank. And throughout the various manufacturing operations, these tools are subjected to rigid tests and careful inspections by men whose skill, experience and engineering knowledge cover the fields of industrial diamonds and grinding wheels. These men know diamonds! They know the production man's problems! They know how to design and manufacture tools to solve those problems!

Next time you buy radius forming diamond tools specify Wheel Trueing! You'll be assured of utmost precision, accuracy, dependable performance and money-saving economy. You'll get radius forming tools *engineered to your jobs!*

Other Wheel Trueing products include diamond tools for straight or form dressing—thread dressing—contact gauges—and drill bits for coring or blasting.

WHEEL TRUEING TOOL COMPANY

3200 W. Davison Ave. Detroit 6, Michigan

The need for close tolerances on high speed production of war equipment has given new importance to selecting polishing abrasives. That LIONITE has been selected in hundreds of plants indicates its ability to produce uniform results at high speed and low cost. LIONITE grains are noted for their uniformity from lot to lot.

Due to tremendous expansion over the past three years, production of LIONITE grains has increased many times over. Conservation Order M-319 has now been amended so that most users of 20,000 lbs. or less of abrasive grains in a two months' period can now purchase LIONITE without allocation. LIONITE grains in practically all sizes are now available for prompt shipment from stock.

GENERAL ABRASIVE COMPANY, INC.

Lionite and Carbonite Abrasive Grains

NIAGARA FALLS, NEW YORK, U. S. A.

help Brazil by enabling her to turn the wood of her vast forests into the by-products of wood distillation—alcohols and basic organic acids—instead of burning it as fuel. In the Brazilian climate, eucalyptus trees attain a diameter of 10 in. and a height of 60 or 70 ft. only nine years after planting.

Dr. Bates, who for 10 years was a professor of metallurgy at the Case School of Applied Science, joined the Westinghouse Electric & Mfg. Co. in 1937. When wartime demands placed many metals on the critical list, he directed the intensive research which led to the development of new substitutes. His division also developed and improved a number of new alloys which have vital military applications because of their ability to withstand high temperatures.

Born in Elyria, Ohio, Dr. Bates was graduated from Ohio Wesleyan University in 1923 with a degree of Bachelor of Arts. Further study at the Case School of Applied Science brought him the degree of bachelor of science in 1925 and that of master of science in 1927. After winning a fellowship, he went to France in 1931 to study at the Ecole de Metallurgie in the University of Nancy. From 1925 to 1937 he taught metallurgy at the Case School and at intervals during that period was also a consulting metallurgist for companies in Cleveland, Detroit, and elsewhere.

•

A **summary** by the Co-ordinator of Inter-American Affairs of the chief materials Brazil is supplying United Nations war industry follows:

Bauxite — Brazilian bauxite, described as of superior quality, with the advantages of shallow deposits and low mining costs, are being developed for export as well as for an aluminum industry in Brazil. Large deposits of bauxite are well distributed, particularly in the states of Minas Geraes, Espírito Santo, Maranhao and Para.

Beryllium—Brazil is rated the principal supplier of this light-weight mineral, which is used in combination with other metals to make heat and shock-resistant alloys especially adapted for airplane and automobile parts, surgical instruments and electrolytic processes.

Bismuth — This element, rather widely distributed in Brazil's mineral regions, is used in the preparation of alloys employed in the manufacture of electrical fuse wire, fire-fighting

apparatus and for safety plugs in boilers.

Corundum — Next to diamonds in hardness, corundum has an important war role in providing cutting edges and abrasives for machine tools. Geologists have located excellent deposits of corundum in Brazil to help supply war-expanded needs for this material.

Diamonds—Wartime industrial demand for diamonds makes the Brazilian deposits relatively more important than before the war.

Iron Ore—Brazil's iron ore deposits are generally recognized as among the largest known. Some deposits in the State of Minas Geraes assay as high as 90 per cent iron. Transportation is being improved to permit United Nations war industry to use the Brazilian iron deposits on a larger scale.

Steel-Making Materials — Brazil's mineral regions are productive of various materials which are used to give special qualities to steel indispensable in the manufacture of arms, farm machinery, rail and other heavy equipment. Notable among these alloying materials are manganese, chromium and molybdenum. Material for alloys has been an especially valuable contribution to United Nations war industry. Brazil's output of manganese has been expanded greatly. Also well distributed in Brazil's mineral regions are wolframite and scheelite, the ores from which tungsten is derived.

Mica—Brazil has become increasingly important as a source of high-grade mica for United Nations war industry, and is rated high in priority among United States imports, in view of the great production of electrical equipment for war purposes.

Monazite and Lithium—Along Brazil's shoreline and river banks are found sands which yield rare minerals prized for chemical uses. Brazil's monazitic sands are estimated to be the largest in the world and are the source of thorium, cerium and other rare minerals. Lithium is also derived from these rare minerals.

Nickel and Cobalt—United Nations war industry gets nickel mainly from Canada, but Brazil has substantial deposits which are being worked to some extent for wartime needs. It is one of the essentials in the manufacture of armour plate for battleships. Brazil's nickel deposits are a reserve for future use, including postwar industrialization in Brazil. Cobalt, likewise used in special quality steels, is found in Brazil in association with nickel.

ARC WELDING HIGH LIGHTS

MUREX ELECTRODES were among the first of the "hot rods" available to the welding industry. Introduced thirteen years ago by Metal & Thermit, these heavy, all-mineral coated electrodes for downhand welding were sensational because of the high currents at which they operated and the excellent, X-ray clean weld metal they produced.

Fabricators of pressure vessels, machine frames, bases and other heavy units were quick to appreciate the advantages of electrodes of this type, and to put them to use in reducing welding costs and improving the quality of welding.

Today, concerns who were among the original users of downhand Murex Electrodes are the leading producers of war materials and are making use of the high speed welding techniques which these "hot rods" make possible to turn out tanks, gun mounts, bombs and other armaments at an unprecedented rate.

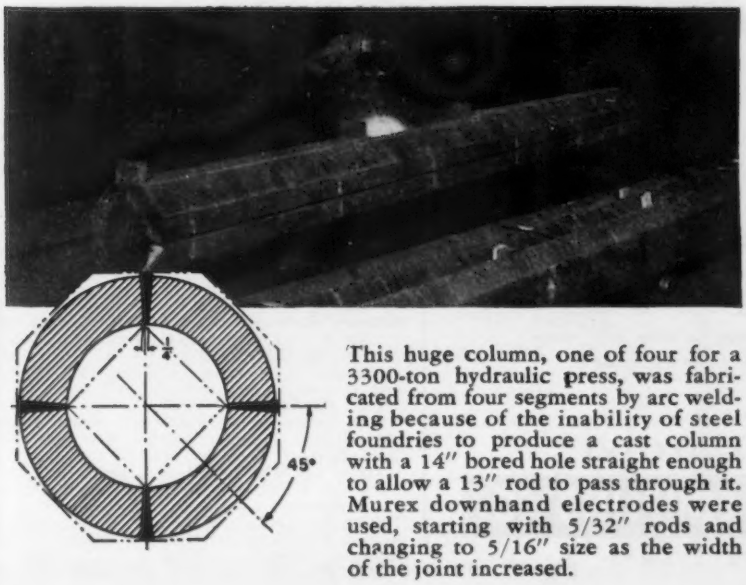
Illustrated are several typical applications—past and present—of this kind of welding.

The Murex line, of course, also includes electrodes for all-position work, for use with a.c. equipment, for welding alloy steels and for hard surfacing. Write for the Murex war time catalog.

Pressure vessels, made by Black, Sivalls & Bryson Inc. of Oklahoma City, for low temperature service in the oil refining industry, are fabricated with Murex nickel steel electrodes, chosen because of their fast downhand characteristics and high physical properties. Such pressure vessels are welded as rapidly as mild steel.

In the early days of coal mining every operation was performed by human labor and animal power. Today mechanization dominates every activity. Typical of the heavy equipment, which must stand hard and constant usage, is this Goodman Shaker Conveyor. Photograph shows welding a shovel trough of a duckbill loading head with Murex Electrodes, selected because of the strength and ductility of the deposited metal.

At the plant of the Eljer Co., Salem, Ohio, men who had become skilled in making plumbing fixtures are now turning out 1000-pound bomb casings. Photograph shows arc welding first pass on upper and lower portions of an aerial bomb. The use of downhand Murex Electrodes assures X-ray clean welds of good penetration and excellent ductilities.



This huge column, one of four for a 3300-ton hydraulic press, was fabricated from four segments by arc welding because of the inability of steel foundries to produce a cast column with a 14" bored hole straight enough to allow a 13" rod to pass through it. Murex downhand electrodes were used, starting with 5/32" rods and changing to 5/16" size as the width of the joint increased.

Electric Furnace Accessories Shown In Enemy Patent List

• • • In the twelfth list of seized enemy patents available on the obtainment of a license from the Alien Property Custodian, electric furnace accessories and controls are shown. These patents deal with all types of electrically heated industrial furnaces. This series of seized patents began in the Nov. 4 issue of THE IRON AGE, where information on rules and procedures was shown.

In the items shown, the sub-class number appears first, followed by the patent number, description, inventor's name and nation, and date of patent issuance. The patent description in full may be acquired from the Government in the manner described in the Nov. 4 issue of THE IRON AGE, page 95.

Class 13—Electric Furnaces

(1) 1,690,795. Electric furnace for melting and relining metals and metal alloys and especially steel. G. Sagramoso, Italy. 11-6-28.

(1) 1,830,992. Electric arc furnace comprising a double-walled furnace shell and a wide hearth or trough with a single wall. F. Frenzel, Germany. 11-10-31.

(6) 2,071,707. Electric furnace for melting glass in which the glass is melted by means of electric current flowing through the body of glass. J. Regenstreif and O. Sorge, Germany. 2-23-37.

(6) 2,274,986. Apparatus for drawing sheet glass. G. Kilian and R. Strohschneider, Germany. 3-3-42.

(9) 1,660,159. Production of alloys of the platinum group by means of an apparatus which melts small bodies of pulverized metals in the electric arc, consisting of a supporting plate of calcium oxide and means to apply one electrode parallel and adjacent to the surface of the plate and the other electrode diagonally opposite the first electrode. E. Haagn, Germany. 2-21-28.

(11) 2,164,024. Electric arc furnace for the performance of smelting processes and reactions in the solid or liquid phases. Kurt Schneider and Herman Schunck, Germany. 6-27-39.

(11) 2,171,435. Method of and means for magnetically blowing electric arcs on metal electrodes. K. Schneider and H. Schunck, Germany. 8-29-39.

(11) 2,171,436. Method of and means for magnetically blowing electric arcs on metal electrodes. K. Schneider and H. Schunck, Germany. 9-29-39.

(12) 1,669,453. Wiring system for transformers for multiphase furnaces. H. Brock, Germany. 5-15-28.

(13) 2,248,020. Means for automatically controlling and adjusting the electrodes of an arc furnace during operation thereof. K Freudenhammer, Germany. 7-1-41.

Copyright, 1944

(14) 2,297,484. Electrode holder consisting of two spaced superposed clamping jaw arrangements. F. Lehrer and J. Wotschke, Germany. 9-29-42.

(15) 1,675,742. Electrode holder for electric furnaces. F. Weckerle, Germany. 7-3-28.

(16) 1,677,712. Electrode holder, more especially for carbon electrodes in closed electric furnaces. J. Dion, Germany. 7-17-28.

(16) 1,737,890. Apparatus and method of controlling electrodes in electric furnaces without interruption of the furnace operation. F. Noichl and E. Schmidt, Germany. 12-3-29.

(16) 2,121,578. Means for adjusting the electrodes of electric furnaces. E. Winter and F. Luckerath, Germany. 6-21-38.

(18) 1,785,587. Method of connecting electrodes by means of which the stump of an old electrode is united with a new electrode. C. Kuhlmann, Germany. 12-16-30.

(18) 1,850,515. Device for joining two sections of a carbon electrode together. G. Peltz, Germany. 3-22-32.

(19) 1,840,491. Process of manufacturing carbon electrodes for electric furnaces. O. Dietsche, Germany. 1-12-32.

(20) 1,661,694. Electric resistance furnace

NEW 1944 CATALOG and

WIRE ROPE BUYERS' GUIDE

Replaces ALL other catalogs

Changes in wire rope strengths, sizes, grades makes this new catalog a necessity to anyone specifying, using, and buying wire rope.

Information contained in the new 1944 Guide will save you delay in purchasing of wire rope, as well as help you conserve (through proper maintenance) your present wire rope.

Designed, Written for Wire Rope Users

Every wire rope user who *needs* a catalog for reference should have *this* one. It will help you on the job. This is no ordinary manufacturer's catalog. It is designed and written for the wire rope consumer.

Ask for your copy of Catalog G-15

No Charge, simply write your request on company letterhead and mail to Macwhyte Company, or any of our distributors and mill depots near you.

NO. 709

MACWHYTE COMPANY

Wire Rope Manufacturers

2911 Fourteenth Avenue, Kenosha, Wisconsin

Mill Depots: New York · Pittsburgh · Chicago · Fort Worth · Portland · Seattle · San Francisco

Distributors throughout the U. S. A.

MACWHYTE PREformed and Internally Lubricated Wire Rope

MONARCH WHYTE STRAND Wire Rope

MACWHYTE Special Traction Elevator Rope

MACWHYTE Braided Wire Rope Slings

MACWHYTE Aircraft Cables and Tie-Rods

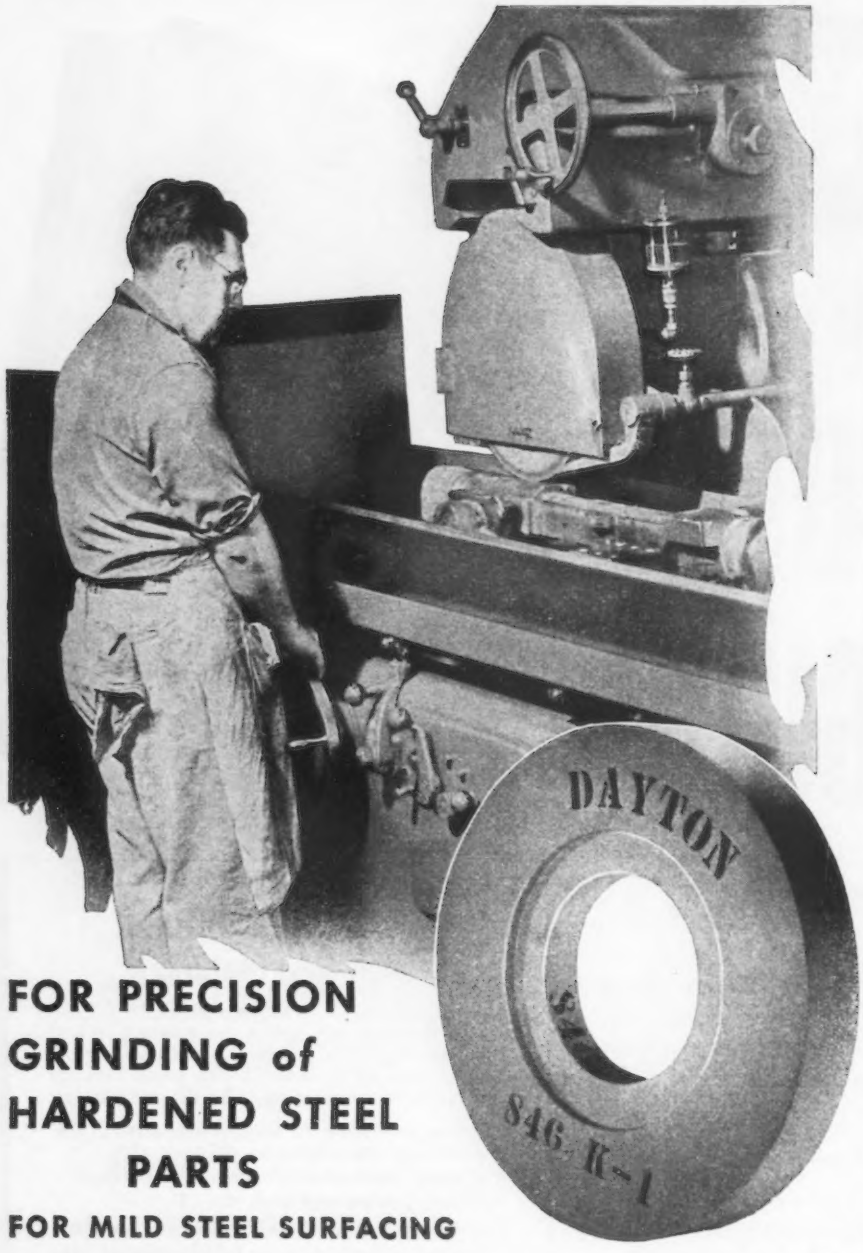
NEW TYPE GUIDE... Many New Features!

Inside the covers of this 160 page BUYERS' GUIDE are all the facts and figures you'd expect to find about wire rope, PLUS many that will surprise you. And it's completely indexed with visual tabs for quick reference. Here are only a few of many features:

- ★ ***All information*** **in accordance with NEW wire rope simplification plan**
- ★ ***Tabular index*** **for split-second reference**
- ★ ***Handy pocket*** **and desk size (4½ x 6½)**
- ★ ***Special binding.*** **Pages lay flat when opened**
- ★ ***Special information*** **on lubrication of wire ropes**
- ★ ***Wire rope constructions***
- ★ ***Slings***
- ★ ***How to order*** **wire rope**
- ★ ***Working loads,*** **safety factors, sheave and drum tolerances, reeling and unreeling, how to seize ropes, etc.**
- ★ ***90 pages of practical data*** **on use and care of wire rope**
- ★ ***Discount tables***
- ★ ***Glossary*** **of wire rope terms in daily use**
- ★ ***16 sections,*** **each with quick tab index**
- ★ ***Complete index*** **to each section printed on each tab index, plus a complete index in back of book, plus a special feature, "YOUR INDEX."**

When you buy wire rope be sure to specify

MACWHYTE PREformed WIRE ROPE



FOR PRECISION GRINDING of HARDENED STEEL PARTS

FOR MILD STEEL SURFACING

Almost daily this 846-K-1 Dayton wheel makes new friends. Not every wheel can make and support that statement.

Some find the 846-K-1 Dayton particularly effective when surfacing mild steel—maximum removal of stock with little wear on the wheel.

Others find it equally suitable for precision grinding operations—excellent finish—high production.

Still others use it, not to surface some one material only, but to process a variety of materials—high production and long wear the invariable result.

It may be that you are puzzled over some surface grinding problem. It may be that a Dayton 846-K-1 would solve that problem. Why not find out? Outline that problem by letter, wire, or phone. A Dayton 846-K-1, or some other Dayton wheel perhaps, may solve it for you.

Dayton Wheels in all types and sizes for all grinding requirements.

SIMONDS WORDEN WHITE COMPANY, 711 NEGLEY PLACE, DAYTON, OHIO

DAYTON GRINDING WHEELS

adapted for heating by nitrogenization. A. Fry, Germany. 3-6-28.

(20) 1,700,942. Apparatus for the production of substantially pure carbon for use in the manufacture of carbon filaments of the crystalline variety to be used in incandescent electric lamps. A. Lederer, Austria. 2-5-29.

(20) 1,747,934. Apparatus for hardening products of iron, steel and other ferro-magnetic materials. W. Heidenhain, Germany. 2-18-30.

(20) 1,776,053. Apparatus for the manufacture of castings of difficulty-meltable metals and metalloids. H. Voigtlander and O. Kaufels, Germany. 9-16-30.

(20) 1,995,524. Aluminium melting furnace adapted to be tilted like a cradle to each side of the vertical central axis, consisting of two melting chambers heated from the roof and a common collection chamber for the molten aluminium. E. Russ, Germany. 3-26-35.

(20) 2,104,886. Electrically heated annealing furnace. W. Rohn, Germany. 1-11-38.

(20) 2,323,051. Electric furnace comprising a resistance heating rod, a water-cooled metal terminal connected to said rod at one end of the latter, a carriage disposed outside the furnace, current feed wires connected to said carriage and a stationary support. O. Junker, E. Breuer, K. Knauff, Germany. 6-29-43.

(22) 1,678,875. Electric bright annealing furnace, in combination, an elongated air-tight furnace shell closed at the top and open at the bottom and filled with a protective gas during the annealing operation. W. Rohn, Germany. 7-31-28.

(22) 1,678,876. Electric bright-annealing furnace for continuously bright annealing. W. Rohn, Germany. 7-31-28.

(23) 2,206,608. Apparatus adapted for metallurgy and similar fields of utilization wherein high voltage, high frequency electric current is employed. H. Kikuchi and M. Hirose, Japan. 7-2-40.

(23) 2,215,045. Apparatus adapted for metallurgy and similar fields of utilization wherein high voltage, high frequence impulsive electric current is employed. H. Kikuchi and M. Hirose, Japan. 9-17-40.

(25) 1,637,167. Electrical heating body for high temperatures especially for ceramic metallurgical processes and chemical processes. F. Weckerle, Germany. 7-26-27.

(25) 1,695,860. Electric annealing or heating furnace. W. Rohn, Germany. 12-18-28.

(25) 2,140,228. Electrically heated furnace for producing high temperatures. H. Henk, Germany. 12-13-38.

(26) 1,642,198. High-frequency furnace circuit. F. Gerth and W. Fischer, Germany. 9-13-27.

(26) 1,811,213. Furnace heated by high frequency coils, the use of which is increasingly warranted in carrying out metallurgical processes. W. Rohn, Germany. 6-23-31.

(26) 1,837,031. High frequency induction furnace or heating apparatus. V. Engelhardt and R. Gross. 12-15-31.

(26) 1,843,044. Induction furnace for melting, annealing and similar kinds of industrial heat treatment in which a part of the secondary circuit is designed as a heating element. E. Russ, Germany. 1-26-32.

(26) 1,818,341. Device for annealing of metal rings of magnetizable material. F. Linnhoff, Germany. 8-11-31.

(26) 2,041,333. Apparatus for producing carbon-free metals, alloys, and the like. H. Gruber and W. Rohn, Germany. 5-19-36.

(26) 2,090,074. Induction furnace for heating and stirring molten metal. W. Rohn, Germany. 8-17-37.

(27) 1,645,526. High-frequency electric furnace for heating or melting metals. F. Gerth, Germany. 10-18-27.

(27) 1,721,073. High-frequency induction furnace comprising a crucible and a primary coil inductively associated therewith. W. Esmarch, Germany. 7-16-29.

(27) 1,748,706. Electric induction furnace of the air-core type. W Esmarch, Germany. 2-25-30.

(27) 1,983,242. Induction furnace in which each individual coil traversed by a certain phase of the current is arranged between two coils through which the two other phases of the current are flowing. W. Rohn, Germany. 12-4-34.

(27) 2,184,741. High frequency smelting furnace. F. Hartmann, Germany. 12-26-39.

(29) 1,676,545. Induction furnace of the type in which one or a plurality of closed channels in communication with a hearth are surrounded by the transformer core or a plurality of cores. R. Gross, Germany. 7-10-28.

(29) 1,770,662. Induction furnace in which the bottom or hearth of the melting chamber is inclined and descends from the upper, smaller end of the channel to the lower,

larger end thereof. E. Russ, Germany. 7-15-30.

(29) 1,793,137. Electric furnace for the smelting of metals which have grooves filled with molten metal and terminates at the upper end in a hearth space. E. Russ, Germany. 2-17-31.

(29) 1,977,388. Electric induction furnace of the type having a pool for molten metal and walls forming a single submerged channel. H. Ilberg, Germany. 10-16-34.

(29) 2,166,734. Low-frequency induction furnace of the type having a vertical melting channel. R. Strube and W. Ewald, Germany. 7-18-39.

(31) 2,219,612. Electric reaction furnace operating under reduced pressure. B. Berghaus and W. Burkhardt, Germany. 10-29-40.

(31) 2,231,104. Electric reaction furnace having a sieve or filter provided in the gas inlet or gas outlet. B. Berghaus and W. Burkhardt, Germany. 2-11-41.

(33) 1,837,070. Apparatus for charging aluminum producing furnaces. E. Roth, Germany. 12-15-31.

(16) 1,928,854. Electrode suspension means adaptable to electrodes which are baked in the furnace in which they are used. Jean Grolee, France. 10-3-33.

(18) 1,613,212. Self-baking electrode which has a contact supplying electric current to the electrode without substantial loss of voltage. Jens Westly, Norway. 1-4-27.

(18) 1,691,505. Electrode which is baked in the furnace in which it is used, with a casing around the electrode outside the mantle, used as a mould for the electrode during the tamping. Martin Walther, Norway. 11-13-28.

(18) 1,686,474. Self-baking electrode with a shell structure. Carl Wilhelm, Soderberg, Norway. 10-2-28.

(18) 1,640,735. Process of making channeled continuous electrodes. Carl Wilhelm Soderberg, Norway. 8-30-27.

(18) 1,686,302. A means of distance handling of electrodes. Martin Walther, Norway. 10-2-28.

(18) 1,723,582. An attachment for use between the inserts and the electrode mass by giving the carbon inserts such a shape that the electrode mass may penetrate into or surround the single parts of the carbon inserts. Mathias Ovrom Sem, Norway. 8-6-29.

(18) 1,774,674. Electrode baked while in use in the electric furnace consisting of a baked and unbaked part. Mathias Ovrom Sem, Norway. 9-2-30.

(18) 2,193,434. Electrode with slide contacts. Mathias Ovrom Sem, Norway. 3-12-40.

(19) 1,639,007. Process of building up self-baking electrodes. Mathias Ovrom Sem, Norway. 8-16-27.

(19) 1,670,052. Electrode mass for self-baking electrodes. Carl Wilhelm Soderberg, Norway. 5-15-28.

(19) 1,675,674. Process for the production of carbon electrodes. Imre Szarvasy, Hungary. 7-3-28.

(19) 1,751,177. Process which avoids previous heating of the paste which is used in the manufacture of self-baking electrodes. Mathias Ovrom Sem, Norway. 3-18-30.

(19) 1,783,135. Carbon adapted for electrotechnical use and a process of manufacture thereof. Marcel Oswald, France. 11-25-30.

(19) 2,159,183. Process permitting the electrode to be lowered through its casing while in use. Mathias Ovrom Sem, Norway. 5-23-39.

(19) 2,224,739. Continuous electrode and method of supplying current thereto. Luigi Manfredini, Italy. 12-10-40.

(20) 1,734,536. Resistance type electric furnace suitable for thermic treatment of metals. Victor Sorrel and Louis Andre, France. 11-5-29.

(21) 2,089,022. Means for heating, fusing and/or casting articles made of substances having a high melting point in an electrical furnace. Henri George and Gaston Delpech, France. 8-3-37.

(21) 2,104,555. Single-phase furnace employing one or more electrical resistances which radiate heat upon the substance to be treated. Blaise Cousteix, France. 1-4-38.

(21) 2,104,557. Means for heating, fusing and/or casting articles made of substances having a high melting point in an electrical furnace. Henri George, Paris. 1-4-38.

(21) 2,214,123. Electrical furnace heated by heat radiation originating from electrical heating elements installed within the heating chamber and carried by its cover. Gaston Delpech, France. 9-10-40.

(23) 1,806,210. Electric furnace enabling the conductors heretofore used to be dispensed with and to employ the furnace casing as a conductor. Paul Louis, Joseph Migust, France. 5-19-31.

(23) 1,997,524. Electrical resistance furnace. Jean Kuntziger, Henri Delecourt and Joseph Raison, Belgium. 4-9-35.

(23) 2,304,016. Salt bath furnace for heat treatments of metals, with a view to tempering, cementation, cyaniding, annealing and the like operations. Ivan Psyches, France. 12-1-42.

(25) 2,253,981. Current supply device for resistors of electric furnaces. Ivan Psyches, France. 8-26-41.

(26) 1,743,956. Induction furnace consisting in disposing a few magnetic iron cores externally of the primary circuit. Paul Emmanuel Bunet, France. 1-14-30.

(26) 1,786,202. Apparatus for high-temperature treatment of ores and other substances. Marcel Fourment, France. 12-23-30.

(26) 1,885,966. Automatic rotary machine heating by induction. The products are heated during rotation of furnaces and ejected towards the end of each revolution of the machine. Pierre Viry, France. 11-1-32.

(27) 1,763,229. Apparatus for the treatment of gases at high temperature, with a view to obtaining a uniform temperature which can be controlled at will. Marcel Fourment, France. 6-10-30.

(27) 2,216,567. Centrifugal electric furnace plant intended for use in melting and casting or sintering in one single operation articles of ultra-refractory material. Robert Esnault-Pelterie, France. 10-1-40.

(28) 1,760,741. Magnetic-core induction furnace. Paul Emmanuel Bunet, France. 5-27-30.

(28) 1,805,469. Electric furnace of the type to be heated by high frequency currents. Rene Dufour, France. 5-19-31.

(33) 1,784,699. Automatic charging of electric furnaces. P. Miguet, France. 12-9-30.

(33) 1,807,090. Method of charging electrical furnaces and apparatus for carrying out said method. G. Pistor, Germany. 5-26-31.

(34) 1,756,457. Manufacture of objects consisting of refractory, insulating, abrasive, or like substances. M. Fourment, France. 4-29-30.

(This Feature To Be Continued in an Early Issue.)

DPC and Army Announce New Contracts

• • • **The War Department** announced Jan. 12:

Award of contract to John Bowen Co., Boston, for construction of buildings, grading, paving and utilities at Bedford Airport, Bedford, Mass. Estimated amount of the contract is $547,410. Work will be supervised by the Boston district office of the Corps of Engineers.

Authorization for construction of runway improvements, widening taxiways and extension of existing night lighting system at Brookley Field, Ala. The initial authorization is $500,000. Work to be supervised by the Mobile district office of the Corps of Engineers.

Authorization for runway construction at McClellan Field, Sacramento Air Depot, Cal. Initial authorization is $500,000. Work will be supervised by the Sacramento district office of the Corps of Engineers.

• • • **Defense Plant Corp.,** RFC subsidiary, has authorized the following contracts:

Tube Turns, Inc., Louisville, Ky., to provide additional equipment at a plant in Jefferson County, Ky., at a cost in excess of $145,000, making a total commitment of more than $2,000,000.

Motion Pictures Engineering Corp., Chicago, to provide equipment at a plant in Cook County, Ill., at a cost in excess of $25,000.

Higgins Aircraft, Inc., New Orleans, La., to provide additional facilities at a plant in New Orleans at a cost in excess of $3,750,000, making a total commitment of more than $29,800,000.

North American Aviation, Inc., New York, to provide additional plant facilities at Inglewood, Cal., at a cost in excess of $1,500,000, making a total commitment of more than $9,600,000.

Sun Oil Co., Philadelphia, to provide additional equipment at a plant in Toledo, Ohio, at a cost in excess of $950,000, making a total commitment of more than $7,300,000.

Ozark Ore Co., Cleveland, Ohio, to provide plant facilities at Iron Mountain, Mo., at a cost in excess of $1,000,000.

Renown Stove Co., Owasso, Mich., to provide equipment at a plant in Owasso, at a cost in excess of $45,000.

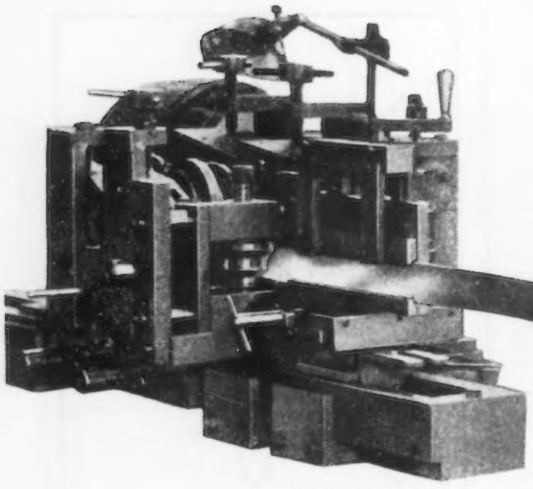
When a single hair is too thick! .

Copy restrictions forbid divulging the exact use made of these tiny springs but "electronics" conveys the idea. Wound from .018 stainless steel wire the one stumbling block to quantity production was the requirement of testing thousands daily as the allowable variation in length under load must be held to exceedingly close limits.

The device we employ—we made it ourselves—reads to one thousandth of an inch yet is so simple to operate that one girl without past experience now handles inspection with ease. Rejects are no longer a bugaboo. If *ingenuity* can help you—

Write, wire or better still . . . phone us.

AMERICAN SPRING OF HOLLY, INC.
HOLLY, MICHIGAN



Your Forming Rolls tell the Story!

ROEBLING FLAT WIRE pays off when it is formed, punched, sheared or drawn . . . pays off in the form of faster production, fewer rejects. It's the effect of holding dimensions *to strict tolerances,* of seeing that steel analysis is *right,* temper and uniformity *closely controlled.*

And flat wire is just one of a family of Roebling Wire Products that gets this custom-tailored treatment. With steel-making facilities, trained manpower and special production tools, we are ready to deliver either round, shaped, flat wires or strip steel that will help your fabricating machines do a better job.

New York WPB Conference Draws Big Attendance

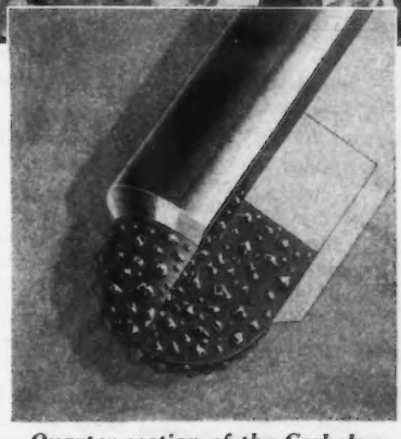
• • • **Over 1000 production engineers** and metallurgists attended the 11 industries panels held in connection with the War Production Conference held in New York, Jan. 14, under the sponsorship of the Engineering Societies Committee on War Production at the request of the WPB. It was the third and largest such joint meeting held in this area. Problems relating to metallurgy, foundry industries, welding, tool engineering, manpower utilization, chemical industries, transportation and safety were discussed. Capt. Eddie Rickenbacker was the dinner speaker. He related his experiences in visiting all world battle fronts.

Among some of the technical papers presented were several on non-ferrous foundry practice, including two on light metal alloys presented by R. E. Ward, metallurgist, and A. Cristello, foundry manager, Eclipse-Pioneer Division, Bendix Aviation Corp.; two papers on centrifugal castings, one on non-ferrous metals, by I. E. Cox, chief engineer, National Bearings Metals Corp., the other on ferrous metals, by S. D. Moxley, chief metallurgist, American Cast Iron Pipe Co., Birmingham. G. L. Ritcher, metallurgist, Farrel Birmingham Co., discussed cast iron foundry problems. The processing and selection of NE steels was the subject of a paper by Dr. N. E. Woldman, chief metallurgical engineer, Eclipse-Pioneer Division, Bendix Aviation Corp.

At the tool engineering session, Philip M. McKenna, president, Kennametal, Inc., described the progress made in the application of steel cutting carbides in recent years. He showed a high alloy steel aircraft wing hinge that had been milled at 660 ft. per min. with a chip load of 0.005 in., using a slotting saw with negative rake and negative helix angles. Surface speeds twice those commonly used for turning may be safely used for milling, Mr. McKenna said, and he indicated that a bed type miller, because of its more rigid construction, gave twice as many pieces per grind as a knee and column type machine.

Frank W. Curtis, consulting engineer, Induction Heating Corp., illustrated some ingenious fixtures designed to facilitate induction brazing and hardening of various small components. Transite, glass and plastics served very well for this type of fixture application since these materials are non-magnetic and non-conductors.

GET THIS EXTRA SERVICE FROM DIAMONDS WHEN DRESSING GRINDING WHEELS!



WHEN you use diamond-impregnated Carboloy Dressers you get extra service from every carat of diamond. Special matrix holds even extremely small particles securely. Makes possible the use of small stones—thus taking advantage of greater proportionate area of harder, tougher, outer-skin per carat. Each diamond keeps dressing right down to the last particle of usefulness—giving you as much as 90% utilization of diamond content. No need to switch to small jobs as the dresser wears. If required, you can use same dresser, throughout its life, on same size of wheel.

Carboloy Dressers give you these advantages plus elimination of all remountings—uniform, dependable results—and at least a 25% annual saving in diamond dresser costs. For rough, semi-finish, and finish dressings. Available in three sizes at $9.60, $12.60 and $15.35, including desired standard holder. Write for folder DR-100.

Quarter section of the Carboloy Dresser shown above. Fits all standard holders. No remountings necessary. To get a new cutting surface, simply give dresser a ¼ turn in holder. Long periods of continuous service. 2 minutes to "recondition" when required at infrequent intervals.

For GENERAL USE ON GRINDING WHEELS

Re-Issued

WITH A

Distinctive New Feature

A revised edition of our Tool Manual is just off the press. It has been brought up to date and a new section added, called "Tool Wear Analysis."

Unique ways and means for determining how overall performance may be improved following visual inspection of a dull tool are described and illustrated by charts. The analysis is based on the premise that the best tool performance and maximum life between regrinds is realized when conditions are such that the dulling of a carbide tip due to edge wear and dulling due to top surface wear are maintained in balance, and at a minimum.

This new section of the Manual suggests that a check be made: First, of the prevailing grinding methods to see if they are in harmony with recommended practice; second, of the cutting speed used, to ascertain if it is within the prescribed general range for the particular material being machined. A chart is provided to show the proper relation between speed and feed, and how adjustment may be made in this respect for best results as to wear resistance on a particular job within the limits of a single carbide grade. Finally, characteristics of the several KENNAMETAL grades are given with charts provided to facilitate analysis and to determine if a change in grade would be advisable to effect improvement.

You will, of course, want this valuable manual with its distinctive new feature; it will help assure the continued efficiency of your KENNAMETAL tools. A copy will be forwarded upon request.

—●—

The revolutionary method of analysing tool wear discussed in the KENNAMETAL Manual is also available in form of a wall chart especially designed for shop and tool room use. Write for yours today.

SUPERIOR CEMENTED CARBIDES

Briefly Told—

• Cancellations during 1943 of orders held by General Electric Co. totaled more than $450,000,000, according to President Gerard Swope, while orders received amounted to $1,360,643,000. Orders during 1942 were 32 per cent higher, totaling $2,003,039,000. Unfilled orders on hand and assured business pending at the close of the year was equivalent to about a year's output at current production rates and prices, Mr. Swope said.

●

• The M9 anti-aircraft gun director, in addition to its tracker, consists of an electrical computer and a range finder, each separate but coordinated with each other. It tracks the plane, automatically calculates the lead of the guns to suit individual conditions, aims, and follows the plane flight electrically. Army officers hail the M9 director as "one of the greatest advances ever made in the art of gun fire control."

●

• With restrictions partially lifted on the Army's new M9 anti-aircraft gun director, it can now be revealed that its tracking device relies on a pair of mechanical type variable speed transmissions for accuracy in following the flight of enemy aircraft. Two modified Model 25 Graham built drives are used, one to rotate the tracker in azimuth and the other to control elevation.

●

• War plants in upstate New York have turned back nearly $25,000,000 of their war profits to the Government as a result of renegotiation of their contracts, according to Col. Frank J. Atwood, chief of the Rochester Ordnance District. In addition, the plants have paid back $9,000,000 in voluntary refunds. Excess profits developed largely because of the "difficulty in forecasting costs," according to Col. Atwood.

●

• Buffalo plants of Curtiss-Wright Corp.'s airplane division are completing contracts for P-47 Thunderbolts, reducing production of P-40 Warhawks and stepping up output of C-46 Commando cargo carriers. Despite reduction in P-40 output, more of these planes will continue to be built than in pre-Pearl Harbor days. The shifts in production are being accompanied by an increasing need for additional workers.

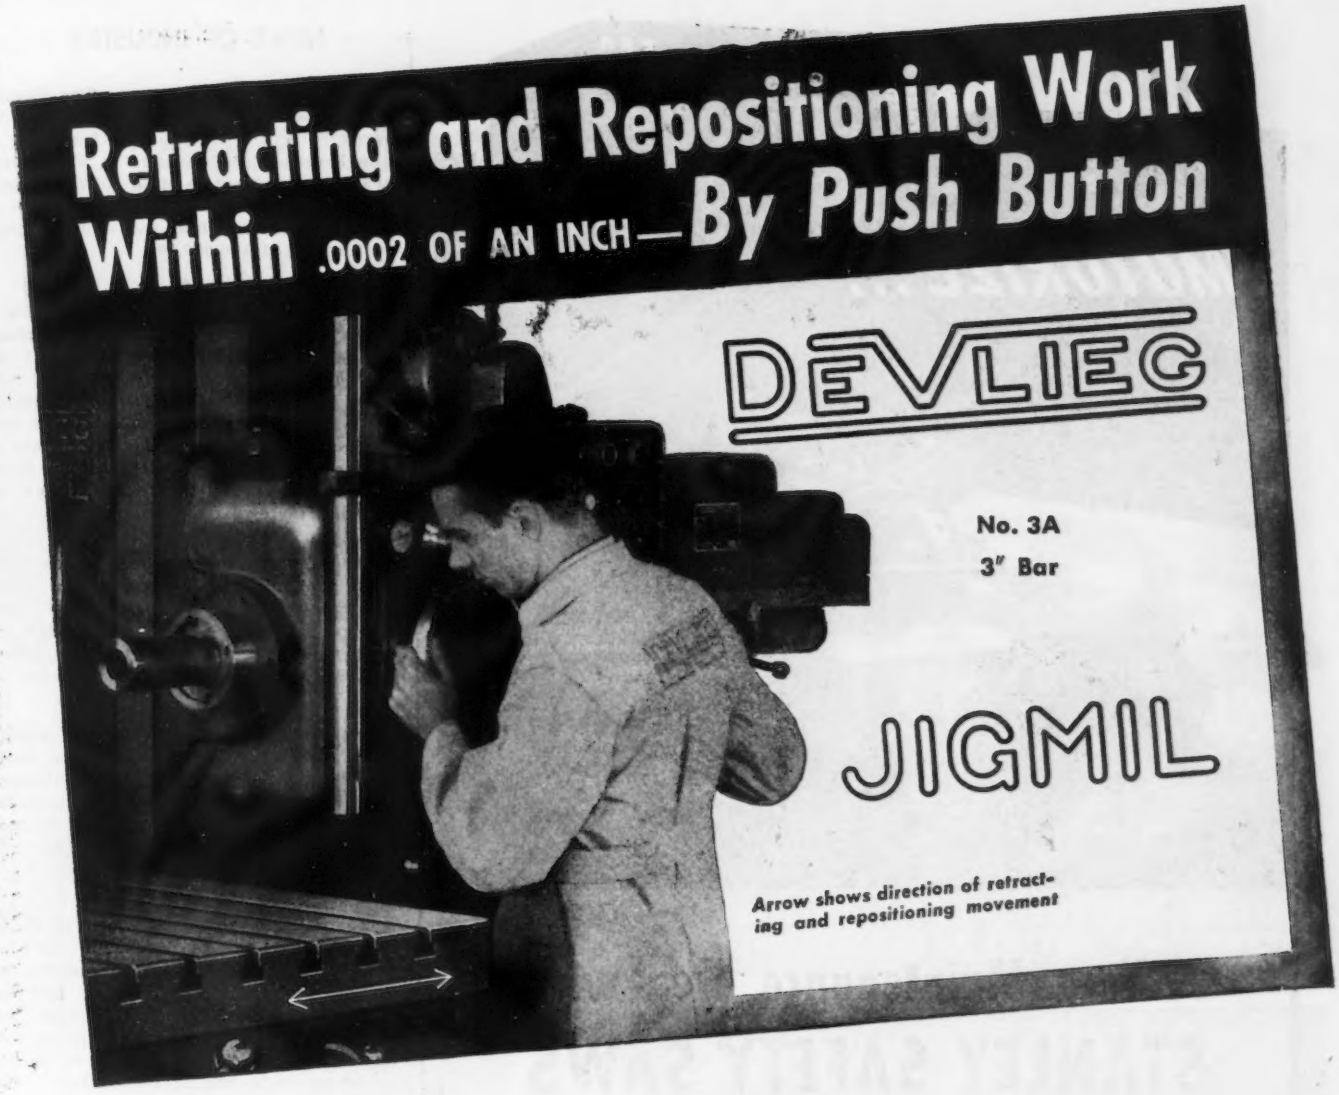
●

• Carnegie-Illinois Steel Corp. set a new production record of 22,743,000 ingot tons during 1943. New high marks in 16 blast furnace units and 25 steel-producing units were set during the year. There were also 33 new annual Carnegie-Illinois records made by rolling mills, 13 by miscellaneous producing groups and one by coke oven units. During December a new company monthly record production of over 1,150,000 tons of coke was established.

●

• In 1943 the Fore River Yard and Bethlehem-Hingham Yard launched 99 ships having a total value of $400,000,000. The ships ranged from destroyer

Retracting and Repositioning Work Within .0002 OF AN INCH—By Push Button



The most frequently needed function in a precision boring machine is that of retracting the work to facilitate measuring and tool setting.

In the DeVlieg Jigmil, this function is automatic—by fingertip control. Operation of a push button unlocks the table and moves it by rapid traverse to the desired position for measuring. For repositioning, operation of a single push button will cause the table to return to its cutting position by rapid traverse, stopping and locking automatically. Uniformity of selected position for stopping and locking is dependable within .0002".

The DeVlieg Jigmil is a new type machine—has the spacing accuracy of a Jig Borer — Performance Qualities of a Milling Machine—Convenience and Flexibility of a Horizontal Boring Mill. All control is so centered and organized that the operator never has to take his eyes off the work.

Thus, the Jigmil fulfills the machine tool ideal—a powerful and accurate extension of the operator's hand.

Many machines show 75 per cent greater average daily productivity.

escorts to aircraft carriers. The Bethlehem-Hingham yard produced more destroyer escorts than any other yard in the United States, while the Fore River was the only yard to build heavy cruisers. Peak employment approximated 51,000 at the two yards, while the monthly payroll averaged $16,000,000.

•

• In a letter to Premier Stalin pledging a 20 per cent production boost in 1944, residents of the Sverdlovsk district of the Urals said they boosted output 50 per cent in 1943 compared to 1942. One girl turned out 300,000 shells above her quota, it was said. Economies in fuel were made, including 88,000 tons of coke while increasing production. The Veisokogorsky iron mine saved 4,000,000 kw. in electrical energy.

•

• The Curtiss-Wright Corp.'s three manufacturing divisions produced 26 times as many warplanes, engines and propellers during the first 11 months of 1943 as during the corresponding period in 1939, an increase of 2500 per cent.

•

• More than a million American soldiers with imperfect eyesight have been made more efficient for military duties through an eye-correction program inaugurated by the Army two years ago and directed by the Surgeon General's office, the American Optical Co. said recently.

•

• To pay for the prize award of $4500 and expenses of the Museum of Fine Arts mural competition for a mural for the Museum library, the Van Norman Machine Tool Co., Springfield, Mass., recently presented the president of the Museum's trustees $5000. At a special ceremony at a Springfield Rotary Club luncheon, Charles Van Norman, chairman of the board of the company, turned over to Dr. William B. Kirkham, president of the museum trustees, Van Norman's contribution to the Museum's national competition won by Pvt. Sante Graziani, U.S.A.

•

• Thirteen thousand cases of reported sabotage, none directed by a foreign power, have been investigated by the FBI within the last two years. One case in ten was found to be actual, according to Fred Hallford, special agent.

•

• Conveyor belts tapping hitherto inaccessible mineral deposits, smaller power drives with higher efficiency, and high-pressure hose especially adapted to new x rays for trees and foliage lead the list of war-developed post-war possibilities in the rubber industry which are certain to alter peacetime America's industrial, agricultural and mining scenes, according to Goodyear Tire & Rubber Co.'s managers.

•

• With nearly 3,400,000 housing units thus far provided for essential war workers, the war housing problem has been mastered in the majority of the nation's crowded war industry centers, according to John B. Blandford, Jr., Administrator of the National Housing Agency.

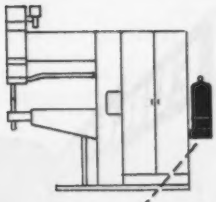
•

• The late Dr. Charles Francis Brush was honored by the Navy Dec. 28, when a destroyer bearing his name went down the ways at the Bethlehem Steel Co. Staten Island, N. Y., shipyard.

•

• Membership in the Gray Iron Founders' Society in December was at a new record high of 739 foundries in 42 states and Hawaii, according to W. W. Rose,

SCIAKY

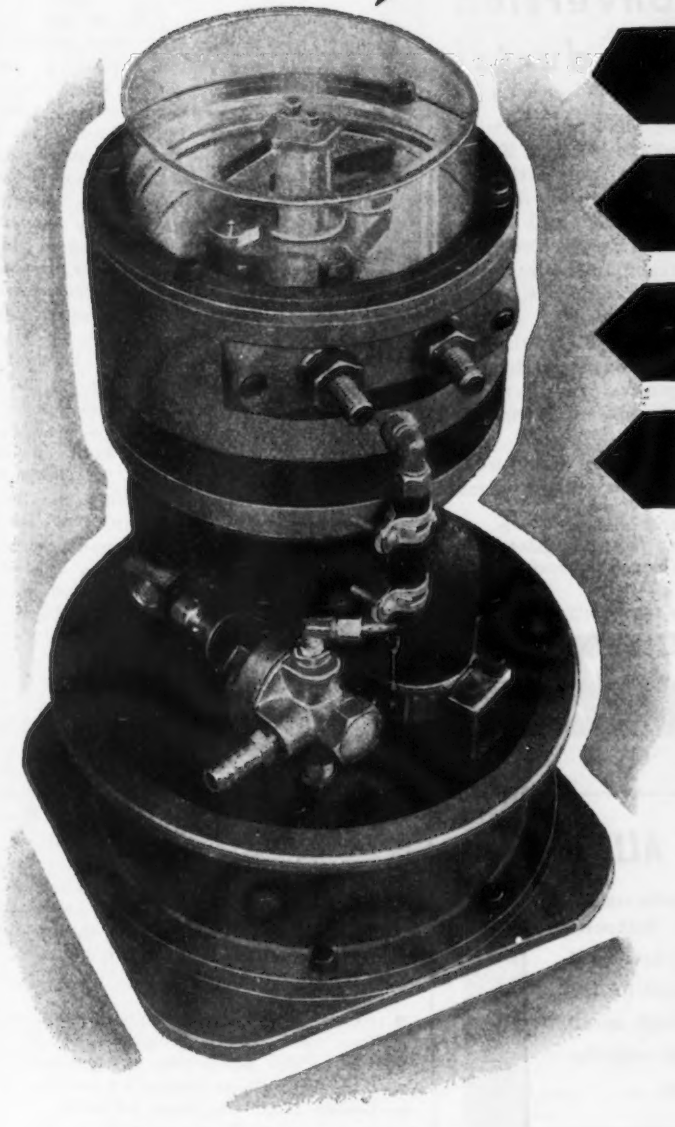


announces a significant achievement in the field of electro-magnetic stored energy resistance welding . . .

a d-c current interruptor — *without arc*

DYNATROL

PATENT PENDING



NO ROUTINE MAINTENANCE REQUIRED

ACCURATE CONTROL OF SECONDARY CIRCUIT DUE TO ABSENCE OF ARCING IN PRIMARY

INCREASED EFFICIENCY OF ELECTRO-MAGNETIC ENERGY SYSTEM — SHORTER CHARGING TIME

SPEED INCREASED 20% OVER MACHINES OPERATING ON CONTACTOR SYSTEM

THE SCIAKY DYNATROL provides the answer to contactor problems on electro-magnetic stored energy resistance welding equipment. This high-speed device performs the function of accurately interrupting the charging current to the reactor *without arc.*

The problem of interrupting a d.c. current in a highly reactive circuit has always been considered difficult because it is necessary to dissipate the electro-magnetic energy stored in the circuit in order to stop the flow of current. On former Sciaky machines, this was accomplished by a contactor unit, which together with an arc-blowing device, arc-laminating shields, etc., produced a highly accurate interruption of the charging current.

However, in industrial production, the continuous arcing finally results in a deterioration of the contact tips, requiring periodical maintenance and replacement. It was considered desirable to solve this problem in such a way that the same consistent welds be produced without any maintenance of the interrupting device. To this end, the DYNATROL was developed and was found to be not only a means of more accurate and efficient current interruption, but also, because of the shorter charging time, *actually increases operating speeds 20%.*

The DYNATROL is available on all Sciaky Stored Energy machines up to 50KW.

Descriptive bulletin 201-A ready soon. Write for your copy.

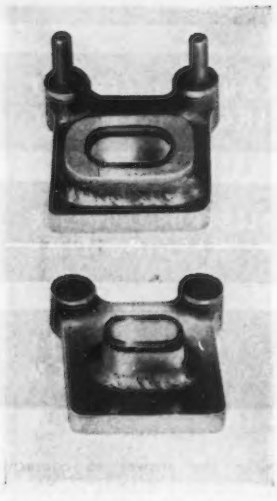
Eureka TOOL STEEL ELECTRODES

save vital tool steel for Victory

Eureka TOOL STEEL ELECTRODES

save time in Reconversion to Postwar Products!



RIGHT NOW we are all devoting 100% of our time to the winning of the war, and the Welding Equipment & Supply Company's Eureka Tool Steel Electrodes are doing their part by saving tons of *vital* tool steel, and countless man-hours. This savings is accomplished in the many industries where Eureka Tool Steel Electrodes are being used in the repair and maintenance of Tool and Die sections and the composite construction of new dies by welding.

When *peace* again prevails, Eureka Electrodes will play an equally important part in industry by helping to speed up the reconversion for postwar manufacturing by saving valuable time in the composite fabrication of new dies.

Illustrations at left show fabrication dies with Eureka Tool Steel Electrode deposits used as cutting edges.

★ *If you are making postwar plans now, we invite you to write us for complete information on Eureka Electrodes today.* ★

executive vice-president. This is a net gain of 111 during the past year.

■

• A. M. Byers reported gross sales increased 18 per cent to $24,157,136 in 1943 over the preceding year, but net profit dropped from $1,195,422 to $1,147,113 because of higher labor and material costs and taxes, which were $506,049 over 1942.

■

• A practical demonstration of foundry methods, from blueprints to finished casting, was devised recently by members of the Eastern Division of the Steel Founders Society of America and set up, together with a melting furnace in full operation, in the Hall of Prime Movers at the Franklin Institute, Philadelphia. Sample castings are poured at relatively low temperatures from the Ajax-Tama-Wyatt electric induction type furnace, and the various ways of applying gates and risers, as well as proper mold and core handling for steel and iron, are illustrated by representative castings, both finished and in the rough. Modern tool set-ups for machining iron, steel, and malleable castings are also explained.

■

• Republic Steel Corp. broke all basic producing records during 1943. Steel production averaged 100.4 per cent of capacity as compared with 99.6 per cent in 1942. Electric furnace ingot production, amounting to 1,085,000 tons, exceeded the 1,029,067-ton output of the entire industry in 1939. Republic's 1942 tonnage of electric furnace ingots was 916,000 tons. Coke output increased from 4,735,000 in 1942 to 5,109,000 tons in 1943. Pig iron output in 1942 was 5,316,000 tons and in 1943 was 5,548,000 tons. During the year Republic established 20 new steel ingot production records, 17 blast furnace records, and 22 coke records.

•

• An almost silent primer for the Mark V hand grenade has been developed, enabling American troops to throw grenades without revealing position. Development of the new primer from a shotshell primer was revealed by Winchester Repeating Arms Co., a division of Western Cartridge Co. The hand grenade primer merely sets off a fuse, whereas a shotshell primer, operating under high pressure, must ignite the smokeless powder in the shotshell. For this reason the "bang" of a shotshell primer has been reduced to a mild "plop" by a revision of the priming mixture formula. Increase in the use of grenades in close combat is focusing attention on this weapon. An article in a recent issue of *The American Rifleman* points out that considerable close combat is the order of the day. Close combat is encountered by infantry in consolidating ground gained and in jungle fighting. Grenades augment primary weapons such as the rifle in trench or foxhole warfare and where the enemy may be encountered at close quarters.

•

• WLB approved a company-wide incentive plan for Westinghouse Electric and Mfg. Co. permitting non-production workers as well as production employees to benefit from increased efficiency. The approval covers the company's 30 plants, and the plan was sponsored jointly by the company and the CIO United Electrical, Radio and Machine Workers of

"... and to my daughter, Abigail, I bequeath my good Brass skillet"

LIFE was earnest and frugal . . . inflation was a purely physical phenomenon . . . when the colonies were young. Implements of living were painstakingly made of the longest-lived materials, to last from generation to generation. And so it was, naturally, that good honest brass was wrought into kitchen utensils, warming pans, andirons, vises, tankards, table plate, and other basic necessities. These were heirlooms, often taxable, always specifically mentioned in wills, usually important considerations to dowry-minded wife seekers.

And the honest qualities that made brass a respected household servant, then, have made it a well-nigh universal servant since. To industry, in thousands of uses, brass has brought the otherwise impossible combination of advantages of strength, ductility, resiliency, with ready machinability and extraordinary durability . . . plus, when needed, a lasting decorative value that runs the spectrum from rich russet to corn-tassel gold. And it is a fact worth remarking that in many of these uses, no satisfactory substitute has ever been found for brass. For the simple reason that brass, like a faithful friend, *wears well* in every aspect of its character.

This is how brass has been regarded . . . and also how it has been made . . . for the past ninety-three years, in the mills at Bristol.

BRISTOL BRASS

CORPORATION

Makers of Brass since 1850, Bristol, Conn.

STRENES METAL
IN FRONT LINE OF SERVICE

BEFORE THE WAR

Strenes can be cast to shape. Most of the usual machining time is saved. Redressing is reduced. That is why before the war Strenes scored heavily as forming and drawing die metal. In one case around 2,000,000 stampings were obtained and the die is still in good condition, ready to resume operation at the end of the war. Runs of 100,000 pieces up are not uncommon. Hundreds of the largest plants in the country used it regularly in their tooling programs. Want the names of pre-war users of Strenes?

IN THE WAR

Strenes today is being used for draw pots, draw pot inserts, draw rings for draw bench operation, for progressing upsetting dies—all in shell manufacture. Glad to identify all such users and many others.

AFTER THE WAR

After the war, refrigerator, stove, metal casket, grave vault, farm implement and other manufacturers will resume with Strenes metal forming and drawing dies. Many of the automobile, truck and tractor builders are extensive users, for body, fender and hood dies. Will name them to interested inquirers.

Look into the merits of Strenes metal—Try it, at least once.

THE
ADVANCE FOUNDRY CO.
DAYTON, OHIO
100 SEMINARY STREET

America. The plan is retroactive to April 8, 1943, and a company official said the retroactive bonus for the non-production workers would approximate $239.00 each. Non-production workers will receive no bonus until incentive workers efficiency reaches 115 per cent. At that point, they will be paid in a ratio slightly under one per cent of their basic pay for each two per cent of efficiency, above 115 per cent, reached by incentive workers in their plant.

•

• One of the Navy's newest possessions is a 10,000-k.w. mobile power plant delivered by the General Electric Co., to the Philadelphia Navy Yard for the Bureau of Yards & Docks. First of its kind, the mobile plant is one of two such units G.E. is supplying to the Bureau. It comprises six specially built railway cars housing a complete steam-turbine generating station as well as the switchgear and transformer apparatus for controlling and distributing the electric power it is capable of producing. The unit has no motive power of its own, but it can be transported quickly by rail to any point where additional or emergency power may be required and set up in 24 hours. Bunker C fuel oil is used to fire the boilers, and a sufficient supply is carried in the mobile unit for two hours operation. Generation is at 13,800 volts. The transformer included with the unit provides other voltages which correspond to those of the electric distribution system at any naval shore establishment where the unit may be needed.

•

• *An official Navy photograph made from one of the X-Ray plates taken in the case of the "human bomb," the sailor who carried an unexploded 20 mm. shell in his hip during a battle in the South Pacific, has been received by the Kelley-Koett Mfg. Co., X Ray manufacturers in Covington, Ky. Plainly apparent in the X-Ray photograph is the black and menacing outline of the 20 mm. anti-aircraft shell, which was lodged in the hip of Allen L. Gordon, Rock Island, Ill., a fire controlman. Gordon was given first aid then rushed to a Navy hospital on an island outpost. There two Navy doctors, working behind steel plate, removed the deadly missile. Navy officials report that the patient, no longer a "bomb," is recuperating satisfactorily.*

•

• The United States Rubber Co. is expanding production facilities of four major tire plants. These plants are located at Chicopee Falls, Mass., Eau Claire, Wis., Detroit and Los Angeles. More than $25,000,000 will be spent to increase the output of these plants and when completed in late 1944, tire production, in point of tonnage, will be increased more than 30 per cent above that of any previous time in company history.

•

• Production of the "chest-and-wing" section for the Navy's Corsair fighter plane has been more than tripled in the past three months by the aircraft division of Willys-Overland Motors. The increased output is due largely to the development of a half-mile station-to-station assembly line which permits rapid training of inexperienced aircraft workers. In exceeding Navy production quotas the Willys aircraft plant turned out twice as many wing sections in October as in the preceding month, and increased production an additional 50 per cent during November. The assembly line technique developed has made possible the training of new workers for specific jobs in a relatively short period, thus enabling the company to boost production.

•

• Consolidated Vultee Aircraft Corp., San Diego division, believing rivet distribution and control has long been neglected as an integral and vital part of the aviation production picture, has worked out a program of distribution which engineers estimate will save the company well over $1,000,000 annually in manpower and material. Involved are innovations in the field of packaging rivets, and personal distribution of required rivets to riveters, in contrast to older, wasteful methods wherein riveters left their work to obtain their own rivets.

•

• Canada's export trade in 1943 reached "the highest figure in history" and far exceeded imports. The total of domestic and foreign exports during the year attained the unprecedented figure of slightly more than $3,000,000,000. In other words, exports in 1943 were at the rate of $250,000,000 a month, or $10,000,000 per working day. The value of 1943 exports was more than three times greater than the value of 1939 exports, set at more than $935,900,000. Well over 70 per cent of these exports were materials used directly in the carrying on of this total war. While the great bulk of exports went to the United Kingdom and the United States, exports to the Middle East and to the Far East, both of them war zones, were enormous. Moreover exports of munitions to Russia were of unprecedented value. Exports of motor vehicles and parts, including trucks, gun carriers and tanks, showed an increase of from $26,000,000 in 1939 to $472,000,000 in 1943. Exports of guns, amounting to only a few thousand dollars in 1939, totaled $144,000,000 last year.

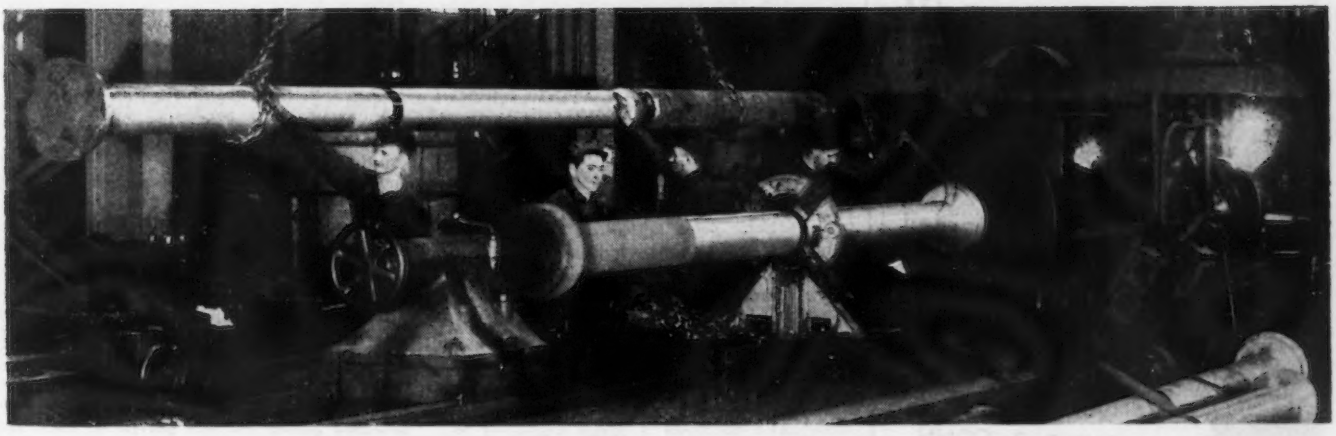
•

• National production figures for the aircraft industry for 1943, compiled by the WPB, show that Consolidated Vultee Aircraft Corp. is the world's largest producer of airplanes. Tom M. Girdler, chairman of the board, said that the company in 1943 delivered more airplanes by number and by weight than any other manufacturer. A telegram from the Aircraft Production Board, a unit of the WPB, congratulated the company on its 1943 output. The telegram disclosed that "Consolidated Vultee deliveries of more than 126,000,000 lb., including spares, compared with 115,000,000 lb. delivered by the second largest producer. The third largest producer delivered 73,000,000 lb." Mr. Girdler stated: "Consolidated Vultee delivered over 12 per cent by number and over 16 per cent by weight of all aircraft built in the United States."

•

• Prospecting for low volatile coking coal has been started on Lookout Mountain near Fort Payne in northeastern Alabama, according to Richard W. Smith, district engineer of the U. S. Bureau of Mines at the University of Alabama, Tuscaloosa. The area to be prospected contains about 140 sq. mi. If mineable quantities are found, it is expected that mines will be developed and that the coal will be used in place of that from the Pocahontas districts of West Virginia. The West Virginia

CHURNING THE SEAS *with* Barium Steels



THE first rotations of many Destroyer Escort propeller shafts occur on lathes in the shops of Barium, where such shafts are turned.

But before that, the steel itself was melted and refined in Barium's furnaces and forged under Barium's giant presses and hammers and scientifically heat treated.

Through the unified control of all these operations from the furnace to the lathe, Barium provides our fighters with propeller shafts and thrust bearings for destroyers and other vessels . . . with breech blocks and housings for light and heavy guns — all of super strength and finest quality — meeting the exacting specifications of the Armed Forces.

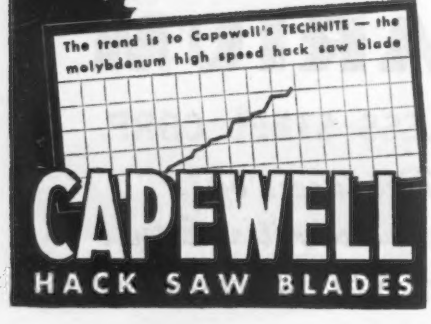
Capewell
HACK SAW BLADES
Cut Time FOR
TOOL MANUFACTURER
DOING WAR WORK

This manufacturer had difficulty finding a blade that would take the punishment of his high-speed production — six pieces of 3½" steel stock at a cut, 135 strokes. Then Capewell's Technite hack saw blade was tested. The result: orders and repeat orders. Have you investigated Capewell hack saw blades?

THE CAPEWELL
MANUFACTURING CO.
HARTFORD, 2, CONN.



CAPEWELL
HACK SAW BLADES

coal is brought into the Birmingham District for mixing with Birmingham coking coal, which is considered high volatile.

●

• A machine for bending and stretching metal parts for aircraft at a speed and economy never attained before has been developed for Goodyear Aircraft Corp. It has been put into operation at the Akron, Ohio, plant. The Roto-Stretcher, as it is called, forms parts without wrinkles due to the controlled force it exerts during operations. Costly handwork required by other methods are said to be unnecessary. One man operates the apparatus and the first machine installed at Goodyear is said to have paid for its development and cost in a single week's operation. Parts can readily be formed on the Roto-Stretcher that previously had to be formed in conventional mechanical dies. Springback, or change in shape after the part leaves the machine, is negligible, so that uniformity is assured. The Goodyear machine is being used to form parts with contours up to 360 deg., an operation thought impossible by stretch or bend methods.

●

• The Plastics Materials Mfgrs. Association reelected James L. Rodgers of the Plaskon Co. as president, and William Thiele of the Catalin Corp. as vice-president. John E. Walker will continue as secretary-treasurer of the association. The group also announced the expansion of technical activities of the association with the appointment of F. H. Carman as general manager. With a change in the by-laws of the association, a board of directors was elected for the year 1944. The members of the board are the president and vice-president and A. E. Pitcher, plastics division, E. I. du Pont de Nemours & Co.; J. C. Brooks, vice-president, Monsanto Chemical Co., plastics division; J. R. Hoover, plastic material division, B. F. Goodrich Co.; and Harry Dent, president, Durez Plastics and Chemicals, Inc.

●

• Representatives of 10 manufacturers of synthetic resin adhesives met in New York Jan. 13 and formed an association aimed primarily at "offering cooperation in utilizing synthetic adhesives for war products and unified industry action on industry-wide problems in dealing with the armed services and other government agencies. The group will be known as the "Resin" Adhesive Manufacturers Association" and includes a large share of the companies now producing synthetic resin adhesives for further sale or manufacture. The officers of the new association are: president, W. F. Leicester, vice-president, Casein Co., of America; vice-president, C. F. Hosford, Jr., president, Pennsylvania Coal Products Co.; secretary-treasurer, J. E. Waller. Mr. Leicester, the president, described the organization as a movement to coordinate the resources of the member firms in a common effort. The need for the new organization was recognized through the activities of the Plastics Materials Manufacturers' Association wherein the assistance to industry and the armed forces on those products indicated a similar service could be rendered in connection with the utilization of these adhesives. The new association includes those concerns whose adhesives are based on phenol, urea, resorcin, melamine, vinyls and alkyd resins. An important phase of the program instituted in the first meeting was the appointment of a Technical Advisory Committee including representatives of each member company.

●

• War expenditures by the United States in 1943 amounted to $85,135,000,000, as compared to the $52,406,000,000 expended in 1942, an increase of 62½ per cent, the WPB announced. The average daily rate of war expenditure in 1943 rose 61.4 per cent over 1942, from $169,100,000 to $272,900,000. The daily rate is based on the 310 days in 1942 and the 312 days in 1943 on which checks were cleared by the Treasury.

●

• Railroads handled in 1943 the greatest volume of export freight traffic on record, according to the Association of American Railroads. Export traffic is moving freely through the various ports, all of which are in a completely "liquid" condition. Cars of export freight, excluding grain and coal, unloaded at all ports in this country in 1943 totaled 1,401,186 compared with 893,576 cars in 1942. Export grain unloaded at all ports in 1943 totaled 53,204 cars compared with 30,315 cars in 1942. Coastwise freight unloaded at all ports in the past year totaled 7333 cars, compared with 30,951 cars in 1942.

●

• Aluminum will supplement but not replace steel in the postwar cars, Clinton Davidson, president, Management Planning, Inc., stated, commenting on a survey of the automotive field by the research department of his organization. The exponents of aluminum have overlooked the advantages of the new, light steels developed during the war, the details of which are a military secret. These steels are greatly superior to the heavier steels used before the war. One leading car manufacturer, according to the survey, said that no increased use of aluminum was in prospect, while another major manufacturer pointed out that they would not use more aluminum unless the price dropped to 11 or 12c. per lb., from the present price of from 15 to 20c. per lb. Twenty-five years ago experiments with aluminum bodies proved unsatisfactory and unduly expensive. Aluminum has many advantages and several major disadvantages. The factors of cost, strength and durability all favor the lighter steels in postwar cars.

●

• A total of 26,760,000 steel castings were produced during the last quarter of 1943, according to the WPB Steel Division. The divisions arrived at this conclusion by taking the total weight of all castings fabricated during the quarter—669,000 tons—and dividing by 50 lb., the estimated average weight of steel castings. Production of castings by weight over the past three years was as follows: 1941, 1,577,736 tons; 1942, 2,239,693 tons; and 1943, 2,742,604 tons.

●

• Delegation of authority has been made to the Aircraft Scheduling Unit of the Aircraft Resources Control Board to grant specific authorizations to deliver magnesium products going into aircraft and aircraft equipment. Heretofore, authorizations were granted by the WPB Aluminum and Magnesium Division on the recommendation of the Aircraft Scheduling Unit. This authority was delegated by the issuance of directive 34.

Canada's Reduced War Production Permits Manufacture of Civilian Goods

Toronto

• • • **Slackening tempo** is indicated in Canada's war production program, and is now accompanied by a swing to civilian manufacturing. Improvement in the anti-submarine campaign reduced Canada's program for the construction of frigates and corvettes. No new contracts are expected to be let for these types of craft. However, it was pointed out that the downward revision of the program will have comparatively little effect in 1944, since ships for which keels already have been laid will be completed. New contracts now being negotiated may replace work that has been cut off, but no new corvettes or frigates will be started. Last year production of cargo ships was curtailed when contracts involving upwards of $50,000,000 were cancelled. The effect of the revision will be felt gradually through 1944 and no large layoffs of men are anticipated immediately, since a large part of this year's program is already underway.

Donald Gordon, chairman of the Wartime Prices and Trade Board stated in Ottawa that limited manufacture of washing machines and home electric irons has started again in Canada and the whole field of household utensils is under examination by the board. Officials of two major washing machine companies in the Toronto area said that permits for resumption of production had been issued in December. Under present schedules output will be about 15 per cent of the 1941 total.

Restrictions on manufacture of low pressure welded steel boilers for steam or hot water heating have been lifted. Copper and brass rod may now be used in the manufacture of certain articles of plumbing equipment, and four types of pumps in five sizes, originally banned, may now be manufactured.

W. P. Bayley, secretary-treasurer of Page-Hersey Tubes Ltd., producers of wrought, black and galvanized pipe, tubes, etc., announced that the company has again entered the export markets and fair tonnages have been booked for shipment to British Empire countries. It is expected that this export trade will increase this year.

Among the Week's Trade Notes

B. F. Goodrich Co., Akron, Ohio, announces that soon after Jan. 1 it will establish manufacturing operations in DuBois, Pa. The new unit will manufacture products in which rubber and textiles are employed. The company also announced that a new manufacturing plant will be built in Miami, Okla.

•

Bethlehem Steel Co. has acquired the plant and business of Atlas Steel Barrel Corp., Bayonne, N. J. It will be operated as a division of Bethlehem Steel.

•

Oceco Division, Johnston & Jennings Co., Cleveland, has appointed General Meters & Controls Co., Chicago, as its representative in the Chicago territory.

•

Master Tool & Machine Co., 279 Public Service Building, Milwaukee, has been organized by Oscar Peterson, John Salo and Leo Zehren.

•

Irrgang Engineering Co., 744 Broad Street, Newark, N. J., has been formed by L. Irrgang to assist manufacturers as consultant engineer.

•

Precision Paper Tube Co., Chicago, has expanded its facilities to allow for increased production.

•

Edward Valve & Mfg. Co., Inc., East Chicago, Ind., has appointed Eshelman & Potter, Birmingham, Ala., and Charlotte, N. C., as its representative in the Southeastern section of the country.

•

E. D. Jones & Son Co., Pittsfield, Mass., is closing its foundry after 80 years of operations.

Ransome Machinery Co. is now a wholly owned subsidiary of Worthington Pump and Machinery Corp., Harrison, N. J. Ransome Welding positioning equipment is now available to industries through Worthington district office in all principal cities.

•

Davis Engineering Co., Worcester, has devised an automatic strut-bending and forming machine that combines three formerly separate manufacturing operations.

•

B. F. Goodrich Co., Akron, Ohio, announces that its Industrial Products Sales division has been granted national distribution rights of the Punch-Lok hose clamp and method of applying it to hose of all types, electric cable, and wire or textile rope.

•

N. A. Woodworth Co. has purchased the Suprex Co., manufacturers of precision gages, ground thread taps and form tools.

•

International Harvester Co. has created a separate motor truck division to have entire control of design, production, and distribution of International trucks. P. V. Moulder, former assistant to the second vice-president of the company, has been appointed general manager of the new division.

•

Walker Mfg. Co., Racine, Wis., has purchased the former factory building of the Jacobsen Mfg. Co. in that city as part of its postwar planning program.

•

Michigan Tool Co., Detroit, will now have factory service and sales in district offices at 1217 Grant Building, Pittsburgh 19, and 1109 Fletcher Trust Building, Indianapolis 9.

HOW TO DEGREASE MAGNESIUM PARTS

FASTER with

SPECIALIZED OAKITE MATERIALS

Are you applying Dow surface treatments or other protective coatings to magnesium airplane parts? Then you know that complete removal of dirt, grease, fabricating oils and other foreign matter is a prime requisite to the proper ADHESION and DURABILITY of the finish.

How can you obtain these essential CHEMICALLY CLEAN surfaces quickly and economically? By using Oakite Test X or other recommended Oakite material. After cleaning, microscopic examination will show that surfaces are free of ALL deposits. Moreover, SAFE Oakite wetting-out and emulsifying action will not etch, pit or abrade surfaces . . thus assuring protective coatings of maximum effectiveness.

Send for *FREE* Data!

For complete war-data on this or any other production cleaning job, write TODAY . . . no obligation, of course!

PERSONALS

K. E. SUTTON, manager, Wright Aeronautical Corp.'s Wood-Ridge, N. J. factory.

• **Lee Bergstrom** has been made Los Angeles representative of Joseph T. Ryerson & Son, Inc., Chicago. Mr. Bergstrom started in the steel business in Seattle at the age of 13.

• **Floyd C. Lowell,** formerly branch manager and sales engineer of the Buffalo office of Henry Prentiss & Co., Inc., is now associated with the Buffalo Machinery Co., Inc., Buffalo, as sales manager.

• **Grant Davis** has been appointed sales manager of Standard Steel Corp., Los Angeles. Previously Mr. Davis was with Lima Locomotive Works and the Koehring Co.

• **A. N. Swanson** has been appointed chief process metallurgist in the Chicago metallurgical division, Carnegie-Illinois Steel Corp. He is succeeded by **C. J. Hunter,** formerly coordinator of armor plate products in the Pittsburgh general office.

• **R. L. Sullivan,** of American Can Co., has been made vice-president in charge of the Atlantic division; **W. J. Wardell,** comptroller, named vice-president and comptroller, and **W. C. Stolk,** vice-president in charge of sales. All three executives have served most of their business careers with the company.

• **K. C. Plasterer** has been named manager of the Oldsmobile shell plant, Kansas City. He succeeds **Maynard T. Murray,** who returns to Lansing in direct charge of all shell and shot production. **Russell Trapnell** has been named plant superintendent of shell plant No. 1 in Lansing.

• **K. E. Sutton,** associated with the Wright Aeronautical Corp. since 1929 as assistant factory manager, production manager and general superintendent of its plants in the Paterson, N. J., area, has been named manager of the Wood-Ridge warplane engine plant. **A. M. Scheerer,** experimental engineer with the organization for the past eight years, has been appointed engineering manager of the same factory. Mr. Sutton replaces **A. Amundsen,** named to the same position last September.

• **W. S. Richardson,** general manager of the chemicals division of the B. F. Goodrich Co., Akron, Ohio, has been elected vice-president of the Hycar Chemical Co. Mr. Richardson succeeds **Raymond W. Albright.**

• **W. O. Lawrence, Jr.,** plant engineer of the Universal Atlas Cement Co. at Leeds, Ala., has been named assistant plant manager. Mr. Lawrence took his first post with Universal Atlas, a U. S. Steel Corp. subsidiary, in 1933.

• **A. M. Donze,** factory manager of Timken Roller Bearing Co., Canton, Ohio, has become vice-president in charge of production. At the same time, **H. M. Richey,** assistant factory manager, was promoted to factory manager.

• **Walter G. Hildorf,** recently became director of Metallurgy of the Timken Roller Bearing Co., and is the first to occupy that newly created office. Mr. Hildorf was formerly Timken's chief metallurgical engineer, a position now held by **Ralph L. Wilson.**

• **James E. Ashman** has been appointed procedure supervisor of the accounting department of Carnegie-Illinois Steel Corp., Pittsburgh. He formerly held a similar position with American Steel & Wire Co.

• **Roy E. Ward,** district manager of the Austin Co., at Los Angeles since 1925, and **Frank W. Maynard,** the company's district manager at Oakland, Cal., since 1937, have been named vice-presidents of the company.

• **Charles O. Guernsey** has now resumed his position as vice-president of the J. G. Brill Co., New York. For the past 20 months Mr. Guernsey had been serving in an administrative capacity with the Philadelphia ordnance district.

A. M. SCHEERER, engineering manager of Wright Aeronautical Corp.'s Wood-Ridge, N. J., warplane engine factory.

• **H. W. Erler,** formerly superintendent of No. 1 open hearth, Gary works, Carnegie-Illinois Steel Corp., has been appointed superintendent of No. 4 open hearth replacing **S. L. Moffatt,** resigned. **W. G. Hoffman** has been promoted to superintendent of No. 1 open hearth succeeding Mr. Erler, and **Ross Sibley** replaces Mr. Hoffman.

• **P. V. Moulder,** former assistant to the second vice-president of International Harvester Co., Chicago, has been appointed general manager of the newly created truck division of the company. **W. D. Reese,** has been made manager of engineering of the truck division, and **V. A. Guebard** has been named manager of manufacturing.

• **Henry F. Schippel** has been named manager of the aeronautical section of the field engineering department of the tire division of B. F. Goodrich Co.

• **Raymond Diaz,** formerly treasurer of Benner Chemical Co., Chicago, has been appointed supervisor of district offices of the Diamond Alkali Sales Corp.

• **Herbert L. Rawlins,** of the East Pittsburgh Works of Westinghouse Electric & Mfg Co., has been named manager of the protective devices engineering department, replacing **L. R. Ludwig,** who has been appointed manager of the motor division. Also **A. W. Hill,** design engineer, has become manager of power circuit breaker engineering.

PAUL S. KILLIAN, purchasing agent for Bethlehem Steel Co., as announced in the Jan. 20 issue, p. 86.

• **Albert Bradley**, executive vice-president of General Motors Co., has been appointed chairman of the Distribution Policy Group, which has been under the jurisdiction of **R. H. Grant**, retired vice-president.

• **R. C. Hardy** has been made district manager of General Electric's Central Station division, Cleveland. Mr. Hardy succeeds the late **Erle F. Whitney**, who had been manager for 14 years.

• **J. H. Tice** has been made district sales manager of Jones & Laughlin Steel Corp., at Tulsa, Okla., succeeding **R. J. Woods, Jr.**, who has been transferred to the Frick-Reid Supply Corp. as district manager of tube sales in Tulsa. **C. T. Hapgood** has been transferred to Pittsburgh as assistant manager of tubular products sales in charge of oil country goods, and **D. J. Ambrose** was appointed assistant district sales manager at Cincinnati.

• **L. H. Brandt**, formerly with the national ammonia division of du Pont, has joined the technical service department of the Pennsylvania Salt Mfg. Co., Philadelphia, Pa.

• **W. E. Mackley**, of American Steel & Wire Co., has been appointed manager of the manufacturers sales department of the New York office. **F. E. Ward** succeeds Mr. Mackley as manager of sales at Buffalo, N. Y.

• **Carl L. Zak** has been appointed manager of tubular sales for Pittsburgh Steel Co., Pittsburgh. He had been secretary of the Seamless Steel Tube Institute, Pittsburgh, since 1941.

• **Charles R. Cox**, president of the National Tube Co. and of Tubular Alloy Steel Corp., both U. S. Steel subsidiaries, has been elected president of the Western Pennsylvania Safety Council. He succeeds **Raymond A. Tucker**, who continues as a director of the organization.

• **E. A. Green** has been named general assistant to the manager of General Electric's motor division.

• **Robert W. Worley** has recently been appointed to the position of chief engineer of the union drawn steel division of Republic Steel Corp., Massillon, Ohio.

• **Eugene Mowlds, Jr.**, was appointed contracting manager at Philadelphia, and **Joseph W. Small, III**, for the same position at Baltimore by American Bridge Co., a U. S. Steel subsidiary. Mr. Mowlds succeeds **Charles Rieder, Jr.**, who retired after more than 50 years of service.

• **G. W. Dolan** has been elected president of the Mathieson Alkali Works, Inc., following the retirement of **E. M. Allen**. Mr. Allen will continue to hold his office as chairman of the board of directors of the company. Mr. Dolan joined the Mathieson organization in 1930 and has held various positions of responsibility. In 1941 he was elected executive vice-president of the company.

• **Harry L. McClees**, formerly secretary of Crucible Steel Casting Co., has been elected president and **Harry Bloodsworth, Jr.**, formerly sales manager, has been elected secretary of the company.

HENRY ROWOLD, vice-president, Mack-International Motor Truck Corp.

• **Henry Rowold** has been appointed vice-president of Mack-International Motor Truck Corp., New York. Mr. Rowold joined the Mack organization in 1919. He was placed in charge of national account sales in 1939, and as vice-president will continue in that capacity.

• **W. C. Shull** has been made manager of National Battery Co.'s account sales. He succeeds **J. C. Hammond**, who leaves the battery industry to become sales manager of the Franklin Transformer Mfg Co.

• **Lt. Col. Cecil P. Young**, U. S. A., Ret., has been appointed executive vice-president of the Wickwire Spencer Aviation Corp., a subsidiary of Wickwire Spencer Steel Co.

OBITUARY...

• **George E. Hardy**, vice-president of William A. Hardy & Sons Co., Fitchburg, died Jan. 12.

• **Leonard A. Burton**, sales representative of the George F. Wright Steel & Wire Co., Worcester, since 1911, died suddenly on Jan. 11. He was born in Worcester 52 years ago.

• **Alexander O. Hoeftman**, electrical engineer and cable expert and formerly on the staff of the American Steel & Wire Co., Worcester, died at St. Petersburg, Fla., Jan. 12.

• **Clement R. H. Cunningham**, president of Crucible Steel Casting Co., Lansdowne, Pa., which he founded in 1905, died Dec. 5.

• **Albert D. Troth**, director of purchases of Sharon Steel Corp., Sharon, Pa., died Jan. 19.

• **John B. Madden**, 59, Buffalo agent for several large industrial concerns, died Jan. 9 at his home in that city. He was a former manufacturer of engineering specialties and high-pressure valves.

• **Lyle B. Yeaton**, former secretary of the Wholesale Metal Dealers Club in Los Angeles and for 24 years statistician for the Iron & Steel Warehouse industry, Cal., died at the age of 56 in his home at Los Angeles.

• **Edward E. Staley**, 72 years old, chairman of the board of directors of the Baker Mfg Co., died on Dec. 23, 1943, at his home in Springfield, Ill., after an illness of several years.

MACHINE TOOLS

. . . News and Market Activities

W. & S. to Make Bakewell Tapper

Cleveland

• • • **To prepare for postwar** markets, the Warner & Swasey Co. announces the purchase of manufacturing rights for the Bakewell tapping machine from the Bakewell Mfg. Co., of Los Angeles. To be known as the Warner & Swasey precision threading and tapping machine, its production is being transferred to the company's Cleveland plants and its sale will be handled by the same branch offices as handle Warner & Swasey turret lathes.

In the Bakewell tapper the lead screw is integral with the spindle and is engaged by two stationary brass shoes or guide fingers which are cut and re-cut by a hob of the same pitch on the upper part of the lead screw. The fingers are actuated by a solenoid mechanism. The unit is capable of cutting threads accurate to Class 5 fits on a mass production basis. Prolonged tap life is assured by a safety clutch which is adjustable for various types of material being threaded. These include plastics, aluminum, magnesium, bronze, nickel and stainless steels.

•

Machine Tools Sales to U. K. Being Put on Cash Basis

Washington

• • • **With Great Britain** tooled up for war, certain capital goods shipments to that country for peace time use are being removed from lend-lease and placed on a dollar cash basis. Included in this group are machine tools and machinery. It is said that so far exports on this basis have been relatively small and are expected to be so long as Great Britain is so greatly occupied with war conditions.

The lend-lease agreement between Washington and London is being revised to include a recently stated policy of Leo T. Crowley, head of the Federal Economic Administration, of which lend-lease is a part. Mr. Crowley maintains that Great Britain is well supplied with industrial war equipment and should pay dollars for some types of capital goods which previously were shipped under lend-lease for military production.

•

Plan A.S.T.E. Annual Meeting At Philadelphia in March

Detroit

• • • **The annual meeting** of the American Society of Tool Engineers has been scheduled for March 27 and 28, in Philadelphia, with headquarters at the Bellevue-Stratford Hotel. Technical sessions are scheduled for both morning and afternoon on the 27th and 28th as well as the evening of the 27th. The annual banquet will be held Tuesday evening, March 28.

In contrast with the last two years, no exhibition is scheduled. It is unlikely as a matter of fact that any shows will be held by the society prior to the termination of European hostilities. Plans are being projected, however, for the holding of the largest exhibition in history of production equipment, tools and machines approximately 90 days after the end of the war in Europe.

•

Postwar Clinic Held

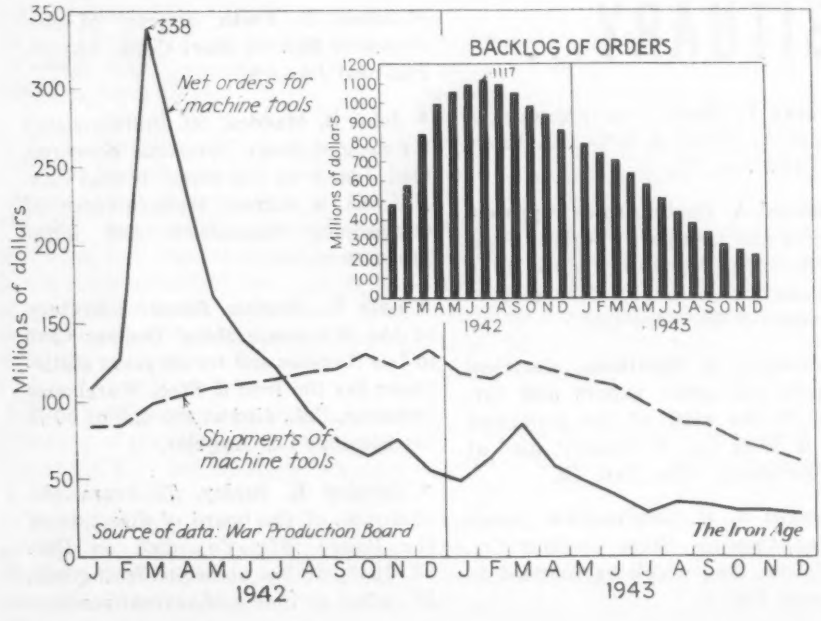
Cincinnati

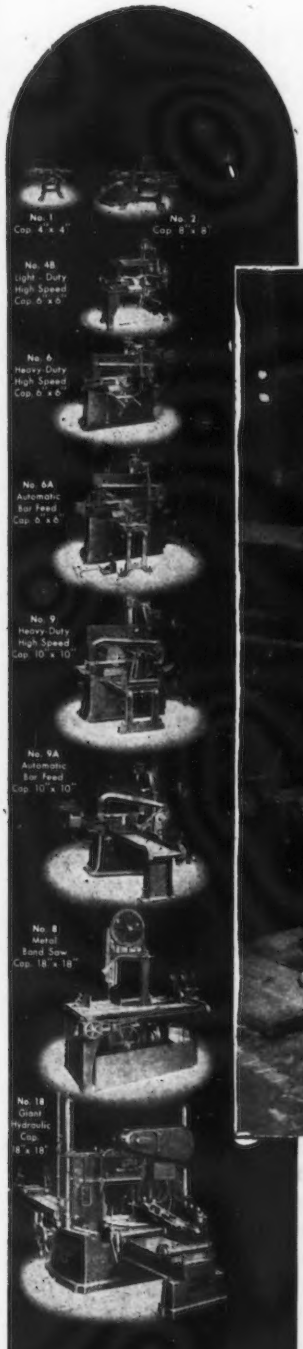
• • • **Much attention** during this present week was attracted by a war and postwar clinic being conducted under the auspices of the Cincinnati Association of Credit Men. Beginning on Tuesday of this week the clinic was to run during the afternoon and evening of that day, with the first address to be given by Frederick B. Geier, president of the Cincinnati Milling Machine Co., who is also chairman of the Hamilton County Committee for Economic Development.

Business as well as the machine tool industry is giving quite a bit of attention to this clinic, which was to discuss the entire gamut of business enterprise and taxes, with some attention given to postwar electronics and possible new items. Conversion to subcontracts for job work as well as the manufacture of complete war products is also being pushed rapidly among machine tool men in this area. A number of plants are now contracting for machine work on a job basis and the greater number of the plants are doing other than straight machine tool manufacture.

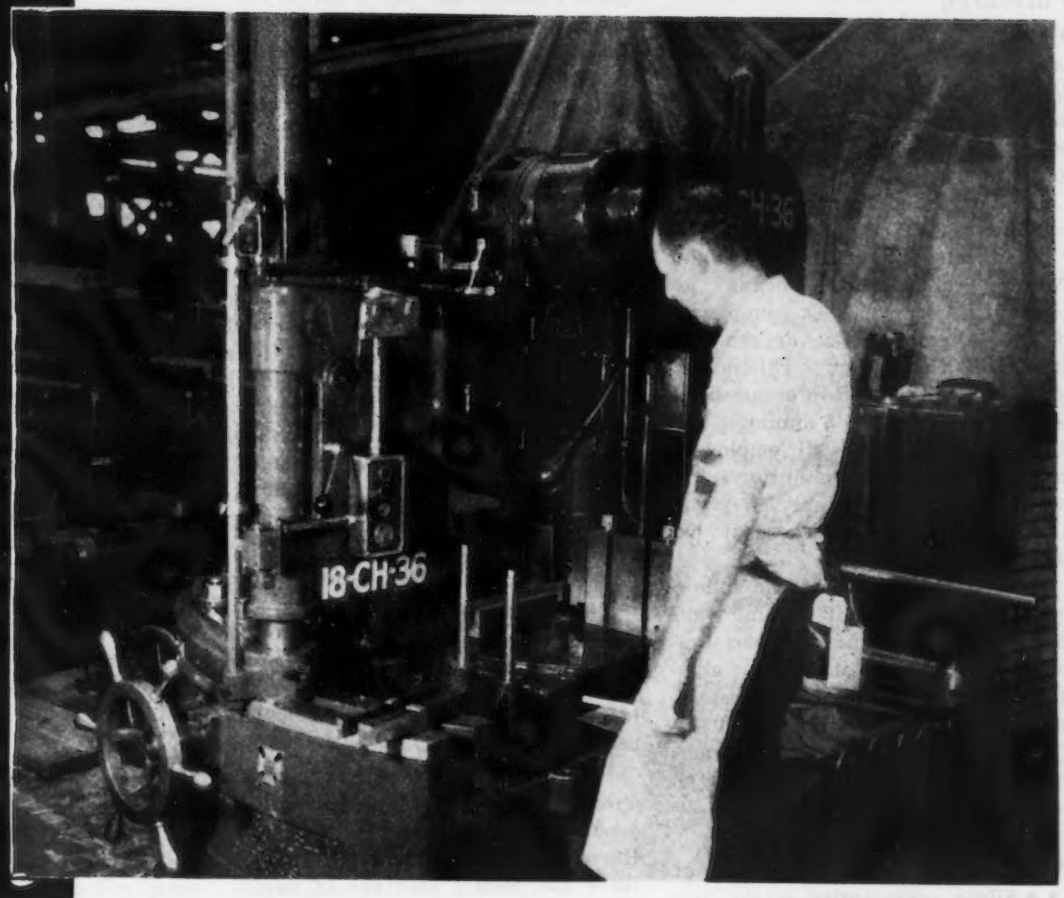
Machine Tool Backlog Dropped 14 Per Cent

The backlog of unfilled orders at the end of December totaled $211,751,000, or 14 per cent less than the November backlog of $246,509,000. Shipments of machine tools during December totaled $60,680,000, a decrease of more than 15 per cent from the November shipment value of $71,811,000, according to the WPB Tools Division. Total firm orders received in December were valued at $33,746,000, or approximately 10.5 per cent less than the November total of $37,705,000. Cancellations of orders in December were $6,942,000, or 16 per cent more than the $5,979,000 November cancellations. Net December orders were $26,804,000.





MARVEL SAWS



(ABOVE.) The MARVEL No. 18 Hydraulic Hack Saw shown in action at the Philadelphia Navy Yard cutting a test piece of heavy plate.

For Thin Tubes or Heavy Plate!

Two shipbuilding jobs—one at the Philadelphia Navy Yard and one at the New York Shipbuilding Corporation—demonstrate the wide variety of jobs that can be performed on MARVEL Sawing Machines. Producing a clean 45° mitered cut in tubing of thin cross-section, or sawing through thick sections of heavy plate are just two of the many jobs that can be turned out with speed and economy on MARVEL Saws.

Take advantage of MARVEL Free Technical Service! At your request a competent MARVEL Engineer will study your metal-cutting problems and make recommendations for increasing your metal sawing efficiency to meet the increased demands of defense production.

(AT RIGHT.) At the New York Shipbuilding Corporation, a MARVEL No. 8 Universal Tool Room Sawing Machine finds wide application in cutting bars, tubes, etc., either straight through or at any desired angle up to 45°. The machine will accommodate one or more pieces of stock up to 12" square in cross-section.

CIO-AWA Demands Retroactive Wages

Pittsburgh

• • • **The Aluminum Co.** of America, last week, turned down the CIO's request for a retroactive date on any wage adjustments that might be subsequently granted. The union immediately called upon the War Labor Board to decide this issue without delay.

Meanwhile, the CIO Aluminum Workers of America began negotiations for 60,000 employees of the Aluminum Co. of America throughout the country. Elimination of the North-South differentials is asked. In addition to a minimum 15c. per hr. increase for all employees, the union also wants a uniform hiring rate of 95c. per hr. in every Aluminum Co. plant where it has contracts.

Other demands include the following: Establishment of a joint wage scale committee to bring about uniformity in the wage structures; elimination of an incentive bonus system; an annual wage guarantee of 40 hr. a week; a 15-day sick leave program; and other working condition factors.

•

Peak in Silver Use

• • • **Silver consumption** in the arts and industries of the United States set a new high record of 125,000,000 oz. in 1943, an increase of 10,000,000 oz. or about 9 per cent over the previous high of 115,000,000 oz. used in 1942. In Canada approximately 4,000,000 oz. were consumed, Handy & Harmon stated in their 28th annual review.

United States consumption during the past year was more than four times the average annual amount for the five-year period prior to 1941, which was the first year in which there was any appreciable use of silver in war industries.

Of the silver consumed in the United States during 1943, about 65 per cent went into war production or for purposes classified as essential by the War Production Board. Largest single use was for photographic film, following in order of quantity by silver brazing alloys and silver-lead solders, airplane engine bearings, electrical contacts and parts, military insignia, silver-plated eating utensils for the Army and Navy and, in considerably less volume, by medical and dental products.

Production of silver-lead solders increased greatly during 1943 in order to conserve tin in the lead-tin soft solders ordinarily employed in the canning industry.

The price of silver to manufacturers increased during the past year and a half from the prewar level of 35c. an oz. to 45c. an oz., and for many purposes to 71.11c. The higher figure was established in September, 1942, by OPA for domestic silver, and in July, 1943, the Green Act raised the price to that level for Treasury silver.

The Green Act, in addition to increasing the selling price of Treasury silver to 71.11c. an oz., restricted the leasing of Treasury silver for use within the United States for a period limited to six months after the present war and permitted the use of loaned silver as backing for silver certificates.

Passage of the Green Act to make Treasury silver available came at a most opportune time, the Handy & Harmon report pointed out, because there had been a shortage of newly-mined metal for several months and the situation appeared to be getting progressively worse. In the case of foreign silver, priced at 45c., the shortage was the direct result of a decline in imports caused by Mexico's retention for increased coinage.

On July 29, WPB, acting under the terms of the Green Act, published the necessary regulations to release Treasury silver for industrial consumption. M-199 which had been amended on Feb. 25 to extend its provisions to cover domestic silver and establish monthly quotas of 50 per cent of the average used in either 1941 or 1942 for the non-essential use of such silver and amended again on May 10 to place quotas on a quarterly basis, was further changed to add Treasury silver. Three lists classified according to end use were created for foreign, domestic and Treasury silver. End-use lists were: List A (foreign silver) for medicines, photography, electrical contacts and certain priority-rated orders; List B (domestic silver) for uses considered non-essential; List C (Treasury silver) for engine bearings, brazing alloys, solders and official military insignia.

Authorization to charge the same price for semi-fabricated products made of Treasury silver as for those made of domestic silver was granted by OPA in July and during August the price increase was extended to cover solders, babbitt metal, specified mixed metals such as silver-lead solders, and scrap produced by suppliers in the course of their operations.

The higher price level for Treasury and domestic silver has created an inventory risk, the report stated, which would be lacking in normal times. Although the Treasury Department has promised to prepare an agreement whereby manufacturers will be permitted, subject to reasonable limitations, to resell to the government the Treasury silver remaining in inventory, no such protection against loss exists in the case of inventories of domestic silver.

•

Copper Scrap Prices Revised

• • • **Ceiling price changes**, designed to facilitate the movement of copper scrap and copper alloy scrap to ingot makers and copper refiners were announced Jan. 20 by OPA.

Decreases in ceiling prices on the following grades of scrap on sales to copper refiners and ingot makers were announced:

Brass pipe scrap, reduced to 7.50c. a lb., f.o.b. shipping point, from 8c.

Old rolled brass scrap, reduced to 7c. a lb. from 7.75c.

Admiralty condenser tubes, reduced to 7.50c. from 8c.

Muntz metal condenser tubes, reduced to 7c. from 7.50c.

Plated rolled brass sheet, pipe and reflectors, reduced to 6.50c. from 7.50c.

These reductions are applicable only in sales to copper refiners and ingot makers.

At the same time, OPA announced specific maximum prices for two grades of copper scrap not previously priced. They are: No. 2 copper borings, 8.75c. a lb., f.o.b. shipping point, and contaminated gilding metal solids, 8.50c. a lb. Previously, these two grades had to be sold as refinery brass at ceiling prices averaging less than 8c. a lb.

REFINER, SMELTER PRICES

(Cents per lb. unless otherwise noted)

Aluminum, 99+%, del'd	15.00
